7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.59 Command Instruction (CPGC2_COMMAND_INSTRUCTION[18])—Offset 3C6Ah

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.60 Command Instruction (CPGC2_COMMAND_INSTRUCTION[19])—Offset 3C6Bh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.61 Command Instruction (CPGC2_COMMAND_INSTRUCTION[20])—Offset 3C6Ch

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.62 Command Instruction (CPGC2_COMMAND_INSTRUCTION[21])—Offset 3C6Dh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.63 Command Instruction (CPGC2_COMMAND_INSTRUCTION[22])—Offset 3C6Eh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.64 Command Instruction (CPGC2_COMMAND_INSTRUCTION[23])—Offset 3C6Fh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.65 Hammer Repeats (CPGC2_HAMMER_REPEATS)—Offset 3C70h

Hammer Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Hammer Repeats (Hammer_Repeats):** Hammer_Repeats is the number of times any command is repeated at the same address when the Hammer control bit is set in the Command_Instruction (if not an offset command).

5.12.66 Current Hammer Repeats (CPGC2_HAMMER_REPEATS_CURRENT)—Offset 3C74h

Current Hammer Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Hammer Repeats (Hammer_Repeats_Current):** Current Hammer Loopcount (down count).

5.12.67 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[0])—Offset 3C78h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.68 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[1])—Offset 3C79h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.69 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[2])—Offset 3C7Ah

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.70 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[3])—Offset 3C7Bh

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.71 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[4])—Offset 3C7Ch

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.72 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[5])—Offset 3C7Dh

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.73 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[6])—Offset 3C7Eh

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.74 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[7])—Offset 3C7Fh

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.75 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[8])—Offset 3C80h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.76 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[9])—Offset 3C81h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.77 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[10])—Offset 3C82h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.78 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[11])—Offset 3C83h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.79 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[12])—Offset 3C84h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.80 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[13])—Offset 3C85h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.81 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[14])—Offset 3C86h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.82 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[15])—Offset 3C87h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.12.83 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[0])—Offset 3C88h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.84 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[1])—Offset 3C89h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.85 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[2])—Offset 3C8Ah

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.86 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[3])—Offset 3C8Bh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.87 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[4])—Offset 3C8Ch

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.88 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[5])—Offset 3C8Dh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.89 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[6])—Offset 3C8Eh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.90 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[7])—Offset 3C8Fh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.91 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[8])—Offset 3C90h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.92 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[9])—Offset 3C91h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.93 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[10])—Offset 3C92h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.94 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[11])—Offset 3C93h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

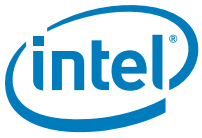
Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.12.95 Offset Repeats (CPGC2_OFFSET_REPEATS[0])—Offset 3C94h

Set the loopcount for Offset (Distance from Base). Selected by Command_Instruction.Offset_Group bit.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Offset Repeats (Offset_Repeats):** Set the loopcount for Offset (Distance from Base). The entire list of Offset Commands are executed for each loop.

5.12.96 Offset Repeats (CPGC2_OFFSET_REPEATS[1])—Offset 3C98h

Set the loopcount for Offset (Distance from Base). Selected by Command_Instruction.Offset_Group bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Offset Repeats (Offset_Repeats):** Set the loopcount for Offset (Distance from Base). The entire list of Offset Commands are executed for each loop.

5.12.97 Current Offset Repeats (CPGC2_OFFSET_REPEATS_CURRENT)—Offset 3C9Ch

Current Offset Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Offset Repeats (Offset_Repeats_Current):** Current Offset Loopcount (down count).

5.12.98 Region Low Row Address (CPGC2_REGION_LOW_ROW)—Offset 3CA0h

Region low row address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RW	**Low Row (Low_Row):** Set the bottom Row for the physical memory being tested. This value is added to all Region Row Addresses computed.

5.12.99 Region Low Col Address (CPGC2_REGION_LOW_COL)—Offset 3CA4h

Region low column address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10:2	0h RW	**Low Column (Low_Col):** Set the lowest Column for the physical memory being tested. This value is added to all Region Column Addresses computed.
1:0	0h RO	Reserved.

5.12.100 Block Low Row Current (CPGC2_BLOCK_ORIGIN_ROW_CURRENT)—Offset 3CA8h

Block low row current.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Block Origin Row (Block_Origin_Row_Current):** Current row within the testing region of memory Updated as the block traverses through the region.

5.12.101 Current Base Address Rank and Column (CPGC2_BASE_ADDRESS_COL_RANK_CURRENT)—Offset 3CACh

Current Base Address both Rank and Column.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:16	0h RO/V	**Current Rank Base Address (Base_Rank_Current):** Current Base Address Rank within the block.
15:11	0h RO	Reserved.
10:2	0h RO/V	**Current Column Base Address (Base_Col_Current):** Current Base Address Column within the block.
1:0	0h RO	Reserved.

5.12.102 Current Base Address Bank and Row (CPGC2_BASE_ADDRESS_ROW_BANK_CURRENT)—Offset 3CB0h

Current Base Address both Bank and Row.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RO/V	**Current Bank Base Address (Base_Bank_Current):** Current Base Address Bank within the block.
23:18	0h RO	Reserved.
17:0	0h RO/V	**Current Row Base Address (Base_Row_Current):** Current Base Address Row within the block.

5.12.103 Current Offset Address Column (CPGC2_OFFSET_ADDRESS_COL_CURRENT)—Offset 3CB4h

Current Offset Address - Column

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10:2	0h RO/V	**Current Column Offset Address (Offset_Col_Current):** Current Offset Address Column within the block. Only valid if the current Command_Instruction pointed to by Command_Instruction_Current is an Offset command.
1:0	0h RO	Reserved.

5.12.104 Current Offset Address Row (CPGC2_OFFSET_ADDRESS_ROW_CURRENT)—Offset 3CB8h

Current Offset Address - Row

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Row Offset Address (Offset_Row_Current):** Current Offset Address Row within the block. Only valid if the current Command_Instruction pointed to by Command_Instruction_Current is an Offset command.

5.12.105 Address Size (CPGC2_ADDRESS_SIZE)—Offset 3CBCh

Set the size of the Region and Block.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:24	0h RW	**Region Row Size (Region_Size_Bits_Row):** 2^Region_Size_Bits_Row is the number of rows in the testing region. Must be >= to Block_Size_Bits_Row.
23:20	0h RW	**Region Column Size (Region_Size_Bits_Col):** 2^Region_Size_Bits_Col is the number of columns in the testing region. It is also used as the Block_Size_Bits_Col value to set the size of the block. Minimum value is 1 if Address_Decode_Enable =1, so this normally needs to be set to the number of Column bits of the memory.
19:16	0h RW	**Block Ranks Size (Block_Size_Num_Ranks):** Number of Ranks to test for a Block (as N-1 = top rank number). All Rank Addresses go through the Rank Address Lookup table.
15:12	0h RW	**Block Banks Size (Block_Size_Num_Banks):** Number of Banks to test for a Block (as N-1 = top bank number). All Bank Address values go through the Bank Address Lookup table.
11:9	0h RO	Reserved.
8:4	0h RW	**Block Row Size (Block_Size_Bits_Row):** 2^Block_Size_Bits_Row is the number of rows for a Block. If block traversal is used, then this must be at least 4 rows (=2). Minimum value is 1 if Address_Decode_Enable =1.
3:0	0h RW	**Block Column Size (Block_Size_Bits_Col):** Reserved for use as Block_Size_Bits_Col - Fixed as same as Region_Size_Bits_Col for the SoC. There is no column traversal of a block.

5.12.106 Base Address Control (CPGC2_BASE_ADDRESS_CONTROL)—Offset 3CC0h

Control handling of Base Address - inversion and increment rates and increment amounts.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26	0h RW	**Address Inversion Rate (Address_Inversion_Rate):** Address_Inversion_Rate determines if the enabled Address Fields toggle inversion on the Command Sequence Boundary (following a Command_Instruction with the Last bit set) or every Command_Instruction. 0 Invert enabled Address fields after executing the Command_Instruction with the Last bit set. 1 Invert enabled Address fields following each Command_Instruction
25:22	0h RW	**Address Inversion Enable (Address_Inversion_Enable):** Address_Inversion_Enable enables particular Address Fields to be inverted. [25] Rank_Inversion_Enable. [24] Bank_Inversion_Enable. [23] Row_Inversion_Enable. [22] Col_Inversion_Enable.
21	0h RW	**Address Increment Rate (Address_Order0_Inc_Rate):** Address_Order0_Inc_Rate determines if the Address Order 0 Field is incremented on the Command Sequence Boundary (following a Command_Instruction with the Last bit set) or every Command_Instruction. 0 Increment Address after executing the Command_Instruction with the Last bit set. 1 Increment Address following each Command_Instruction.
20:18	0h RO/V	**Rank Increment (Fixed) (Reserved_Rank_Inc):** All Base Rank addresses are incremented (or decremented) by 2^Rank_Inc (unsigned value).
17:15	0h RO/V	**Bank Increment (Fixed) (Reserved_Bank_Inc):** All Base Bank addresses are incremented (or decremented) by 2^Bank_Inc (unsigned value).
14:11	0h RW	**Column Increment (Col_Inc):** All Base and Offset Column addresses are incremented (or decremented) by 2^Col_Inc (unsigned value).

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	Reserved.
9:6	0h RW	**Row Increment (Row_Inc):** All Base and Offset Row addresses are incremented (or decremented) by 2^Row_Inc (unsigned value).
5	0h RW	**Block Move Half Block (Block_Move_Half_Block):** if Block_Move_One_Row =1 then the Block is moved by 1 row Else if Block_Move_Half_Bock = 1 then the Block is moved by 2^(Block_Size_Bits_Row)/2 Rows Else the Block is moved by = 2^(Row_Block_Size).
4	0h RW	**Block Move One Row (Block_Move_One_Row):** See Block_Move_Half_Block for description.
3:0	0h RO	Reserved.

5.12.107 Address PRBS Control (CPGC2_ADDRESS_PRBS_CONTROL)—Offset 3CC4h

Control PRBS Address generator.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	Reserved.
25	0h RW	**Address_PRBS_High Row map enable (Address_PRBS_High_Row):** The higher order bits of the PRBS Address Generator (bits 3 through Address_PRBS_Size-1) will be on the same Row bits when the PRBS Address is selected.
24	0h RW	**Address_PRBS_High Column map enable (Address_PRBS_High_Col):** The higher order bits of the PRBS Address Generator (bits 3 through Address_PRBS_Size-1) will be on the same Column bits when the PRBS Address is selected.
23:18	0h RO	Reserved.
17	0h RW	**Address_PRBS_Mid Row map enable (Address_PRBS_Mid_Row):** Bits [2:1] of the Row address will be bits [2:1] of the PRBS Address Generator when the PRBS Address is selected.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Address_PRBS_Mid Column map enable (Address_PRBS_Mid_Col):** Bits [2:1] of the Column address will be bits [2:1] of the PRBS Address Generator when the PRBS Address is selected.
15:10	0h RO	Reserved.
9	0h RW	**Address_PRBS_Low Row map enable (Address_PRBS_Low_Row):** LSB of Row address will be the LSB of the PRBS Address Generator when the PRBS Address is selected.
8	0h RW	**Address_PRBS_Low Column map enable (Address_PRBS_Low_Col):** LSB of Column address will be the LSB of the PRBS Address Generator when the PRBS Address is selected.
7	0h RW	**Address PRBS Enable (Address_PRBS_Enable):** If Address_PRBS_Enable is active, and Address_Decode_Enable is not active in the current Address_Instruction, then each command is enabled to use the PRBS address if the Address_Decode_or_PRBS_En bit is set.
6:4	0h RO	Reserved.
3:0	0h RW	**Address PRBS Size (Address_PRBS_Size):** Size of PRBS for address generation if Address_PRBS_Enable is active. See text for PRBS Polynomials being used for each setting.

5.12.108 Address PRBS Seed (CPGC2_ADDRESS_PRBS_SEED)—Offset 3CC8h

Seed for Address PRBS generator.

Access Method

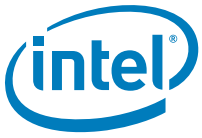
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RW	**Address PRBS Seed (Address_PRBS_Seed):** Seed for Address PRBS generator.

5.12.109 Current Address PRBS Status (CPGC2_ADDRESS_PRBS_CURRENT)—Offset 3CCCh

Current value of Address PRBS generator.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Address PRBS (Address_PRBS_Current):** Current value of Address PRBS generator. Address advances as Address_Order0_Inc_Rate. The Seed is re-loaded (from Save) at each Algorithm_Instruction boundary.

5.12.110 Address PRBS Save (CPGC2_ADDRESS_PRBS_SAVE)—Offset 3CD0h

Currently saved Address PRBS seed.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Address PRBS Save (Address_PRBS_Save):** Saved value of Address PRBS generator. Value is saved automatically during block advance, and restored (from Seed) when Block Traversal (Repeats) is complete.

5.12.111 Command FSM Current State (CPGC2_CMD_FSM_CURRENT)—Offset 3CD4h

Current state of Command FSM - used at stop-on-error to determine the current progress in the test at the time of the error.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:28	0h RO/V	**Address Instruction Pointer (Address_Instruction_Current):** Current Address_Instruction pointer.
27:26	0h RO	Reserved.
25:24	0h RO/V	**Data Instruction Pointer (Data_Instruction_Current):** Current Data_Instruction pointer.
23:18	0h RO	Reserved.
17:15	0h RO/V	**Algorithm Instruction Pointer (Algorithm_Instruction_Current):** Current Algorithm_Instruction pointer.
14:13	0h RO	Reserved.
12:8	0h RO/V	**Command Instruction Pointer (Command_Instruction_Current):** Current Command_Instruction pointer.
7	0h RO	Reserved.
6	0h RO/V	**Offset Group Select Pointer (Offset_Group_Instruction_Current):** Current Offset_Group as pointed to by the Current Command_Instruction (if an Offset instruction).
5:3	0h RO/V	**Offset Address Instruction Pointer (Offset_Address_Instruction_Current):** Current Offset_Address_Instruction pointer.
2:0	0h RO/V	**Offset Command Instruction Pointer (Offset_Command_Instruction_Current):** Current Offset_Command_Instruction pointer.

5.12.112 Algorithm Wait Timer Configuration (CPGC2_WAIT_2_START_CONFIG)—Offset 3CD8h

Configure the time base for the Algorithm Wait Timer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default:

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Increment value (Increment_Value):** See Prescaler field for information on this field.
27:26	0h RO	Reserved.
25:16	0h RW	**Clock Frequency (Clock_Freq):** When a setting of 1MHz or 1KHz is used in Wait_Clock_Frequency, this field provides a way to tell the hardware the native Memory Controller clock frequency, which is fed into the Prescaler automatically (with a 1 Increment_Value also automatically fed into the counter).
15:10	0h RO	Reserved.
9:0	0h RW	**Prescaler (Prescaler_for_Clock_Freq):** In order to make the 'standard' 1 GHz clock for the CPGC specified Wait_Clock_Frequency setting, we need to provide a pre-scaler, and Increment Value to modify the existing Wait_Timer_Current advancement. This field will divide the native Memory Controller clock by the provided value, with '1' being 'No Divide'. After that divide, the Wait_Timer_Current will advance by the 'Increment_Value' field. In this way, we are creating a clock ratio able to 'multiply' the native Memory Controller clock by 'Increment_Value/Prescaler'. For small values of Wait_Time, the error will be substantial, and it may be better to modify the programming to the '11' Native Clock setting and manually compute the required Wait_Time for the desired delay.

5.12.113 VISA Mux Selection (CPGC2_VISA_MUX_SEL)—Offset 3CDCh

Selection for VISA mux controls.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:13	0h RW	**Error Group 1 (Err1_grp_Sel):** Err Group 1 Select.
12:11	0h RW	**Error Group 0 (Err0_grp_Sel):** Err Group 0 Select.
10:9	0h RW	**DPAT Group 1 (Dpat1_grp_Sel):** Dpat Group 1 Select.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW	**DPAT Group 0 (Dpat0_grp_Sel):** Dpat Group 0 Select.
6:5	0h RW	**Command Group 1 (Cmd1_grp_Sel):** Cmd Group 1 Select.
4:3	0h RW	**Command Group 0 (Cmd0_grp_Sel):** Cmd Group 0 Select.
2	0h RW	**Error-Command (Err1_or_Cmd1):** Err group 1 or Cmd group 1 select.
1	0h RW	**Command-DPAT (Cmd0_or_Dpat1):** Cmd group 0 or Dpat group 1 select.
0	0h RW	**DPAT-Error (Dpat0_or_Err0):** Dpat group 0 or Err group 0 select.

5.12.114 Loopback Sequencer Configuration (CPGC_LB_SEQ_CFG)—Offset 3CE0h

Loopback Sequencer Config.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Start Test Delay (START_TEST_DELAY):** Start_Test_Delay is the delay period (in byte clocks) to execute a test(i.e transition to Loopback.Pattern) after the link is in Loopback.Idle and Local_Start_Test is asserted. If Local_Start_Test is set upon the initial enttry to Loopback.Idle then a test (entry to Loopback.Pattern) will immediately start after Start_Test_Delay number of byte clocks is enforced. During Start_Test_test the Valid must not be asserted (i.e Loopback.PM) and no comparison of data will be taking place. Start_Test_Delay=0 is reserved and not allowed. Start_Test_Delay=1 will result in a 1byte clock delay. Start_Test_Delay=2 will result in a 2byte clock delay.
23:21	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:16	0h RW	**Loopcount (LOOPCOUNT):** 2^(Loopcount) determines the length of a test. One Loopcount consists of Pattern_Length followed by PM_Length. Pattern_Length corresponds to the Loopback Master generating patterns and the Loopback. Slave and/or Loopback Master performing error checking occurring (valid is asserted). PM_Length corresponds to the functional power savings mode (valid is not asserted). Loopcount=0 means the test is infinite. Loopcount=1 means the test will end after two loops. Loopcount=2 means the test will end after four loops. Loopcount=3 means the test will end after eight loops.
15:8	0h RW	**PM Length (PM_LENGTH):** PM_Length(i.e Loopback.PM) forms the second half of the loopcount sequence with Pattern_Length (i.e Loopback.Pattern)forming the first half. PM_Length is used in conjunction with Pattern_Length and Loopcount to go in and out of Power Savings Modes in an identical way to how the functional power saving mode behave. This includes post amble, pre-amble, etc. PM_Length duration is defined in total # of byte clocks. If PM_Length is set to 0 then no power saving modes will be entered. If the end of the test has not been reached, (Current_Loopcount!=Loopcount) the loopcount is incremented and the sequence repeats (Pattern_Length followed by PM_Length). If the end of the test has not been reached (Current_Loopcount=Loopcount) the link transitions back to Loopback.Idle following the PM state.
7:0	0h RW	**Pattern Length (PATTERN_LENGTH):** Pattern_Length (i.e Loopback.Pattern) forms the first half of the Loopcount sequence with PM_Length (i.e Loopback.PM) forming the second half. Pattern_Length is the portion of Loopcount when patterns are generated (Loopback Master) and compared (Loopback Master and optionally the Loopback Slave). Pattern_Length duration is defined in total # of byte clocks. A zero value is illegal. The Sum of Pattern_Length and PM_Length (Duration of a Loopcount) must always be set to a value of two or more.

5.12.115 Loopback Sequencer Control (CPGC_LB_SEQ_CTL)—Offset 3CE4h

Loopback sequencer control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:12	0h RW	**Initialization Mode (INITIALIZATION_MODE):** A change to Initialization_Mode occurs immediately. 00 - OFF - REUT is clock gated. 01 - LSM Mode - Enter Loopback.Idle state through the appropriate Link Layer bits as a Loopback Master or Loopback Slave. 10 - Force Master - Force entry to Loopback.Idle as a Loopback Master (Supported if Force_Loopback capability is set). 11 - Force Slave - Force entry to Loopback.Idle as Loopback Slave (Supported if Force_Loopback capability is set). Note: A user must be careful to transition both sides of the Link to Loopback.Idle if switching Initialization_Mode from Force Master or Force Slave to LSM Mode or undefined behavior can be expected. Note: Initialization Mode should not be changed while Local_Start_Test is set, or while Test_In_Progress is set.
11:7	0h RO	Reserved.
6	0h RW	**Bind Stop on Error (BIND_STOP_ON_ERROR):** Test will stop based on Global_Error (external input) and Local_Error will drive Global_Error.
5	0h RW	**Bind Clear Errors (BIND_CLEAR_ERRORS):** Local_Clear_Errors will clear all other REUT instances that have this bit set.
4	0h RW	**Bind Stop Test (BIND_STOP_TEST):** Local_Stop_Test will stop all other REUT instances that have this bit set.
3	0h RW	**Bind Start Test (BIND_START_TEST):** Local_Start_Test will start all other REUT instances that have this bit set.
2	0h RW/V	**Local Clear Errors (LOCAL_CLEAR_ERRORS):** Setting Local_Clear_Errors to 1 will immediately clear all local Error registers (i.e. CPGC_ERR_* registers). Local_Clear_Errors will immediately clear to 0 after clearing affected registers. If this bit fails to auto-clear, then there is no clock and the clear will occur at the start of the next test.
1	0h RW/V	**Local Stop Test (LOCAL_STOP_TEST):** If Local_Stop_Test is set to 1 and a Loopback test is in progress (i.e. Test_In_Progress=1) then a transition to Loopback. Idle will occur as soon as possible (i.e. Link enters Loopback.PM). Local_Stop_Test will immediately clear to 0 after stopping a Loopback test (i.e. Local_Stop_Test=0 while in Loopback.Idle).

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Local Start Test (LOCAL_START_TEST):** If Local_Start_Test is set a Sequence will immediately start, or wait until entry to Loopback state. A complete Sequence is defined by the following behavior: 1) An initial delay of Start_Test_Delay byte clocks must first occur in Loopback.PM (with Valid de-asserted). 2) Transition to Loopback.Pattern (Valid asserted) for a duration of Pattern_Length Byte clocks during which data is generated and compared by the Loopback Master and optionally compared by the Loopback Slave. 3) Increment Loopcounter. 4) Optionally Transition to Loopback.PM (with Valid de-asserted), if so programmed, for a duration of PM_Length Byte clocks during which power modes are functionally enforced as what would happen normally based on the length of the PM_Length duration. 5) If Current Loopcount !=2^Loopcount then go to step 2. 6) If Current Loopcount !=2^Loopcount then the Link returns to Loopback.Idle, Local_Start_Test is cleared for the Master. Local_Start_Test is not cleared on the Loopback.Slave.

5.12.116 Loopback Loopcount Tx Status (CPGC_LB_SEQ_LOOPCOUNT_TX_STATUS)—Offset 3CE8h

Indicates the current TX Loopcount value in the Sequence.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Loopcount (CURRENT_LOOPCOUNT):** Current_Loopcount indicates how many times the full Sequence has been executed in the TX path. Current_Loopcount is cleared by Local_Clear_Errors.

5.12.117 Loopback Loopcount Rx Status (CPGC_LB_SEQ_LOOPCOUNT_RX_STATUS)—Offset 3CECh

Indicates the current RX Loopcount value in the Sequence.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Loopcount (CURRENT_LOOPCOUNT):** Current_Loopcount indicates how many times the full Sequence has been executed in the RX path. Current_Loopcount is cleared by Local_Clear_Errors.

5.12.118 Pattern Length Status (CPGC_LB_SEQ_PL_RX_STATUS)—Offset 3CF0h

Indicates how many Bytes are left in Loopback.Pattern.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RO/V	**Current Pattern Length (CURRENT_PATTERN_LENGTH):** Current_Pattern_Length is used in conjunction with Stop_On_Error_Control conditons to determine where the last failure occurred within Loopback.Pattern. Current_Pattern_Length indicates how many Bytes were left in Loopback. Pattern when the error occurred. Current_Pattern_Length is cleared by Local_Clear_Errors.

5.12.119 Refresh Control (CPGC_MISC_REFRESH_CTL)—Offset 3CF4h

CPGC MISC REFRESH CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Panic Refresh Only (PANIC_REFRESH_ONLY):** Reserved
30:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Start Test on RefZQ (REFZQ_EN_START_TEST_SYNC):** Reserved
7:4	0h RO	Reserved.
3:0	0h RW	**Rank Mask of Refresh (REFRESH_RANK_MASK):** Reserved

5.12.120 ZQ Control (CPGC_MISC_ZQ_CTL)—Offset 3CF8h

CPGC MISC ZQ CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Always do ZQ (ALWAYS_DO_ZQ):** Reserved
30:2	0h RO	Reserved.
1:0	0h RW	**Rank Mask of ZQ (ZQ_RANK_MASK):** Reserved

5.12.121 ODT Control (CPGC_MISC_ODT_CTL)—Offset 3CFCh

CPGC MISC ODT CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDR Training MPR Pattern (MPR_Train_DDR_On):** Reserved
30:18	0h RO	Reserved.
17:16	0h RW	**Rank ODT On (ODT_ON):** Reserved
15:2	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Rank ODT Override (ODT_OVERRIDE):** Reserved

5.12.122 CKE Control (CPGC_MISC_CKE_CTL)—Offset 3D00h

CPGC MISC CKE CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**Rank CKE On (CKE_ON):** Reserved
15:9	0h RO	Reserved.
8	0h RW	**Start Test on CKE (CKE_EN_START_TEST_SYNC):** Reserved
7:2	0h RO	Reserved.
1:0	0h RW	**Rank CKE Override (CKE_OVERRIDE):** Reserved

5.12.123 Command Rate (CPGC_MISC_CMD_RATE)—Offset 3D04h

CPGC CMD_RATE

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100Ah

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MRW uses 2 clocks CS (init_mrw_2n_cs):** Reserved
30:14	0h RO	Reserved.
13:12	1h RW	**CK to CKE delay (ck_to_cke_delay):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	**Reset Delay (reset_delay):** Reserved
7:4	0h RW	**Reset On Command (reset_on_command):** Reserved
3:1	5h RW	**Command Rate Limit (cmd_rate_limit):** Reserved
0	0h RW	**Enable Command Rate Limit (enable_cmd_rate_limit):** Reserved

5.12.124 External Trigger Control (CPGC_MISC_EXT_TRIGGER)—Offset 3D08h

CPGC MISC EXT TRIGGER

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**Trigger Out on Test Done (TRIGGER_OUT_ON_TEST_DONE):** Reserved
2	0h RW	**Trigger Out on Error (TRIGGER_OUT_ON_ERROR):** Reserved
1	0h RW	**Trigger Out on Start (TRIGGER_OUT_GLOBAL_START):** Reserved
0	0h RW	**Trigger in to Start (TRIGGER_IN_GLOBAL_START):** Reserved

5.12.125 Sequence Control (CPGC_SEQ_CTL)—Offset 3D0Ch

Sequence Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RW/V	**Continue Single Step (CONTINUE_SINGLE_MODE):** When in Single_Command_Mode setting this bit will enable a new command to be issued. This bit immediately clears after being set.
8	0h RW	**Single Step/Cmd Mode (SINGLE_CMD_MODE):** Enter Single Command mode were we will issue one command from CPGC and then pause command issuing. This may be resumed by setting Continue_Single_Mode, or normal continuous operation resumed by clearing this bit.
7:3	0h RO	Reserved.
2	0h RW/V	**Clear Errors (CLEAR_ERRORS):** Setting this bit will immediately clear all error registers and error status. This bit will automatically self clear.
1	0h RW/V	**Stop Test (STOP_TEST):** Forces an exit from the tests running on this engine/channel. Note that this will also cause a test stop for all engines with GLB_STOP_BIND set. This bit will self clear.
0	0h RW/V	**Start Test (START_TEST):** Used to initiate a transition to active mode on this engine/channel (note that INIT_MODE has to be programmed first). Note that this will also cause a test start for all engines with GLB_START_BIND set. This bit will self clear.

5.12.126 Sequence Configuration A (CPGC_SEQ_CFG_A)—Offset 3D10h

Sequence Configuration Low Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 200000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22	0h RW	**Request Data Size (REQUEST_DATA_SIZE):** Size of requests CPGC is issuing, 64B and 32B transactions and is encoded as follows: 0 - 32 Byte Transactions 1 - 64 Byte Transactions

Bit Range	Default & Access	Field Name (ID): Description
21	1h RW	**CPGC Control (CPGC_CONTROL):** Used to indicate the OPIO(MCDRAM) or CPGC(DDR) mode. 1 - CPGC Mode. 0 - OPIO Mode.
20:15	0h RO	Reserved.
14:12	0h RW	**Initialization Mode (INITIALIZATION_MODE):** 000 - IDLE MODE 001 - ACTIVE MODE 010 - DIRECT MODE 011 - ACTIVE MODE 100 - MRS MODE 101 - ERROR DUMP MODE (Reserved) 110 - WDB FILL MODE (Reserved) 111 - REWIND MODE (Reserved)
11	0h RW	**Bind Stop Test (GLOBAL_STOP_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test stop (both forced and due to a stop condition) for any channel engine with GLOBAL_STOP_BIND set will cause the same action to occur on all engines with GLOBAL_STOP_BIND set. This feature is usually used when synchronization between multiple engines/ channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
10	0h RW	**Bind Start Test (GLOBAL_START_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test start for any channel with GLOBAL_START_BIND set will cause the same action to occur on all engines with GLOBAL_START_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
9	0h RW	**Bind Stop-on-Error (GLOBAL_STOP_ON_ERR_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test stop (due to an error condition) for any channel with GLOBAL_STOP_ON_ERR_BIND set will cause the same action to occur on all engines with GLOBAL_STOP_ON_ERR_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Bind Clear Errors (GLOBAL_CLEAR_ERR_BIND):** Setting this bit will bind this channel engine to all other channel engines. Clearing all error registers and error status for any channel with GLOBAL_CLEAR_ERR_BIND set will cause the same action to occur on all engines with GLOBAL_CLEAR_ERR_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
7	0h RO	Reserved.
6	0h RW	**Constant Write Strobe (ENABLE_CONSTANT_WRITE_STROBE):** Reserved
5:0	0h RO	Reserved.

5.12.127 Sequence Configuration B (CPGC_SEQ_CFG_B)—Offset 3D14h

Sequence Config High.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW	**Start Delay (START_DELAY):** Number of clock cycles (in CPGC-S clock domain) the start of the test is delayed by after START_TEST has been asserted by the user. This is usually used to synchronize multiple SoC CPGC engines on multiple channels according to a defined phase relationship.

5.12.128 Sequence Status (CPGC_SEQ_STATUS)—Offset 3D18h

Sequence Test Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Test Done (TEST_DONE):** This bit will be set when the test is complete (or has been forced to exit due to a stop condition). Bit is cleared on a reset or when user starts another test.
30	0h RO/V	**Test Busy (TEST_BUSY):** This bit will be set when once a test has started. Bit is cleared on a reset or once test is done (or has been forced to exit due a stop condition).
29	0h RO/V	**Algorithm Done (ALGO_DONE):** This bit will be set when all the algorithms are complete. It is cleared on a reset.
28	0h RO/V	**Single Step/Cmd Paused (SINGLE_MODE_PAUSED):** This bit will be set when a command has been issued and we are paused due to Single_Command_Mode. The test may be continued by either clearing Single_Command_Mode or by setting Continue_Single_Mode.
27:0	0h RO	Reserved.

5.12.129 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[0])—Offset 3D20h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.130 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[1])—Offset 3D24h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.131 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[2])—Offset 3D28h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.132 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[3])—Offset 3D2Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.133 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[4])—Offset 3D30h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.134 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[5])—Offset 3D34h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.135 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[6])—Offset 3D38h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.136 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[7])—Offset 3D3Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.137 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[8])—Offset 3D40h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.138 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[9])—Offset 3D44h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.139 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[10])—Offset 3D48h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.140 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[11])—Offset 3D4Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.141 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[12])—Offset 3D50h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.142 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[13])—Offset 3D54h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.143 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[14])—Offset 3D58h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.144 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[15])—Offset 3D5Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.12.145 Mode3 Fail Status LSB (CPGC2_RASTER_REPO_CONTENT_ECC1)—Offset 3D60h

Lower half of the Raster Repository Mode3 Fail Status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO/V/P	**ECC Chunk 3 (ECC_chunk3):** ECC chunk 3 raster when in Mode 1.
27:26	0h RO/V/P	**Bank3 Fail Count (fail_count3):** Bank 3 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
25	0h RO/V/P	**Bank3 Any Fail (fail_any3):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
24	0h RO/V/P	**Bank3 Excessive Fail (fail_excess3):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
23:20	0h RO/V/P	**ECC Chunk 2 (ECC_chunk2):** ECC chunk 2 raster when in Mode 1.
19:18	0h RO/V/P	**Bank2 Fail Count (fail_count2):** Bank 2 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
17	0h RO/V/P	**Bank2 Any Fail (fail_any2):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
16	0h RO/V/P	**Bank2 Excessive Fail (fail_excess2):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
15:12	0h RO/V/P	**ECC Chunk 1 (ECC_chunk1):** ECC chunk 1 raster when in Mode 1.
11:10	0h RO/V/P	**Bank1 Fail Count (fail_count1):** Bank 1 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO/V/P	**Bank1 Any Fail (fail_any1):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
8	0h RO/V/P	**Bank1 Excessive Fail (fail_excess1):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
7:4	0h RO/V/P	**ECC Chunk 0 (ECC_chunk0):** ECC chunk 0 raster when in Mode 1.
3:2	0h RO/V/P	**Bank0 Fail Count (fail_count0):** Bank 0 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
1	0h RO/V/P	**Bank0 Any Fail (fail_any0):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
0	0h RO/V/P	**Bank0 Excessive Fail (fail_excess0):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.

5.12.146 Mode3 Fail Status MSB (CPGC2_RASTER_REPO_CONTENT_ECC2)—Offset 3D64h

Upper half of the Raster Repository Mode3 Fail Status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO/V/P	**ECC Chunk 7 (ECC_chunk7):** ECC chunk 7 raster when in Mode 1.
27:26	0h RO/V/P	**Bank7 Fail Count (fail_count7):** Bank 7 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
25	0h RO/V/P	**Bank7 Any Fail (fail_any7):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
24	0h RO/V/P	**Bank7 Excessive Fail (fail_excess7):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
23:20	0h RO/V/P	**ECC Chunk 6 (ECC_chunk6):** ECC chunk 6 raster when in Mode 1.
19:18	0h RO/V/P	**Bank6 Fail Count (fail_count6):** Bank 6 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO/V/P	**Bank6 Any Fail (fail_any6):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
16	0h RO/V/P	**Bank6 Excessive Fail (fail_excess6):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
15:12	0h RO/V/P	**ECC Chunk 5 (ECC_chunk5):** ECC chunk 5 raster when in Mode 1.
11:10	0h RO/V/P	**Bank5 Fail Count (fail_count5):** Bank 5 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
9	0h RO/V/P	**Bank5 Any Fail (fail_any5):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
8	0h RO/V/P	**Bank5 Excessive Fail (fail_excess5):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
7:4	0h RO/V/P	**ECC Chunk 4 (ECC_chunk4):** ECC chunk 4 raster when in Mode 1.
3:2	0h RO/V/P	**Bank4 Fail Count (fail_count4):** Bank 4 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
1	0h RO/V/P	**Bank4 Any Fail (fail_any4):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
0	0h RO/V/P	**Bank4 Excessive Fail (fail_excess4):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.

5.12.147 Read Command Count (CPGC2_READ_COMMAND_COUNT_CURRENT)—Offset 3D68h

Current count of reads.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Current Read Command Count (Read_Command_Count_Current):** Current count of reads - freezes on stop_on_error conditions at the number of reads including the error that caused the stop.

5.12.148 Mask Errors on First N Reads (CPGC2_MASK_ERRS_FIRST_N_READS)—Offset 3D6Ch

Masking for the first N read operations - all errors are ignored.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Mask First N Reads (Mask_First_N_Reads):** 0=no masking, N= number of reads that will not result in any error indication for the raster repository.

5.12.149 Raster Repository Status (CPGC2_RASTER_REPO_STATUS)—Offset 3D70h

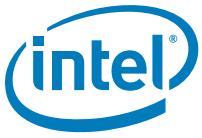
Raster repository status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Raster Repository Clear (RasterRepoClear):** Reset the raster repo entries. This bit auto-clears.
30	0h RW/P	**Stop on Raster Full (StopOnRaster):** If Raster Mode 1, test will stop after loading the bitmap into the raster. If Raster Mode 2, test will stop after loading 8 errors in the raster.
29:18	0h RO	Reserved.
17:16	0h RW/P	**Raster Repository Mode (RasterRepoMode):** 00 Mode 1 BitMap Mode. 01 Mode 2 Summary Mode. 10 mode 3 Filtered Failed Row Mode.
15:12	0h RO	Reserved.
11:10	0h RW/P	**Excess Failure Maximum (FailMax):** Maximum number of failing address before an additional failing address will set fail_excess for any bank. 00 one failure, 01 - two failures, 10 - three failures, 11- four failures.



Bit Range	Default & Access	Field Name (ID): Description
9	0h RO/V/P	**Summary Any Fail (FailAnyAll):** 0 - indicates no failing addresses. 1 - indicates 1 or more failing addresses.
8	0h RO/V/P	**Summary Excessive Fail (FailExcessAll):** 0 - indicates less than or exactly max_fail failing addresses on all banks. 1 - indicates at least one bank's errors exceed the max_fail limit.
7	0h RO	Reserved.
6:4	0h RO/V/P	**Number of Summary Entries (NumErrLogged):** Indicates the current number of errors loaded in the raster repo in Mode 2. Max value is 8.
3	0h RO	Reserved.
2	0h RO/V/P	**Raster Repository Full (RasterRepoFull):** Indicates when the no. of errors logged exceed max value of 8.
1	0h RO/V/P	**Summary Valid (SummaryValid):** Indicates when the summary information of the erroneous bitmap is loaded in the current summary buffer. This information consist of Algorithmic data, Physical Addr (Rank, Bank,Row,Col) and 8 2-bit error summary for every chunk.
0	0h RO/V/P	**Bitmap valid (BitmapValid):** Indicates when Mode 1 erroneous bitmap data is loaded in the raster repo.

5.12.150 Error Summary A (CPGC2_ERR_SUMMARY_A)—Offset 3D74h

Most recent error sumary data, not yet written to the Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**Algorithm Summary (Algorithm_Summary):** Algorithm_Summary - currently formatted as: [2:0] Offset_Command_Instruction_Current. [5:3] Offset_Address_Instruction_Current. [10:6] Command_Instruction_Current. [13:11] Algorithm_Instruction_Current. [15:14] Data_Instruction_Current.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V/P	**Error Summary (Error_Summary):** Error_Summary - formatted as a pair of adjacent bits for each chunk, 00=no error in that chunk, 01=one error in that chunk, 10=two errors in that chunk, 11=three or more errors in that chunk.

5.12.151 Error Summary B (CPGC2_ERR_SUMMARY_B)—Offset 3D78h

Most recent error summary data, not yet written to the Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO/V/P	**Physical Address (Physical_Address_Summary):** Error_Summary - Physical Address encoded as: [7:0] Column, [25:8] Row, [28:26] Bank, [29] Rank.
1:0	0h RO/V/P	**Algorithm Summary (Algorithm_Summary):** Algorithm_Summary - currently formated as: [1:0] Address_Instruction_Current.

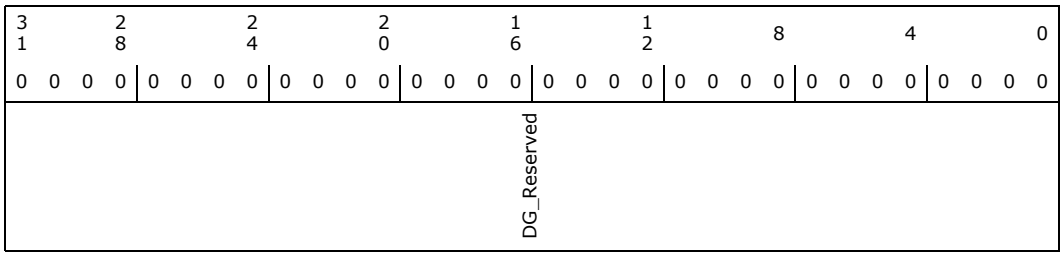
5.12.152 Future use Reserved (CPGC2_ERR_SUMMARY_C)—Offset 3D7Ch

Reserved for expansion of Error_Summary.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Future use Reserved (DG_Reserved):** Reserved for expansion of Error_Summary (bits 7:0).

5.12.153 Data Pattern Generation Buffer Control (CPGC_DPAT_BUF_CTL)—Offset 3D80h

Data Pattern Buffer Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RO/V	**Read Buffer Pointer (RD_BUF_PTR):** Pointer to current entry in the data pattern buffers used for generating the read data.
23:20	0h RO/V	**Write Buffer Pointer (WR_BUF_PTR):** Pointer to current entry in the data pattern buffers used for generating the write data.
19	0h RO	Reserved.
18:16	0h RW	**Buffer End Pointer (BUF_END_PNTR):** Pointer to last data pattern buffer entry before wrapping back to BUF_STRT_PTR if incrementing is enabled through being different from BUF_STRT_PTR. Note: The actual size of this field depends on the # of lines supported for data generation. i.e If 1 or 2 lines are supported then it is a 1 bit field, if 8 lines are supported then 3 bits are available. Currently the RTL uses internal CPGC buffers so it has 4 lines and requires 2 bits.
15:11	0h RO	Reserved.
10:8	0h RW	**Buffer Start Pointer (BUF_STRT_PNTR):** Pointer to first buffer entry. Also used as the only entry if BUF_INC_EN is not enabled. Note: The actual size of this field depends on the # of lines supported for data generation (DATA_PAT_DEPTH_CAP), i.e If 1 or 2 lines are supported then it is a 1 bit field, if 16 lines are supported then the whole 4 bits are available. Currently the RTL uses internal CPGC buffers so it has 8 lines and requires 3 bits.
7	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Buffer Pointer Increment Scale (BUF_PNTR_INC_SCALE):** If set, the buffer pointer will be incremented at a linear rate given by BUF_PTR_INC_RATE, otherwise the buffer pointer will be incremented at an exponential rate given by BUF_PTR_INC_RATE. 1=Buffer Pointer Increment Rate field is treated as a linear number. 0=Buffer Pointer Increment Rate field is treated is an exponential number.
5:0	0h RW	**Buffer Pointer Increment Rate (BUF_PNTR_INC_RATE):** 0: Each buffer entry will be used for 2^BUF_PTR_INC_RATE number of bursts (64Bytes). 1: Each buffer entry will be used for BUF_PTR_INC_RATE + 1 number of 8-UI -- before incrementing the buffer pointer by 1. Note: To disable Buffer Pointer increments, set BUF_END_PTR==BUF_STRT_PTR.

5.12.154 Data Pattern Generation Configuration (CPGC_DPAT_CFG)—Offset 3D84h

Data Pattern Configuration Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Reload LFSR Seed Rate (RELOAD_LFSR_SEED_RATE):** Reload_LFSR_Seed_Rate only exists if the LFSR_Save_Restore capability is set to 1. Reload_LFSR_Seed_Rate and Save_LFSR_Seed_Rate is most often used in conjunction with Lane_Rotate_Rate where the user desires to replay the same deterministic LFSR stress as the victim aggressor patterns shifts Lanes left. When the victim aggressor pattern returns to the starting position the current LFSR stress is saved using Save_LFSR_Seed_Rate to allow the LFSR stress to advance for the new period. 2^(Reload_LFSR_Seed_Rate-1) defines the periodic Loopcount interval that the current LFSR Seed UNISEQ#_RDSTAT.Uniseq_RdStat is reloaded from CPGC_UNISEQ#_RDSAVE.Pattern_Buffer. When the Save_LFSR_Seed_Rate and Reload_LFSR_Seed_Rate is reached in the same Bit only the saving of the LFSR seed takes place. Examples: 0=Disable - The current LFSR seed is never reloaded. 1=The current LFSR seed is reloaded every Loopcount. 2=The current LFSR seed is reloaded every other Loopcount. 3=The current LFSR seed is reloaded every fourth Loopcount.
23:16	0h RW	**Save LFSR Seed Rate (SAVE_LFSR_SEED_RATE):** Save_LFSR_Seed_Rate only exists if the LFSR_Save_Restore capability is set to 1. See Reload_LFSR_Seed_Rate for use model. UNISEQ#_RDSAVE.Pattern_Buffer is initially loaded at the start of a test with UNISEQ#_RDSTAT.Uniseq_RdStat (the Seed). 2^(Reload_LFSR_Seed_Rate-1) * (Save_LFSR_Seed_Rate) defines the periodic Loopcount interval that the current LFSR Seed is saved into UNISEQ#_RDSAVE.Pattern_Buffer. When the Save_LFSR_Seed_Rate and Reload_LFSR_Seed_Rate is reached in the same Loopcount only the saving of the LFSR seed takes place. Examples: 0=Disable - The current LFSR seed (UNISEQ#_RDSTAT.Uniseq_RdStat) is saved only at the start of test into UNISEQ#_RDSAVE.Pattern_Buffer. 1=Illegal (Would save every Reload and effectively disable both Save and Reload). 2=The current LFSR seed is saved every other 2^(Reload_LFSR_Seed_Rate-1) Loopcounts. 3=The current LFSR seed is saved every third Reload (and Reload does not happen).

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Reserved for future use (ECC_DATA_SOURCE_SEL):** Indicates whether byte 0 (Dq0-Dq7) or byte 7 (dq56-dq63) is transmitted and compared for the ECC byte. 0=byte group 0 will be transmitted and compared for the ECC byte. 1=byte group 7 will be transmitted and compared for the ECC byte. Hardware directs if ECC is included within Generation and Checking. This bit may be reserved if ECC is not supported, or if this functionality is controlled from a different register.
14	0h RW	**Reserved for future use (ECC_REPLACE_BYTE_CONTROL):** ECC_Replace_Byte_Control is used by the Read data path to mux the received ECC byte into the same byte group indicated by ECC_Data_Source_Sel. This is needed to capture ECC cacheline errors into the WDB when Enable_WDB_Error_Capture is set to 1. This bit may be reserved if ECC is not supported, or if this functionality is controlled from a different register.
13	0h RW	**ECC Disable (ECC_DISABLE):** Setting this bit will internally disable all related ECC features in CPGC having the effect of generating all '1 in the ECC CPGC interface outputs, and of Binding to '0 all the ECC interface CPGC inputs. ECC masks and error comparisons will be disabled as well. If ECC is supported, but not directly passed to CPGC, then this bit when set will enable the ECC_REPLACE_BYTE_CONTROL and ECC_DATA_SOURCE_SEL functionality, to allow driving of ECC from another Byte Lane, and replacing the incoming data with ECC for that Byte Lane. When ECC is disabled with this bit, then the output of CPGC will be determined based on BE_TRAIN_ERR_EN and may output all 1's or the content of the DRAMDM and XDRAMDM registers as Byte-Enables.
12:10	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Read Address As Data (READ_ADDRESS_AS_DATA):** When Read_Address_as_Data is set to '1' any address fields that the CADB is overriding during a Select cycle should be used for comparing the incoming data. Otherwise, the functional path decoded address field should be used for comparing the incoming data. This override of the data will not respect any inversion, rotation or other data modification. It will only be active (override the normal output/reference) when Alternate_Data is active in either the Command_Instruction or the Offset_Command_Instruction as appropriate . The functional path decoded address field used for read comparison is repeated in chunk and should follow the Data Construction rules described below on what bytegroup relates to what decoded address: Chunk0 - Byte0 =Column(7:0). Chunk0 - Byte1 =Column(9:8) <- as many Column bits as supported. Chunk0 - Byte2 =Row(0:7). Chunk0 - Byte3 =Row(15:8). Chunk0 - Byte4 =Row(17:16)<- as many Row bits as supported. Chunk0 - Byte5 =Bank(3:0) [Note: Bank Group may be part of this field] <- as many Bank bits as supported. Chunk0 - Byte6 =Rank(1:0) <- as many Rank bits as supported (would be CS# if CADB output supported). Chunk0 - Byte7 =Reserved (set to 0).
8	0h RW	**Write Address As Data (WRITE_ADDRESS_AS_DATA):** When Write_Address_as_Data is set to '1', any address fields that the CADB is overriding during a Select cycle should be used for generating the write data. Otherwise, the functional path decoded address field should be used for generating the write data. Data Construction rules follow the same as for READ_ADDRESS_AS_DATA. This format is subject to change based on memory technology supported and other reasons. What is to be guaranteed is that every Cache line of data will be unique to each address.
7:6	0h RW	**Unisequencer 2 Mode (UNISEQ2_MODE):** Defines the operational mode for unified sequence 2 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.
5	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	**Unisequencer 1 Mode (UNISEQ1_MODE):** Defines the operational mode for unified sequence 1 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.
2	0h RO	Reserved.
1:0	0h RW	**Unisequencer 0 Mode (UNISEQ0_MODE):** Defines the operational mode for unified sequence 0 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.

5.12.155 LFSR Configuration and Lane Rotate (CPGC_DPAT_XTRA_LFSR_CFG)—Offset 3D88h

Unisequencer LFSR configuration and Lane Rotation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	0h RW	**Lane Rotate Rate (LANE_ROTATE_RATE):** Lane_Rotate_Rate only exists if the Lane_Rotation_Support capability exists. 2^(Lane_Rotate_Rate-1) indicates the periodic Loopcount rate when the EXTBUF_# registers are rotated up by one bit. Lane_Rotate_Rate=0 disables all rotation. Lane_Rotate_Rate=1 causes the EXTBUF_# registers to be rotated every one Loopcount. Lane_Rotate_Rate=2 causes the EXTBUF_# registers to be rotated every other Loopcount. Etc.. When the EXTBUF_# registers are rotated Bit 0 shifts to Bit 1 all the way up to the Max-1 Bit and the Max bit shifts to Bit0.
23	0h RW	**Unisequencer 2 LFSR Stagger Enable (UNISEQ2_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq2_Mode is programmed to Select LFSR or the behavior is undefined.
22:21	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Unisequencer 2 LFSR Polynomial Select (UNISEQ2_LFSR_POLYNOMIAL_SIZE):** Possible Polynomial Sizes: 0x0=Use 8 bit LFSR (x8 + x6 + x5 + x4) 0x1=Use 15 bit LFSR (x15 + x14) 0x2=Use 31 bit LFSR (x31 + x28) 0x3=Use 23 bit LFSR (x23 + x18) 0x4=Use 7 bit LFSR (x7 + x6) 0x5=Use 16 bit LFSR (x16+x5+x4+x3) 0x6=Use 23 bit LFSR (x23+x21+x18+x15+x7+x2) 0x7=Use 32 bit LFSR (x32+x31+x30+x10)
17:16	0h RO	Reserved.
15	0h RW	**Unisequencer 1 LFSR Stagger Enable (UNISEQ1_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq1_Mode is programmed to Select LFSR or the behavior is undefined.
14:13	0h RO	Reserved.
12:10	0h RW	**Unisequencer 1 LFSR Polynomial Select (UNISEQ1_LFSR_POLYNOMIAL_SIZE):** Possible Polynomial Sizes: 0x0=Use 8 bit LFSR (x8 + x6 + x5 + x4) 0x1=Use 15 bit LFSR (x15 + x14) 0x2=Use 31 bit LFSR (x31 + x28) 0x3=Use 23 bit LFSR (x23 + x18) 0x4=Use 7 bit LFSR (x7 + x6) 0x5=Use 16 bit LFSR (x16+x5+x4+x3) 0x6=Use 23 bit LFSR (x23+x21+x18+x15+x7+x2) 0x7=Use 32 bit LFSR (x32+x31+x30+x10)
9:8	0h RO	Reserved.
7	0h RW	**Unisequencer 0 LFSR Stagger Enable (UNISEQ0_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq0_Mode is programmed to Select LFSR or the behavior is undefined.
6:5	0h RO	Reserved.
4:2	0h RW	**Unisequencer 0 LFSR Polynomial Select (UNISEQ0_LFSR_POLYNOMIAL_SIZE):** Possible Polynomial Sizes: 0x0=Use 8 bit LFSR (x8 + x6 + x5 + x4) 0x1=Use 15 bit LFSR (x15 + x14) 0x2=Use 31 bit LFSR (x31 + x28) 0x3=Use 23 bit LFSR (x23 + x18) 0x4=Use 7 bit LFSR (x7 + x6) 0x5=Use 16 bit LFSR (x16+x5+x4+x3) 0x6=Use 23 bit LFSR (x23+x21+x18+x15+x7+x2) 0x7=Use 32 bit LFSR (x32+x31+x30+x10)

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	Reserved.

5.12.156 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[0])—Offset 3D8Ch

Data Pattern Unified Sequencer 0 Seed Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.12.157 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[1])—Offset 3D90h

Data Pattern Unified Sequencer 0 Seed Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.12.158 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[2])—Offset 3D94h

Data Pattern Unified Sequencer 0 Seed Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.12.159 Unisequencer LMN Control (CPGC_DPAT_UNISEQ_LMN[0])—Offset 3D98h

Data Pattern Unified Sequencer 0 LMN Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	1h RW	**N Count (N_CNT):** N_Count only exists if LMN_Support capability is set to 1. After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).

Bit Range	Default & Access	Field Name (ID): Description
23:16	1h RW	**M Count (M_CNT):** M_Count only exists if LMN_Support capability is set to 1. After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).
15:8	1h RW	**L Count (L_CNT):** If LMN_Support capability is set to 0 then: A periodic square wave is generated that has the following behavior. 1) Drive L_Polarity for L_Count Bits. 2) Drive inverse of L_Polarity for L_Count Bits. 3) Go to step 1. Else if LMN_Support is set to 1 then: After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency is set to 1. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).
7:4	0h RW	**L Count High-bits (L_COUNTER_HI):** Additional 4 bits to increase the size of L Count up to 12.
3	0h RO	Reserved.
2	0h RW	**L Counter Mode Enable (L_COUNT_EN):** Used in concatenation with FREQ_SWEEP_EN to enable 3 possible modes of LMN behavior.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Frequence Sweep Mode Enable (FREQ_SWEEP_EN):** Used in concatenation with L_COUNT_EN to enable 3 possible modes of LMN behavior: {L_COUNT_EN,FREQ_SWEEP_EN} {0,0} - Normal LMN. {0,1} - Sweep clock pattern from 2*M period down to 2*N_Count period and repeat. {1,0} - L-Counter - drive clock pattern of 2*L period. {1,1} - Currently same as L-Counter mode - reserved for future use. If Normal LMN mode, then the following pattern is continuously repeated: 1) Drive L_Count bits with the polarity set by L_Polarity. 2) Drive M_Count bits with the inverse of L_Polarity. 3) Drive N_Count bits with the value of L_Polarity. 4) Go to step 2. If any L_Count, M_Count, or N_Count=0 then the state will freeze at the polarity driven for that stage. If Sweep mode, then the following pattern is continuously repeated: 1) Drive L_Count bits with the polarity set by L_Polarity. 2) X_count=M_Count 3) Drive X_Count bits with the inverse of L_Polarity. 4) Drive X_Count bits with the value of L_Polarity. 5) Drive X_Count bits with the inverse of L_Polarity. 6) If X_Count==N_Count then go to step 9. 7) X_Count=X_Count-1 8) Go to step 10. 9) X_Count=M_Count 10) Drive X_Count bits with the value of L_Polarity. 11) Go to step 3. If LCount mode, then the following pattern is continuously repeated: 1) Drive L_Polarity for L_Count Bits. 2) Drive inverse of L_Polarity for L_Count Bits. 3) Go to step 1. If {0,1}, L_Count, M_Count, and N_Count must never be programmed to 0 and is considered undefined. If {1,0}, L_Count must never be programmed to 0 and is considered undefined. If {0,1}, M_Count and N_Count must be greater than or equal to 8 or behavior may be implementation specific. If {0,1}, N_Count must be programmed less than M_Count.
0	0h RW	**Initial Output (L_SEL):** The initial logic output of the sequencer is defined as follows: 0 - Output Logic '0' for L_CNT UIs. 1 - Output Logic '1' for L_CNT UIs.

5.12.162 Invert and DC Control (CPGC_DPAT_INVDCCTL)—Offset 3DA4h

Data Pattern Inversion/DC Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA0000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Mask Rotate Enable (MASK_ROTATE_EN):** If set, the inversion/DC mask will rotate to the left at a rate defined by the MASK_ROTATE_RATE field.
30	0h RW	**DC Mask Mode Enable (DC_OR_INV):** Selects between using the inversion/DC mask for inversion or DC as follows: 0 - Mask used for inversion. 1 - Mask used for driving a DC signal of polarity DC_POL.
29	0h RW	**DC Polarity (DC_POL):** Selects the polarity of the signal to be driven through the inversion/DC mask if DC_OR_INV is set to 1: 0 - Drive a logic low (zero). 1 - Drive a logic high (one).
28:25	0h RO	Reserved.
24:16	AAh RW	**Byte Group Mapping (BYTEGROUP_MAPPING):** Select between the two bytes of unique lanes being generated by the DPAT pattern generator, to be applied in each DQ byte group, as many byte groups as required by the number of DQ pins. MSB is always for the ECC byte group, used only if ECC is present.
15:12	0h RO	Reserved.
11:8	0h RW	**Mask Rotate Rate (MASK_ROTATE_RATE):** If inversion mask rotation is enabled through MASK_ROTATE_EN, the mask will rotate to the left every time 2^MASK_ROTATE_RATE bursts (64Bytes) have been have been issued.
7:0	0h RW	**ECC ByteGroup Invert/DC Enable (ECC_INV_DC_MASK):** A value of for any of the bits means the corresponding ECC lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [71:64] of the continuous shift register composed of this field along with DATA_INV_DC_MASK_HI and DATA_INV_DC_MASK_LO. Note: this field is only available if ECC is supported for the current implementation, otherwise it is reserved.

5.12.163 Data Invert/DC Enable Low (CPGC_DPAT_INV_DC_MASK_LO)—Offset 3DA8h

Low Data Pattern Inversion/DC Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Invert/DC Enable Low (DATA_INV_DC_MASK_LO):** A value of '1' for any of the bits means the corresponding data lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [31:0] of the continuous shift register composed of this field along with ECC_INV_DC_MASK and DATA_INV_DC_MASK_HI. DPAT generator only uses the appropriate bits based on the widest bus that this CPGC block is designed to support. This register is also used to provide the Initial value for the Alternate Data pattern generator.

5.12.164 Data Invert/DC Enable High (CPGC_DPAT_INV_DC_MASK_HI)—Offset 3DACh

High Data Pattern Inversion/DC Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Invert/DC Enable High (DATA_INV_DC_MASK_HI):** A value of '1' for any of the bits means the corresponding data lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [63:32] of the continuous shift register composed of this field along with ECC_INV_DC_MASK and DATA_INV_DC_MASK_LO.

5.12.165 Byte Enable Mask Lower (CPGC_DPAT_DRAMDM)—Offset 3DB0h

Data Pattern DRAM Data Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Byte Enable Mask Lower (DATA_MASK_LO):** A byte enable field with each bit corresponding to a data byte sent during a burst such that: 0 - Mask the Corresponding Byte. 1 - No Mask to the Corresponding Byte. The byte-to-bit mapping is given by Byte[n] -> bit[n]. This register is for the first half cacheline of data. It is only used when ECC is not present or is disabled.

5.12.166 Byte Enable Mask Upper (CPGC_DPAT_XDRAMDM)—Offset 3DB4h

Extended Data Pattern DRAM Data Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Byte Enable Mask Upper (DATA_MASK_HI):** A byte enable field with each bit corresponding to a data byte sent during a burst such that: 0 - Mask the Corresponding Byte. 1 - No Mask to the Corresponding Byte. The byte-to-bit mapping is given by Byte[n+32] -> bit[n]. This register is for the Second half cacheline of data. It is only used when ECC is not present or is disabled.

5.12.167 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[0])—Offset 3DB8h

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.12.168 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[1])—Offset 3DBCh

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.12.169 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[2])—Offset 3DC0h

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.12.170 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[0])—Offset 3DC4h

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.12.171 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[1])—Offset 3DC8h

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.12.172 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[2])—Offset 3DCCh

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.12.173 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[0])—Offset 3DD0h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.12.174 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[1])—Offset 3DD4h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.12.175 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[2])—Offset 3DD8h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.12.176 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[0])—Offset 3DDCh

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.12.177 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[1])—Offset 3DE0h

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.12.178 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[2])—Offset 3DE4h

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.12.179 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[0])—Offset 3DE8h

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.12.180 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[1])—Offset 3DECh

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.12.181 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[2])—Offset 3DF0h

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.12.182 Unisequencer Save Status - Read (CPGC_DPAT_UNISEQ_RDSAVE[0])—Offset 3DF4h

Read PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Save Status (PATTERN_BUFFER):** CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer will reflect either the initial or last saved value of CPGC_UNISEQ#_RDSTAT. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.12.183 Unisequencer Save Status - Read (CPGC_DPAT_UNISEQ_RDSAVE[1])—Offset 3DF8h

Read PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Save Status (PATTERN_BUFFER):** CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer will reflect either the initial or last saved value of CPGC_UNISEQ#_RDSTAT. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.12.185 Extended Pattern Buffer (CPGC_DPAT_EXTBUF[0])—Offset 3E00h

DPAT Pattern Select Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AAAAAAAAh

Bit Range	Default & Access	Field Name (ID): Description
31:24	AAh RW	**Data Line 3 (DATA_LINE3):** Contents of Pattern Buffer for Cache Line 3. EXTBUF[0] corresponds to Lane 0 (32 UI of data maximum). EXTBUF[1] corresponds to Lane 1 (32 UI of data maximum). ..... EXTBUF[15] corresponds to Lane 15. These 16 lanes are replicated across the number of active DQ lanes on the memory interface.

Bit Range	Default & Access	Field Name (ID): Description
23:16	AAh RW	**Data Line 2 (DATA_LINE2):** Contents of Pattern Buffer for Cache Line 2. Line 2 (and same for Lines 3..0) refers to the 8-UI partial cache line as pointed to current status at CPGC_DPAT_BUF_CTL. This advancement is controlled by CPGC_DPAT_BUF_CTL.
15:8	AAh RW	**Data Line 1 (DATA_LINE1):** Contents of Pattern Buffer for Cache Line 1.
7:0	AAh RW	**Data Line 0 (DATA_LINE0):** Contents of Pattern Buffer for Cache Line 0.

5.12.186 Extended Pattern Buffer (CPGC_DPAT_EXTBUF[1])—Offset 3E04h

DPAT Pattern Select Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

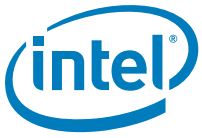
Default: AAAAAAAAh

Bit Range	Default & Access	Field Name (ID): Description
31:24	AAh RW	**Data Line 3 (DATA_LINE3):** Contents of Pattern Buffer for Cache Line 3. EXTBUF[0] corresponds to Lane 0 (32 UI of data maximum). EXTBUF[1] corresponds to Lane 1 (32 UI of data maximum). ..... EXTBUF[15] corresponds to Lane 15. These 16 lanes are replicated across the number of active DQ lanes on the memory interface.
23:16	AAh RW	**Data Line 2 (DATA_LINE2):** Contents of Pattern Buffer for Cache Line 2. Line 2 (and same for Lines 3..0) refers to the 8-UI partial cache line as pointed to current status at CPGC_DPAT_BUF_CTL. This advancement is controlled by CPGC_DPAT_BUF_CTL.
15:8	AAh RW	**Data Line 1 (DATA_LINE1):** Contents of Pattern Buffer for Cache Line 1.
7:0	AAh RW	**Data Line 0 (DATA_LINE0):** Contents of Pattern Buffer for Cache Line 0.

5.12.187 Extended Pattern Buffer (CPGC_DPAT_EXTBUF[2])—Offset 3E08h

DPAT Pattern Select Buffer.

Access Method



Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AAAAAAAAh

Bit Range	Default & Access	Field Name (ID): Description
31:24	AAh RW	**Data Line 3 (DATA_LINE3):** Contents of Pattern Buffer for Cache Line 3. EXTBUF[0] corresponds to Lane 0 (32 UI of data maximum). EXTBUF[1] corresponds to Lane 1 (32 UI of data maximum). ..... EXTBUF[15] corresponds to Lane 15. These 16 lanes are replicated across the number of active DQ lanes on the memory interface.
23:16	AAh RW	**Data Line 2 (DATA_LINE2):** Contents of Pattern Buffer for Cache Line 2. Line 2 (and same for Lines 3..0) refers to the 8-UI partial cache line as pointed to current status at CPGC_DPAT_BUF_CTL. This advancement is controlled by CPGC_DPAT_BUF_CTL.
15:8	AAh RW	**Data Line 1 (DATA_LINE1):** Contents of Pattern Buffer for Cache Line 1.
7:0	AAh RW	**Data Line 0 (DATA_LINE0):** Contents of Pattern Buffer for Cache Line 0.

5.12.188 Extended Pattern Buffer (CPGC_DPAT_EXTBUF[3])—Offset 3E0Ch

DPAT Pattern Select Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AAAAAAAAh

Bit Range	Default & Access	Field Name (ID): Description
31:24	AAh RW	**Data Line 3 (DATA_LINE3):** Contents of Pattern Buffer for Cache Line 3. EXTBUF[0] corresponds to Lane 0 (32 UI of data maximum). EXTBUF[1] corresponds to Lane 1 (32 UI of data maximum). ..... EXTBUF[15] corresponds to Lane 15. These 16 lanes are replicated across the number of active DQ lanes on the memory interface.

Bit Range	Default & Access	Field Name (ID): Description
23:16	AAh RW	**Data Line 2 (DATA_LINE2):** Contents of Pattern Buffer for Cache Line 2. Line 2 (and same for Lines 3..0) refers to the 8-UI partial cache line as pointed to current status at CPGC_DPAT_BUF_CTL. This advancement is controlled by CPGC_DPAT_BUF_CTL.

5.12.201 Error Checker Control (CPGC_ERR_CTL)—Offset 3E40h

Control for Error Checker.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/P	**Cache Line Error Check Enable (ERRCHK_MASK_CACHELINE):** Defines a periodic burst mask that repeats every 64Bytes of data as follows: Bit 0 - Burst 0 Bit 1 - Burst 1 ... Bit 7 - Burst 7 Only bursts with a corresponding bit value of '1' will be checked for errors. A burst is defined as a burst length of 64 bytes of data. In Loopback each bit of this register controls the check of each ByteTime (8-bits) on the bus.
23:16	0h RW/P	**Chunk Error Check Enable (ERRCHK_MASK_CHUNK):** Defines which chunk within the burst of data (i.e. bit within a burst of 8-bits for each lane) to check for errors. Only chunks with a corresponding bit value of '0' will be checked for errors. This field is only used for full width (64bit) DQ busses. Otherwise the upper 32 bits of the Lane Mask is used as the Chunk Enable. This field is also used for Loopback mode for all DQ sizes.
15:14	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW/P	**Stop On Error Control (STOP_ON_ERROR_CTL):** Defines test stop conditions based on error checking as follows: 00 - Never stop: Prevents any error from stopping the test. 01 - Stop On Nth Error: Stop once STOP_ERR_CNTR has accumulated at least (STOP_ON_N + 1) errors. 10 - Stop On All Byte Groups Error: Stop if every byte group indicates that at least one of its lanes accumulated at least one error. That is, if all bits BYTEGRP_ERR_STAT, (and ECC_GRP_ERR_STAT if supported), are all set. 11 - Stop On All Lanes Error: Stop if every lane within every byte group has accumulated at least one error. That is, if all bits in LANE_ERR_STAT_LO, LANE_ERR_STAT_HI, (and LANE_ERR_STATECC if supported) are all set.
11:9	0h RO	Reserved.
8	0h RW/P	**BE Training Enable (BE_TRAIN_ERR_EN):** Enable BE Training Error Detection Feature. Note this bit overrides the BE_TRAIN_ERR_EN bit in CPGC2_ALGORITHM_INSTRUCTION_CTRL.
7:6	0h RO	Reserved.
5:0	0h RW/P	**Stop On Nth Error Count (STOP_ON_N):** If STOP_ON_ERROR is set to Stop on Nth Error Mode, the test will stop after (STOP_ON_N + 1) or more errors have been accumulated in the ERR_CNTR.

5.12.202 Lane Error Mask Lower Bytes (CPGC_ERR_LNEN_LO)—Offset 3E44h

Error Lane Mask for Byte Groups 0-3.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Lower Data Lane Error Mask (DATA_ERRCHK_MASK_LO):** A mask used to disable error checking on data lanes [31:0]. Lanes selected through this mask will not be checked for errors. The lane-to-bit mapping for this mask is given by the following formula: Lane[n] -> bit[n]. Functionality will change with special mapping when buswidth is < 64 (or 72) such that ChunkMask will move to this field starting at bit [...:32] extending the necessary number of bits for a full cache line of data. The mask in ERR_CTL will be unused for these busses/modes.

5.12.203 Lane Error Mask Upper Bytes or Extended Chunk Enable (CPGC_ERR_LNEN_HI)—Offset 3E48h

Error Lane Mask for Byte Groups 4-7 or Extended Chunk Check Enable.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Upper Data Lane Error Mask (DATA_ERRCHK_MASK_HI):** A mask used to disable error checking on data lanes [63:32]. Lanes selected through this mask will not be checked for errors. The lane-to-bit mapping for this mask is given by the following formula: Lane[n+32] -> bit[n]. Functionality will change with special mapping when buswidth is < 64 (or 72) such that ChunkMask will move to this field starting at bit [...:32] extending the necessary number of bits for a full cache line of data. The mask in ERR_CTL will be unused for these busses/modes.

5.12.204 Lane Error Mask ECC (CPGC_ERR_XLNEN)—Offset 3E4Ch

ECC Lane Error Mask.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	FFh RW/P	**ECC Lane Error Mask (ECC_ERRCHK_MASK):** A mask used to disable error checking on ECC lanes. Lanes selected through the mask will not be checked for errors. The lane-to-bit mapping is 1-to-1 and hence bit 1 corresponds to ECC lane 0, bit 1 corresponds to ECC lane 1, and so on. Note: This field is available only if ECC is supported. The default state is to disable ECC checking.

5.12.205 Lane Error Status Lower Bytes (CPGC_ERR_STAT03)—Offset 3E50h

Error Status DQ Lanes 31-0 Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Lower Data Lane Error Status (LANE_ERR_STAT_LO):** Indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to byte groups 0 - 3. Hence lanes [32:0] map to bits [32:0] respectively. The error status information is encoded as follows: 0: No mismatches detected on corresponding lane. 1: At least one mismatch detected on corresponding lane. Cleared on Local Clear Errors.

5.12.206 Lane Error Status Upper Bytes or Extended Chunk Error Status (CPGC_ERR_STAT47)—Offset 3E54h

Error Status DQ Lanes 63-32 Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Upper Data Lane Error Status (LANE_ERR_STAT_HI):** Indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to byte groups 4 - 7. Hence lanes [63:32] map to bits [32:0] respectively. If there are less than 32 data lanes, then this register is used to indicate the Extended Chunk Error Status, and the Chunk Error Status in ECC_CHNK_RANK_STAT is not used. Chunks 0 through 15 (32-bit bus) or 0 through 31 (16-bit bus). The error status information is encoded as follows: 0: No mismatches detected on corresponding lane (chunk). 1: At least one mismatch detected on corresponding lane (chunk). Cleared on Local Clear Errors.

5.12.207 ECC Lane Error Status (CPGC_ERR_ECC_CHNK_RANK_STAT)—Offset 3E58h

Error Status for ECC, Chunks and Ranks.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RO/V/P	**Rank Error Status (RANK_ERR_STAT):** A status field where each bit corresponds to a specific rank. If set, the corresponding rank has accumulated at least one error. Cleared on Local Clear Errors.
15:8	0h RO/V/P	**Chunk Error Status (CHUNK_ERR_STAT):** A flag field where each bit corresponds to a specific chunk (i.e. bit within a burst of 8-bits). If set, the corresponding chunk (UI) has accumulated at least one error. Cleared on Local Clear Errors.
7:0	0h RO/V/P	**ECC Lane Error Status (ECC_LANE_ERR_STAT):** A fag field which indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to the ECC byte group. The error status information is encoded as follows: 0: No mismatches detected on corresponding lane. 1: At least one mismatch detected on corresponding lane. Note: this field is only available if ECC is supported for the current implementation, otherwise it is reserved. If BE Training Enable is set then this field indicates that the particular BE lane had a fault during the write pass. Cleared on Local Clear Errors.

5.12.208 ByteGroup Error Status (CPGC_ERR_BYTE_NTH_PAR_STAT)—Offset 3E5Ch

Error Status for ByteGroup and Error Stop.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	0h RO/V/P	**Nth Error Count Status (Nth_ERROR):** Nth_Error indicates the current Nth Error that has occurred. Nth_Error will roll over upon saturating to its maximum values. An Nth error is defined as 1 or more lane miscompares within a single comparison cycle (i.e. Chunk).
23	0h RO	Reserved.
22:20	0h RO/V/P	**Read Chunk Number Status (RD_CHUNK_NUM_STAT):** RD_Chunk_Num_Status corresponds to the chunk number being read out of the WDB (EXTBUF)for a RdCAS operation while logging an error during Loopback.Pattern. RD_Chunk_Num_Status is needed in conjunction with the lower 3 column address bits of the cacheline experiencing the error in order to deterministically rewind the LFSR/PB/LMN counter after the test is stopped due to an error condition. This is due to the pipelined nature of the data path since a cacheline can be read out of the WDB (EXTBUF) at the same time an error is being detected against an earlier read. Using RD_Chunk_Num_Status and the lower 3 column address bits of the cacheline experiencing the error allows the user to determine the skid between the LFSR/PB/LMN counter and the error detection. RD_Chunk_Num_Status can be cleared by one of two ways. 1. Local_Clear_Errors or (Global_Control and Global_Clear_Errors) to 1. 2. Writing RD_Chunk_Num_Status=0x0. One may also choose to clear individual bits in RD_Chunk_Num_Status. Setting bits in RD_Chunk_Num_Status is undefined and should be avoided. Writing a 0 to bits in RD_Chunk_Num_Status can be cleared independently of Data_Error_Status, ECC_Error_Status, Rank_Error_Status, Chunk_Error_Status, and Byte_Group_Error_Status.
19:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**ECC ByteGroup Error Status (ECCGRP_ERR_STAT):** A set bit implies that the ECC bytegroup has at least one lane that accumulated at least one error. Can also be cleared on Local Clear Errors (or Global_Control and a Global_Clear_Errors) .
7:0	0h RW/1C/V/P	**Data ByteGroup Error Status (BYTEGRP_ERR_STAT):** A flag field with each bit corresponding to a specific byte group. Bit 0 corresponds to byte group 0, bit 1 corresponds to byte group 1, bit 2 corresponds to byte group 2, and so on. A set bit implies that the corresponding byte group has at least one lane that accumulated at least one error. When BE Training Enable is set, then this field will indicate that a data error has occured that was not due to the corresponding BE signal. Can also be cleared on Local Clear Errors (or Global_Control and a Global_Clear_Errors) .

5.12.209 Error Counter Control (CPGC_ERR_CNTRCTL[0])—Offset 3E60h

Counter Control is used to control what is captured in the CPGC_ERR_ERRCNTR#.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW/P	**Error Counter Control (COUNTER_CONTROL):** Counter_Control determines what gets counted by CPGC_ERR_CNTR_#.Error_Counter. 00=Count Errors on all Lanes - The Error Counter will capture the OR of all errors across all unmasked Lanes in a Chunk. For example, if 1 lane or 72 lanes experience an error in a Chunk then the CPGC_ERR_CNTR_#.Error_Counter will be incremented by only 1. 01=Count Errors on a particular Lane - The Error Counter will count the exact number of errors on the Lane indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. 10=Count Errors on a particular Byte Group - The Error Counter will count the number of errors on the Byte group indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. ECC is byte group 8. An error within one Chunk within the selected ByteGroup is counted as 1 error. 11=Count Errors on a particular Chunk - The Error Counter will count the number of errors on the a particular chunk in the cacheline indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER, across all lanes.
6:0	0h RW/P	**Error Counter Pointer (COUNTER_POINTER):** Used in conjunction with Counter_Control to indicate which Lane, which ByteLane or which Chunk the CPGC_ERR_CNTR_#.Error_Counter will count errors on.

5.12.210 Error Counter Control (CPGC_ERR_CNTRCTL[1])—Offset 3E64h

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW/P	**Error Counter Control (COUNTER_CONTROL):** Counter_Control determines what gets counted by CPGC_ERR_CNTR_#.Error_Counter. 00=Count Errors on all Lanes - The Error Counter will capture the OR of all errors across all unmasked Lanes in a Chunk. For example, if 1 lane or 72 lanes experience an error in a Chunk then the CPGC_ERR_CNTR_#.Error_Counter will be incremented by only 1. 01=Count Errors on a particular Lane - The Error Counter will count the exact number of errors on the Lane indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. 10=Count Errors on a particular Byte Group - The Error Counter will count the number of errors on the Byte group indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. ECC is byte group 8. An error within one Chunk within the selected ByteGroup is counted as 1 error. 11=Count Errors on a particular Chunk - The Error Counter will count the number of errors on the a particular chunk in the cacheline indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER, across all lanes.
6:0	0h RW/P	**Error Counter Pointer (COUNTER_POINTER):** Used in conjunction with Counter_Control to indicate which Lane, which ByteLane or which Chunk the CPGC_ERR_CNTR_#.Error_Counter will count errors on.

5.12.216 Error Counter Control (CPGC_ERR_CNTRCTL[7])—Offset 3E7Ch

Counter Control is used to control what is captured in the CPGC_ERR_ERRCNTR#.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW/P	**Error Counter Control (COUNTER_CONTROL):** Counter_Control determines what gets counted by CPGC_ERR_CNTR_#.Error_Counter. 00=Count Errors on all Lanes - The Error Counter will capture the OR of all errors across all unmasked Lanes in a Chunk. 6:0	0h RW/P	**Error Counter Pointer (COUNTER_POINTER):** Used in conjunction with Counter_Control to indicate which Lane, which ByteLane or which Chunk the CPGC_ERR_CNTR_#.Error_Counter will count errors on.

5.12.218 Error Counter (CPGC_ERR_CNTR[0])—Offset 3E84h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.219 Error Counter (CPGC_ERR_CNTR[1])—Offset 3E88h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.220 Error Counter (CPGC_ERR_CNTR[2])—Offset 3E8Ch

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.221 Error Counter (CPGC_ERR_CNTR[3])—Offset 3E90h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.222 Error Counter (CPGC_ERR_CNTR[4])—Offset 3E94h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.223 Error Counter (CPGC_ERR_CNTR[5])—Offset 3E98h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.224 Error Counter (CPGC_ERR_CNTR[6])—Offset 3E9Ch

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.225 Error Counter (CPGC_ERR_CNTR[7])—Offset 3EA0h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.226 Error Counter (CPGC_ERR_CNTR[8])—Offset 3EA4h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.12.227 Error Counter Overflow (CPGC_ERR_CNTR_OV)—Offset 3EA8h

Indicates the current error counter overflow value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8:0	0h RW/1C/V/P	**Error Counter Overflow Status (ERROR_COUNTER_OVERFLOW):** Contains the overflow flags for all Error Counters. Bit 0 corresponds to ERROR_COUNTER_0. Bit 1 corresponds to ERROR_COUNTER_1. .. Bit 8 corresponds to ERROR_COUNTER_8. Error Counter Overflow Status can be cleared by one of two ways: 1. Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) to 1. 2. Writing the correspoing Error Counter Overflow Status bit to 1. Writing a 0 to bits in Counter_Overflow_Status can be cleared independently of Data_Error_Status, Byte_Group_Error_Status, Chunk_Error_Status, and ECC_Error_Status.

5.12.228 Error Log Control and Status (CPGC_ERRLOG_CTL_STAT)—Offset 3EACh

Error Logging Control and Status - All Error Log information must be read out before doing a Local Clear Errors.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW/1S	**Error Log Clear Read Buffer Pointer (CLR_DUN_RDBUF_PTR):** Initializes the Error Log Current Read Pointer. Do this prior to the start of a test.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1S	**Error Log Increment Chunk Count (INC_CHUNK_COUNT):** Advance to next portion of data which is then available in the Error Log Data Register.
14	0h RW/1S	**Error Log Auto Seek to Error (ERRLOG_AUTO):** Asserting this bit will have the effect of CPGC automatically generating the needed Read transactions such as the current Read Pointer targets the last failing cacheline. Instead of manually browsing, user can set this bit and logic will make sure that CURR_RD_PTR==ERROR_RD_PTR. This bit will always return '0' if read by software.
13	0h RW/1S	**Error Log Increment Current Read Pointer (ERRLOG_MOVE):** Asserting this bit will have the effect of incrementing by one the Current Read Pointer at the actual Read Data Buffer. User can manually browse through the Read Data Buffer and dump its contents. This bit will always return '0' if read by software.
12	0h RW/P	**Error Log Auto Chunk Increment (ERRLOG_AUTO_CHNK_INC):** Signal that will allow auto-increment feature for each 32bit data chunk read from the Error Log Data register. Note: If this bit is set, when doing the last 32bit data access via reading the Error Log Data register, the Error Log Current Read Pointer will auto increment as well.
11:9	0h RO	Reserved.
8:5	0h RO/V/P	**Error Log Error Read Pointer (ERROR_RD_PTR):** Provides the Read Pointer location that caused the error that triggered STOP_ON_ERROR. This will be used for knowing exactly which entry in the Read Data Buffer contains the faulty cacheline data.
4	0h RO	Reserved.
3:0	0h RO/V/P	**Error Log Current Read Pointer (CURR_RD_PTR):** Provides the current Read Pointer location indexed at the Read Data Buffer. This will be used for knowing how many Reads the user needs to issue to return the pointer to the actual failing entry.

5.12.229 Error Log Data Access (CPGC_ERRLOG_DATA)—Offset 3EB0h

Error Logging Data Access Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Error Log Data (ERRLOG_DATA):** 32 bits of data corresponding to one of eight (or four for ANN) 32 bit PMI chunks available per Read Pointer location. If ERRLOG_AUTO_CHNK_INC is set, then each read to this register will read out a successive 32 bit PMI chunk of data.

5.12.230 Loopback Error Status (CPGC_ERR_TEST_ERR_STAT)—Offset 3EB4h

Indicates when a test is complete and if any errors occurred for Loopback mode.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RO/V	**Loopback Test in Progress (TEST_IN_PROGRESS):** Used to indicate a loopback test is in progress.
0	0h RO/V/P	**Loopback Local Error Status (ERROR_STATUS):** Bit set during the loopback test. Cleared when Local_Clear_Error in Loopback Sequencer Control is set.

5.12.231 Rank Logical To Physical Map (CPGC_SEQ_RANK_L2P_MAPPING)—Offset 3EB8h

Rank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 76543210h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:28	7h RW	**Rank 7 Mapping (L2P_RANK7_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	Reserved.
26:24	6h RW	**Rank 6 Mapping (L2P_RANK6_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
23	0h RO	Reserved.
22:20	5h RW	**Rank 5 Mapping (L2P_RANK5_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
19	0h RO	Reserved.
18:16	4h RW	**Rank 4 Mapping (L2P_RANK4_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
15	0h RO	Reserved.
14:12	3h RW	**Rank 3 Mapping (L2P_RANK3_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
11	0h RO	Reserved.
10:8	2h RW	**Rank 2 Mapping (L2P_RANK2_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
7	0h RO	Reserved.
6:4	1h RW	**Rank 1 Mapping (L2P_RANK1_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
3	0h RO	Reserved.
2:0	0h RW	**Rank 0 Mapping (L2P_RANK0_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).

5.12.232 Bank Logical to Physical Map Low (CPGC_SEQ_BANK_L2P_MAPPING_A)—Offset 3EBCh

Bank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 76543210h

Bit Range	Default & Access	Field Name (ID): Description
31:28	7h RW	**Bank 7 Mapping (L2P_BANK7_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
27:24	6h RW	**Bank 6 Mapping (L2P_BANK6_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
23:20	5h RW	**Bank 5 Mapping (L2P_BANK5_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
19:16	4h RW	**Bank 4 Mapping (L2P_BANK4_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
15:12	3h RW	**Bank 3 Mapping (L2P_BANK3_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
11:8	2h RW	**Bank 2 Mapping (L2P_BANK2_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
7:4	1h RW	**Bank 1 Mapping (L2P_BANK1_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
3:0	0h RW	**Bank 0 Mapping (L2P_BANK0_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).

5.12.233 Bank Logical to Physical Map High (CPGC_SEQ_BANK_L2P_MAPPING_B)—Offset 3EC0h

Bank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FEDCBA98h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW	**Bank 15 Mapping (L2P_BANK15_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
27:24	Eh RW	**Bank 14 Mapping (L2P_BANK14_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
23:20	Dh RW	**Bank 13 Mapping (L2P_BANK13_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
19:16	Ch RW	**Bank 12 Mapping (L2P_BANK12_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
15:12	Bh RW	**Bank 11 Mapping (L2P_BANK11_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
11:8	Ah RW	**Bank 10 Mapping (L2P_BANK10_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
7:4	9h RW	**Bank 9 Mapping (L2P_BANK9_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
3:0	8h RW	**Bank 8 Mapping (L2P_BANK8_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).

5.12.234 Rank Address Swizzle (CPGC_SEQ_RANK_ADDR_SWIZZLE)—Offset 3EC4h

This register is used to swizzle the Logical to Physical Rank bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FEDCh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:12	Fh RW	**Rank 3 Swizzle (L2P_RANK3_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Only Rank address bits available to the memory controller are valid, others should be set to 0xF.
11:8	Eh RW	**Rank 2 Swizzle (L2P_RANK2_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
7:4	Dh RW	**Rank 1 Swizzle (L2P_RANK1_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
3:0	Ch RW	**Rank 0 Swizzle (L2P_RANK0_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.

5.12.235 Bank Address Swizzle (CPGC_SEQ_BANK_ADDR_SWIZZLE)—Offset 3EC8h

This register is used to swizzle the Logical Bank and Row address bits to Physical Bank bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEB38h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:15	1Bh RW	**Bank 3 Swizzle (L2P_BANK3_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value. Only Bank address bits available to the memory controller are valid, others should be set to 0x1F.
14:10	1Ah RW	**Bank 2 Swizzle (L2P_BANK2_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.
9:5	19h RW	**Bank 1 Swizzle (L2P_BANK1_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.

Bit Range	Default & Access	Field Name (ID): Description
4:0	18h RW	**Bank 0 Swizzle (L2P_BANK0_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.

5.12.236 Row Address Swizzle Low (CPGC_SEQ_ROW_ADDR_SWIZZLE_A)—Offset 3ECCh

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A418820h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	5h RW	**Row 5 Swizzle (L2P_ROW5_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
24:20	4h RW	**Row 4 Swizzle (L2P_ROW4_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	3h RW	**Row 3 Swizzle (L2P_ROW3_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	2h RW	**Row 2 Swizzle (L2P_ROW2_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	1h RW	**Row 1 Swizzle (L2P_ROW1_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Row 0 Swizzle (L2P_ROW0_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.12.237 Row Address Swizzle Mid (CPGC_SEQ_ROW_ADDR_SWIZZLE_B)—Offset 3ED0h

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 16A4A0E6h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	Bh RW	**Row 11 Swizzle (L2P_ROW11_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
24:20	Ah RW	**Row 10 Swizzle (L2P_ROW10_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	9h RW	**Row 9 Swizzle (L2P_ROW9_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	8h RW	**Row 8 Swizzle (L2P_ROW8_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	7h RW	**Row 7 Swizzle (L2P_ROW7_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	6h RW	**Row 6 Swizzle (L2P_ROW6_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.12.238 Row Address Swizzle High (CPGC_SEQ_ROW_ADDR_SWIZZLE_C)—Offset 3ED4h

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2307B9ACh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	11h RW	**Row 17 Swizzle (L2P_ROW17_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value. Only Row address bits available to the memory controller are valid, others should be set to 0x1F.
24:20	10h RW	**Row 16 Swizzle (L2P_ROW16_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	Fh RW	**Row 15 Swizzle (L2P_ROW15_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	Eh RW	**Row 14 Swizzle (L2P_ROW14_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	Dh RW	**Row 13 Swizzle (L2P_ROW13_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	Ch RW	**Row 12 Swizzle (L2P_ROW12_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.12.239 Row Address XOR (CPGC_SEQ_ROW_ADDR_SWIZZLE_X)—Offset 3ED8h

Row XOR source selection for lower order Row addresses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW	**Address DQ Invert Enable (ADDR_DQ_INV_EN):** Enables the lookup table to invert the DQs based on select Row address bits.
28:20	0h RO	Reserved.
19:15	1Fh RW	**Row 3 XOR Swizzle (L2P_ROW3_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
14:10	1Fh RW	**Row 2 XOR Swizzle (L2P_ROW2_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
9:5	1Fh RW	**Row 1 XOR Swizzle (L2P_ROW1_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
4:0	1Fh RW	**Row 0 XOR Swizzle (L2P_ROW0_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.12.240 Column Address Swizzle Low (CPGC_SEQ_COL_ADDR_SWIZZLE_A)—Offset 3EDCh

This register is used to swizzle the Logical to Physical COL bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 65432100h

Bit Range	Default & Access	Field Name (ID): Description
31:28	6h RW	**Column 6 Swizzle (L2P_COL6_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Rank Bits start at select value of 12. A value of 11 will select a constant '0' value.
27:24	5h RW	**Column 5 Swizzle (L2P_COL5_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
23:20	4h RW	**Column 4 Swizzle (L2P_COL4_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
19:16	3h RW	**Column 3 Swizzle (L2P_COL3_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
15:12	2h RW	**Column 2 Swizzle (L2P_COL2_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
11:8	1h RW	**Column 1 Swizzle (L2P_COL1_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
7:4	0h RW	**Column 0 Swizzle (L2P_COL0_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Column Address Bit 0 always corresponds to the logical A[6] for 64B requests and A[5] for 32B requests.
3:0	0h RO	Reserved.

5.12.241 Column Address Swizzle High (CPGC_SEQ_COL_ADDR_SWIZZLE_B)—Offset 3EE0h

This register is used to swizzle the Logical to Physical COL bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 87h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:4	8h RW	**Column 8 Swizzle (L2P_COL8_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Rank Bits start at select value of 12. A value of 11 will select a constant '0' value. Only Row address bits available to the memory controller are valid, others should be set to 11.
3:0	7h RW	**Column 7 Swizzle (L2P_COL7_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.

5.12.242 DQ Inversion Lookup Data Low (CPGC_SEQ_ROW_ADDR_DQ_MAP0)—Offset 3EE8h

DQ Map Register 0 - This register should be 64-bit aligned at an even address - 0x0 or 0x8.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** Data written to this register will be placed in the DQ Map register as a stack. Data is read from the bottom of the stack (higher locations). The last write covers Row addresses of Row[11:4] = (0..31). Reading requires you to write into the stack to get the next location. Since this is destructive, if the data is to be preserved, then the data read should be used for the write. See documentation for details.

5.12.243 DQ Inversion Lookup Data High (CPGC_SEQ_ROW_ADDR_DQ_MAP1)—Offset 3EECh

DQ Map Register 1 - This register should be 64-bit aligned at the following odd address - 0x4 or 0xC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** Data written to this register will be placed in the DQ Map register as a stack. Data is read from the bottom of the stack (higher locations). The last write covers Row addresses of Row[11:4] = (32..63). Reading requires you to write into the stack to get the next location. Since this is destructive, if the data is to be preserved, then the data read should be used for the write.

6.1 Registers Summary

Table 6-1. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FF4h	FF7h	(CTXREG1)—Offset FF4h	0h
FF8h	FFBh	(ECOREG1)—Offset FF8h	0h
31030h	31033h	(PAVP1)—Offset 31030h	0h
323A4h	323A7h	(PAVP2)—Offset 323A4h	0h

6.1.1 (CTXREG1)—Offset FF4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**CTXSIZE:** (p)Register to store value for number of CTX DWORD.(/p)

6.1.2 (ECOREG1)—Offset FF8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**LOCK:** (p)Lock bit for this register(/p)
30:0	0h RW	**ECOREG**

6.1.3 (PAVP1)—Offset 31030h

PAVP register for SAI testing

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**DATA:** (p)PAVP register for SAI testing(/p)

6.1.4 (PAVP2)—Offset 323A4h

PAVP register for SAI testing

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**DATA:** (p)PAVP register for SAI testing(/p)

7.1.1 LJPLL_RW_CONTROL_1 (LJPLL_CR_RW_CONTROL_1)—Offset 10h

LJPLL CR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**SSC_FRAC_STEP (SSC_FRAC_STEP):** ssc fraction step
7:0	0h RW	**SSC_RATIO_STEP (SSC_RATIO_STEP):** SSC ratio step

7.1.2 LJPLL_RW_CONTROL_2 (LJPLL_CR_RW_CONTROL_2)—Offset 14h

LJPLL CR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**PLL_RSVD_1 (PLL_RSVD_1):** PLL Rsvd
11:10	0h RW	**SSC_MODE (SSC_MODE):** SSC mode select
9	0h RW	**SSC_EN (SSC_EN):** SSC enable
8:0	0h RW	**SSC_CYC_TO_PEAK_M1 (SSC_CYC_TO_PEAK_M1):** Ssc cycle to peak

7.1.3 depll_cp (depll_cp)—Offset 20h

Policy DEPLL_POLICY_GROUP CP Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

7.1.4 depll_rac (depll_rac)—Offset 28h

Policy DEPLL_POLICY_GROUP RAC Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

7.1.5 depll_wac (depll_wac)—Offset 30h

Policy DEPLL_POLICY_GROUP WAC Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

7.2 Registers Summary

Table 7-2. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
50h	53h	GMCH Graphics Control (GGC_0_0_0_PCI)—Offset 50h	500h
54h	57h	Device Enable (DEVEN_0_0_0_PCI)—Offset 54h	BFh

7.2.1 GMCH Graphics Control (GGC_0_0_0_PCI)—Offset 50h

GMCH Graphics Control Register.

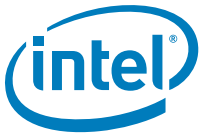
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 500h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	5h RW/L	**Graphics Mode Select (GMS):** This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled.Hardware does not clear or set any of these bits automatically based on IGD being disabled/ enabled.BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0.BIOS Requirement: Given new sizes allow down to 8MB allocation, BIOS has to ensure there is sufficient space for WOPCM and basic GFX Stolen functions.00h: 0MB01h: 32MB02h: 64MB03h: 96MB04h: 128MB05h: 160MB (default)06h: 192MB07h: 224MB08h: 256MB09h: 288MB0Ah: 320MB0Bh: 352MB0Ch: 384MB0Dh: 416MB0Eh: 448MB0Fh: 480MB10h: 512MB11h - 1Fh: Reserved20h:1024MB21h - 2Fh: Reserved30h:1536MB31h - 3Fh: Reserved40h: 2048MB41h - EFh: ReservedF0h: 4MBF1h: 8MBF2h: 12MBF3h: 16MBF4h: 20MBF5h: 24MBF6h: 28MBF7h: 32MBF8h: 36MBF9h: 40MBFAh: 44MBFBh: 48MBFCh: 52MBFDh: 56MBFEh: 60MBFFh: ReservedHardware functionality in case of programming this value to Reserved is not guaranteed.
7:6	0h RW/L	**GTT Graphics Memory Size (GGMS):** This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled.GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register.Hardware functionality in case of programming this value to Reserved is not guaranteed.0x0: No Preallocated Memory0x1: 2MB of Preallocated Memory0x2: 4MB of Preallocated Memory0x3: 8MB of Preallocated Memory
5:3	0h RO	**RESERVED (RSVD_0):** Reserved
2	0h RW/L	**Versatile Acceleration Mode Enable (VAMEN):** Enables the use of the iGFX engines for Versatile Acceleration.1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h.0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
1	0h RW/L	**IGD VGA Disable (IVD):** 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00.1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80.BIOS Requirement: BIOS must not set this bit to 0 if the GMS field pre-allocates no memory.This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override (CAPID0_A[IGD] = 1) or via a register (DEVEN[3] = 0).
0	0h RW/L	**GGC Lock (GGCLCK):** When set to 1b, this bit will lock all bits in this register.



7.2.2 Device Enable (DEVEN_0_0_0_PCI)—Offset 54h

Allows for enabling/disabling of PCI devices and functions that are within the CPU package. The table below the bit definitions describes the behavior of all combinations of transactions to devices controlled by this register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: BFh

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**RESERVED (RSVD_3)**
14	0h RW	**Chap Enable (D7EN)**
13	0h RW	**Device 6 Enable (D6EN)**
12:11	0h RO	**RESERVED (RSVD_2)**
10	0h RW/L	**Device 5 Enable (D5EN)**
9:8	0h RO	**RESERVED (RSVD_1)**
7	1h RW/L	**Device 4 Enable (D4EN)**
6	0h RO	**RESERVED (RSVD_0)**
5	1h RW/L	**Device 3 enable for Display HD Audio (D3EN)**
4	1h RW/L	**Internal Graphics Engine (D2EN):** 0: Bus 0 Device 2 is disabled and hidden1: Bus 0 Device 2 is enabled and visibleThis bit will be set to 0b and remain 0b if Device 2 capability is disabled.
3	1h RW/L	**PEG10 Enable (D1F0EN)**
2	1h RW/L	**PEG11 Enable (D1F1EN)**
1	1h RW/L	**PEG12 Enable (D1F2EN)**
0	1h RO	**Host Bridge (D0EN)**

7.2.3 DMA Protected Range (DPR_0_0_0_PCI)—Offset 5Ch

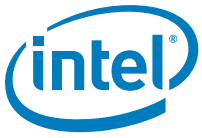
DMA protected range register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO/V	**Top of DPR (TOPOFDPR):** Top address + 1 of DPR. This is the base of TSEG. Bits 19:0 of the BASE reported here are 0x0_0000.
19:12	0h RO	**RESERVED (RSVD_1):** Reserved
11:4	0h RW/L	**DPRSIZE (DPRSIZE):** This is the size of memory, in MB, that will be protected from DMA accesses. A value of 0x00 in this field means no additional memory is protected.The maximum amount of memory that will be protected is 255MB.The amount of memory reported in this field will be protected from all DMA accesses, including translated CPU accesses and graphics. The top of the protected range is the BASE of TSEG -1.Note: If TSEG is not enabled, then the top of this range becomes the base of stolen graphics, or ME stolen space or TOLUD, whichever would have been the location of TSEG, assuming it had been enabled.The DPR range works independently of any other range, including the NoDMA.TABLE protection or the PMRC checks in VTd, and is done post any VTd translation or LT NoDMA lookup. Therefore incomming cycles are checked against this range after the VTd translation and faulted if they hit this protected range, even if they passed the VTd translation or were clean in the NoDMA lookup. All the memory checks are OR'ed with respect to NOT being allowed to go to memory. So if either PMRC, DPR, NoDMA table lookup, NoDMA.TABLE.PROTECT OR a VTd translation disallows the cycle, then the cycle is not allowed to go to memory. Or in other words, all of the above checks must pass before a cycle is allowed to DRAM.HW reports the status of DPR enable/disabled through the PRS field in this register.
3	0h RO	**RESERVED (RSVD_0):** Reserved
2	0h RW/L	**EPM (EPM):** This field controls DMA accesses to the DMA Protected Range (DPR) region.0: DPR is disabled.1: DPR is enabled. All DMA requests accessing DPR region are blocked.HW reports the status of DPR enable/disabled through the PRS field in this register.
1	0h RO/V	**Protected Range Status (PRS):** This field indicated the status of DPR.0: DPR protection disabled.1: DPR protection enabled.
0	0h RW/L	**Lock (LOCK):** All bits which may be updated by SW in this register are locked down when this bit is set.



7.2.4 TOUUD_LO_0_0_0_PCI (TOUUD_LO_0_0_0_PCI)—Offset A8h

Top of Upper Usable DRAM This 64 bit register defines the Top of Upper Usable DRAM. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled this value must be set to reclaim limit 1byte 1MB aligned since reclaim limit is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than or equal to 4GB. BIOS Restriction: Minimum value for TOUUD is 4GB.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**TOUUD (TOUUD):** This register contains bits 38 to 20 of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled this value must be set to reclaim limit 1MB aligned since reclaim limit 1byte is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than 4GB. Note: for 40bit addressing have to add a bit to this field
19:1	0h RO	**RESERVED_0 (RESERVED_0):** Reserved should return 0s on read
0	0h RW	**LOCK_RESERVED (LOCK_RESERVED):** This lock bit only impacts the Display copy of this register. In the Cunit all register protection is implemented with SAI policy groups. This bit is maintained in the Cunit for software observability. Diplay description: This bit will lock all writeable settings in this register including itself client definition.

7.2.5 TOUUD_HI_0_0_0_PCI (TOUUD_HI_0_0_0_PCI)—Offset ACh

Top of Upper Usable DRAM This 64 bit register defines the Top of Upper Usable DRAM. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled this value must be set to reclaim limit 1byte 1MB aligned since reclaim limit is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than or equal to 4GB. BIOS Restriction: Minimum value for TOUUD is 4GB.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
6:0	0h RW	**TOUUD_HI (TOUUD_HI):** This register contains bits 38 to 20 of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled this value must be set to reclaim limit 1MB aligned since reclaim limit 1byte is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than 4GB. Note: for 40bit addressing have to add a bit to this field

7.2.6 Base Data of Stolen Memory (BDSM_0_0_0_PCI)—Offset B0h

This register contains the base address of graphics data stolen DRAM memory.

Access Method

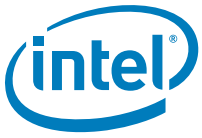
Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/L	**Graphics Base of Stolen Memory (BDSM):** This register contains bits 31 to 20 of the base address of stolen DRAM memory. BIOS determines the base of graphics stolen memory by subtracting the graphics stolen memory size (PCI Device 0 offset 52 bits 6:4) from TOLUD (PCI Device 0 offset BC bits 31:20).
19:1	0h RO	**RESERVED (RSVD_0):** Reserved
0	0h RW/L	**Lock (LOCK):** This bit will lock all writeable settings in this register, including itself.

7.2.7 Base of GTT Stolen Memory (BGSM_0_0_0_PCI)—Offset B4h

This register contains the base address of stolen DRAM memory for the GTT.



Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/L	**Graphics Base of GTT Stolen Memory (BGSM):** This register contains the base address of stolen DRAM memory for the GTT. BIOS determines the base of GTT stolen memory by subtracting the GTT graphics stolen memory size (PCI Device 0 offset 52 bits 11:8) from the Graphics Base of Data Stolen Memory (PCI Device 0 offset B0 bits 31:20).
19:1	0h RO	**RESERVED (RSVD_0):** Reserved
0	0h RW/L	**Lock (LOCK):** This bit will lock all writeable settings in this register, including itself.

7.2.8 TSEG Base Memory (TSEGMB_0_0_0_PCI)—Offset B8h

This 32 bit register defines the TSEG Base.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/L	**TSEG Memory Base (TSEGMB):** This register contains the base address of TSEG DRAM memory. BIOS determines the base of TSEG memory which must be at or below Graphics Base of GTT Stolen Memory (PCI Device 0 Offset B4 bits 31:20).Bios must program the value of TSEGMB to be the same as BGSM when TSEG is disabled.
19:1	0h RO	**RESERVED (RSVD_0):** Reserved
0	0h RW/L	**Lock (LOCK):** This bit will lock all writeable settings in this register, including itself.

7.2.9 Top Of Low Usable DRAM (TOLUD_0_0_0_PCI)—Offset BCh

This 32 bit register defines the low usable DRAM.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/L	**Top of Low Usable DRAM (TOLUD):** This register contains bits 31 to 20 of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system.The top of low usable DRAM is the lowest address above both graphics stolen memory and Tseg.
19:1	0h RO	**RESERVED (RSVD_0):** Reserved
0	0h RW/L	**Lock (LOCK):** This bit will lock all writeable settings in this register, including itself.

7.2.10 Capabilities A (CAPID0_A_0_0_0_PCI)—Offset E4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Display HD Audio Disable (DHDAD)**
30	0h RW	**PEG12 Disable (PEG12D)**
29	0h RW	**PEG11 Disable (PEG11D)**
28	0h RW	**PEG10 Disable (PEG10D)**
27	0h RW	**PCI Express Link Width Upconfig Disable (PELWUD)**
26	0h RW	**DMI Width (DW)**
25	0h RW	**ECC Disable (ECCDIS)**
24	0h RW	**Force DRAM ECC Enabled (FDEE)**
23	0h RW	**VTd Disable (VTDD):** 0 - Enable VTd1 - Disable VTd
22	0h RW	**DMI Gen 2 Disable (DMIG2DIS)**
21	0h RW	**PEG Gen 2 Disable (PEGG2DIS)**

Bit Range	Default & Access	Field Name (ID): Description
20:19	0h RW	**DDR Size (DDRSZ)**
18	0h RW	**Bclk overclocking disable (PCIE_RATIO_DIS)**
17	0h RW	**Disable 1N Mode (D1NM)**
16	0h RW	**Full ULT Fuse Read Disable (FUFRD)**
15	0h RW	**Camarillo Device Disable (CDD)**
14	0h RW	**2 DIMMS per Channel Disable (DDPCD)**
13	0h RW	**X2APIC Enabled (X2APIC_EN)**
12	0h RW	**Performance Dual Channel Disable (PDCD)**
11	0h RW	**Internal Graphics Disable (IGD):** 0b: There is a graphics engine within this CPU. Internal Graphics Device (Device 2) is enabled and all of its memory and I/O spaces are accessable. Configuration cycles to Device 2 will be completed within the CPU. All non-SMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2 and IO registers within Device 2 and VGA Enable of the PCI to PCI bridge control (If PCI Express GFX attach is supported). A selected amount of Graphics Memory space is pre-allocated from the main memory based on Graphics Mode Select (GMS in the GGC Register). Graphics Memory is pre-allocated above TSEG Memory.1b: There is no graphics engine within this CPU. Internal Graphics Device (Device 2) and all of its memory and I/O functions are disabled. Configuration cycle targeted to Device 2 will be passed on. All non-SMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control. Device 2 is disabled and hidden.
10	0h RO	Reserved.
9:8	0h RW	**Capability Device ID (CDID)**
7:4	0h RW	**Compatibility Rev ID (CRID):** This is an 8-bit value that indicates the revision identification number for the Host Device 0.
3	0h RW	**DDR Overclocking (DDR_OVERCLOCK)**
2	0h RW	**IA Overclocking Enabled by DSKU (OC_ENABLED_DSKU)**
1	0h RW	**DDR Write VRef (DDR_WRTVREF)**
0	0h RW	**DDR3L Enable (DDR3L_EN)**

7.2.11 Capabilities B (CAPID0_B_0_0_0_PCI)—Offset E8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Reserved_31 (SPARE31)**
30	0h RW	**IA Overclocking DSKU Control Disable (OC_CTL_DSKU_DIS)**
29	0h RW	**IA Overclocking Enable (OC_ENABLED)**
28	0h RW	**SMT Capability (SMT)**
27:25	0h RW	**Cache Size Capability (CACHESZ)**
24	0h RW	**SVMDIS (SVMDIS):** 0 - SVM mode enabled1 - SVM mode disabled
23:21	0h RW	**DDR3 Maximum Frequency Capability with 100 Memory (PLL_REF100_CFG)**
20	0h RW	**Gen3 Disable Fuse for PCIe PEG Controllers (PEGG3_DIS)**
19	0h RW	**Package Type (PKGTYP)**
18	0h RW	**Additive Graphics Enabled (ADDGFXEN):** 0 - Additive Graphics Disabled1 - Additive Graphics Enabled
17	0h RW	**Additive Graphics Capable (ADDGFXCAP):** 0 - Capable of Additive Graphics1 - Not capable of Additive Graphics
16	0h RW	**Primary PEG Port x16 Disable (PEGX16D)**
15:12	0h RW	**Reserved_15_12 (SPARE15_12)**
11	0h RO	Reserved.
10:8	0h RW	**Reserved_10_8 (SPARE10_8)**
7	0h RO	Reserved.
6:4	0h RW	**DDR3 Maximum Frequency Capability (DMFC)**
3	0h RW	**Reserved_3 (SPARE3)**
2	0h RW	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dual PEG Force x1 when VGA Enabled (DPEGFX1)**
0	0h RW	**Single PEG Force x1 when VGA Enabled (SPEGFX1)**

7.3 Registers Summary

Table 7-3. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	(VID2_0_2_0_PCI)—Offset 0h	0h
2h	3h	Device Identification (DID2_0_2_0_PCI)—Offset 2h	A84h
4h	5h	(PCICMD_0_2_0_PCI)—Offset 4h	0h
6h	7h	(PCISTS2_0_2_0_PCI)—Offset 6h	0h
8h	Bh	(RID2_CC_0_2_0_PCI)—Offset 8h	0h
Ch	Ch	(CLS_0_2_0_PCI)—Offset Ch	0h
Dh	Dh	(MLT2_0_2_0_PCI)—Offset Dh	0h
Eh	Eh	(HDR2_0_2_0_PCI)—Offset Eh	0h
Fh	Fh	(BIST_0_2_0_PCI)—Offset Fh	0h
10h	13h	(GTTMMADR_LO_0_2_0_PCI)—Offset 10h	0h
14h	17h	(GTTMMADR_HI_0_2_0_PCI)—Offset 14h	0h
18h	1Bh	(GMADR_LO_0_2_0_PCI)—Offset 18h	0h
1Ch	1Fh	(GMADR_HI_0_2_0_PCI)—Offset 1Ch	0h
20h	23h	(IOBAR_0_2_0_PCI)—Offset 20h	0h
2Ch	2Dh	(SVID2_0_2_0_PCI)—Offset 2Ch	0h
2Eh	2Fh	(SID2_0_2_0_PCI)—Offset 2Eh	0h
3Ch	3Ch	(INTRLINE_0_2_0_PCI)—Offset 3Ch	0h
3Dh	3Dh	(INTRPIN_0_2_0_PCI)—Offset 3Dh	0h
3Eh	3Eh	(MINGNT_0_2_0_PCI)—Offset 3Eh	0h
3Fh	3Fh	(MAXLAT_0_2_0_PCI)—Offset 3Fh	0h
58h	58h	(DEV2CTL_0_2_0_PCI)—Offset 58h	0h
60h	61h	(HSRW_0_2_0_PCI)—Offset 60h	0h
62h	62h	(MSAC_0_2_0_PCI)—Offset 62h	0h
63h	63h	(VTD_STATUS_0_2_0_PCI)—Offset 63h	0h
ACh	ADh	(MSI_CAPID_0_2_0_PCI)—Offset ACh	0h
AEh	AFh	(MC_0_2_0_PCI)—Offset AEh	0h
B0h	B3h	(MA_0_2_0_PCI)—Offset B0h	0h
B4h	B5h	(MD_0_2_0_PCI)—Offset B4h	0h
D4h	D5h	(PMCS_0_2_0_PCI)—Offset D4h	0h
E0h	E1h	(SWSMI_0_2_0_PCI)—Offset E0h	0h
E8h	E9h	(SWSCI_0_2_0_PCI)—Offset E8h	0h
F8h	FBh	(SRID_0_2_0_PCI)—Offset F8h	0h

Table 7-3. Summary of pcs_regs Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FCh	FFh	(ASLS_0_2_0_PCI)—Offset FCh	0h
104h	105h	(PASID_CAP_0_2_0_PCI)—Offset 104h	0h
106h	106h	(PASID_CTRL_0_2_0_PCI)—Offset 106h	0h
204h	205h	(ATS_CAP_0_2_0_PCI)—Offset 204h	0h
206h	207h	(ATS_CTRL_0_2_0_PCI)—Offset 206h	0h
304h	305h	(PR_CTRL_0_2_0_PCI)—Offset 304h	0h
306h	307h	(PR_STATUS_0_2_0_PCI)—Offset 306h	0h
30Ch	30Fh	(OPRA_0_2_0_PCI)—Offset 30Ch	0h

7.3.1 (VID2_0_2_0_PCI)—Offset 0h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.2 Device Identification (DID2_0_2_0_PCI)—Offset 2h

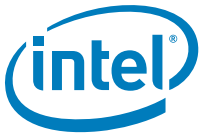
This register combined with the Vendor Identification register uniquely identifies any PCI device.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: A84h

Bit Range	Default & Access	Field Name (ID): Description
15:7	15h RO/V	**Device Identification Number MSB (DID_MSB):** This is the upper part of a 16 bit value assigned to the device.
6:2	1h RO/V	**Device Identification Number STRAPS (DID_STRAPS):** These are bits 6:2 of the 16 bit value, updated from straps.
1:0	0h RO/V	**Device Identification Number SKU (DID_SKU):** This is the lower part of a 16 bit value assigned to the device.



7.3.3 (PCICMD_0_2_0_PCI)—Offset 4h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.4 (PCISTS2_0_2_0_PCI)—Offset 6h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.5 (RID2_CC_0_2_0_PCI)—Offset 8h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.6 (CLS_0_2_0_PCI)—Offset Ch

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.7 (MLT2_0_2_0_PCI)—Offset Dh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.8 (HDR2_0_2_0_PCI)—Offset Eh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.9 (BIST_0_2_0_PCI)—Offset Fh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.10 (GTTMMADR_LO_0_2_0_PCI)—Offset 10h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.11 (GTTMMADR_HI_0_2_0_PCI)—Offset 14h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.12 (GMADR_LO_0_2_0_PCI)—Offset 18h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.13 (GMADR_HI_0_2_0_PCI)—Offset 1Ch

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.14 (IOBAR_0_2_0_PCI)—Offset 20h

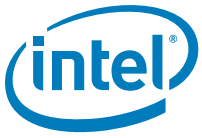
Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**



7.3.15 (SVID2_0_2_0_PCI)—Offset 2Ch

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.16 (SID2_0_2_0_PCI)—Offset 2Eh

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.17 (INTRLINE_0_2_0_PCI)—Offset 3Ch

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.18 (INTRPIN_0_2_0_PCI)—Offset 3Dh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.19 (MINGNT_0_2_0_PCI)—Offset 3Eh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.20 (MAXLAT_0_2_0_PCI)—Offset 3Fh

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.21 (DEV2CTL_0_2_0_PCI)—Offset 58h

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.22 (HSRW_0_2_0_PCI)—Offset 60h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.23 (MSAC_0_2_0_PCI)—Offset 62h

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.24 (VTD_STATUS_0_2_0_PCI)—Offset 63h

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.25 (MSI_CAPID_0_2_0_PCI)—Offset ACh

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.26 (MC_0_2_0_PCI)—Offset AEh

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.27 (MA_0_2_0_PCI)—Offset B0h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.28 (MD_0_2_0_PCI)—Offset B4h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.29 (PMCS_0_2_0_PCI)—Offset D4h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.30 (SWSMI_0_2_0_PCI)—Offset E0h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.31 (SWSCI_0_2_0_PCI)—Offset E8h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.32 (SRID_0_2_0_PCI)—Offset F8h

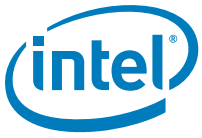
Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**



7.3.33 (ASLS_0_2_0_PCI)—Offset FCh

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.3.34 (PASID_CAP_0_2_0_PCI)—Offset 104h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.35 (PASID_CTRL_0_2_0_PCI)—Offset 106h

Regiter used for GT save/restore definition in PUNIT It is just a byte used as a single field.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Data**

7.3.36 (ATS_CAP_0_2_0_PCI)—Offset 204h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.37 (ATS_CTRL_0_2_0_PCI)—Offset 206h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.38 (PR_CTRL_0_2_0_PCI)—Offset 304h

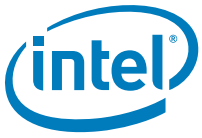
Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**



7.3.39 (PR_STATUS_0_2_0_PCI)—Offset 306h

Regiter used for GT save/restore definition in PUNIT It is just the word used as a single field.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data**

7.3.40 (OPRA_0_2_0_PCI)—Offset 30Ch

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.4 Registers Summary

Table 7-4. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
6C88h	6C8Fh	GFXVTDBAR_0_0_0_MCHBAR_C (MCHBAR_FULL)—Offset 6C88h	0h

7.4.1 GFXVTDBAR_0_0_0_MCHBAR_C (MCHBAR_FULL)—Offset 6C88h

This is the base address for the Graphics VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset the GFXVT configuration space is disabled and must be enabled by writing a 1 to GFXVTBAREN. BIOS programs this register after which the register cannot be altered.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
38:12	0h RW	**GFXVTBAR (GFXVTBAR):** This field corresponds to bits 39 to 12 of the base address GFXVT configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFXVT register set. All the Bits in this register are locked in LT mode.
11:2	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
1	0h RW	**LOCK (LOCK):** This lock bit only impacts the Display copy of this register. In the Cunit all register protection is implemented with SAI policy groups. This bit is maintained in the Cunit for software observability. Diplay description: Locks the contents of the register including itself.
0	0h RW/L	**GFXVTBAREN (GFXVTBAREN):** 0: GFXVTBAR is disabled and does not claim any memory 1: GFXVTBAR memory mapped accesses are claimed and decoded appropriately This bit will remain 0 if VTd capability is disabled.

7.5 Registers Summary

Table 7-5. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
101010h	101013h	(GU_CNTL)—Offset 101010h	0h
101014h	101017h	(CLOCK_GATE_DIS)—Offset 101014h	0h
10101Ch	10101Fh	(GU_ECO)—Offset 10101Ch	0h
101020h	101023h	(PCBR_LSB)—Offset 101020h	0h
101024h	101027h	(PCBR_MSB)—Offset 101024h	0h
108180h	108183h	(MPMEN)—Offset 108180h	0h
1081C0h	1081C3h	(MPLMBASE)—Offset 1081C0h	0h
108200h	108203h	(MPLMLIMIT)—Offset 108200h	0h
108240h	108243h	(MPHMBASE_LSB)—Offset 108240h	0h
108244h	108247h	(MPHMBASE_MSB)—Offset 108244h	0h
108280h	108283h	(MPHMLIMIT_LSB)—Offset 108280h	0h
108284h	108287h	(MPHMLIMIT_MSB)—Offset 108284h	0h

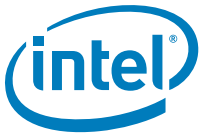


Table 7-5. Summary of pcs_regs Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
108300h	108303h	(MGCMD)—Offset 108300h	0h
110000h	110003h	(SVM_DEV_MODE_CNFG)—Offset 110000h	0h
12000Ch	12000Fh	(DEV2SEQSTS)—Offset 12000Ch	0h
124830h	124833h	(RTADDR_LSB)—Offset 124830h	0h
124834h	124837h	(RTADDR_MSB)—Offset 124834h	0h

7.5.1 (GU_CNTL)—Offset 101010h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.2 (CLOCK_GATE_DIS)—Offset 101014h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

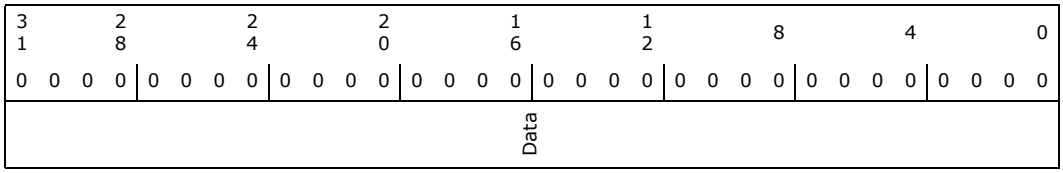
7.5.3 (GU_ECO)—Offset 10101Ch

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.4 (PCBR_LSB)—Offset 101020h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.5 (PCBR_MSB)—Offset 101024h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.6 (MPMEN)—Offset 108180h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.7 (MPLMBASE)—Offset 1081C0h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.8 (MPLMLIMIT)—Offset 108200h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.9 (MPHMBASE_LSB)—Offset 108240h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.10 (MPHMBASE_MSB)—Offset 108244h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.11 (MPHMLIMIT_LSB)—Offset 108280h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.12 (MPHMLIMIT_MSB)—Offset 108284h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.13 (MGCMD)—Offset 108300h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.14 (SVM_DEV_MODE_CNFG)—Offset 110000h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.15 (DEV2SEQSTS)—Offset 12000Ch

This register reflects the status of Device 2 sequencer flows and FSM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RSVD**
8	0h RO	**IOMMU_IDLE**
7:4	0h RO	**RSVD1**
3:0	0h RO	**FSM**

7.5.16 (RTADDR_LSB)—Offset 124830h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.5.17 (RTADDR_MSB)—Offset 124834h

Regiter used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6 Registers Summary

Table 7-6. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
18h	1Bh	(GCMD_REG_0_0_0_VTDBAR)—Offset 18h	0h
1Ch	1Fh	(GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch	0h
20h	27h	(RTADDR_REG_0_0_0_VTDBAR)—Offset 20h	0h
28h	2Fh	(CCMD_REG_0_0_0_VTDBAR)—Offset 28h	0h
34h	37h	(FSTS_REG_0_0_0_VTDBAR)—Offset 34h	0h
38h	3Bh	(FECTL_REG_0_0_0_VTDBAR)—Offset 38h	0h
3Ch	3Fh	(FEDATA_REG_0_0_0_VTDBAR)—Offset 3Ch	0h
40h	43h	(FEADDR_REG_0_0_0_VTDBAR)—Offset 40h	0h
44h	47h	(FEUADDR_REG_0_0_0_VTDBAR)—Offset 44h	0h
64h	67h	(PMEN_REG_0_0_0_VTDBAR)—Offset 64h	0h
68h	6Bh	(PLMBASE_REG_0_0_0_VTDBAR)—Offset 68h	0h
6Ch	6Fh	(PLMLIMIT_REG_0_0_0_VTDBAR)—Offset 6Ch	0h
70h	77h	(PHMBASE_REG_0_0_0_VTDBAR)—Offset 70h	0h
78h	7Fh	(PHMLIMIT_REG_0_0_0_VTDBAR)—Offset 78h	0h
80h	87h	(IQH_REG_0_0_0_VTDBAR)—Offset 80h	0h
88h	8Fh	(IQT_REG_0_0_0_VTDBAR)—Offset 88h	0h
90h	97h	(IQA_REG_0_0_0_VTDBAR)—Offset 90h	0h
9Ch	9Fh	(ICS_REG_0_0_0_VTDBAR)—Offset 9Ch	0h
A0h	A3h	(IECTL_REG_0_0_0_VTDBAR)—Offset A0h	0h
A4h	A7h	(IEDATA_REG_0_0_0_VTDBAR)—Offset A4h	0h
A8h	ABh	(IEADDR_REG_0_0_0_VTDBAR)—Offset A8h	0h
ACh	AFh	(IEUADDR_REG_0_0_0_VTDBAR)—Offset ACh	0h
B8h	BFh	(IRTA_REG_0_0_0_VTDBAR)—Offset B8h	0h
DCh	DFh	(PRESTS_REG_0_0_0_VTDBAR)—Offset DCh	0h
E0h	E3h	(PRECTL_REG_0_0_0_VTDBAR)—Offset E0h	0h
E4h	E7h	(PREDATA_REG_0_0_0_VTDBAR)—Offset E4h	0h
E8h	EBh	(PREADDR_REG_0_0_0_VTDBAR)—Offset E8h	0h
ECh	EFh	(PREUADDR_REG_0_0_0_VTDBAR)—Offset ECh	0h
400h	407h	(FRCDL_REG_0_0_0_VTDBAR)—Offset 400h	0h
408h	40Fh	(FRCDH_REG_0_0_0_VTDBAR)—Offset 408h	0h
500h	507h	(IVA_REG_0_0_0_VTDBAR)—Offset 500h	0h
508h	50Fh	(IOTLB_REG_0_0_0_VTDBAR)—Offset 508h	0h
F00h	F07h	(INTRTADDR_0_0_0_VTDBAR)—Offset F00h	0h

Table 7-6. Summary of pcs_regs Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
F08h	F0Fh	(INTIRTA_0_0_0_VTDBAR)—Offset F08h	0h

7.6.1 (GCMD_REG_0_0_0_VTDBAR)—Offset 18h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.2 (GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.3 (RTADDR_REG_0_0_0_VTDBAR)—Offset 20h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.4 (CCMD_REG_0_0_0_VTDBAR)—Offset 28h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.5 (FSTS_REG_0_0_0_VTDBAR)—Offset 34h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.6 (FECTL_REG_0_0_0_VTDBAR)—Offset 38h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.7 (FEDATA_REG_0_0_0_VTDBAR)—Offset 3Ch

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.8 (FEADDR_REG_0_0_0_VTDBAR)—Offset 40h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

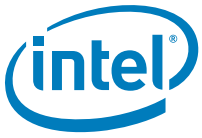
7.6.9 (FEUADDR_REG_0_0_0_VTDBAR)—Offset 44h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.10 (PMEN_REG_0_0_0_VTDBAR)—Offset 64h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.11 (PLMBASE_REG_0_0_0_VTDBAR)—Offset 68h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.12 (PLMLIMIT_REG_0_0_0_VTDBAR)—Offset 6Ch

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.13 (PHMBASE_REG_0_0_0_VTDBAR)—Offset 70h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.14 (PHMLIMIT_REG_0_0_0_VTDBAR)—Offset 78h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.15 (IQH_REG_0_0_0_VTDBAR)—Offset 80h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.16 (IQT_REG_0_0_0_VTDBAR)—Offset 88h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.17 (IQA_REG_0_0_0_VTDBAR)—Offset 90h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.18 (ICS_REG_0_0_0_VTDBAR)—Offset 9Ch

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.19 (IECTL_REG_0_0_0_VTDBAR)—Offset A0h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.20 (IEDATA_REG_0_0_0_VTDBAR)—Offset A4h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.21 (IEADDR_REG_0_0_0_VTDBAR)—Offset A8h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.22 (IEUADDR_REG_0_0_0_VTDBAR)—Offset ACh

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.23 (IRTA_REG_0_0_0_VTDBAR)—Offset B8h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.24 (PRESTS_REG_0_0_0_VTDBAR)—Offset DCh

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.25 (PRECTL_REG_0_0_0_VTDBAR)—Offset E0h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.26 (PREDATA_REG_0_0_0_VTDBAR)—Offset E4h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.27 (PREADDR_REG_0_0_0_VTDBAR)—Offset E8h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.28 (PREUADDR_REG_0_0_0_VTDBAR)—Offset ECh

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.6.29 (FRCDL_REG_0_0_0_VTDBAR)—Offset 400h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.30 (FRCDH_REG_0_0_0_VTDBAR)—Offset 408h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.31 (IVA_REG_0_0_0_VTDBAR)—Offset 500h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.32 (IOTLB_REG_0_0_0_VTDBAR)—Offset 508h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.33 (INTRTADDR_0_0_0_VTDBAR)—Offset F00h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.6.34 (INTIRTA_0_0_0_VTDBAR)—Offset F08h

Register used for GT save/restore definition in PUNIT It is just the whole qword used as a single field.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW	**Data**

7.7 Registers Summary

Table 7-7. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
42060h	42063h	(RM_TIMEOUT)—Offset 42060h	0h
42400h	42403h	Display Engine Power1 (DE_POWER1)—Offset 42400h	0h
42404h	42407h	Display Engine Power2 (DE_POWER2)—Offset 42404h	0h
44074h	44077h	(TIMESTAMP_OVERRIDE)—Offset 44074h	0h
44200h	44203h	(MASTER_INT_CTL)—Offset 44200h	0h
44444h	44447h	Display Engine Port Interrupts (DE_PORT_INTERRUPT_IMR)—Offset 44444h	CF80003Bh
4444Ch	4444Fh	Display Engine Port Interrupts (DE_PORT_INTERRUPT_IER)—Offset 4444Ch	0h
444E4h	444E7h	(PCU_INTERRUPT_IMR)—Offset 444E4h	0h
444ECh	444EFh	(PCU_INTERRUPT_IER)—Offset 444ECh	0h
45004h	45007h	Display Arbitration Control 2 (ARB_CTL2)—Offset 45004h	E80h
45280h	45283h	(WM_DBG)—Offset 45280h	0h
45504h	45507h	(DC_STATE_EN)—Offset 45504h	0h
45520h	45523h	(DC_STATE_DEBUG)—Offset 45520h	0h
46408h	4640Bh	(NDE_RSTWRN_OPT)—Offset 46408h	0h
46530h	46533h	(CLKGATE_DIS_0)—Offset 46530h	0h
46534h	46537h	(CLKGATE_DIS_MISC)—Offset 46534h	0h
50210h	50213h	(MSG_PCU_INT)—Offset 50210h	0h
50400h	50403h	(KVMR1)—Offset 50400h	0h

Table 7-7. Summary of pcs_regs Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
50800h	50803h	(PAVP1)—Offset 50800h	0h
50804h	50807h	(PAVP2)—Offset 50804h	0h
51008h	5100Bh	(DFSM2)—Offset 51008h	0h
5100Ch	5100Fh	(DFSM3)—Offset 5100Ch	0h
8F0E0h	8F0E3h	DMC RMBUS Trap (DMC_RMBUS_TRAP)—Offset 8F0E0h	0h
C4030h	C4033h	(HOTPLUG_CTL)—Offset C4030h	0h
C4034h	C4037h	(HPD_PULSE_CNT_B)—Offset C4034h	0h
C4038h	C403Bh	(HPD_FILTER_CNT)—Offset C4038h	0h
C4044h	C4047h	(HPD_PULSE_CNT_C)—Offset C4044h	0h
C404Ch	C404Fh	(HPD_PULSE_CNT_A)—Offset C404Ch	0h
130094h	130097h	(GSADBG)—Offset 130094h	0h
1300B0h	1300B3h	(GSA_AUDIO_BDF)—Offset 1300B0h	0h
1300B4h	1300B7h	(GSA_TOUCH_BDF)—Offset 1300B4h	0h

7.7.1 (RM_TIMEOUT)—Offset 42060h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.2 Display Engine Power1 (DE_POWER1)—Offset 42400h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Power Well 2 State (POWER_WELL_2_STATE):** This field indicates the status of display power well 2.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RO	**Display Pipes enabled (DISPLAY_PIPES_ENABLED):** This field indicates if any display pipes are enabled.
29	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
28	0h RO	**Power Well 1 State (POWER_WELL_1_STATE):** This field indicates the status of display power well 1.
27:26	0h RO	**SRD Status (SRD_STATUS):** This field indicates the live status of the SRD link on eDP DDI-A
25	0h RO	**KVM Session Status (KVM_SESSION_STATUS):** This field indicates the status of KVM session.
24:13	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
12:10	0h RO	**Enabled Pipe Scalers (ENABLED_PIPE_SCALERS):** The total number of pipe scalers enabled.
9:8	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
7:4	0h RO	**Transmit Lanes Enabled (TRANSMIT_LANES_ENABLED):** The total number of DDI lanes enabled.
3	0h RO	**RESERVED_3 (RESERVED_3):** Reserved
2:0	0h RO	**Enabled DPLLs (ENABLED_DPLL):** The total number of Display PLLs enabled.

7.7.3 Display Engine Power2 (DE_POWER2)—Offset 42404h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DE Bandwidth counter (DE_BANDWIDTH_COUNTER):** This counter increments on every cache line put arriving at the DE. The bandwidth is estimated by taking the difference between two reads at a known interval. Access is actually read/write variant. Writes to this register will load the write data into the counter. The GDR_DFT regisetr Hold_DE_POWER2 bit can be set to stop the count from incrementing.

7.7.4 (TIMESTAMP_OVERRIDE)—Offset 44074h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.5 (MASTER_INT_CTL)—Offset 44200h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.6 Display Engine Port Interrupts (DE_PORT_INTERRUPT_IMR)—Offset 44444h

This table indicates which events are mapped to each bit of the Display Engine Port Interrupt registers. The IER enabled Display Engine Port Interrupt IIR (sticky) bits are ORed together to generate the DE_Port Interrupts Pending bit in the Master Interrupt Control register. 0x44440 = ISR 0x44444 = IMR 0x44448 = IIR 0x4444C = IER

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CF80003Bh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**MIPI C (MIPI_C):** The ISR is an active high level indicating an interrupt is set in MIPIC_INTR_STAT_REG or MIPIC_INTR_STAT_REG_1.

Bit Range	Default & Access	Field Name (ID): Description
30	1h RW	**MIPI A (MIPI_A):** The ISR is an active high level indicating an interrupt is set in MIPIA_INTR_STAT_REG or MIPIA_INTR_STAT_REG_1.
29:28	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
27	1h RW	**AUX Channel D (AUX_CHANNEL_D):** The ISR is an active high pulse on the AUX DDI D done event. This event will not occur for SRD AUX done.
26	1h RW	**AUX Channel C (AUX_CHANNEL_C):** The ISR is an active high pulse on the AUX DDI C done event. This event will not occur for SRD AUX done.
25	1h RW	**AUX Channel B (AUX_CHANNEL_B):** The ISR is an active high pulse on the AUX DDI B done event. This event will not occur for SRD AUX done.
24	1h RW	**MIPI C TE (MIPI_C_TE):** The ISR is an active high pulse indicating a TE interrupt is set in MIPIC_STATUS.
23	1h RW	**MIPI A TE (MIPI_A_TE):** The ISR is an active high pulse indicating a TE interrupt is set in MIPIA_STATUS.
22:6	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
5	1h RW	**DDI C Hotplug (DDI_C_HOTPLUG):** The ISR gives the live state of the DDI C HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.
4	1h RW	**DDI B Hotplug (DDI_B_HOTPLUG):** The ISR gives the live state of the DDI B HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.
3	1h RW	**DDI A Hotplug (DDI_A_HOTPLUG):** The ISR gives the live state of the DDI A HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.
2	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
1	1h RW	**GMBUS (GMBUS):** The ISR is an active high pulse when any of the unmasked events in GMBUS4 Interrupt Mask register occur.
0	1h RW	**AUX Channel A (AUX_CHANNEL_A):** The ISR is an active high pulse on the AUX DDI A done event. This event will not occur for SRD AUX done.

7.7.7 Display Engine Port Interrupts (DE_PORT_INTERRUPT_IER)—Offset 4444Ch

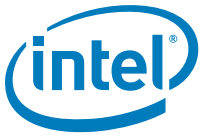
This table indicates which events are mapped to each bit of the Display Engine Port Interrupt registers. The IER enabled Display Engine Port Interrupt IIR (sticky) bits are ORed together to generate the DE_Port Interrupts Pending bit in the Master Interrupt Control register. 0x44440 = ISR 0x44444 = IMR 0x44448 = IIR 0x4444C = IER

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MIPI C (MIPI_C):** The ISR is an active high level indicating an interrupt is set in MIPIC_INTR_STAT_REG or MIPIC_INTR_STAT_REG_1.
30	0h RW	**MIPI A (MIPI_A):** The ISR is an active high level indicating an interrupt is set in MIPIA_INTR_STAT_REG or MIPIA_INTR_STAT_REG_1.
29:28	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
27	0h RW	**AUX Channel D (AUX_CHANNEL_D):** The ISR is an active high pulse on the AUX DDI D done event. This event will not occur for SRD AUX done.
26	0h RW	**AUX Channel C (AUX_CHANNEL_C):** The ISR is an active high pulse on the AUX DDI C done event. This event will not occur for SRD AUX done.
25	0h RW	**AUX Channel B (AUX_CHANNEL_B):** The ISR is an active high pulse on the AUX DDI B done event. This event will not occur for SRD AUX done.
24	0h RW	**MIPI C TE (MIPI_C_TE):** The ISR is an active high pulse indicating a TE interrupt is set in MIPIC_STATUS.
23	0h RW	**MIPI A TE (MIPI_A_TE):** The ISR is an active high pulse indicating a TE interrupt is set in MIPIA_STATUS.
22:6	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
5	0h RW	**DDI C Hotplug (DDI_C_HOTPLUG):** The ISR gives the live state of the DDI C HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.
4	0h RW	**DDI B Hotplug (DDI_B_HOTPLUG):** The ISR gives the live state of the DDI B HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**DDI A Hotplug (DDI_A_HOTPLUG):** The ISR gives the live state of the DDI A HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled.
2	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
1	0h RW	**GMBUS (GMBUS):** The ISR is an active high pulse when any of the unmasked events in GMBUS4 Interrupt Mask register occur.
0	0h RW	**AUX Channel A (AUX_CHANNEL_A):** The ISR is an active high pulse on the AUX DDI A done event. This event will not occur for SRD AUX done.

7.7.8 (PCU_INTERRUPT_IMR)—Offset 444E4h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.9 (PCU_INTERRUPT_IER)—Offset 444ECh

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.10 Display Arbitration Control 2 (ARB_CTL2)—Offset 45004h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: E80h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VRH Memory Wake (VRH_MEMORY_WAKE)**
30	0h RO	**Reserved (RSVD_0)**
29:28	0h RW	**LP WD Write Request Limit (LP_WD_WRITE_REQUEST_LIMIT)**
27:14	0h RO	**Reserved (RSVD_1)**
13	0h RW	**Decomp CCS PAVP Enc (DECOMP_CCS_PAVP_ENC)**
12	0h RW	**Arbiter Trickle Feed Allow on HP Request (ARB_TRICKLE_ALLOW_HP)**
11	1h RW	**Audio Memory Wake (AUDIO_MEMORY_WAKE)**
10:9	3h RW	**Inflight LP Read Request Limit (LP_RD_REQUEST_LIMIT)**
8	0h RO	**Reserved (RSVD_2)**
7	1h RW	**LP Read Write Arb (LP_READ_WRITE_ARB)**
6	0h RO	**Reserved (RSVD_3)**
5:4	0h RW	**Inflight HP Read Request Limit (HP_RD_REQUEST_LIMIT)**
3	0h RW	**Enable IPC (ENABLE_IPC):** Enables the Isochronous Priority Control. If enabled, Display sends demoted requests once the transition watermark is reached. If transition watermark is not enabled, Display sends demoted requests when the display buffer is full. 0b - Disable, 1b - Enable
2	0h RO	**Reserved (RSVD_4)**
1:0	0h RW	**RTID FIFO Watermark (RTID_FIFO_WM)**

7.7.11 (WM_DBG)—Offset 45280h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.12 (DC_STATE_EN)—Offset 45504h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.13 (DC_STATE_DEBUG)—Offset 45520h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.14 (NDE_RSTWRN_OPT)—Offset 46408h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.15 (CLKGATE_DIS_0)—Offset 46530h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.16 (CLKGATE_DIS_MISC)—Offset 46534h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.17 (MSG_PCU_INT)—Offset 50210h

Access: Sent from PCU to North Display. This message is used to forward PCU interrupts to Display Engine. A message received with a 1b in a data bit will indicate an interrupt event occurred. This message is also known as the PCU Interrupt Message (PIM).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**PCU_Interrupts**

7.7.18 (KVMR1)—Offset 50400h

KVMR1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**KVMR1**
3:0	0h RSV	**RESERVED**

7.7.19 (PAVP1)—Offset 50800h

PAVP1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**PAVP1**

7.7.20 (PAVP2)—Offset 50804h

PAVP2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**PAVP2**

7.7.21 (DFSM2)—Offset 51008h

This register contains fuse and strap settings for display. This register is not reset by a debug reset or FLR. Access is RO_FW. Only writes from PCU (cfgspace 0x11111 and srcID 0x10) to Display on the message channel will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Bank_1_EBB_Trim_data**
15:0	0h RW	**Bank_0_EBB_Trim_data**

7.7.22 (DFSM3)—Offset 5100Ch

This register contains fuse and strap settings for display. This register is not reset by a debug reset or FLR. Access is RO_FW. Only writes from PCU (cfgspace 0x11111 and srcID 0x10) to Display on the message channel will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register.

Access Method

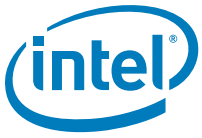
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Bank_3_EBB_Trim_data**
15:0	0h RW	**Bank_2_EBB_Trim_data**

7.7.23 DMC RMBUS Trap (DMC_RMBUS_TRAP)—Offset 8F0E0h

This register controls the RMBUS trapping.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RMBUS Trap Enable (RMBUS_TRAP_ENABLE):** This field enables the RMBUS trap. 0b - Disable, 1b - Enable
30	0h RW	**Trap Delayed Arm (TRAP_DELAYED_ARM)**
29	0h RW	**Trap Discard (TRAP_DISCARD)**
28	0h RW	**Trap Address Type (TRAP_ADDRESS_TYPE)**
27	0h RW	**Wait Clear (WAIT_CLEAR)**
26:20	0h RO	**Reserved (RSVD_0)**
19:2	0h RW	**Trap Address (TRAP_ADDRESS)**
1:0	0h RO	**Reserved (RSVD_1)**

7.7.24 (HOTPLUG_CTL)—Offset C4030h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.25 (HPD_PULSE_CNT_B)—Offset C4034h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.26 (HPD_FILTER_CNT)—Offset C4038h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.27 (HPD_PULSE_CNT_C)—Offset C4044h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.28 (HPD_PULSE_CNT_A)—Offset C404Ch

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.29 (GSADBG)—Offset 130094h

Access is RO_FW. Only writes from non-IA sources (srcID not 0x00) will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register. This register is not reset by the device 2 FLR.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GSADBG**

7.7.30 (GSA_AUDIO_BDF)—Offset 1300B0h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data**

7.7.31 (GSA_TOUCH_BDF)—Offset 1300B4h

Register used for GT save/restore definition in PUNIT It is just the whole dword used as a single field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

8.1 Registers Summary

Table 8-1. Summary of pcs_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	LJPLL_RW_CONTROL_1 (LJPLL_CR_RW_CONTROL_1)—Offset 10h	0h
14h	17h	LJPLL_RW_CONTROL_2 (LJPLL_CR_RW_CONTROL_2)—Offset 14h	0h
20h	27h	dsipll_cp (dsipll_cp)—Offset 20h	40001200211h
28h	2Fh	dsipll_rac (dsipll_rac)—Offset 28h	40001200211h
30h	37h	dsipll_wac (dsipll_wac)—Offset 30h	40001200211h

8.1.1 LJPLL_RW_CONTROL_1 (LJPLL_CR_RW_CONTROL_1)—Offset 10h

LJPLL CR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**SSC_FRAC_STEP (SSC_FRAC_STEP):** ssc fraction step
7:0	0h RW	**SSC_RATIO_STEP (SSC_RATIO_STEP):** SSC ratio step

8.1.2 LJPLL_RW_CONTROL_2 (LJPLL_CR_RW_CONTROL_2)—Offset 14h

LJPLL CR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**PLL_RSVD_1 (PLL_RSVD_1):** PLL Rsvd
11:10	0h RW	**SSC_MODE (SSC_MODE):** SSC mode select
9	0h RW	**SSC_EN (SSC_EN):** SSC enable
8:0	0h RW	**SSC_CYC_TO_PEAK_M1 (SSC_CYC_TO_PEAK_M1):** Ssc cycle to peak

8.1.3 dsipll_cp (dsipll_cp)—Offset 20h

Policy DSIPLL_POLICY_GROUP CP Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

8.1.4 dsipll_rac (dsipll_rac)—Offset 28h

Policy DSIPLL_POLICY_GROUP RAC Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

8.1.5 dsipll_wac (dsipll_wac)—Offset 30h

Policy DSIPLL_POLICY_GROUP WAC Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200211h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200211h RW	**sai[63:0] (sai)**

9 System Agent

9.1 Registers Summary

Table 9-1. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
48h	4Bh	B-Unit Copy of the MCHBAR (B_CR_MCHBAR_LO_0_0_0_PCI)—Offset 48h	FDFF8001h
4Ch	4Fh	B-Unit Copy of the MCHBAR (B_CR_MCHBAR_HI_0_0_0_PCI)—Offset 4Ch	0h
50h	51h	B-Unit Shadow of GGC (B_CR_GGC_0_0_0_PCI)—Offset 50h	0h
54h	57h	B-Unit Shadow of the DEVEN Register (B_CR_DEVEN_0_0_0_PCI)—Offset 54h	33h
60h	63h	B-Unit PCI Express Enhanced Configuration Range Base Address Low (B_CR_PCIEXBAR_LO_0_0_0_PCI)—Offset 60h	0h
64h	67h	B-Unit PCI Express Enhanced Configuration Range Base Address High (B_CR_PCIEXBAR_HI_0_0_0_PCI)—Offset 64h	0h
A8h	ABh	Top of Upper Usable DRAM Low (B_CR_TOUUD_LO_0_0_0_PCI)—Offset A8h	0h
ACh	AFh	Top of Upper Usable DRAM High (B_CR_TOUUD_HI_0_0_0_PCI)—Offset ACh	1h
B4h	B7h	Base of Graphics Stolen Memory (B_CR_BGSM_0_0_0_PCI)—Offset B4h	0h
B8h	BBh	B-Unit Copy of the TSEG Memory Base (B_CR_TSEGMB_0_0_0_PCI)—Offset B8h	100000h
BCh	BFh	Top of Lower Usable DRAM (B_CR_TOLUD_0_0_0_PCI)—Offset BCh	40000000h
E4h	E7h	Capability ID0 A (B_CR_CAPID0_A_0_0_0_PCI)—Offset E4h	0h
E8h	EBh	Capability ID0 B (B_CR_CAPID0_B_0_0_0_PCI)—Offset E8h	0h

9.1.1 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_LO_0_0_0_PCI)—Offset 48h

This register contains the lower 32bits of the MCHBAR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: FDFF8001h

Bit Range	Default & Access	Field Name (ID): Description
31:15	1FBFFh RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. MCHBAR[38:15] is {MCHBAR_HI[6:0],MCHBAR_LO[31:15]}. If incoming Request Address[38:15] matches MCHBAR[38:15] then request hits an address in the MCHBAR range.

Bit Range	Default & Access	Field Name (ID): Description
14:4	0h RO	**Base Address Not Implemented (BASE_ADDR_NOT_IMPLEMENTED):** Hardwired to 0 to indicate size of BAR 32kB.
3:1	0h RO	**Reserved (RESERVED_0):** Prefetchable space.
0	1h RW	**MCHBAR Enable (MCHBAREN):** • 0: MCHBAR is disabled and does not claim any memory • 1: MCHBAR memory mapped accesses are claimed and decoded appropriately

9.1.2 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_HI_0_0_0_PCI)—Offset 4Ch

This register contains the upper 32 bits of the MCHBAR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	0h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. If incoming Request Address[38:15] matches MCHBAR[38:15], then request hits an address in the MCHBAR range.

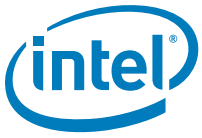
9.1.3 B-Unit Shadow of GGC (B_CR_GGC_0_0_0_PCI)—Offset 50h

B-Unit shadow of the GMCH Graphics Control Register.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 0 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Graphics Memory Select (GMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics device in VGA nonlinear and Native linear modes. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. This register is also Intel TXT lockable. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD bit 1 of this register is 0. • 00h:0MB • 01h:32MB • 02h:64MB • 03h:96MB • 04h:128MB • 05h:160MB • 06h:192MB • 07h:224MB • 08h:256MB • 09h:288MB • 0Ah:320MB • 0Bh:352MB • 0Ch:384MB • 0Dh:416MB • 0Eh:448MB • 0Fh:480MB • 10h:512MB • 20h:...1024MB... • 30h:...1536MB... • 3Fh:...2016MB • 40h-FFh:Illegal value
7:6	0h RW	**Size of Graphics Translation Table Memory (GGMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register. Hardware functionality in case of programming this value to Reserved is not guaranteed. 0x0:No Preallocated Memory 0x1:2MB of Preallocated Memory 0x2:4MB of Preallocated Memory 0x3:8MB of Preallocated Memory
5:3	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Versatile Acceleration Mode Enable (VAMEN):** Enables the use of the iGFX enbines for Versatile Acceleration. • 1: iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. • 0: iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
1	0h RW/L	**IGA VGD Disable (IVD):** • 0: Enable. Device 2 IGD claims VGA memory and IO cycles, and the SubClass Code within Device 2 Class Code register is 00. • 1: Disable. Device 2 IGD does not claim VGA cycles Mem and IO, and the Sub Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field bits 7:3 of this register preallocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override B_CR_CAPID0_A[IGD] 1 or via a register DEVEN[3] 0. This register is locked by Intel TXT lock.
0	0h RW	**GGCLCK (GGCLCK):** Reserved. Unused by the B-Unit.

9.1.4 B-Unit Shadow of the DEVEN Register (B_CR_DEVEN_0_0_0_PCI)—Offset 54h

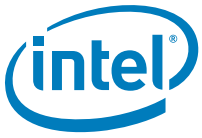
The DEVEN register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 33h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RESERVED_1):** Reserved.
5	1h RW	**Device 3 Function 0 Enable (D3F0EN):** • 0: Bus 0 Device 3 Function 0 is disabled and hidden • 1: Bus 0 Device 3 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 3 capability is disabled.
4	1h RW	**Device 2 Function 0 Enable (D2F0EN):** • 0: Bus 0 Device 2 Function 0 is disabled and hidden • 1: Bus 0 Device 2 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 2 capability is disabled.
3:2	0h RO	**Reserved (RESERVED_0):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**Device 0 Function 1 Enable (D0F1EN):** • 0: Bus 0 Device 1 Function 0 is disabled and hidden • 1: Bus 0 Device 1 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 0/0/1 capability is disabled.
0	1h RO	**Device 0 Function 0 Enable (D0F0EN):** Bus 0 Device 0 Function 0 may not be disabled, and is therefore hardwired to 1.

9.1.5 B-Unit PCI Express Enhanced Configuration Range Base Address Low (B_CR_PCIEXBAR_LO_0_0_0_PCI)—Offset 60h

Defines the base address of the PCI Express Enhanced Configuration region. This register contains the lower 32bits of PCIEXBAR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**PCI Express Base Address (PCIEXBAR):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-Unit and A-Unit.
27	0h RO	**ADMSK128 (ADMSK128):** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.
26	0h RO	**ADMSK64 (ADMSK64):** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.
25:3	0h RO	**Reserved (RESERVED_1):** Reserved.
2:1	0h RO	**Length of the Region (LENGTH):** Reserved and set to 0 indicating a fixed 256 MB region.
0	0h RW	**PCIEXBAR Range Enable (PCIEXBAREN):** • 0: PCIEXBAR range is disabled. Address may target DRAM or MMIO, depending on other address decode rules. • 1: PCIEXBAR range is enabled. Incoming request address must be compared with PCIEXBAR to determine whether the request targets PCI Express Enhanced Configuration region.

9.1.6 B-Unit PCI Express Enhanced Configuration Range Base Address High (B_CR_PCIEXBAR_HI_0_0_0_PCI)—Offset 64h

Defines part of the base address of the PCI Express Enhanced Configuration region. See bit field description.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	0h RW	**PCI Express Base Address (PCIEXBAR):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-unit and A-unit.

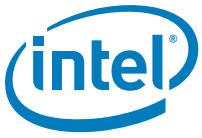
9.1.7 Top of Upper Usable DRAM Low (B_CR_TOUUD_LO_0_0_0_PCI)—Offset A8h

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the lower 32 bits of TOUUD.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.
19:1	0h RO	**Reserved (RESERVED_1):** Reserved.
0	0h RW	**LOCK (LOCK):** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

9.1.8 Top of Upper Usable DRAM High (B_CR_TOUUD_HI_0_0_0_PCI)—Offset ACh

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the upper 32 bits of TOUUD.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	1h RW	**Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.

9.1.9 Base of Graphics Stolen Memory (B_CR_BGSM_0_0_0_PCI)—Offset B4h

Defines the Base of the Graphics Stolen Memory. In addition, the SMM range is defined to end at the preceding byte. See TSEGMB register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Graphics Stolen Memory (BGSM):** This register contains the base address of the Graphics Stolen Memory. The limit for the Graphics Stolen Memory is TOLUD-1. Incoming Request Address[31:20] is compared against BGSM[31:20] and TOLUD[31:20] to determine if the address falls in the range. The comparison check is as follows: BGSM[31:20]<=Address[31:20] && Address[31:20]<TOLUD[31:20] and Address[38:32]==0.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**LOCK (LOCK):** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

9.1.10 B-Unit Copy of the TSEG Memory Base (B_CR_TSEGMB_0_0_0_PCI)—Offset B8h

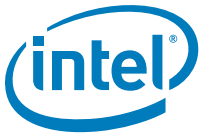
B-Unit copy of the TSEGMB. TSEGMB defines the base of the SMM range and the BGSM register defines the limit of the SMM range. Note: In prior SoCs the base register was defined in SMMRRL register and the limit was defined in the SMMRRH register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	1h RW	**Base address of TSEG DRAM Memory (TSEGMB):** BIOS determines the base of TSEG memory which must be at or below Graphics Base of GTT Stolen Memory BGSM. SMM range starts at this base and ends at BGSM1. Incoming Request Address [31:20] will be compared with TSEGMB[31:20] and BGSM[31:20] to determine if the request targets the SMM range. The comparison check is as follows: Address[31:20]>=TSEGMB[31:20] && Address[31:20]<BGSM[31:20] and Address[38:32]==0. If the check passes, the request targets the SMM range. If the protection for the range is enabled, then the request SAI is compared against allowed SAIs specified by BSMRRAC and BSMRWAC registers to determine if access is allowed.



Bit Range	Default & Access	Field Name (ID): Description
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**LOCK (LOCK):** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

9.1.11 Top of Lower Usable DRAM (B_CR_TOLUD_0_0_0_PCI)—Offset BCh

This register defines the Top of Lower Usable DRAM range and start of the Lower MMIO Address range. Formerly defined in BMBOUND.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 40000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	400h RW	**Top of Lower Usable DRAM (TOLUD):** Defines the top of lower usable DRAM, which ends at the preceding byte. Lower MMIO Address range starts at this address and continues up to the 4GB Address 0xFFFF_FFFF. Bits 31:20 are compared with incoming request Address[31:20] to determine whether the request targets lower usable DRAM range or the lower MMIO range. If Request Address[31:20]>=TOLUD[31:20] and Request Address[38:32]==0 then the Request Address falls in the Lower MMIO Address range.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**LOCK (LOCK):** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

9.1.12 Capability ID0 A (B_CR_CAPID0_A_0_0_0_PCI)—Offset E4h

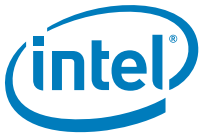
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Spare 31-24 (SPARE31_24):** Reserved for future capabilities.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**VTd Disable (VTDD):** • 0: Enable VTd • 1: Disable VTd
22	0h RW	**Fuse Spare 22 (FUSE_SPARE22):** Fuse backed spare.
21	0h RW	**Fuse Spare 21 (FUSE_SPARE21):** Fuse backed spare.
20	0h RW	**Fuse Spare 20 (FUSE_SPARE20):** Fuse backed spare.
19	0h RW	**Fuse Spare 19 (FUSE_SPARE19):** Fuse backed spare.
18	0h RW	**Fuse Spare 18 (FUSE_SPARE18):** Fuse backed spare.
17	0h RW	**Fuse Spare 17 (FUSE_SPARE17):** Fuse backed spare.
16	0h RW	**Fuse Spare 16 (FUSE_SPARE16):** Fuse backed spare.
15	0h RW	**Camarillo DPTF Disable (CDD):** • 0: DPTF Camarillo associated memory spaces are accessible. • 1: DPTF Camarillo associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF can not be set.
14	0h RW	**Fuse Spare 14 (FUSE_SPARE14):** Fuse backed spare.
13	0h RW	**Fuse Spare 13 (FUSE_SPARE13):** Fuse backed spare.
12	0h RW	**Fuse Spare 12 (FUSE_SPARE12):** Fuse backed spare.
11	0h RW	**Internal Graphics Disable (IGD):** • 0: There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. • 1: There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.



Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**Device ID Override Enable (DIDOE):** Controls if there is an override of Dev2 GFX device ID. • 0: Disable ability to override DID -- For production • 1: Enable ability to override DID -- For debug and samples only
9:8	0h RO	**Control Device ID Value (CDID):** Controls the value of Dev2 GFX device ID. Identifier assigned to the core/primary PCI device.The corresponding two bit capability ID programming is: • 00: Desktop • 01: Mobile • 10: Server • 11: Marketing Spare
7:0	0h RW	**Spare 7-0 (SPARE7_0):** Reserved for future capabilities.

9.1.13 Capability ID0 B (B_CR_CAPID0_B_0_0_0_PCI)—Offset E8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Imaging Unit Memory/IO Disable (IMGU_DIS):** • 0: Imaging Unit associated memory spaces are accessible. • 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for Iunit can not be set.
30	0h RW	**Fuse Spare 30 (FUSE_SPARE30):** Fuse backed spare.
29	0h RW	**Fuse Spare 29 (FUSE_SPARE29):** Fuse backed spares potentially to be used for PKGTYP encoding.
28	0h RW	**Fuse Spare 28 (FUSE_SPARE28):** Fuse backed spares potentially to be used for PKGTYP encoding.
27	0h RW	**Fuse Spare 27 (FUSE_SPARE27):** Fuse backed spares potentially to be used for PKGTYP encoding.
26	0h RW	**Fuse Spare 26 (FUSE_SPARE26):** Fuse backed spares potentially to be used for PKGTYP encoding.
25	0h RW	**Fuse Spare 25 (FUSE_SPARE25):** Fuse backed spares potentially to be used for PKGTYP encoding.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**SVM Disable (SVMDIS):** • 0: Enable SVM mode • 1: Disable SVM mode
23:0	0h RW	**Spare 23-0 (SPARE23_0):** Reserved for future capabilities.

9.2 Registers Summary

Table 9-2. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	5h	B-Unit Copy of PCICMD for IGD (B_CR_PCICMD_0_2_0_PCI)—Offset 4h	0h
10h	13h	B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_LO_0_2_0_PCI)—Offset 10h	4h
14h	17h	B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_HI_0_2_0_PCI)—Offset 14h	0h
18h	1Bh	B-Unit Copy of GMADR (B_CR_GMADR_LO_0_2_0_PCI)—Offset 18h	4h
1Ch	1Fh	B-Unit Copy of GMADR (B_CR_GMADR_HI_0_2_0_PCI)—Offset 1Ch	0h
20h	23h	B-Unit Copy of the IOBAR (B_CR_IOBAR_0_2_0_PCI)—Offset 20h	1h
58h	58h	B-Unit Copy of Device 2 Control Register (B_CR_DEV2CTL_0_2_0_PCI)—Offset 58h	0h
62h	62h	B-Unit Copy of MSAC (B_CR_MSAC_0_2_0_PCI)—Offset 62h	1h
78h	79h	B-Unit Copy of Device 2 Control Register (B_CR_DEVICECTL_0_2_0_PCI)—Offset 78h	0h
D4h	D5h	B-Unit Copy of PMCS for IGD (B_CR_PMCS_0_2_0_PCI)—Offset D4h	0h

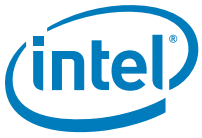
9.2.1 B-Unit Copy of PCICMD for IGD (B_CR_PCICMD_0_2_0_PCI)—Offset 4h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RESERVED_0):** Reserved.
10	0h RW/V	**INTx Disable (INTDIS):** This bit disables the device from asserting INTx. • 0: Enable the assertion of this devices INTx signal. • 1: Disable the assertion of this devices INTx signal. DO_INTx messages will not be sent to DMI.
9	0h RO	**FB2B (FB2B):** Not Implemented. Hardwired to 0.



Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**SEN (SEN):** Not Implemented. Hardwired to 0.
7	0h RO	**WCC (WCC):** Not Implemented. Hardwired to 0.
6	0h RO	**PER (PER):** Not Implemented. Hardwired to 0. Since the IGD belongs to the category of devices that does not corrupt programs or data in system memory or hard drives the IGD ignores any parity error that it detects and continues with normal operation.
5	0h RO	**VPS (VPS):** This bit is hardwired to 0 to disable snooping.
4	0h RO	**MWIE (MWIE):** Hardwired to 0. The IGD does not support memory write and invalidate commands.
3	0h RO	**SCE (SCE):** This bit is hardwired to 0. The IGD ignores Special cycles.
2	0h RW/V	**BME (BME):** • 0: Disable IGD bus mastering. • 1: Enable the IGD to function as a PCI compliant master. .
1	0h RW/V	**MAE (MAE):** This bit controls the IGD's response to memory space accesses. • 0: Disable. • 1: Enable. Device 2 Function Level Reset must reset this bit.
0	0h RW/V	**IOAE (IOAE):** This bit controls the IGD's response to I/O space accesses. • 0: Disable. • 1: Enable. Device 2 Function Level Reset must reset this bit.

9.2.2 B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_LO_0_2_0_PCI)—Offset 10h

This register contains the lower 32 bits of GTTMMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**Memory Base Address (MBA):** GTTMMADR[38:24] is {GTTMMADR_HI[6:0],GTTMMADR_LO[31:24]}. These bits, which are set by the OS, correspond to address signals [38:24]. 16MB combined for MMIO and Global GTT table aperture. 2MB are for MMIO, 6MB are reserved and 8 MB are for GTT.

Bit Range	Default & Access	Field Name (ID): Description
23:4	0h RO	**Address Mask (ADM):** Hardwired to 0s to indicate at least 16MB address range.
3	0h RO	**Prefetch Memory Enable (PREFMEM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Base Address Type (MEMTYP):** • 00: To indicate 32 bit base address • 01: Reserved • 10: To indicate 64 bit base address • 11: Reserved
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

9.2.3 B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_HI_0_2_0_PCI)—Offset 14h

This register contains the upper 32 bits of GTTMMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved. Must be set to 0 since addressing above 512GB is not supported.
6:0	0h RW/V	**Memory Base Address (MBA):** These bits are set by the OS, and correspond to address signals [38:24]. 16MB combined for MMIO and Global GTT table aperture. 2MB are for MMIO, 6MB are reserved and 8 MB are for GTT.

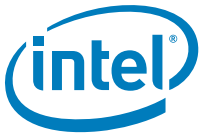
9.2.4 B-Unit Copy of GMADR (B_CR_GMADR_LO_0_2_0_PCI)—Offset 18h

This register contains the lower 32 bits of GMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 4h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Memory Base Address or Address Map 4096 (ADMSK4096):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
30	0h RW/V	**Memory Base Address or Address Map 2048 (ADMSK2048):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
29	0h RW/V	**Memory Base Address or Address Map 1024 (ADMSK1024):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
28	0h RW/V	**Memory Base Address or Address Map 512 (ADMSK512):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
27	0h RW/V	**Memory Base Address or Address Map 256 (ADMSK256):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
26:4	0h RO	**Address Mask (ADM):** Hardwired to 0s to indicate at least 128MB address range.
3	0h RO	**Prefetch Memory Enable (PREFMEM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Base Address Type (MEMTYP):** • 00: To indicate 32 bit base address • 01: Reserved • 10: To indicate 64 bit base address • 11: Reserved
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

9.2.5 B-Unit Copy of GMADR (B_CR_GMADR_HI_0_2_0_PCI)—Offset 1Ch

This register contains the upper 32 bits of GMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved. Must be set to 0 since addressing above 512GB is not supported.
6:0	0h RW/V	**Memory Base Address (MBA):** These bits are set by the OS, and correspond to address signals [38:32].

9.2.6 B-Unit Copy of the IOBAR (B_CR_IOBAR_0_2_0_PCI)—Offset 20h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 2 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_1):** Reserved.
15:6	0h RW/V	**IO Base Address Register Select (IOBASE):** These bits correspond to address signals [15:6]. If there is a match then address hits the IOBAR. Device 2 FLR must reset this field.
5:3	0h RO	**Reserved (RESERVED_0):** Reserved.
2:1	0h RO	**Memory Base Address Type (MEMTYPE):** Hardwired to 0s to indicate 32bit address.
0	1h RO	**Memory or IO Space (MIOS):** Hardwired to 1 to indicate IO space.

9.2.7 B-Unit Copy of Device 2 Control Register (B_CR_DEV2CTL_0_2_0_PCI)—Offset 58h

Access Method

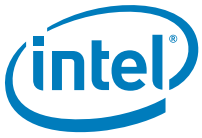
Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW/V	**IOBAR Disable (IOBARDIS):** System BIOS can choose to disable and hide the IOBAR for systems that do not require legacy IOBAR access to Gfx MMIO registers. • 0: IOBAR is enabled and exposed at offset 0x20 in Device 2 Configuration space. Default • 1: IOBAR is disabled and not visible in PCI Configuration Space. Behaves as if hardwired to zeros.

9.2.8 B-Unit Copy of MSAC (B_CR_MSAC_0_2_0_PCI)—Offset 62h

This data is used to determine the size of Aperture GMADR, and affects certain bits of the GMADR register.



Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 2 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RESERVED_0):** Reserved.
4	0h RW/V	**Aperture Size 4 (APSZ4):** Refer to description for APSZ0 [0:0].
3	0h RW/V	**Aperture Size 3 (APSZ3):** Refer to description for APSZ0 [0:0].
2	0h RW/V	**Aperture Size 2 (APSZ2):** Refer to description for APSZ0 [0:0].
1	0h RW/V	**Aperture Size 1 (APSZ1):** Refer to description for APSZ0 [0:0].
0	1h RW/V	**Aperture Size 0 (APSZ0):** This field is used in conjunction with other APSZ fields to determine the size of Aperture GMADR. It affects certain bits of the GMADR register. The description below is for all APSZ fields [4:0]: • 00000b: 128MB GMADR.B[26:4] is hardwired to 0. • 00001b: 256MB GMADR.B[27]=0, RO. • 00010b: illegal hardware will treat this as 00011. • 00011b: 512MB GMADR.B[28:27]=0, RO. • 00100b-00110b: illegal hardware will treat this as 00111. • 00111b: 1024MB GMADR.B[29:27]=0,RO. • 01000b-01110b: illegal hardware will treat this as 01111. • 01111b: 2048MB GMADR.B[30:27]=0,RO. • 10000b-11110b: illegal hardware will treat this as 11111. • 11111b: 4096MB GMADR.B[31:27]=0,RO

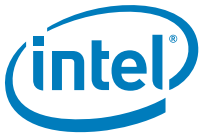
9.2.9 B-Unit Copy of Device 2 Control Register (B_CR_DEVICECTL_0_2_0_PCI)—Offset 78h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**Initiate Function Level Reset (INITIATE_FLR):** A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b. B-Unit uses only this bit for Dev2 FLR. The rest of the bits in this register are ignored by the B-Unit.
14:12	0h RO	**Max Read Request Size (MAX_READ_REQUEST_SIZE):** Functions that do not generate Read Requests larger than 128 bytes and Functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only RO with a value of 000b.
11	0h RO	**Enable No Snoop (ENABLE_NO_SNOOP):** This bit is permitted to be hardwired to 0b if a function would never set the No Snoop attribute in transactions it initiates. The graphics device never generates a PCI Express TLP.
10	0h RO	**Aux Power PM Enable (AUX_PM_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
9	0h RO	**Phantom Functions Enable (PHANTOM_FUNCTIONS_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
8	0h RO	**Extended Tag Field Enable (EXTENDED_TAG_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
7:5	0h RO	**Max Payload Size (MAX_PAYLOAD_SIZE):** Functions that support only the 128byte max payload size are permitted to hardwire this field to 000b.
4	0h RO	**Enable Relaxed Ordering (RO_ENABLE):** A Function is permitted to hardwire this bit to 0b if it never sets the Relaxed Ordering attribute in transactions it initiates as a Requester. The graphics device never generates a PCI Express TLP.
3	0h RO	**Unsupported Request Response Enable (UR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
2	0h RO	**Fatal Error Enable (FATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
1	0h RO	**NonFatal Error Enable (NONFATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
0	0h RO	**Correctable Error Enable (CORRECTABLE_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.



9.2.10 B-Unit Copy of PMCS for IGD (B_CR_PMCS_0_2_0_PCI)—Offset D4h

This is the B-Unit Copy of the Power Management Control/Status Register for the Internal Graphics Device.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 2 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Power Management Event Status (PMESTS):** This bit is 0 to indicate that the Internal Graphics Device does not support Power Management Event generation from D3 (cold).
14:13	0h RO	**Data Scale (DSCALE):** The Internal Graphics Device does not support data register. This bit always returns 00 when read write operations have no effect.
12:9	0h RO	**Data Select (DSEL):** The IGD does not support data register. This bit always returns 0h when read write operations have no effect.
8	0h RO	**Power Management Event Enable (PMEEN):** This bit is 0 to indicate that PME assertion from D3 (cold) is disabled.
7:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1:0	0h RW/V	**Power State (PWRSTAT):** This field indicates the current power state of the IGD, and can be used to set the IGD into a new power state. If software attempts to write an unsupported state to this field, the write operation must complete normally on the bus, but the data is discarded and no state change occurs. On a transition from D3 to D0, the graphics controller is optionally reset to initial values. • 00: D0 Default • 01: D1 Not Supported • 10: D2 Not Supported • 11: D3

9.3 Registers Summary

Table 9-3. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	5h	PCICMD for I-Unit in Device 3 Mode (B_CR_PCICMD_0_3_0_PCI)—Offset 4h	0h
10h	13h	B-Unit Copy of I-Unit BAR (B_CR_ISPMMADR_LO_0_3_0_PCI)—Offset 10h	4h
14h	17h	B-Unit Copy of I-Unit BAR (B_CR_ISPMMADR_HI_0_3_0_PCI)—Offset 14h	0h

Table 9-3. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
78h	79h	B-Unit Copy of Device 3 Control Register (B_CR_DEVICECTL_0_3_0_PCI)—Offset 78h	0h
D4h	D5h	B-Unit Copy of PMCS for I-Unit Device 0/3/0 (B_CR_PMCS_0_3_0_PCI)—Offset D4h	0h

9.3.1 PCICMD for I-Unit in Device 3 Mode (B_CR_PCICMD_0_3_0_PCI)—Offset 4h

B-Unit copy of PCICMD for I-Unit when operating in Device 3 mode.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	0h RW/V	**Memory Access Enable (MAE):** This bit controls the IGD's response to memory space accesses. • 0: Disable. • 1: Enable.
0	0h RW/V	**IO Access Enable (IOAE):** This bit controls the IGD's response to I/O space accesses. • 0: Disable. • 1: Enable.

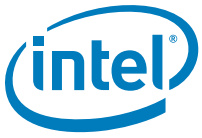
9.3.2 B-Unit Copy of I-Unit BAR (B_CR_ISPMMADR_LO_0_3_0_PCI)—Offset 10h

This register contains the lower 32 bits of I-Unit BAR, defined similarly to GTTMMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 4h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**Memory Base Address (MBA):** ISPMMADR[38:24] is {ISPMMADR_HI[6:0],ISPMMADR_LO[31:24]}. These bits are set by the OS and correspond to address signals [38:24]. 16MB is the size of the ISPMMADR.
23:4	0h RO	**Address Mask (ADM):** Hardwired to zeros to indicate at least 16MB address range.
3	0h RO	**Prefetch Memory Enable (PREFMEM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Base Address Type (MEMTYP):** • 00: To indicate 32 bit base address • 01: Reserved • 10: To indicate 64 bit base address • 11: Reserved
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to zero, to indicate memory space.

9.3.3 B-Unit Copy of I-Unit BAR (B_CR_ISPMMADR_HI_0_3_0_PCI)—Offset 14h

This register contains the upper 32 bits of I-Unit BAR, defined similarly to GTTMMADR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved. Must be set to 0 since addressing above 512GB is not supported.
6:0	0h RW/V	**Memory Base Address (MBA):** Upper bits of ISPMMADR[38:24].

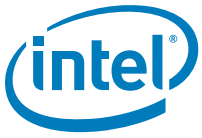
9.3.4 B-Unit Copy of Device 3 Control Register (B_CR_DEVICECTL_0_3_0_PCI)—Offset 78h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**Initiate Function Level Reset (INITIATE_FLR):** A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b. B-Unit uses only this bit for Dev3 FLR. The rest of the bits in this register are ignored by the B-Unit.
14:12	0h RO	**Max Read Request Size (MAX_READ_REQUEST_SIZE):** Functions that do not generate Read Requests larger than 128 bytes and Functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b.
11	0h RO	**Enable No Snoop (ENABLE_NO_SNOOP):** This bit is permitted to be hardwired to 0b if a Function would never set the 'No Snoop' attribute in transactions it initiates. The graphics device never generates a PCI Express TLP.
10	0h RO	**Aux Power PM Enable (AUX_PM_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
9	0h RO	**Phantom Functions Enable (PHANTOM_FUNCTIONS_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
8	0h RO	**Extended Tag Field Enable (EXTENDED_TAG_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
7:5	0h RO	**Max Payload Size (MAX_PAYLOAD_SIZE):** Functions that support only the 128byte max payload size are permitted to hardwire this field to 000b.
4	0h RO	**Enable Relaxed Ordering (RO_ENABLE):** A Function is permitted to hardwire this bit to 0b if it never sets the Relaxed Ordering attribute in transactions it initiates as a Requester. The graphics device never generates a PCI Express TLP.
3	0h RO	**Unsupported Request Response Enable (UR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
2	0h RO	**Fatal Error Enable (FATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
1	0h RO	**Nonfatal Error Enable (NONFATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
0	0h RO	**Correctable Error Enable (CORRECTABLE_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.



9.3.5 B-Unit Copy of PMCS for I-Unit Device 0/3/0 (B_CR_PMCS_0_3_0_PCI)—Offset D4h

This is the B-Unit copy of the Power Management Control/Status Register for I-Unit device 0/3/0.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1:0	0h RW/V	**Power State (PWRSTAT):** This field indicates the current power state of the I-Unit, and can be used to set the I-Unit into a new power state. If software attempts to write an unsupported state to this field, the write operation must complete normally on the bus, but the data is discarded and no state change occurs. On a transition from D3 to D0, the I-Unit is optionally reset to initial values. • 00: D0 Default • 01: D1 Not Supported • 10: D2 Not Supported • 11: D3

9.4 Registers Summary

Table 9-4. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
80h	81h	B-Unit Copy of the I/O Decode Ranges Register for LPC (B_CR_IOD_LPC)—Offset 80h	0h
82h	83h	B-Unit Copy of the I/O Enables Register for LPC (B_CR_IOE_LPC)—Offset 82h	0h
84h	87h	B_LGIR1_LPC (B_CR_LGIR1_LPC)—Offset 84h	0h
88h	8Bh	B_LGIR2_LPC (B_CR_LGIR2_LPC)—Offset 88h	0h
8Ch	8Fh	B_LGIR3_LPC (B_CR_LGIR3_LPC)—Offset 8Ch	0h
90h	93h	B_LGIR4_LPC (B_CR_LGIR4_LPC)—Offset 90h	0h
98h	9Bh	B-Unit Copy of the LPC Generic Memory Range Register for LPC (B_CR_LGMR_LPC)—Offset 98h	0h
D8h	DBh	B-Unit Copy of the BIOS Decode Enable Register for LPC (B_CR_BDE_LPC)—Offset D8h	FFCFh

9.4.1 B-Unit Copy of the I/O Decode Ranges Register for LPC (B_CR_IOD_LPC)—Offset 80h

Affects B-Unit SAD for LPC regions.

Access Method

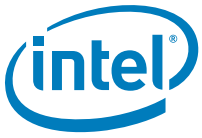
Type: CFG Register (Size: 16 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW/V	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port. • 0 => 3F0h-3F5h, 3F7h (Primary) • 1 => 370h-375h, 377h (Secondary)
11:10	0h RO	Reserved.
9:8	0h RW/V	• Reserved
7	0h RO	Reserved.
6:4	0h RW/V	**ComB Range (CB):** The following table describes which range to decode for the ComB Port. • 000: 3F8h-3FFh (COM 1) • 001: 2F8h-2FFh (COM 2) • 010: 220h-227h • 011: 228h-22Fh • 100: 238h-23Fh • 101: 2E8h-2EFh (COM 4) • 110: 338h-33Fh • 111: 3E8h-3EFh (COM 3)
3	0h RO	Reserved.
2:0	0h RW/V	**ComA Range (CA):** The following table describes which range to decode for the ComA Port. • 000: 3F8h-3FFh (COM 1) • 001: 2F8h-2FFh (COM 2) • 010: 220h-227h • 011: 228h-22Fh • 100: 238h-23Fh • 101: 2E8h-2EFh (COM 4) • 110: 338h-33Fh • 111: 3E8h-3EFh (COM 3)

9.4.2 B-Unit Copy of the I/O Enables Register for LPC (B_CR_IOE_LPC)—Offset 82h

Affects B-Unit SAD for LPC regions.



Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9	0h RW/V	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0h RW/V	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.
7:4	0h RO	Reserved.
3	0h RW/V	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE.
2	0h RW/V	**Parallel Port Enable (PPE)**
1	0h RW/V	**Com Port B Enable (CBE):** Enables decoding of the ComB range to LPC. Range is selected LIOD.CB.
0	0h RW/V	**Com Port A Enable (CAE):** Enables decoding of the ComA range to LPC. Range is selected LIOD.CA.

9.4.3 B_LGIR1_LPC (B_CR_LGIR1_LPC)—Offset 84h

B-Unit copy of the LPC Generic I/O Range #1 register for LPC. Affects B-Unit SAD for LPC regions.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RO	Reserved.
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that SoC does not provide decode down to the word or byte level.
1	0h RO	Reserved.
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

9.4.4 B_LGIR2_LPC (B_CR_LGIR2_LPC)—Offset 88h

B-Unit copy of the LPC Generic I/O Range #2 register for LPC. Affects B-Unit SAD for LPC regions.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

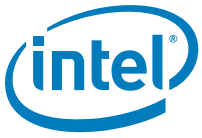
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that SoC does not provide decode down to the word or byte level.
1	0h RO	Reserved.
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

9.4.5 B_LGIR3_LPC (B_CR_LGIR3_LPC)—Offset 8Ch

B-Unit copy of the LPC Generic I/O Range #3 register for LPC. Affects B-Unit SAD for LPC regions.

Access Method



Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that SoC does not provide decode down to the word or byte level.
1	0h RO	Reserved.
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

9.4.6 B_LGIR4_LPC (B_CR_LGIR4_LPC)—Offset 90h

B-Unit copy of the LPC Generic I/O Range #4 register for LPC. Affects B-Unit SAD for LPC regions.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that SoC does not provide decode down to the word or byte level.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	Reserved.
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

9.4.7 B-Unit Copy of the LPC Generic Memory Range Register for LPC (B_CR_LGMR_LPC)—Offset 98h

Affects B-Unit SAD for LPC regions.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/V	**Memory Address [31:16] (ADDR_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	Reserved.
0	0h RW/V	**LPC Memory Range Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

9.4.8 B-Unit Copy of the BIOS Decode Enable Register for LPC (B_CR_BDE_LPC)—Offset D8h

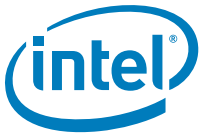
Affects B-Unit SAD for BIOS regions only when BIOS is resident in LPC.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 0

Default: FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_0):** Reserved.
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS ranges: FFF80000h-FFFFFFFFh and FFB80000h-FFBFFFFFh.



Bit Range	Default & Access	Field Name (ID): Description
14	1h RW/V	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS ranges: FFF00000h-FFF7FFFFh and FFB00000h-FFB7FFFFh.
13	1h RW/V	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS ranges: FFE80000h-FFEFFFFFh and FFA80000h-FFAFFFFFh.
12	1h RW/V	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS ranges: FFE00000h-FFE7FFFFh and FFA00000h-FFA7FFFFh.
11	1h RW/V	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS ranges: FFD80000h-FFDFFFFFh and FF980000h-FF9FFFFFh.
10	1h RW/V	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS ranges: FFD00000h-FFD7FFFFh and FF900000h-FF97FFFFh.
9	1h RW/V	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS ranges: FFC80000h-FFCFFFFFh and FF880000h-FF8FFFFFh.
8	1h RW/V	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS ranges: FFC00000h-FFC7FFFFh and FF800000h-FF87FFFFh.
7	1h RW/V	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h-FFFFFh.
6	1h RW/V	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h-EFFFFh.
5:4	0h RO	**Reserved (RESERVED_1):** Reserved.
3	1h RW/V	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS ranges: FF700000h-FF7FFFFFh and FF300000h-FF3FFFFFh.
2	1h RW/V	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS ranges: FF600000h-FF6FFFFFh and FF200000h-FF2FFFFFh.
1	1h RW/V	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS ranges: FF500000h-FF5FFFFFh and FF100000h-FF1FFFFFh.
0	1h RW/V	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS ranges: FF400000h-FF4FFFFFh and FF000000h-FF0FFFFFh.

9.5 Registers Summary

Table 9-5. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
50h	53h	B-Unit Copy of the TCO Base Address Register for Legacy SMBUS (B_CR_TCOBASE_SMBUS)—Offset 50h	0h
54h	57h	B-Unit Copy of the TCO Control Register for Legacy SMBUS (B_CR_TCOCTL_SMBUS)—Offset 54h	0h

9.5.1 B-Unit Copy of the TCO Base Address Register for Legacy SMBUS (B_CR_TCOBASE_SMBUS)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW/V	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, mappable anywhere in the 64k I/O space on 32-byte boundaries.
4:0	0h RO	Reserved.

9.5.2 B-Unit Copy of the TCO Control Register for Legacy SMBUS (B_CR_TCOCTL_SMBUS)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 31 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RW/V	**TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled.
7:0	0h RO	Reserved.

9.6 Registers Summary

Table 9-6. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
D8h	DBh	B-Unit Copy of the BIOS Decode Enable register for SPI (B_CR_BDE_SPI)—Offset D8h	FFCFh

9.6.1 B-Unit Copy of the BIOS Decode Enable register for SPI (B_CR_BDE_SPI)—Offset D8h

Affects B-Unit SAD for BIOS regions, only when BIOS is resident in SPI.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 2

Default: FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_0):** Reserved.
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS ranges: FFF80000h-FFFFFFFFh and FFB80000h-FFBFFFFFh.
14	1h RW/V	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS ranges: FFF00000h-FFF7FFFFh and FFB00000h-FFB7FFFFh.
13	1h RW/V	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS ranges: FFE80000h-FFEFFFFFh and FFA80000h-FFAFFFFFh.
12	1h RW/V	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS ranges: FFE00000h-FFE7FFFFh and FFA00000h-FFA7FFFFh.
11	1h RW/V	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS ranges: FFD80000h-FFDFFFFFh and FF980000h-FF9FFFFFh.
10	1h RW/V	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS ranges: FFD00000h-FFD7FFFFh and FF900000h-FF97FFFFh.
9	1h RW/V	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS ranges: FFC80000h-FFCFFFFFh and FF880000h-FF8FFFFFh.
8	1h RW/V	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS ranges: FFC00000h-FFC7FFFFh and FF800000h-FF87FFFFh.
7	1h RW/V	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h-FFFFFh.
6	1h RW/V	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h-EFFFFh.
5:4	0h RO	**Reserved (RESERVED_1):** Reserved.
3	1h RW/V	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS ranges: FF700000h-FF7FFFFFh and FF300000h-FF3FFFFFh.
2	1h RW/V	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS ranges: FF600000h-FF6FFFFFh and FF200000h-FF2FFFFFh.
1	1h RW/V	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS ranges: FF500000h-FF5FFFFFh and FF100000h-FF1FFFFFh.
0	1h RW/V	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS ranges: FF400000h-FF4FFFFFh and FF000000h-FF0FFFFFh.

9.7 Registers Summary

Table 9-7. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	B-Unit Copy of IOBAR MMIO INDEX (B_CR_INDEX_0_2_0_IOBAR)—Offset 0h	0h

9.7.1 B-Unit Copy of IOBAR MMIO INDEX (B_CR_INDEX_0_2_0_IOBAR)—Offset 0h

Device 2 Function Level Reset must reset this register.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RESERVED_0):** Reserved.
22:2	0h RW/V	**Register or GTT Offset (REGGTO):** This field selects any one of the DWORD registers within the MMIO register space of Device 2 if the target is MMIO Registers. This field selects a GTT offset if the target is the GTT.
1:0	0h RW/V	**Targeted Register Type (TARG):** • 00: MMIO Registers • 01: GTT • 1X: Reserved

9.8 Registers Summary

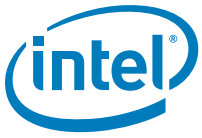
Table 9-8. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	0h	B-Unit Shadow of Legacy VGA Decode GR and MSR Bits (B_CR_VGADEC_0_2_0_VGABAR)—Offset 0h	0h

9.8.1 B-Unit Shadow of Legacy VGA Decode GR and MSR Bits (B_CR_VGADEC_0_2_0_VGABAR)—Offset 0h

Device 2 Function Level Reset must reset this entire register.

Access Method



Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RESERVED_0):** Reserved.
4	0h RW/V	**Page Mode Enable (VGAGR10):** • 0: VGA mode • 1: Page mode
3:2	0h RW/V	**Select for VGA Memory Space (VGAGR6):** • 00: 0xA_0000-0xB_FFFF • 01: 0xA_0000-0xA_FFFF • 10: 0xB_0000-0xB_7FFF • 11: 0xB_0000-0xB_FFFF
1	0h RW/V	**VGA Memory Access Control (VGAMSR1):** Controls memory access, not IO. • 0: VGA memory access is disabled • 1: VGA memory access is enabled
0	0h RW/V	**IO Space Select (VGAMSR0):** Selects the IO space. • 0: 3Bx mode mono • 1: 3Dx mode color

9.9 Registers Summary

Table 9-9. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
64h	67h	B-Unit Copy of Default VTd BAR PMEN (B_CR_PMEN_REG_0_0_0_DEFVTDBAR)—Offset 64h	0h
68h	6Bh	B-Unit Copy of Default VTd BAR PLM Base Register (B_CR_PLMBASE_REG_0_0_0_DEFVTDBAR)—Offset 68h	0h
6Ch	6Fh	B-Unit Copy of Default VTd BAR PLM Limit Register (B_CR_PLMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 6Ch	0h
70h	77h	B-Unit Copy of Default VTd BAR PHM Base Register (B_CR_PHMBASE_REG_0_0_0_DEFVTDBAR)—Offset 70h	0h
78h	7Fh	B-Unit Copy of Default VTd BAR PHM Limit Register (B_CR_PHMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 78h	0h

9.9.1 B-Unit Copy of Default VTd BAR PMEN (B_CR_PMEN_REG_0_0_0_DEFVTDBAR)—Offset 64h

B-Unit copy of the Default VTd BAR PMEN register. Bit 31 is the only bit used for B-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**EPM (EPM):** This field controls DMA accesses to the protected lowmemory and protected highmemory regions. • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled. Access control is implemented. IA accesses are always allowed access. NonIA accesses are allowed if request SAI matches the SAI of the Default VTd Engine. Requests blocked due to protected memory region violation are not recorded or reported as remapping faults. Hardware reports the status of the protected memory enable/disable operation through the PRS field in this register. Hardware implementations supporting DMA draining must drain any inflight translated DMA requests queued within the RootComplex before indicating the protected memory region as enabled through the PRS field.
30:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RO	**PRS Unused (PRS):** Unused by the B-Unit. This field indicates the status of protected memory regions: • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled.

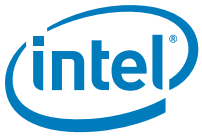
9.9.2 B-Unit Copy of Default VTd BAR PLM Base Register (B_CR_PLMBASE_REG_0_0_0_DEFVTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant bit position with 0 in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software must setup the protected low memory region below 4GB. Section 10.4.18 of the Intel Virtualization Technology for Directed I/O: Spec describes the Protected Low-Memory Limit register and hardware decoding of these registers. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/V	**Protected Low Memory Base (PLMB):** This register specifies the base of the protected low-memory region in system memory.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

9.9.3 B-Unit Copy of Default VTd BAR PLM Limit Register (B_CR_PLMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 6Ch

This register sets up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and it must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and then finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s. The Protected low-memory base and limit registers function as follows: Programming the protected low-memory base and limit registers with the same value in bits 31:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/V	**Protected Low Memory Limit (PLML):** This register specifies the last host physical address of the DMA protected low memory region in system memory.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

9.9.4 B-Unit Copy of Default VTd BAR PHM Base Register (B_CR_PHMBASE_REG_0_0_0_DEFVTDBAR)—Offset 70h

This is the register to set up the base address of the DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value

read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:20	0h RW/V	**Protected High Memory Base (PHMB):** This register specifies the base of protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

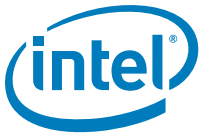
9.9.5 B-Unit Copy of Default VTd BAR PHM Limit Register (B_CR_PHMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all ones to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all ones. The protected high-memory base and limit registers function as follows: Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:20	0h RW/V	**Protected High Memory Limit (PHML):** This register specifies the last host physical address of the DMA protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW where HAW is the host address width.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

10.1 Registers Summary

Table 10-1. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID Register (DEVICE_ID_VENDOR_ID_0_0_0_PCI)—Offset 0h	5AF08086h
4h	7h	PCI Status and PCI Command Register (PCI_STATUS_COMMAND_0_0_0_PCI)—Offset 4h	7h
8h	Bh	PCI Revision ID and PCI Class Code Register (REVISION_ID_CLASS_CODE_0_0_0_PCI)—Offset 8h	6000000h
Ch	Fh	Master Latency Timer and Header Type Register (MASTER_LATENCY_TIME_0_0_0_PCI)—Offset Ch	800000h
2Ch	2Fh	PCI Subsystem Vendor ID and PCI Subsystem ID (SVID_SID_0_0_0_PCI)—Offset 2Ch	0h
34h	37h	Capability Register Pointer (CAPPTR_0_0_0_PCI)—Offset 34h	E0h
48h	4Bh	Memory Controller Hub Base Address Register (MCHBAR_LO_0_0_0_PCI)—Offset 48h	0h
4Ch	4Fh	Memory Controller Hub Base Address Register (MCHBAR_HI_0_0_0_PCI)—Offset 4Ch	0h
50h	53h	Graphics and Memory Controller Hub Graphics Control Register (GGC_0_0_0_PCI)—Offset 50h	0h
54h	57h	Device Enable Register (DEVEN_0_0_0_PCI)—Offset 54h	33h
58h	5Bh	Protected Audio Video Path Control (PAVPC_0_0_0_PCI)—Offset 58h	0h
60h	63h	PCI Express Enhanced Configuration Range Base Address Low (PCIEXBAR_LO_0_0_0_PCI)—Offset 60h	0h
64h	67h	PCI Express Enhanced Configuration Range Base Address High (PCIEXBAR_HI_0_0_0_PCI)—Offset 64h	0h
A8h	ABh	Top of Upper Usable DRAM Low (TOUUD_LO_0_0_0_PCI)—Offset A8h	0h
ACh	AFh	Top of Upper Usable DRAM High (TOUUD_HI_0_0_0_PCI)—Offset ACh	0h
B0h	B3h	Base of Data Stolen Memory (BDSM_0_0_0_PCI)—Offset B0h	0h
B4h	B7h	Base of Graphics Stolen Memory (BGSM_0_0_0_PCI)—Offset B4h	0h
B8h	BBh	Top Segment Memory Base (TSEGMB_0_0_0_PCI)—Offset B8h	100000h
BCh	BFh	Top of Lower Usable DRAM (TOLUD_0_0_0_PCI)—Offset BCh	100000h
DCh	DFh	Scratchpad (SKPD_0_0_0_PCI)—Offset DCh	0h
E0h	E3h	Capability ID0 Capability Control (CAPID0_CAPCTRL0_0_0_0_PCI)—Offset E0h	10C0009h
E4h	E7h	Capability ID0 A (CAPID0_A_0_0_0_PCI)—Offset E4h	0h
E8h	EBh	Capability ID0 B (CAPID0_B_0_0_0_PCI)—Offset E8h	0h
F8h	FBh	Design and Engineering Backup Register 0 (DEBUP0_0_0_0_PCI)—Offset F8h	0h
FCh	FFh	Design and Engineering Backup Register 1 (DEBUP1_0_0_0_PCI)—Offset FCh	0h
061Ch		I/O Buffer Control (IOBCTL)—Offset 061Ch	C000004h
0054h		Power Management Control And Status (PCS)—Offset 0054h	8h

Table 10-1. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1048h		LTRC_D013C_PCE—Offset 1048h	8080080h
0050h		PID_PC—Offset 0050h	C8436001h

10.1.1 Device ID and Vendor ID Register (DEVICE_ID_VENDOR_ID_0_0_0_PCI)—Offset 0h

This register uniquely identifies any PCI device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 5AF08086h

Bit Range	Default & Access	Field Name (ID): Description
31:23	B5h RW/V	**Strap2 Portion of Device ID (DEVICE_ID_STRAP2):** The reset default value of this register is tied to the parameter DEVICE_ID_STRAP2. These bits can be rewritten from SETIDVALUE message 1st DW data byte2, byte3.
22:21	3h RO	**Strap1 Portion of Device ID (DEVICE_ID_STRAP1):** These bits are tied to a C-Unit parameter DEVICE_ID_STRAP1.
20:16	10h RO/V	**Fuse Backed Portion of Device ID (DEVICE_ID_FUSE):** These bits of Device ID are fuse backed.
15:0	8086h RO	**Vendor ID (VENDOR_ID):** Hardwired to Intel's Vendor ID value.

10.1.2 PCI Status and PCI Command Register (PCI_STATUS_COMMAND_0_0_0_PCI)—Offset 4h

PCI Status is used to record status information for PCI bus related events. PCI Command provides coarse control over a device's ability to generate and respond to PCI cycles.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
31:0	7h RO	**PCI Status and PCI Command (PCI_STATUS_AND_COMMAND):** Hardwired to 32'h00000007, allowing this device to respond to I/O space and Memory Space accesses. This device is also allowed to behave as a bus master.

10.1.3 PCI Revision ID and PCI Class Code Register (REVISION_ID_CLASS_CODE_0_0_0_PCI)—Offset 8h

Revision ID contains the revision number of the device. Class Code identifies the basic function of the device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 6000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	600h RO	**Class Code 1 (CLASS_CODE1):** Hardwired 16'h0600, indicating this device is a Host Bridge.
15:8	0h RO	**Class Code 0 (CLASS_CODE0):** Hardwired to 8'h00, indicating this device is a Host Bridge.
7:0	0h RW/V	**Revision ID Strap (REVISION_ID_STRAP):** These bits can be rewritten from SETIDVALUE message 1st DW data byte 0.

10.1.4 Master Latency Timer and Header Type Register (MASTER_LATENCY_TIME_0_0_0_PCI)—Offset Ch

This register defines Latency Timer and layout of the device Configuration Space header.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RESERVED_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	80h RO	**Header Type (HEADER_TYPE):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in the Configuration Space) and also whether or not the device contains multiple functions. Hardwired to 8'h80, indicating this is a multi-function device.
15:8	0h RO	**Master Latency Timer (MASTER_LATENCY_TIMER):** This field specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. Hardwired to 1'b0.
7:0	0h RO	**Reserved (RESERVED_0):** Reserved.

10.1.5 PCI Subsystem Vendor ID and PCI Subsystem ID (SVID_SID_0_0_0_PCI)—Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Subsystem ID (SUBSYSTEM_ID):** PCI Subsystem ID: This field should be programmed during BIOS initialization.
15:0	0h RW	**Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID):** PCI Subsystem Vendor ID: This field should be programmed by BIOS during bootup to indicate the vendor of the system board.

10.1.6 Capability Register Pointer (CAPPTR_0_0_0_PCI)—Offset 34h

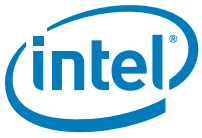
This register contains a pointer to the first Capability Register in a linked list.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: E0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RESERVED_0):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
7:0	E0h RO	**Base Address of First Capability Register (BASE_ADDR):** This pointer is an 8-bit address to an offset within this device's Configuration Space that holds the first Capability Register (CAPID0_CAPCTRL).

10.1.7 Memory Controller Hub Base Address Register (MCHBAR_LO_0_0_0_PCI)—Offset 48h

This register contains the lower 32bits of the MCHBAR base address.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of MCHBAR. MCHBAR[38:15] is {MCHBAR_HI[6:0],MCHBAR_LO[31:15]}. If incoming Request Address[38:15] matches MCHBAR[38:15] then the request hits and address in the MCHBAR range.
14:4	0h RO	**Base Address not Implemented (BASE_ADDR_NOT_IMPLEMENTED):** Hardwired to 0 to indicate size of BAR 32kB.
3:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**MCHBAR Enable (MCHBAREN):** • 0: MCHBAR is disabled and does not claim any memory • 1: MCHBAR memory mapped accesses are claimed and decoded appropriately

10.1.8 Memory Controller Hub Base Address Register (MCHBAR_HI_0_0_0_PCI)—Offset 4Ch

This register contains the upper 32bits of the MCHBAR base address.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	0h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. If incoming Request Address[38:15] matches MCHBAR[38:15], then request hits an address in the MCHBAR range.

10.1.9 Graphics and Memory Controller Hub Graphics Control Register (GGC_0_0_0_PCI)—Offset 50h

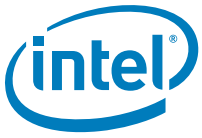
The GMCH Graphics Control register configures the memory preallocated to the internal graphics device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_1):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Graphics Memory Select (GMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics device in VGA nonlinear and Native linear modes. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. This register is also Intel TXT lockable. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD bit 1 of this register is 0. • 00h:0MB • 01h:32MB • 02h:64MB • 03h:96MB • 04h:128MB • 05h:160MB • 06h:192MB • 07h:224MB • 08h:256MB • 09h:288MB • 0Ah:320MB • 0Bh:352MB • 0Ch:384MB • 0Dh:416MB • 0Eh:448MB • 0Fh:480MB • 10h:512MB • 20h:...1024MB... • 30h:...1536MB... • 3Fh:...2016MB • 40h-FFh:Illegal value
7:6	0h RW	**Size of Graphics Translation Table Memory (GGMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register. Hardware functionality in case of programming this value to Reserved is not guaranteed. • 0h: No Preallocated Memory • 1h: 2MB of Preallocated Memory • 2h: 4MB of Preallocated Memory • 3h: 8MB of Preallocated Memory
5:3	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Versatile Acceleration Mode Enable (VAMEN):** Enables the use of the iGFX engines for Versatile Acceleration. • 1: iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. • 0: iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
1	0h RW/V	**IGD VGA Disable (IVD):** • 0: Enable. Device 2 IGD claims VGA memory and IO cycles the SubClass Code within Device 2 Class Code register is 00. • 1: Disable. Device 2 IGD does not claim VGA cycles Mem and IO and the Sub Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field bits 7:3 of this register preallocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse override CAPID0_A[IGD] set to 1h or via a register DEVEN[D2F0EN] set to 0h.
0	0h RW	**GGC Register Lock (GGCLCK):** This lock bit only impacts the Display copy of this register. In the C-Unit all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit locks all other writeable bits in this register.

10.1.10 Device Enable Register (DEVEN_0_0_0_PCI)—Offset 54h

The DEVEN register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 33h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RESERVED_1):** Reserved.
5	1h RW/V	**Device 3 Function 0 Enable (D3F0EN):** • 0: Bus 0 Device 3 Function 0 is disabled and hidden • 1: Bus 0 Device 3 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 3 capability is disabled.
4	1h RW/V	**Device 2 Function 0 Enable (D2F0EN):** • 0: Bus 0 Device 2 Function 0 is disabled and hidden • 1: Bus 0 Device 2 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 2 capability is disabled.
3	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	1h RW/V	**Device 0 Function 1 Enable (D0F1EN):** • 0: Bus 0 Device 0 Function 1 is disabled and hidden • 1: Bus 0 Device 0 Function 1 is enabled and visible This bit will be set to 0b and remain 0b if Device 0/0/1 capability is disabled.
0	1h RO	**Device 0 Function 0 Enable (D0F0EN):** Bus 0 Device 0 Function 0 may not be disabled, and is therefore hardwired to 1.

10.1.11 Protected Audio Video Path Control (PAVPC_0_0_0_PCI)—Offset 58h

This register contains the control bits for the Protected Audio Video Path.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Protected Content Memory (PCMBASE):** Sizes supported in SoC: 1M, 2M, 4M, and 8M. Base value programmed from Top of Stolen Memory itself defines the size of the Write Only Protected Content Memory (WOPCM). Separate WOPCM size programming is redundant information and not required. Default 1M size programming. 4M recommended for SoC.
19:7	0h RO	**Reserved (RSVD2):** Reserved.
6	0h RW	**ASMF Enable (ASMFEN):** ASMF method enable • 0: Disabled (default) • 1: Enabled
5	0h RO	**Reserved (RSVD1):** Reserved.
4	0h RW	**Override Attack (OVTATTACK):** Override of Unsolicited Connection State Attack and Terminate. • 0: Disable Override. Attack Terminate allowed. • 1: Enable Override. Attack Terminate disallowed.
3	0h RW	**Heavy Mode Select (HVYMODSEL)**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**PAVP Register Lock (PAVPLCK):** This lock bit only impacts the Display copy of this register. In the C-Unit, all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit locks all writeable contents in this register when set, including itself. Only a hardware reset can unlock the register again. This lock bit needs to be set only if PAVP is enabled (bit 1 of this register is asserted.)
1	0h RW	**Protected Audio Video Path Enable (PAVPE):** • 0: PAVP functionality is disabled. • 1: PAVP functionality is enabled.
0	0h RW	**Protected Content Memory Enable (PCME):** This field enables Protected Content Memory within Graphics Stolen Memory. This memory is the same as the Write Only Protected Content Memory area whose size is defined by bit 5 of this register. This register is locked when PAVPLCK is set. • 0: Protected Content Memory is disabled and cannot be programmed in this manner when PAVP is enabled. • 1: Protected Content Memory is enabled and is the only programming option available when PAVP is enabled.

10.1.12 PCI Express Enhanced Configuration Range Base Address Low (PCIEXBAR_LO_0_0_0_PCI)—Offset 60h

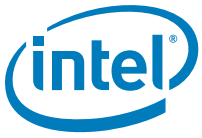
This register contains the lower 32bits of the base address of the PCI Express Enhanced Configuration region.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**PCI Express Base Address Register (PCIEXBAR):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-Unit and A-Unit.
27	0h RO	**Address Mask for 128MB region (ADMSK128):** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.
26	0h RO	**Address Mask for 64MB region (ADMSK64):** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.



Bit Range	Default & Access	Field Name (ID): Description
25:3	0h RO	**Reserved (RESERVED_0):** Reserved.
2:1	0h RO	**Length of the Region (LENGTH):** Reserved and set to 0, indicating a fixed 256 MB region.
0	0h RW	**PCIEXBAR Range Enable (PCIEXBAREN):** • 0: The PCIEXBAR range is disabled. Address may target DRAM or MMIO, depending on other address decode rules. • 1: The PCIEXBAR range is enabled. Incoming request address must be compared with PCIEXBAR to determine whether the request targets PCI Express Enhanced Configuration region.

10.1.13 PCI Express Enhanced Configuration Range Base Address High (PCIEXBAR_HI_0_0_0_PCI)—Offset 64h

This register contains the upper 32bits of the base address of the PCI Express Enhanced Configuration region.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	0h RW	**PCI Express Base Address Register (PCIEXBAR_HI):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-Unit and A-Unit.

10.1.14 Top of Upper Usable DRAM Low (TOUUD_LO_0_0_0_PCI)—Offset A8h

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the lower 32 bits of TOUUD.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved should return 0s on read.
0	0h RW	**TOUUD Register Lock (LOCK_RESERVED):** This lock bit only impacts the Display copy of this register. In the C-Unit, all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit will lock all writeable settings in this register, including itself (client definition).

10.1.15 Top of Upper Usable DRAM High (TOUUD_HI_0_0_0_PCI)—Offset ACh

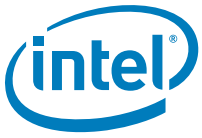
Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the upper 32 bits of TOUUD.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved.
6:0	0h RW	**Top of Upper Usable DRAM (TOUUD_HI):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.



10.1.16 Base of Data Stolen Memory (BDSM_0_0_0_PCI)—Offset B0h

Defines the Base of the Data Stolen Memory. In addition, the GSM range is defined to end at the preceding byte. See BGSM register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Data Stolen Memory (BDSM):** This register contains the base address of the Data Stolen Memory. The limit for the Data Stolen Memory is TOLUD-1. This range is not decoded by the system agent, but is a sub-region of BGSM decoded by the Integrated Graphics Device. Incoming Request Address[31:20] is compared against BDSM[31:20] and TOLUD[31:20] to determine if the address falls in the range. The comparison check is as follows: BDSM[31:20]<=Address[31:20] && Address[31:20]<TOLUD[31:20] and Address[38:32]==0.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**BDSM Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit will lock all writeable settings in this register, including itself.

10.1.17 Base of Graphics Stolen Memory (BGSM_0_0_0_PCI)—Offset B4h

Defines the Base of the Graphics Stolen Memory. In addition, the SMM range is defined to end at the preceding byte. See TSEGMB register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Graphics Stolen Memory (BGSM):** This register contains the base address of the Graphics Stolen Memory. The limit for the Graphics Stolen Memory is TOLUD-1. Incoming Request Address[31:20] is compared against BGSM[31:20] and TOLUD[31:20] to determine if the address falls in the range. The comparison check is as follows: BGSM[31:20]<=Address[31:20] && Address[31:20]<TOLUD[31:20] and Address[38:32]==0. The Integrated Graphics Device (IGD) further subdivides this range, however outside of the IGD the access protections are the same and the system is not aware of the further sub-division. These divisions include a Data segment and a PCM segment.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**BGSM Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit, all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit will lock all writeable settings in this register, including itself.

10.1.18 Top Segment Memory Base (TSEGMB_0_0_0_PCI)—Offset B8h

TSEGMB defines the base of the SMM range, and the BGSM register defines the limit of the SMM range. Note: In prior SoCs, the base register was defined in SMMRRL register and the limit was defined in the SMMRRH register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	1h RW	**Base address of Top Segment DRAM Memory (TSEGMB):** BIOS determines the base of TSEG memory, which must be at or below Graphics Base of GTT Stolen Memory BGSM. SMM range starts at this base and ends at BGSM1. Incoming Request Address [31:20] will be compared with TSEGMB[31:20] and BGSM[31:20] to determine if the request targets the SMM range. The comparison check is as follows: Address[31:20]>=TSEGMB[31:20] && Address[31:20]<BGSM[31:20] and Address[38:32]==0. If the check passes, the request targets the SMM range. If the protection for the range is enabled, then the request SAI is compared against allowed SAIs specified by BSMRRAC and BSMRWAC registers to determine if access is allowed.

Bit Range	Default & Access	Field Name (ID): Description
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**TSEGMB Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit, all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit will lock all writeable settings in this register, including itself.

10.1.19 Top of Lower Usable DRAM (TOLUD_0_0_0_PCI)—Offset BCh

This register defines the Top of Lower Usable DRAM range and start of the Lower MMIO Address range. Formerly defined in BMBOUND.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	1h RW	**Top of Lower Usable DRAM (TOLUD):** Defines the top of lower usable DRAM, which ends at the preceding byte. Lower MMIO Address range starts at this address and continues up to the 4GB Address 0xFFFF_FFFF. Bits 31:20 are compared with incoming request Address[31:20] to determine whether the request targets lower usable DRAM range or the lower MMIO range. If Request Address[31:20]>=TOLUD[31:20] and Request Address[38:32]==0 then the Request Address falls in the Lower MMIO Address range.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RW	**TOLUD register lock (LOCK):** Reserved. Lock is unused by C-Unit. Register overwrites are protected via SAI access control policy registers.

10.1.20 Scratchpad (SKPD_0_0_0_PCI)—Offset DCh

This register holds 32 writable bits with no functionality behind them. It is for the convenience of BIOS and graphics drivers.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Scratchpad (SKPD):** 1 DWORD of data storage.

10.1.21 Capability ID0 Capability Control (CAPID0_CAPCTRL0_0_0_0_PCI)—Offset E0h

Control bits in this register describe the attributes of CAPID0_A and CAPID0_B capability registers.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 10C0009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RESERVED_0):** Reserved.
27:24	1h RO	**Capability ID Version (CAPID_VER):** This field has the value 0001b to identify the first revision of the CAPID register definition.
23:16	Ch RO	**Capability ID0 Structure Length (CAPIDLEN):** This field has the value 0Ch to indicate the structure length 12 bytes. This is the total size of this CAPCTRL and the CAPID0_A and CAPID0_B registers in the following bytes.
15:8	0h RO	**Next Capability Register Pointer (NEXT_CAP):** This field is hardwired to 00h, indicating the end of the capabilities linked list.
7:0	9h RO	**Capability ID (CAP_ID):** This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers.

10.1.22 Capability ID0 A (CAPID0_A_0_0_0_PCI)—Offset E4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Spare bits[31:24] (SPARE31_24):** Reserved for future capabilities.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW/Fuse	**VTd Disable (VTDD):** • 0: Enable VTd • 1: Disable VTd
22	0h RW/Fuse	**Fuse Spare bit[22] (FUSE_SPARE22):** Fuse backed spare.
21	0h RW/Fuse	**Fuse Spare bit[21] (FUSE_SPARE21):** Fuse backed spare.
20	0h RW/Fuse	**Fuse Spare bit[20] (FUSE_SPARE20):** Fuse backed spare.
19	0h RW/Fuse	**Fuse Spare bit[19] (FUSE_SPARE19):** Fuse backed spare.
18	0h RW/Fuse	**Fuse Spare bit[18] (FUSE_SPARE18):** Fuse backed spare.
17	0h RW/Fuse	**Fuse Spare bit[17] (FUSE_SPARE17):** Fuse backed spare.
16	0h RW/Fuse	**Fuse Spare bit[16] (FUSE_SPARE16):** Fuse backed spare.
15	0h RW/Fuse	**Camarillo Device (DPTF) Disable (CDD):** • 0: DPTF (Camarillo) associated memory spaces are accessible. • 1: DPTF (Camarillo) associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF cannot be set.
14	0h RW/Fuse	**Fuse Spare bit[14] (FUSE_SPARE14):** Fuse backed spare.
13	0h RW/Fuse	**Fuse Spare bit[13] (FUSE_SPARE13):** Fuse backed spare.
12	0h RW/Fuse	**Fuse Spare bit[12] (FUSE_SPARE12):** Fuse backed spare.
11	0h RW/Fuse	**Internal Graphics Disable (IGD):** • 0: There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. • 1: There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**Device ID Override Enable (DIDOE):** Controls if there is an override of Dev2 GFX device ID. • 0: Disable ability to override DID -- For production • 1: Enable ability to override DID -- For debug and samples only
9:8	0h RO	**Control Device ID Value (CDID):** Controls the value of Dev2 GFX device ID. Identifier assigned to the core/primary PCI device. The corresponding two bit capability ID programming is: • 00: Desktop • 01: Mobile • 10: Server • 11: Marketing Spare
7:0	0h RW	**Spare bits[7:0] (SPARE7_0):** Reserved for future capabilities

10.1.23 Capability ID0 B (CAPID0_B_0_0_0_PCI)—Offset E8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/Fuse	**Imaging Unit Memory/IO Disable (IMGU_DIS):** • 0: Imaging Unit associated memory spaces are accessible. • 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for Iunit cannot be set.
30	0h RW/Fuse	**Fuse Spare bit[30] (FUSE_SPARE_30):** Fuse backed spare.
29	0h RW/Fuse	**Fuse Spare bit[29] (FUSE_SPARE_29):** Fuse backed spares potentially to be used for PKGTYP encoding.
28	0h RW/Fuse	**Fuse Spare bit[28] (FUSE_SPARE_28):** Fuse backed spares potentially to be used for PKGTYP encoding.

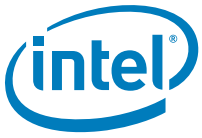
25	0h RW/Fuse	**Fuse Spare bit[25] (FUSE_SPARE_25):** Fuse backed spares potentially to be used for PKGTYP encoding.
24	0h RW/Fuse	**Shared Virtual Memory Disable (SVMDIS):** • 0: Enable Shared Virtual Memory mode • 1: Disable Shared Virtual Memory mode



Bit Range	Default & Access	Field Name (ID): Description
23:0	0h RW	**Spare bits[23:0] (SPARE23_0):** Reserved for future capabilities.

10.1.24 Design and Engineering Backup Register 0 (DEBUP0_0_0_0_PCI)—Offset F8h

Reserved for future spare usage.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Spare bits[31:0] (SPARE_RW):** Spare RW bits for future usage.

10.1.25 Design and Engineering Backup Register 1 (DEBUP1_0_0_0_PCI)—Offset FCh

Reserved for future spare usage.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Spare bits[31:0] (SPARE_RW):** Spare RW bits for future usage.

10.1.26 I/O Buffer Control (IOBCTL)—Offset 061Ch

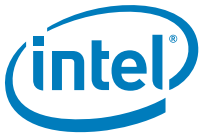
This register allows BIOS to control the I/O buffer configuration based on the motherboard configuration. Notes: 1. Bits 31:26 control the iDISPLAY Audio Link Buffers at the same time that 2. Bits 9:0 control HD-Audio and I2S/SSP Ports 0 and 1 buffers.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 2AC000004h

Range	Access Type	Default (reset)	Description
31:30	RW	0x0 (rst)	**IDSRCP (iDISPLAY Slew Rate Control P)** These bits control the pullup slew rate of the iDISPLAY Audio Link buffers. 00: P Slew Rate for iDISPLAY interface 01: Very slow P Slew Rate 10: Fast P Slew Rate 11: Slow P Slew Rate
29:28	RW	0x0 (rst)	**IDSRCN (iDISPLAY Slew Rate Control N)** These bits control the pulldown slew rate of the iDISPLAY Audio Link buffers. 00: N Slew Rate for iDISPLAY interface 01: Fast N Slew Rate 10: Slow N Slew Rate 11: Very Fast N Slew Rate
27:26	RW	0x3 (rst)	**IDHYS (iDISPLAY Hysteresis Control)** These bits control the hysteresis levels of the iDISPLAY Audio Link buffers. 00: No Hysteresis 01: >80mV (for GTL) 10: >0.1 VCC 11: >80mV (for iDISPLAY)
25:10	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved for future use
9:8	RW	0x0 (rst)	**OSEL (Ownership Select)** Indicates the ownership of the I/O buffer between Intel HD Audio link vs I2S0 / I2S port. 00: Intel HD-Audio link owns all the I/O buffers. 01: Intel HD-Audio link owns 4 of the I/O buffers for 1 HD-Audio codec connection, and I2S1 port owns 4 of the I/O buffers for 1 I2S codec connection. 10: Reserved. 11: I2S0 and I2S1 ports own all the I/O buffers. Note that the 01 setting is ONLY workable with the new type of Intel HD Audio codec known as Mobile HD Audio codec that does not making use of the reset pin.
7:6	RW	0x0 (rst)	**HDASRCP (HD-Audio Slew Rate Control P)** These bits control the pullup slew rate of the HD-Audio Link buffers. 00: P Slew Rate for HD-A interface 01: Slow P slew rate 10: Reserved 11: Reserved
5:4	RW	0x0 (rst)	**HDASRCN (HD-Audio Slew Rate Control N)** These bits control the pulldown slew rate of the HD-Audio Link buffers. 00: N Slew Rate for HD-A interface 01: Slow N slew rate 10: Reserved 11: Reserved



Range	Access Type	Default (reset)	Description
3:2	RW	0x1 (rst)	**HDAHYS (HD-Audio Hysteresis Control)** These bits control the hysteresis levels of the iDISPLAY Audio Link buffers. 00: No Hysteresis 01: HD-A at 1.8V or 3.3V 10: LPC at 3.3V 11: HD-A at 1.5V
1:1	RW	0x0 (rst)	**VSEL (Voltage Select)** When this bit is cleared to 0, the IO buffers will operate in 3.3V mode drive strength attribute. When this bit is set to 1, the IO buffers will operate in 1.8V mode drive strength attribute. The actual voltage of the IO buffer operation is still depending on the VCCPAZ power pin supplied voltage.
0:0	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved for future use

10.1.27 Power Management Control And Status (PCS)—Offset 0054h

This register is used to manage the PCI functions power management state as well as to enable/monitor PMEs. PMES and PMEE bits reside in Resume well, and reset by resume reset.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 8h

Range	Access Type	Default (reset)	Description
31:24	RO	0x0 (rst)	**DT (Data)** Does not apply. Hardwired to 0.
23:23	RO	0x0 (rst)	**BPCCE (Bus Power/Clock Control Enable)** Does not apply. Hardwired to 0.
22:22	RO	0x0 (rst)	**B23 (B2/B3 Support)** Does not apply. Hardwired to 0.
21:16	RO	0x0 (rst)	**RSVD3 (Reserved)** Reserved.
15:15	RW/1C/V	0x0 (rst)	**PMES (PME Status)** This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME bit. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	RO	0x0 (rst)	**RSVD2 (Reserved)** The Intel HD Audio subsystem does not implement the data register.

Range	Access Type	Default (reset)	Description
8:8	RW	0x0 (rst)	**PMEE (PME Enable)** When set, and if corresponding PMES is also set, the Intel HD Audio subsystem send PME to PMC. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
7:4	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved.
3:3	RW/L	0x1 (rst)	**NSR (No Soft Reset)** When set (1), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. When clear (0), devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. Locked when FNCFG.BCLD = 1.
2:2	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved.
1:0	RW	0x0 (rst)	**PS (Power State)** This field is used both to determine the current power state of the Intel HD Audio subsystem and to set a new power state. The values are: • 00: D0 state • 1 1: D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio subsystem's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

10.1.28 LTRC_D013C_PCE—Offset 1048h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 8080080h

Range	Access Type	Default (reset)	Description
31:30	RO	0x0 (rst)	**RSVD1_1 (Reserved)** Reserved.

Range	Access Type	Default (reset)	Description
29:29	RW	0x0 (rst)	**HAE (Hardware Autonomous Enable)** If set, then the IP may request a PG whenever it is idle. Note: If this bit is set, then bits[2:0] must be 000.
28:28	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved.
27:27	RW/L	0x1 (rst)	**SE (Sleep Enable)** If clear, then IP will never asset Sleep to the retention flops. If set, then IP may assert Sleep during PGing. Locked when DFx security policy is not in red unlock state.
26:26	RW	0x0 (rst)	**D3HE (D3-Hot Enable)** If set, then IP will PG when idle and the PMCSR[1:0] register in the IP = '11'.
25:25	RW	0x0 (rst)	**I3E (I3 Enable)** If set, then IP will PG when idle and the D0i3 register (D0i3C[2] = '1') is set. [p]Note: If bits [1:0] = #11#, then the IP would PG whenever either the D3 register or the D0i3 register is set.
24:24	RW	0x0 (rst)	**PMCRE (PMC Request Enable)** If set, then IP will PG when idle and the PMC requests power gating by asserting the pmc_(ip)_sw_pg_req_b signal.
23:20	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved.
19:19	RW/1C/V	0x1 (rst)	**RR (Restore Required)** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a '1'. This bit will be set on initial power up.
18:18	RW	0x0 (rst)	**I3 (D0i3)** SW sets this bit to '1' to move the IP into the D0i3 state. Writing this bit to ' 0' will return the IP to the fully active D0 state (D0i0).
17:17	RW	0x0 (rst)	**IR (Interrupt Request)** SW sets this bit to '1' to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
16:16	RO/V	0x0 (rst)	**CIP (Command-In-Progress)** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.
15:0	RO	0x0 (rst)	**RSVDP0 (Reserved)** Reserved.

10.1.29 PID_PC—Offset 0050h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: C8436001h

Range	Access Type	Default (reset)	Description
31:27	RW/L	0x19 (rst)	**PMES (PME_Support)** Indicates PME# can be generated from D3 and D0 states. Programmable by BIOS for the option to declare SUS well wake is supported or not: 19h (SUS well wake supported) or 09h (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
26:26	RO	0x0 (rst)	**D2S (D2_Support)** The D2 state is not supported.
25:25	RO	0x0 (rst)	**D1S (D1_Support)** The D1 state is not supported.
24:22	RW/L	0x1 (rst)	**AC (Aux_Current)** Reports 55 mA maximum Suspend well current required when in the D3cold state. P rogrammable by BIOS for the option to declare SUS well wake is supported or not: 001b (SUS well wake supported) or 000b (SUS well wake not supported). Locke d when FNCFG.BCLD = 1.
21:21	RO	0x0 (rst)	**DSI (Device Specific Initialization)** Indicates that no device-specific initialization is required.
20:20	RO	0x0 (rst)	**RSVD (Reserved)** Reserved.
19:19	RO	0x0 (rst)	**PMEC (PME Clock)** Does not apply. Hardwired to 0.
18:16	RW/L	0x3 (rst)	**VS (Version)** Indicates support for Revision 1.2 of the PCI Power Management Specification. Programmable by BIOS to older revision if compatibility issue is found. Locked when FNCFG.BCLD = 1.
15:8	RW/L	0x60 (rst)	**NEXT (Next Capability)** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1.
7:0	RO	0x1 (rst)	**CAP (Cap ID)** Indicates that this pointer is a PCI power management capability.

10.2 Registers Summary

Table 10-2. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	Thermal Management Base Address Register (TMBAR_LO_0_0_1_PCI)—Offset 10h	4h

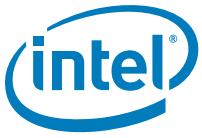


Table 10-2. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
14h	17h	Thermal Management Base Address Register (TMBAR_HI_0_0_1_PCI)—Offset 14h	0h

10.2.1 Thermal Management Base Address Register (TMBAR_LO_0_0_1_PCI)—Offset 10h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**TMMBA (TMMBA):** This field corresponds to bits 31 to 15 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.'
14:4	0h RO	**Address Map (ADM):** Hardwired to 11'h000 to indicate at least 32KB address range.
3	0h RO	**Prefetch Memory (PM):** Hardwired to 1'b0 to prevent prefetching.
2:1	2h RO	**Memory Type (MT):** Hardwired to 2'b10 to indicate 64-bit address.
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

10.2.2 Thermal Management Base Address Register (TMBAR_HI_0_0_1_PCI)—Offset 14h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Reserved RW (RSVDRW):** Must be set to 0 since addressing above 512GB is not supported.
6:0	0h RW	**TMMBA (TMMBA):** This field corresponds to bits 38 to 32 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.

170h		"(SENSOR_CLK_CTL)—Offset 170h"	0h

11.1.1 (VID_DID)—Offset 0h

VID_DID - Vendor ID and Device ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: A888086h

Bit Range	Default & Access	Field Name (ID): Description
31:23	15h RO/V	**DIDH:** Device Identification Number High (DID_HIGH): Upper 9 bits of Device ID, corresponding to SOC ID. Set by SetIDValue

Bit Range	Default & Access	Field Name (ID): Description
22:18	2h RO	**DIDM:** Device Identification Number Mid (DID_MID): Middle 5 bits of Iunit Device ID Connected to straps at Iunit top level
17:16	0h RO/V	**DIDL:** Device Identification Number Low (DID_LOW): Lower 2 bits of Iunit Device ID. Connected to fuse isp_device_id
15:0	8086h RO	**VENDOR_ID:** Vendor Identification Number (VID): PCI standard identification for Intel.

11.1.2 (PCICMD_PCISTS)—Offset 4h

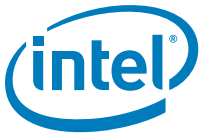
CMD_STS- Command and Status Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30	0h RO/V	**SERR_STS:** SERR status
29	0h RW/1C/V	**RMA:** Received Master Abort (MA): Set when IUNIT recieve UR
28	0h RW/1C/V	**RTA:** Received Target Abort (RTA): Set when IUNIT recieve CA
27	0h RW/1C/V	**STA:** Signaled Target Abort (STA): Set when IUNIT recieve P/NP transaction which is CA
26:21	0h RO	Reserved.
20	1h RO	**CAPLIST:** Capability List (CAP): Indicates that the CAPPOINT register at 34h provides an offset into PCI Configuration Space containing a pointer to the location of the first item in the list.
19	0h RO/V	**INTA_STATUS:** Interrupt Status (IS): Reflects the state of the interrupt in the camera device. Is set to 1 if IER and IIR are both set. Otherwise is set to 0.
18:11	0h RO	Reserved.
10	0h RW	**INTA_DISABLE:** Interrupt Disable (ID): When 1, blocks the sending of ASSERT_INTA and DEASSERT_INTA messages to the Intel Legacy Block (ILB). The interrupt status is not blocked from being reflected in PCICMDSTS.IS. When 0, permits the sending of ASSERT_INTA and DEASSERT_INTA messages to the ILB.
9	0h RW	**FastB2B**



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR_EN**
7	0h RO	Reserved.
6	0h RW	**Parity_Err**
5	0h RW	**VGA_Snp**
4	0h RW	**MWrInv**
3	0h RW	**SPECIAL_CYCLE**
2	0h RW	**BME:** Bus Master Enable (BME): Enables ISP to function as a PCI compliant master. When 0, blocks the sending of MSI interrupts. When 1, permits the sending of MSI interrupts.
1	0h RW	**MSE:** Memory Space Enable (MSE): When set, accesses to this device's memory space is enabled. When 1, the ISP will compare the incoming address on the IOSF bus with ISPMMADR_BAR(31:22). If there is a match and if the IOSF command is either a MEMRD or MEMWR, the ISP will select the command and direct it to internally addressed entity. When 0, the ISP will not claim MEMRD or MEMWR IOSF commands.
0	0h RW	**IOAE:** IO Space Enable - IUNIT doesn't expect to get IO commands.

11.1.3 (RID_CC)—Offset 8h

RID_CC - Revision ID and Class Code Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 4800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	4h RO	**BASECLASS_CODE:** Base-Class Code (BCC): 04h indicates a multimedia device
23:16	80h RO	**SUBCLASS_CODE:** Sub-Class Code: (SCC): 80h indicates a video device
15:8	0h RO	**PROGRAMMING_INTERFACE:** Programming Interface (PI): Default programming interface
7:0	0h RO/V	**REVISION_ID:** Revision ID (RID): The value in this field is set by the setIDValue message

11.1.4 (CLS_MLT_HT_BIST)—Offset Ch

CLS_MLT_HT_BIST - Cache Line Size, Master Latency Timer, Header Type and BIST Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**BIST:** Built In Self Test
23:16	0h RO	**HEADER_TYPE:** Header Type (HDR): Indicates a type 0 header format.
15:8	0h RO	**LATENCY_TIMER:** Latency Timer
7:0	0h RW	**CACHELINE_SIZE:** Cache Line Size: Value is ignored. This field is implemented by PCI Express devices as a read-write field for legacy compatibility purposes but has no effect on any PCI Express device behavior.

11.1.5 (ISPMMADR_LOW)—Offset 10h

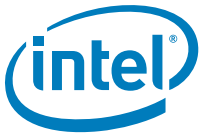
BAR_LOW - Low Part of Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**BASE_ADDR:** Base Address (BA): Set by the OS, these bits correspond to address signals (31:24). The ISP will compare the IOSF address (38:24) with {ISPMMADR_BAR_HI(6:0), ISPMMADR_BAR_LO(31:24)}. If there is a match, and PCICMDSTS(1) = MSE = 1 and the IOSF command is either a MEMRD or MEMWR, the ISP will select the command and direct it to internally addressed entity.
23:4	0h RO	**ADDR_MASK:** Address Mask: Hardwired to 0s to indicate at least 16MB address range
3	0h RO	**PREFETCHABLE:** Prefetchable Memory: Hardwired to 0 to prevent prefetching



Bit Range	Default & Access	Field Name (ID): Description
2:1	2h RO	**TYPE:** Memory Type - 2h indicates 64 bit wide addressing
0	0h RO	**MESSAGE_SPACE:** Message Space - 0h indicates memory space

11.1.6 (ISPMMADR_HIGH)—Offset 14h

BAR_HIGH - High Part of Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6:0	0h RW	**BASE_ADDR:** Base Address MSB

11.1.7 (SVID_SID)—Offset 2Ch

SVID_SID - Subsystem Vendor ID and Subsystem ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEM_ID:** Subsystem ID (SSID): Written by BIOS after reset, can be changed only after a reset cycle
15:0	0h RW/O	**SUBSYSTEM_VENDOR_ID:** Subsystem Vendor ID (SSVID):Written by BIOS after reset, can be changed only after a reset cycle

11.1.8 (CAPPOINT)—Offset 34h

CAPPTR - Capabilities Pointer Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	70h RO	**CAPABILITY_PTR:** Capabilities Pointer (CAP): CAPABILITIES_POINTER: This field contains an offset into the function's PCI Configuration Space for the first item in the New Capabilities Linked List, the CAPID0 register at offset 70h

11.1.9 (INTR)—Offset 3Ch

INTR - Interrupt Properties Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MaxLat:** MaxLat
23:16	0h RO	**MinLat:** MinLat
15:8	1h RO	**INTERRUPT_PIN:** Interrupt Pin (IPIN): PCI Device 0/3/0 (IUNIT) is a single function device. If INTx is used, the PCI spec requires that it use INTA#. If INTx is used (FB_intx_supported fuse is 1), then this field is hard coded to 01h. If INTx is not used (FB_intx_supported fuse is 0), this field is hard coded to 00h. 1h indicates INTA
7:0	0h RW	**INTERRUPT_LINE:** Interrupt Line (ILIN): BIOS written value to communicate interrupt line routing information to the ISP device driver.

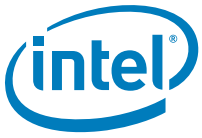
11.1.10 (PCIECAPHDR_PCIECAP)—Offset 70h

PCIE Capabilities Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 92AC10h



Bit Range	Default & Access	Field Name (ID): Description
31:16	92h RO	**PCIE_CAP:** PCIE_CAP: Bits 15:14: Reserved, 0 Bits 13:9: Interrupt Message Number (INTMSG): Since this device only supports one MSI vector, this field is hardwired to 0. Bit 8: Slot Implemented (SLOTIMP): Hardwired to 0 for any endpoint device. Bits 7:4: DevicePort Type: Indicates the specific type of this PCI Express function. 1001b indicates a Root Complex Integrated Endpoint Bits 3:0 Capability Version: Must be hardwired to 2h for Functions compliant to PCI Express 3.0 Base Specification.
15:8	ACh RO	**NEXT_PTR:** Next Capability Pointer: (PCIE_NEXT_CAP): Indicates the next item in the capabilities list or 00h if no other items exist in the linked list of capabilities.
7:0	10h RO	**CAPABILITY_ID:** Capability ID (PCIE_CAPID): Indicates the PCI Express Capability structure. This field must return a Capability ID of 10h indicating that this is a PCI Express Capability structure

11.1.11 (DEVICECAP)—Offset 74h

Capabilities Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 10008000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	10008000h RO	**DEVICECAP:** DEVICECAP: Bits 31:29: Reserved, 0 Bit 28: (FLRCAP): A value of 1b indicates the Function supports the optional Function Level Reset mechanism. Bits 27:26: Power Limit Scale: Not applicable , hardwired to 00b Bits 25:18: Power Limit Value: Not applicable , hardwired to 00b Bits 17:16: Reserved, 0. Bit 15: Role-base Error Reporting (RBER): When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1 Bits 14:12: Reserved, 0. Bits 11:9: Endpoint L1 Acceptable Latency: This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from the L1 state to the L0 state. Bits 8:6: Endpoint L0s Acceptable Latency: This field indicates the acceptable total latency that an Endpoint can withstand due to the transition from the L0s state to the L0 state. Bit 5: Extended Tag Field Supported: This bit indicates the maximum supported size of the Tag field as a Requester. Bits 4:3: Phantom Functions Supported: This field indicates the support for use of unclaimed Function Numbers to extend the number of outstanding transactions for PCIe devices. Bits 2:0: Max_Payload_Size Supported: This field indicates the maximum payload size that the Function can support for TLPs. 000b represents 128 bytes, the minimum allowed value.

11.1.12 (DEVICECTL_DEVICESTS)—Offset 78h

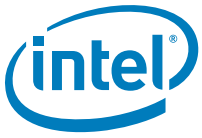
PCI Express Device Capabilities and Control Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RO/V	**DEVICESTS:** Transaction Pending bit: When Set, this bit indicates that the Function has issued Non-Posted Requests that have not been completed. A Function reports this bit is cleared only when all outstanding Non-Posted Requests have completed or have been terminated by the Completion Timeout mechanism. This bit must also be cleared upon the completion of an FLR.
20	0h RO	**Relax_Ord_En:** AUX Power Detected: Not used, 0
19	0h RW/1C/V	**UR_Req_Det:** Unsupported Request Detected - set when IUNIT recieve P/NP transaction which is UR



Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**DEVICECTL_MISC_STS:** DEVICESTS Bits 2:0: Various error detected bits: The Root Complex Integrated Endpoint does not use the PCI Express error reporting mechanism. Always return 0.
15	0h RW	**INIT_FLR:** Initiate Function Level Reset: A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b.
14:0	0h RO	**DEVICECTL_MISC_CTRL:** DEVICECTL - Misc RO ctrl bits. the only bit set reflect Unsupported-Request-Reporting Enable

11.1.13 (MSI_CAPID)—Offset ACh

MSI_CAPID - MSI Capabilities and MSI Control Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 80D005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RO	**AC64:** 64-bit Address Capable (C64): PCIe devices must support 64b MSI addressing.
22:20	0h RW	**MME:** Multiple Message Enable (MME): This field is RW for software compatibility, but only a single message is ever generated.
19:17	0h RO	**MMC:** Multiple Message Capable (MMC)- 3'h0 indicates one outstanding message is supported
16	0h RW	**MSIEN:** MSI Enable (MSIE): If set, MSI is enabled. PCICMDSTS.BME must be set for an MSI to be generated. When 0, blocks the sending of a MSI interrupt. The interrupt status is not blocked from being reflected in the PCICMDSTS.IS bit. When 1, permits sending of a MSI interrupt.
15:8	D0h RO	**NEXT_PTR:** Next Capability Pointer (MSI_NEXT_CAP): This contains a pointer to the next item in the capabilities list which is the Power Management capability
7:0	5h RO	**CAPABILITY_ID:** MSI Capability (MSI_CAPID): Indicates an MSI capability.

11.1.14 (MSI_ADDRESS_LO)—Offset B0h

MSI Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSI_ADDR:** MSI Address: System specified message address, always DW aligned.
1:0	0h RO	Reserved.

11.1.15 (MSI_ADDRESS_HI)—Offset B4h

MSI Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6:0	0h RW	**MSI_ADDR:** MSI Address: Upper 32 bits of the system specified message address.

11.1.16 (MSI_DATA)—Offset B8h

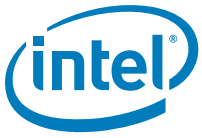
MSI Data Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**MSI_DATA:** MSI Data (MD): This 16-bit field is programmed by system software and is driven onto the lower word of data during the data phase of the MSI write transaction. When the ISP issues an MSI interrupt as a MEMWR on the IOSF, the write data corresponds to the value of this field.



11.1.17 (PMCAP)—Offset D0h

Power Management Capabilities

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 30001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	3h RO	**PMCAP:** PM Capability: Bits 31:27: PME Support (PMES): The camera controller does not generate PME#. Bit 26: D2_SUPPORT (D2S): The D2 power management state is not supported. Bit 25: D1_SUPPORT (D1S): The D1 power management state is not supported. Bits 24:22: Reserved Bit 21: Device Specific Initialization (DSI): Hardwired to 0 to indicate that no special initialization of the camera controller is required before generic class device driver is to use it. Bits 20:19: Reserved Bits 18:16: Version (VS): Indicates compliance with revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**NEXT_PTR:** Next Capability Pointer (PM_NEXT_CAP): End of List
7:0	1h RO	**CAPABILITY_ID:** PM Capability ID (PM_CAPID): SIG defines this ID is 01h for power management

11.1.18 (PMCS)—Offset D4h

Power Management Control/Status

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 3 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C/V	**PMES:** Power Management Event Status: Not used; No PME from D3cold. we put it as RW1C just to be complient w/ PCI spec
14:13	0h RO	**DS:** Data Scale: Not used
12:9	0h RO	**DSEL:** Data Select: Not used
8	0h RO	**PMEEN:** Power Management Event Enable

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	1h RO	**NSR:** No Soft Reset (NSR): This read-only bit indicates that the device does not lose internal state on a D3hot to D0 transition. This means: The internal state is not reset on a D3 (D3hot actually) to D0 transition and no additional operating system intervention is required to preserve the state A transition from D3 to D0 will NOT cause the IP to return to D0 un-initialized. The Iunit+PUnit will restore the state of the IP configuration and MMIO registers .
2	0h RO	Reserved.
1:0	0h RW/V	**PS:** Power State (PS): : Power management is implemented by writing to control registers in the PUNIT. This field may be programmed by the software driver, but no action is taken based on writing to this field

11.1.19 (SENSOR_FREQ_CTL)—Offset 16Ch

Sets the Optional sensor frequency

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

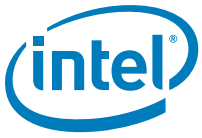
Default: 0h

Range	Access Type	Default (reset)	Description
31:31	RW	0x0 (rst)	**start** Start: When '1', the sensor
30:0	RW	0x0 (rst)	**freq_spec** Optional sensor frequency. For SoC can specify 6.75, 8, 19.2, 9.6, 14.4, 24, 26MHz.

11.1.20 (SENSOR_CLK_CTL)—Offset 170h

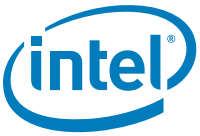
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Range	Access Type	Default (reset)	Description
7:7	RW	0x0 (rst)	**osc_clk3_sel** OSC_CLOCK_OUT3_Select: If 1, selects Opt sensor clk to drive OSC_CLK_OUT3; otherwise 24MHz clock drive to OSC_CLK_OUT3
6:6	RW	0x0 (rst)	**osc_clk3_en** OSC_CLOCK_OUT3_Enable: If 1, enables selected clock to drive OSC_CLK_OUT3
5:5	RW	0x0 (rst)	**osc_clk2_sel** OSC_CLOCK_OUT2_Select: If 1, selects Opt sensor clk to drive OSC_CLK_OUT2; otherwise 24MHz clock drive to OSC_CLK_OUT2
4:4	RW	0x0 (rst)	**osc_clk2_en** OSC_CLOCK_OUT2_Enable: If 1, enables selected clock to drive OSC_CLK_OUT2
3:3	RW	0x0 (rst)	**osc_clk1_sel** OSC_CLOCK_OUT1_Select: If 1, selects Opt sensor clk to drive OSC_CLK_OUT1; otherwise 24Hz clock drive to OSC_CLK_OUT1
2:2	RW	0x0 (rst)	**osc_clk1_en** OSC_CLOCK_OUT1_Enable: If 1, enables selected clock to drive OSC_CLK_OUT1
1:1	RW	0x0 (rst)	**osc_clk0_sel** OSC_CLOCK_OUT0_Select: If 1, selects Opt sensor clk to drive OSC_CLK_OUT0; otherwise 24MHz clock drive to OSC_CLK_OUT0
0:0	RW	0x0 (rst)	**osc_clk0_en** OSC_CLOCK_OUT0_Enable: If 1, enables selected clock to drive OSC_CLK_OUT0

§ §



12 Audio Controller

12.1 Registers Summary

Table 12-1. Summary of HDAHC_CFGREG Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor Identification (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	8C20h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Status (STS)—Offset 6h	10h
8h	8h	Revision Identification (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	0h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	4h
Ch	Ch	Cache Line Size (CLS)—Offset Ch	0h
Dh	Dh	Latency Timer (LT)—Offset Dh	0h
Eh	Eh	Header Type (HTYPE)—Offset Eh	0h
Fh	Fh	Built-in Self Test (BIST)—Offset Fh	0h
10h	13h	Intel HD Audio Base Lower Address (HDALBA)—Offset 10h	4h
14h	17h	Intel HD Audio Base Upper Address (HDAUBA)—Offset 14h	0h
18h	1Bh	Shadowed PCI Configuration Lower Base Address (SPCLBA)—Offset 18h	4h
1Ch	1Fh	Shadowed PCI Configuration Upper Base Address (SPCUBA)—Offset 1Ch	0h
20h	23h	Audio DSP Lower Base Address (ADSPLBA)—Offset 20h	4h
24h	27h	Audio DSP Upper Base Address (ADSPUBA)—Offset 24h	0h
2Ch	2Dh	Subsystem Vendor ID (SVID)—Offset 2Ch	0h
2Eh	2Fh	Subsystem ID (SID)—Offset 2Eh	0h
34h	34h	Capability Pointer (CAPPTR)—Offset 34h	50h
3Ch	3Ch	Interrupt Line (INTLN)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (INTPN)—Offset 3Dh	1h
43h	43h	Test Mode 1 register (TM1)—Offset 43h	0h
50h	51h	PCI Power Management Capability ID (PID)—Offset 50h	6001h
60h	61h	MSI Capability ID (MID)—Offset 60h	7005h
62h	63h	MSI Message Control (MMC)—Offset 62h	80h
64h	67h	MSI Message Lower Address (MMLA)—Offset 64h	0h
68h	6Bh	MSI Message Upper Address (MMUA)—Offset 68h	0h
6Ch	6Dh	MSI Message Data (MMD)—Offset 6Ch	0h
70h	71h	PCI Express Capability ID (PXID)—Offset 70h	10h
72h	73h	PCI Express Capabilities (PXC)—Offset 72h	91h
74h	77h	Device Capabilities (DEVCAP)—Offset 74h	10000000h
78h	79h	Device Control (DEVC)—Offset 78h	2800h

Table 12-1. Summary of HDAHC_CFGREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7Ah	7Bh	Device Status (DEVS)—Offset 7Ah	10h
80h	83h	Vendor Specific Capability Identifiers (VSCID)—Offset 80h	F0146009h
84h	87h	Vendor Specific Extended Capability (VSECID)—Offset 84h	1400010h
8Ch	8Fh	Device Idle Pointer (DEVIDLEPTR)—Offset 8Ch	104A1h
90h	91h	Device Idle Power On Latency (DEVIDLEPOL)—Offset 90h	800h
100h	103h	Virtual Channel Enhanced Capability Header (VCCAP)—Offset 100h	0h
104h	107h	Port VC Capability Register 1 (PVCCAP1)—Offset 104h	1h
108h	10Bh	Port VC Capability Register 2 (PVCCAP2)—Offset 108h	0h
10Ch	10Dh	Port VC Control Register (PVCCTL)—Offset 10Ch	0h
10Eh	10Fh	Port VC Status Register (PVCSTS)—Offset 10Eh	0h
110h	113h	VC0 Resource Capability Register (VC0CAP)—Offset 110h	0h
114h	117h	VC0 Resource Control Register (VC0CTL)—Offset 114h	800000FFh
11Ah	11Bh	VC0 Resource Status Register (VC0STS)—Offset 11Ah	0h
11Ch	11Fh	VCi Resource Capability Register (VCiCAP)—Offset 11Ch	0h
120h	123h	VCi Resource Control Register (VCiCTL)—Offset 120h	0h
126h	127h	VCi Resource Status Register (VCiSTS)—Offset 126h	0h
130h	133h	Root Complex Link Declaration Enhanced (RCCAP)—Offset 130h	10005h
134h	137h	Element Self Description (ESD)—Offset 134h	F000100h
140h	143h	Link 1 Description (L1DESC)—Offset 140h	1h
148h	14Bh	Link 1 Lower Address (L1LADD)—Offset 148h	0h
14Ch	14Fh	Link 1 Upper Address (L1UADD)—Offset 14Ch	0h
0054h		Power Management Control And Status (PCS)—Offset 0054h	8h
0050h		PID_PC—Offset 0050h	C8436001h

12.1.1 Vendor Identification (VID)—Offset 0h

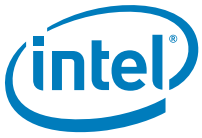
This register identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. FFFFh is an invalid value for Vendor ID.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID):** Indicates that Intel is the vendor.



12.1.2 Device ID (DID)—Offset 2h

This register identifies the particular device. This identifier is allocated by the vendor. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 8C20h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8C20h RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG. Bits(2:0) of the DID is controlled by fuse. IOSF Sideband Set ID Value message initializes bits 15:7 of this register value, whilst bits 6:0 of this register value are hard coded.

12.1.3 Command (CMD)—Offset 4h

This register provides coarse control over a device's ability to generate and respond to PCI cycles.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Read 0.
10	0h RW	**Interrupt Disable (ID):** Enables the device to assert an INTx#. When set, the Intel(r) HD Audio controller's INTx# signal will be de-asserted. When cleared, the INTx# signal may be asserted. Note that this bit does not affect the generation of MSIs.
9	0h RO	**Fast Back to Back Enable (FBE):** Not implemented. Hardwired to 0.
8	0h RW	**SERR Enable (SEN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
7	0h RO	**Wait Cycle Control (WCC):** Not implemented. Hardwired to 0.
6	0h RW	**Parity Error Response (PER):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
5	0h RO	**VGA Palette Snoop (VPS):** Not implemented. Hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Memory Write and Invalidate Enable (MWI):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** • 1: Enable • 0: Disable Controls standard PCI Express bus mastering capabilities for Memory and IO, reads and writes. Note that this also controls MSI generation since MSI are essentially Memory writes.
1	0h RW	**Memory Space Enable (MSE):** When set, enables memory space accesses to the Intel HD Audio controller.
0	0h RO	**I/O Space (IOS):** The Intel HD Audio controller does not implement IO Space, therefore this bit is hardwired to 0.

12.1.4 Status (STS)—Offset 6h

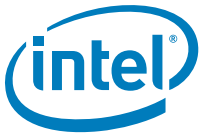
This register is used to record status information for PCI bus related events

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
14	0h RO	**SERR# Status (SERRS):** Not implemented. Hardwired to 0.
13	0h RW/1C/V	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, this bit is set. SW writes a 1 to this bit to clear it.
12	0h RW/1C/V	**Received Target Abort (RTA):** If the completion status received from IOSF is CA, this bit is set. SW writes a 1 to this bit to clear it.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented. Hardwired to 0.
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** Does not apply. Hardwired to 0.
8	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
7	0h RO	**Fast Back to Back Capable (FBC):** Does not apply. Hardwired to 0.



Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO	**66 MHz Capable (C66):** Does not apply. Hardwired to 0.
4	1h RO	**Capabilities List Exists (CLIST):** Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved (RSVD0):** Reserved.

12.1.5 Revision Identification (RID)—Offset 8h

This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the device specific revision identifier. IOSF Sideband Set ID Value message initializes this register value.

12.1.6 Programming Interface (PI)—Offset 9h

This register identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Programming Interface (PI):** Value assigned to the Intel HD Audio subsystem. Locked when FNCFG.BCLD = 1.

12.1.7 Sub Class Code (SCC)—Offset Ah

This register identifies more specifically the function of the device This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RW/L	**Sub Class Code (SCC):** This indicates the device is an Intel HD Audio audio device, in the context of a multimedia device. Locked when FNCFG.BCLD = 1.

12.1.8 Base Class Code (BCC)—Offset Bh

This register broadly classifies the type of function the device performs This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 4h

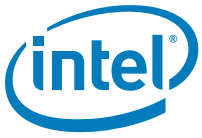
Bit Range	Default & Access	Field Name (ID): Description
7:0	4h RW/L	**Base Class Code (BCC):** This register indicates that the function implements a multimedia device. Locked when FNCFG.BCLD = 1.

12.1.9 Cache Line Size (CLS)—Offset Ch

This specifies the system cache line size in units of DWORDs.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Cache Line Size (CLS):** Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the SoC.

12.1.10 Latency Timer (LT)—Offset Dh

This register specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Latency Timer (LT):** Doesn't apply to PCI Express. RO as 00h if PCI Express. If configured to appear as PCI device, maintain RW for Legacy PCI SW compliance. Locked when FNCFG.HDASPCID = 0.

12.1.11 Header Type (HTYPE)—Offset Eh

This register identifies the layout of the second part of the predefined header and also whether or not the device contains multiple functions.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/L	**Multi Function Device (MFD):** Value of 0 indicates a single function device. Value of 1 indicates a multi function device. Locked when FNCFG.BCLD = 1.
6:0	0h RO	**Header Type (HTYPE):** Implements Type 0 Configuration header.

12.1.12 Built-in Self Test (BIST)—Offset Fh

This optional register is used for control and status of BIST.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Built-in Self Test (BIST):** Not implemented in the Intel HD Audio subsystem. Hardwired to 00h.

Intel HD Audio Base Lower Address (HDALBA)—Offset 10h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Intel HD Audio memory mapped configuration registers depending on implementation.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 4h

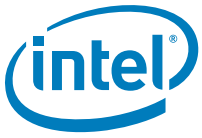
Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**Lower Base Address (LBA):** Base address for the Intel HD Audio subsystem's memory mapped configuration registers. 16 Kbytes are requested by hardwiring bits 13:4 to 0.
13:4	0h RO	**Reserved (RSVD):** Reserved. Hardwired to 0.
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

12.1.13 Intel HD Audio Base Upper Address (HDAUBA)—Offset 14h

This BAR creates a selected size of memory space to signify the base address (upper 32 bits) of the Intel HD Audio memory mapped configuration registers, depending on implementation.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Intel HD Audio Upper Base Address (UBA):** Upper 32 bits of the Base address for the Intel(r) HD Audio controller's memory mapped configuration registers.

12.1.14 Shadowed PCI Configuration Lower Base Address (SPCLBA)—Offset 18h

This BAR creates 4 Kbytes of memory space to signify the base address (lower 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW/L	**Lower Base Address (LBA):** Base address for the PCI Configuration register shadowed to memory mapped. 4 KB is requested by hardwiring bits 11:4 to 0. Locked when PCICFGCTL0.SPCBAD = 1.
11:4	0h RO	**Reserved (RSVD):** Reserved. Hardwired to 0.
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO/V	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

12.1.15 Shadowed PCI Configuration Upper Base Address (SPCUBA)—Offset 1Ch

This BAR creates 4 Kbytes of memory space to signify the base address (upper 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the PCI Configuration register shadowed to memory mapped. Locked when PCICFGCTL0.SPCBAD = 1.

12.1.16 Audio DSP Lower Base Address (ADSPLBA)—Offset 20h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Audio DSP memory mapped configuration registers depending on implementation.
The number of LBA bits in this register is depending on the size of the memory window implemented, represented as x in the register table. The x value is determined by the parameter HDMBABC.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Lower Base Address (LBA):** Base address for the Audio DSP memory mapped configuration registers.
19:4	0h RO	**Reserved (RSVD):** Reserved. Hardwired to 0.
3	0h RO	**Prefetchable (PREF):** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

12.1.17 Audio DSP Upper Base Address (ADSPUBA)—Offset 24h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Audio DSP memory-mapped configuration registers, depending on implementation.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the Audio DSP memory mapped configuration registers.

12.1.18 Subsystem Vendor ID (SVID)—Offset 2Ch

This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with 2 audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot, should have the SVID register implemented. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one audio subsystem from the other(s).
Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SID to create one 32-bit write. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**Subsystem Vendor Identifier (SVID):** These RW bits have no functionality. Locked when FNCFG.BCLD = 1.

12.1.19 Subsystem ID (SID)—Offset 2Eh

This register should be implemented for any function that could be instantiated more than once in a given system, for example, a system with 2 audio subsystems, one down on the motherboard and the other plugged into a PCI expansion slot. The SID register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one audio subsystem from the other(s). Software (BIOS) will write the value to this register. After that, the value can be read, but writes to the register will have no effect. The write to this register should be combined with the write to the SVID to create one 32-bit write. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**Subsystem Identifier (SID):** These RW bits have no functionality. Locked when FNCFG.BCLD = 1.

12.1.20 Capability Pointer (CAPPTR)—Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	**Capability Pointer (CAPPTR):** Indicates that the first capability pointer offset is offset 50h (Power Management Capability).

12.1.21 Interrupt Line (INTLN)—Offset 3Ch

The register is used to communicate interrupt line routing information. This register is not affected by FLR.
Implementation Notes: Due to legacy implementation of the INTLN field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (despite FLR section in PCIe Specification does not have this register in the preservation list), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTLN):** Hardware does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

12.1.22 Interrupt Pin (INTPN)—Offset 3Dh

This register tells which interrupt pin the device (or device function) uses. This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD):** Reserved.
3:0	1h RW/L	**Interrupt Pin (INTPN):** Identifies the interrupt pin the function uses. • 0h: No interrupt pin • 1h: INTA • 2h: INTB • 3h: INTC • 4h: INTD • 5h Fh: reserved Locked when FNCFG.BCLD = 1.

12.1.23 Test Mode 1 register (TM1)—Offset 43h

This register provides some test mode policy for the functional operations.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Fast Reset (FRESET):** Fast Reset is a test mode operation used to reduce the wait time from the start of AZA_BCLK to AZA_RST# de-assertion. It is meant to be used to speed up simulations. • 0: 9 frames • 1: 1 frame This is also used to hasten the wait time required before DOCKAZRST# can be de-asserted after DockAttach bit has been set. Assertion of this bit causes the wait time to reduce from at least 2400 BitClks to 4 BitClks. Assertion of this bit reduces the frame wait time (in dock attach process) for codec enumeration from 32 to 4. Programmed before GCTL.CRSTB = 1.
6:0	0h RO	Reserved.

12.1.24 PCI Power Management Capability ID (PID)—Offset 50h

This register declares the power management capability structure.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 6001h

Bit Range	Default & Access	Field Name (ID): Description
15:8	60h RW/L	**Next Capability (NEXT):** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1.
7:0	1h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI power management capability.

12.1.25 MSI Capability ID (MID)—Offset 60h

This register declares the MSI capability structure. NEXT field is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RO/V	**Next Capability (NEXT):** Points to the PCI Express* capability structure. The value of this field depends on the FNCFG.HDASPCID bit. When FNCFG.HDASPCID is 0 , this field has a value of 70h where it points to the PCI Express capability structure. When FNCFG.HDASPCID bit is 1, this field has a value of 00h to indicate that this is the last capability structure in the list.
7:0	5h RO	**Cap ID (CAP):** Indicates that this pointer is a MSI capability.

12.1.26 MSI Message Control (MMC)—Offset 62h

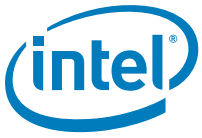
This register provides system software control over MSI.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**64b Address Capability (ADD64):** Indicates the ability to generate a 64-bit message address.
6:4	0h RO	**Multiple Message Enable (MME):** Normally this is a R/W register. However, since only 1 message is supported, these bits are hardwired to 000 = 1 message.
3:1	0h RO	**Multiple Message Capable (MMC):** Hardwired to 0 indicating request for 1 message.
0	0h RW	**MSI Enable (ME):** If set to 1 an MSI will be generated instead of an INTx#signal. If set to 0, an MSI may not be generated.

12.1.27 MSI Message Lower Address (MMLA)—Offset 64h

This register specifies the MSI message address (lower 32 bits).

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSI Message Lower Address (MMLA):** Lower Address used for MSI Message.
1:0	0h RO	**Reserved (RSVD):** Reserved.

12.1.28 MSI Message Upper Address (MMUA)—Offset 68h

This register specifies the MSI message address (Upper 32 bits).

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI Message Upper Address (MMUA):** Upper 32 bits of address used for MSIMessage.

12.1.29 MSI Message Data (MMD)—Offset 6Ch

This register specifies the MSI message data.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**MSI Message Data (MMD):** Data used for MSI Message.

12.1.30 PCI Express Capability ID (PXID)—Offset 70h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Capability (NEXT):** Indicates that this is the last capability structure inthe list.
7:0	10h RO	**Cap ID (CAP):** Indicates that this pointer is a PCI Express capability structure.

12.1.31 PCI Express Capabilities (PXC)—Offset 72h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 91h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD):** Reserved.
13:9	0h RO	**Interrupt Message Number (IMN):** Hardwired to 0.
8	0h RO	**Slot Implemented (SI):** Hardwired to 0.
7:4	9h RO	**Device/Port Type (DPT):** Indicates that this is a Root Complex IntegratedEndpoint Device.
3:0	1h RO	**Capability Version (CV):** Indicates version #1 PCI Express capability.

12.1.32 Device Capabilities (DEVCAP)—Offset 74h

This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD1):** Reserved.
28	1h RW/L	**Functional Level Reset (FLR):** A 1 indicates that the Intel HD Audio subsystem supports the Function Level Reset capability. Locked when FNCFG.BCLD = 1.
27:26	0h RO	**Captured Slot Power Limit Scale (SPLS):** Hardwired to 0.
25:18	0h RO	**Captured Slot Power Limit Value (SPLV):** Hardwired to 0.
17:15	0h RO	**Reserved (RSVD0):** Reserved.
14	0h RO	**Power Indicator Present (PIP):** Hardwired to 0.
13	0h RO	**Attention Indicator Present (AIP):** Hardwired to 0.
12	0h RO	**Attention Button Present (ABP):** Hardwired to 0.
11:9	0h RW/L	**Endpoint L1 Acceptable Latency (L1CAP):** This bit field is defined in the PCI Express spec as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1.
8:6	0h RW/L	**Endpoint L0s Acceptable Latency (L0SCAP):** This bit field is defined in the PCI Express spec as RO. At this time it is risky to assign a hardwired value to this bit field. Making it RW would cause a WHQL failure. By making it RW/L it will appear as RO to WHQL testing while allowing BIOS to write a value at boot that is determined by post silicon system testing. Locked when FNCFG.BCLD = 1.
5	0h RO	**Extended Tag Field Support (ETCAP):** Indicates 5 bit tag supported.
4:3	0h RO	**Phantom Functions Supported (PFCAP):** Indicates phantom functions not supported.
2:0	0h RO	**Max Payload Size Supported (MPCAP):** Indicates 128B maximum payloadsize capability.

12.1.33 Device Control (DEVC)—Offset 78h

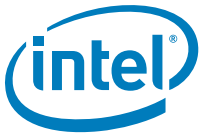
NSNPEN bit is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 2800h

Bit Range	Default & Access	Field Name (ID): Description
15	0h WO	**Initiate FLR (IF):** Used to initiate FLR transition. A write of 1 initiates FLR transition. Since hardware must not respond to any cycles until FLR completion, the read value by software from this bit is 0.
14:12	2h RW	**Max Read Request Size (MRRS):** This field sets the maximum Read Request size for the Function as a Requester. The Function must not generate Read Requests with size exceeding the set value. Defined encodings for this field are: • 000: 128 B • 001: 256 B • 010: 512 B • 011: 1024 B • 100: 2048 B • 101: 4096 B • 110 - 111: Reserved
11	1h RW	**Enable No Snoop (NSNPEN):** When set to 1 (or EM2.FNSNPEN = 1) the Intel HD Audio controller is permitted to set the No Snoop bit in the Requester Attributes of a bus master transaction. In this case VC0, VCp, or VC1 may be used for isochronous transfers. When set to 0 (and EM2.FNSNPEN = 0) the Intel HD Audio controller will not set the No Snoop bit. In the case isochronous transfers will not use VC1(VCi) even if it is enabled since VC1 is never snooped. Isochronous transfers will use either VCp or VC0. This bit is not affected by D3HOT to D0 reset or FLR.
10	0h RO	**Auxiliary (AUX) Power PM Enable (AUXPEN):** Hardwired to 0 indicating Intel HD Audio device does not draw AUX power.
9	0h RO	**Phantom Functions Enable (PFEN):** Hardwired to 0 disabling phantom functions.
8	0h RO	**Extended Tag Field Enable (ETEN):** Hardwired to 0 enabling 5-bit tag.
7:5	0h RO	**Max Payload Size (MAXPAY):** Hardwired to 000 indicating 128 B.
4	0h RO	**Enable Relaxed Ordering (ROEN):** Hardwired to 0 disabling relaxed ordering.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
2	0h RW	**Fatal Error Reporting Enable (FEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
1	0h RW	**Non-Fatal Error Reporting Enable (NFEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
0	0h RW	**Correctable Error Reporting Enable (CEREN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.

12.1.34 Device Status (DEVS)—Offset 7Ah

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD):** Reserved.
5	0h RO/V	**Transactions Pending (TXP):** A 1 indicates that the Intel HD Audio controller has issued Non-Posted requests which have not been completed. A 0 indicates that Completions for all Non-Posted Requests have been received.
4	1h RW/L	**AUX Power Detected (AUXDET):** Hardwired to 1 indicating the device is connected to Suspend power. Programmable by BIOS for the option to declare SUS well wake is supported or not: 1b (SUS well wake supported) or 0b (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
3	0h RO	**Unsupported Request Detected (URDET):** Not implemented. Hardwired to 0.
2	0h RO	**Fatal Error Detected (FEDET):** Not implemented. Hardwired to 0.
1	0h RO	**Non-Fatal Error Detected (NFEDET):** Not implemented. Hardwired to 0.
0	0h RO	**Correctable Error Detected (CEDET):** Not implemented. Hardwired to 0.

12.1.35 Vendor Specific Capability Identifiers (VSCID)—Offset 80h

This register declares the vendor specific capability structure.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: F0146009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of Fh in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of Fh, this field is reserved 0h.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the # of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer.
15:8	60h RW/L	**Next Capability (NEXT):** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1.
7:0	9h RO	**Cap ID (CAP):** Indicates that this pointer is a vendor specific capability.

12.1.36 Vendor Specific Extended Capability (VSECID)—Offset 84h

This register declares the vendor specific extended capability structure.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the # of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 14h.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSEREV):** For this revision of DevIdle, this field is 0h.
15:0	10h RO	**Vendor Specific Extended Capability ID (VSECID):** DevIdle has been assigned the Intel VSEC ID of 10h.

12.1.37 Device Idle Pointer (DEVIDLEPTR)—Offset 8Ch

This register specifies the location pointer to the DevIdle register in MMIO space.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 104A1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	104Ah RO	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register.
0	1h RO	**Valid (Valid):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM.

12.1.38 Device Idle Power On Latency (DEVIDLEPOL)—Offset 90h

This register specifies the device idle power on latency.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD0):** Reserved.
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier. • 010: 1 us • 011: 32 us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32us. Locked when FNCFG.BCLD = 1.
9:0	0h RW/L	**Power On Latency Value (POLV):** Contains the 0#s based BAR Number of the BAR which contains the location of the DevIdle MMIO register.

12.1.39 Virtual Channel Enhanced Capability Header (VCCAP)—Offset 100h

This register is not affected by D3HOT to D0 reset or FLR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/L	**Next Capability Offset (NXTCAP):** Points to the next capability header, which is the Root Complex Link Declaration Enhanced Capability Header. This register is RW/L to support removing the Root Complex Topology Capability from the PCI Express Extended Capability List. For systems which support the Root Complex Topology Capability Structure, boot BIOS should write a 130h to this register, otherwise boot BIOS should write a 000h to this register.
19:16	0h RW/L	**Capability Version (CV):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsystem. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 1h to this register, otherwise boot BIOS should write a 0h to this register. Locked when FNCFG.BCLD = 1.
15:0	0h RW/L	**PCI Express Extended Capability ID (PCIEECID):** This register is RW/L to support removing the PCI Express Extended Capabilities from the Intel HD Audio subsysterm. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 0002h to this register, otherwise boot BIOS should write a 0000h to this register. Locked when FNCFG.BCLD = 1.

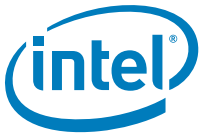
12.1.40 Port VC Capability Register 1 (PVCCAP1)—Offset 104h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD2):** Reserved.
11:10	0h RO	**Port Arbitration Table Entry Size (PARBTBLES):** This is an endpoint device therefore this field is hardwired to 0 s.
9:8	0h RO	**Reference Clock (RC):** This is an endpoint device therefore this field is hardwired to 0 s.



Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD1):** Reserved.
6:4	0h RO	**Low Priority Extended VC Count (LPVCCNT):** Indicates that only VC0 belongs to the low-priority VC group.
3	0h RO	**Reserved (RSVD0):** Reserved.
2:0	1h RO	**Extended VC Count (VCCNT):** Indicates that one extended VC (in addition to VC0) is supported by the Intel(r) HD Audio controller.

12.1.41 Port VC Capability Register 2 (PVCCAP2)—Offset 108h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**VC Arbitration Table Offset (VCARBTBL):** Hardwired to 0 indicating that a VC Arbitration Table is not present.
23:8	0h RO	**Reserved (RSVD):** Reserved.
7:0	0h RO	**VC Arbitration Capability (VCARBCAP):** Hardwired to 0 s. These bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.

12.1.42 Port VC Control Register (PVCCTL)—Offset 10Ch

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0h RO	**Reserved (RSVD):** Reserved.
3:1	0h RO	**VC Arbitration Select (VCARBSEL):** Hardwired to 0 s. Normally these bits are RW. But these bits are not applicable since the Intel HD Audio controller reports a 0 in the Low Priority Extended VC Count field.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Load VC Arbitration Table (LVCARBTBL):** Hardwired to 0 since an arbitration table is not present.

12.1.43 Port VC Status Register (PVCSTS)—Offset 10Eh

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RO	**VC Arbitration Table Status (VCARBTBLSTS):** Hardwired to 0 since the VC Arbitration Table is not present.

12.1.44 VC0 Resource Capability Register (VC0CAP)—Offset 110h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	**Reserved (RSVD1):** Reserved.
22:16	0h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	**Reserved (RSVD0):** Reserved.
7:0	0h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

12.1.45 VC0 Resource Control Register (VC0CTL)—Offset 114h

VC0MAP(7:1) field is not affected by FLR.
Implementation Notes: Due to legacy implementation of the VC0MAP field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe Specification whether it should be reset by D3HOT to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 800000FFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**VC0 Enable (VC0EN):** Hardwired to 1 for VC0.
30:27	0h RO	**Reserved (RSVD2):** Reserved.
26:24	0h RO	**VC0 ID (VC0ID):** Hardwired to 0 since the first VC is always assigned as VC0.
23:20	0h RO	**Reserved (RSVD1):** Reserved.
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
15:8	0h RO	**Reserved (RSVD0):** Reserved.
7:1	7Fh RW	**TC/VC0 Map (VC0MAP):** Bits (7:1) are implemented as R/W bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	1h RO	**TC/VC0 Map (VC0MAP_0):** Bit 0 is hardwired to 1 since TC0 is always mapped to VC0

12.1.46 VC0 Resource Status Register (VC0STS)—Offset 11Ah

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD):** Reserved.
1	0h RO	**VC0 Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio device and is therefore hardwired to 0.
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

12.1.47 VCi Resource Capability Register (VCiCAP)—Offset 11Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Port Arbitration Table Offset (PARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
23	0h RO	**Reserved (RSVD1):** Reserved.
22:16	0h RO	**Maximum Time Slots (MTS):** Hardwired to 0 since this field is not valid for endpoint devices.
15	0h RO	**Reject Snoop Transactions (RST):** Hardwired to 0 since this field is not valid for endpoint devices.
14	0h RO	**Advanced Packet Switching (APS):** Hardwired to 0 since this field is not valid for endpoint devices.
13:8	0h RO	**Reserved (RSVD0):** Reserved.
7:0	0h RO	**Port Arbitration Capability (PARBCAP):** Hardwired to 0 since this field is not valid for endpoint devices.

12.1.48 VCi Resource Control Register (VCiCTL)—Offset 120h

VCiEN bit and VCiID field are not affected by D3HOT to D0 Reset or FLR.
VCiM(7:1) field is not affected by FLR.
Implementation Notes: Due to legacy implementation of the VCiM field being implemented as reset by D3HOT to D0 Reset but not FLR and already work well with existing SW (and there is no clear definition in the PCI and PCIe Specification whether it should be reset by D3HOT to D0 Reset or not), this legacy implementation remains no change and documented here as reset by D3ONLY, which is a deviation from D3RST definition by excluding FLR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VCi Enable (VCiEN):** When set to 1, VCi is enabled. This bit is not affected by D3HOT to D0 reset.
30:27	0h RO	**Reserved (RSVD2):** Reserved.
26:24	0h RW	**VCi ID (VCiID):** This fields assigns a VC ID to the VCi resource. This field is not used by the SoC hardware, but it is RW to avoid confusing software. These bits are not affected by D3HOT to D0 reset.
23:20	0h RO	**Reserved (RSVD1):** Reserved.
19:17	0h RO	**Port Arbitration Select (PARBSEL):** Hardwired to 0 since this field is not valid for endpoint devices.
16	0h RO	**Load Port Arbitration Table (LPARBTBL):** Hardwired to 0 since this field is not valid for endpoint devices.
15:8	0h RO	**Reserved (RSVD0):** Reserved.
7:1	0h RW	**TC/VCi Map (VCiM):** This field indicates the TCs that are mapped to the VCi resource. Bits (7:1) are implemented as RW bits. This field is not used by the hardware, but it is RW to avoid confusing software.
0	0h RO	**TC/VCi Map (VCiM_0):** This field indicates the TCs that are mapped to the VCi resource. Bit 0 is hardwired to 0 indicating it can not be mapped to VCi. This field is not used by the hardware.

12.1.49 VCi Resource Status Register (VCiSTS)—Offset 126h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD):** Reserved.
1	0h RO	**VCi Negotiation Pending (VCNP):** This bit does not apply to the integrated Intel HD Audio subsystem and is therefore hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Port Arbitration Table Status (PARBTBLSTS):** Hardwired to 0 since this field is not valid for endpoint devices.

12.1.50 Root Complex Link Declaration Enhanced (RCCAP)—Offset 130h

Capability Header

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 10005h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Next Capability Offset (NXTCAP):** Indicates this is the last capability.
19:16	1h RO	**Capability Version (CV):** Indicates the version of the capability structure present
15:0	5h RO	**PCI Express Extended Capability ID (PCIEECID):** Indicates that this pointer is a PCI Express Extended Capability

12.1.51 Element Self Description (ESD)—Offset 134h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: F000100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Fh RO	**Port Number (PORT):** Intel HD Audio assigned as Port #15.
23:16	0h RW/L	**Component ID (COMPID):** Indicates the component ID assigned to this element by software. This is written once by platform BIOS and is locked until a platform reset. Locked when FNCFG.BCLD = 1.
15:8	1h RO	**Number of Link Entries (LNKENT):** The Intel HD Audio controller only connects to one device, the SOC egress port. Therefore this field reports a value of 1.
7:4	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO	**Element Type (ELTYP):** The Intel HD Audio controller is an Integrated Root Complex Device. Therefore this field reports a value of 0h.

12.1.52 Link 1 Description (L1DESC)—Offset 140h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Target Port Number (TPORT):** The Intel HD Audio controller targets the SOC RCRB egress port, which is port #0.
23:16	0h RW/L	**Target Component ID (TCOMPID):** This field is programmed by platform BIOS to match the component ID of the SOC RCRB that is attached to this RCRB Locked when FNCFG.BCLD = 1.
15:2	0h RO	**Reserved (RSVD):** Reserved.
1	0h RO	**Link Type (LNKTYP):** Indicates Type 0.
0	1h RO	**Link Valid (LNKVLD):** Hardwired to 1.

12.1.53 Link 1 Lower Address (L1LADD)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO/V	**Link 1 Lower Address (L1LADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.
13:0	0h RO	**Reserved (RSVD):** Reserved.

12.1.54 Link 1 Upper Address (L1UADD)—Offset 14Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 14 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link 1 Upper Address (L1UADD):** Hardwired to match the RCBA register value in the PCI-LPC bridge.

12.1.55 I/O Buffer Control (IOBCTL)—Offset 061Ch

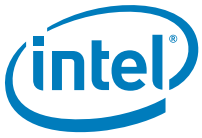
This register allows BIOS to control the I/O buffer configuration based on the motherboard configuration. Notes: 1. Bits 31:26 control the iDISPLAY Audio Link Buffers at the same time that 2. Bits 9:0 control HD-Audio and I2S/SSP Ports 0 and 1 buffers.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 2AC000004h

Range	Access Type	Default (reset)	Description
31:30	RW	0x0 (rst)	**IDSRCP (iDISPLAY Slew Rate Control P)** These bits control the pullup slew rate of the iDISPLAY Audio Link buffers. 00: P Slew Rate for iDISPLAY interface 01: Very slow P Slew Rate 10: Fast P Slew Rate 11: Slow P Slew Rate
29:28	RW	0x0 (rst)	**IDSRCN (iDISPLAY Slew Rate Control N)** These bits control the pulldown slew rate of the iDISPLAY Audio Link buffers. 00: N Slew Rate for iDISPLAY interface 01: Fast N Slew Rate 10: Slow N Slew Rate 11: Very Fast N Slew Rate
27:26	RW	0x3 (rst)	**IDHYS (iDISPLAY Hysteresis Control)** These bits control the hysteresis levels of the iDISPLAY Audio Link buffers. 00: No Hysteresis 01: >80mV (for GTL) 10: >0.1 VCC 11: >80mV (for iDISPLAY)
25:10	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved for future use



Range	Access Type	Default (reset)	Description
9:8	RW	0x0 (rst)	**OSEL (Ownership Select)** Indicates the ownership of the I/O buffer between Intel HD Audio link vs I2S0 / I2S port. 00: Intel HD-Audio link owns all the I/O buffers. 01: Intel HD-Audio link owns 4 of the I/O buffers for 1 HD-Audio codec connection, and I2S1 port owns 4 of the I/O buffers for 1 I2S codec connection. 10: Reserved. 11: I2S0 and I2S1 ports own all the I/O buffers. Note that the 01 setting is ONLY workable with the new type of Intel HD Audio codec known as Mobile HD Audio codec that does not making use of the reset pin.
7:6	RW	0x0 (rst)	**HDASRCP (HD-Audio Slew Rate Control P)** These bits control the pullup slew rate of the HD-Audio Link buffers. 00: P Slew Rate for HD-A interface 01: Slow P slew rate 10: Reserved 11: Reserved
5:4	RW	0x0 (rst)	**HDASRCN (HD-Audio Slew Rate Control N)** These bits control the pulldown slew rate of the HD-Audio Link buffers. 00: N Slew Rate for HD-A interface 01: Slow N slew rate 10: Reserved 11: Reserved
3:2	RW	0x1 (rst)	**HDAHYS (HD-Audio Hysteresis Control)** These bits control the hysteresis levels of the iDISPLAY Audio Link buffers. 00: No Hysteresis 01: HD-A at 1.8V or 3.3V 10: LPC at 3.3V 11: HD-A at 1.5V
1:1	RW	0x0 (rst)	**VSEL (Voltage Select)** When this bit is cleared to 0, the IO buffers will operate in 3.3V mode drive strength attribute. When this bit is set to 1, the IO buffers will operate in 1.8V mode drive strength attribute. The actual voltage of the IO buffer operation is still depending on the VCCPAZ power pin supplied voltage.
0:0	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved for future use

12.1.56 Power Management Control And Status (PCS)—Offset 0054h

This register is used to manage the PCI functions power management state as well as to enable/monitor PMEs. PMES and PMEE bits reside in Resume well, and reset by resume reset.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 8h

Range	Access Type	Default (reset)	Description
31:24	RO	0x0 (rst)	**DT (Data)** Does not apply. Hardwired to 0.
23:23	RO	0x0 (rst)	**BPCCE (Bus Power/Clock Control Enable)** Does not apply. Hardwired to 0.
22:22	RO	0x0 (rst)	**B23 (B2/B3 Support)** Does not apply. Hardwired to 0.
21:16	RO	0x0 (rst)	**RSVD3 (Reserved)** Reserved.
15:15	RW/1C/V	0x0 (rst)	**PMES (PME Status)** This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME bit. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	RO	0x0 (rst)	**RSVD2 (Reserved)** The Intel HD Audio subsystem does not implement the data register.
8:8	RW	0x0 (rst)	**PMEE (PME Enable)** When set, and if corresponding PMES is also set, the Intel HD Audio subsystem send PME to PMC. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
7:4	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved.
3:3	RW/L	0x1 (rst)	**NSR (No Soft Reset)** When set (1), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. When clear (0), devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. Locked when FNCFG.BCLD = 1.
2:2	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved.

Range	Access Type	Default (reset)	Description
1:0	RW	0x0 (rst)	**PS (Power State)** This field is used both to determine the current power state of the Intel HD Audio subsystem and to set a new power state. The values are: • 00: D0 state • 1 1: D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio subsystem's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

12.1.57 LTRC_D013C_PCE—Offset 1048h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 8080080h

Range	Access Type	Default (reset)	Description
31:30	RO	0x0 (rst)	**RSVD1_1 (Reserved)** Reserved.
29:29	RW	0x0 (rst)	**HAE (Hardware Autonomous Enable)** If set, then the IP may request a PG whenever it is idle. Note: If this bit is set, then bits[2:0] must be 000.
28:28	RO	0x0 (rst)	**RSVD0 (Reserved)** Reserved.
27:27	RW/L	0x1 (rst)	**SE (Sleep Enable)** If clear, then IP will never asset Sleep to the retention flops. If set, then IP may assert Sleep during PGing. Locked when DFx security policy is not in red unlock state.
26:26	RW	0x0 (rst)	**D3HE (D3-Hot Enable)** If set, then IP will PG when idle and the PMCSR[1:0] register in the IP = '11'.
25:25	RW	0x0 (rst)	**I3E (I3 Enable)** If set, then IP will PG when idle and the D0i3 register (D0i3C[2] = '1') is set. [p]Note: If bits [1:0] = #11#, then the IP would PG whenever either the D3 register or the D0i3 register is set.
24:24	RW	0x0 (rst)	**PMCRE (PMC Request Enable)** If set, then IP will PG when idle and the PMC requests power gating by asserting the pmc_(ip)_sw_pg_req_b signal.
23:20	RO	0x0 (rst)	**RSVD1 (Reserved)** Reserved.
19:19	RW/1C/V	0x1 (rst)	**RR (Restore Required)** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a '1'. This bit will be set on initial power up.

Range	Access Type	Default (reset)	Description
18:18	RW	0x0 (rst)	**I3 (D0i3)** SW sets this bit to '1' to move the IP into the D0i3 state. Writing this bit to ' 0' will return the IP to the fully active D0 state (D0i0).
17:17	RW	0x0 (rst)	**IR (Interrupt Request)** SW sets this bit to '1' to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
16:16	RO/V	0x0 (rst)	**CIP (Command-In-Progress)** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.
15:0	RO	0x0 (rst)	**RSVDP0 (Reserved)** Reserved.

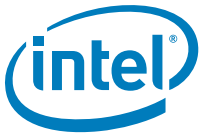
12.1.58 PID_PC—Offset 0050h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: C8436001h

Range	Access Type	Default (reset)	Description
31:27	RW/L	0x19 (rst)	**PMES (PME_Support)** Indicates PME# can be generated from D3 and D0 states. Programmable by BIOS for the option to declare SUS well wake is supported or not: 19h (SUS well wake supported) or 09h (SUS well wake not supported). Locked when FNCFG.BCLD = 1.
26:26	RO	0x0 (rst)	**D2S (D2_Support)** The D2 state is not supported.
25:25	RO	0x0 (rst)	**D1S (D1_Support)** The D1 state is not supported.
24:22	RW/L	0x1 (rst)	**AC (Aux_Current)** Reports 55 mA maximum Suspend well current required when in the D3cold state. P rogrammable by BIOS for the option to declare SUS well wake is supported or not: 001b (SUS well wake supported) or 000b (SUS well wake not supported). Locke d when FNCFG.BCLD = 1.
21:21	RO	0x0 (rst)	**DSI (Device Specific Initialization)** Indicates that no device-specific initialization is required.
20:20	RO	0x0 (rst)	**RSVD (Reserved)** Reserved.



Range	Access Type	Default (reset)	Description
19:19	RO	0x0 (rst)	**PMEC (PME Clock)** Does not apply. Hardwired to 0.
18:16	RW/L	0x3 (rst)	**VS (Version)** Indicates support for Revision 1.2 of the PCI Power Management Specification. Programmable by BIOS to older revision if compatibility issue is found. Locked when FNCFG.BCLD = 1.
15:8	RW/L	0x60 (rst)	**NEXT (Next Capability)** Points to the next capability structure (MSI). Locked when FNCFG.BCLD = 1.
7:0	RO	0x1 (rst)	**CAP (Cap ID)** Indicates that this pointer is a PCI power management capability.

12.2 Registers Summary

Table 12-2. Summary of HDAHC_MMREG Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Global Capabilities (GCAP)—Offset 0h	6701h
2h	2h	Minor Version (VMIN)—Offset 2h	0h
3h	3h	Major Version (VMAJ)—Offset 3h	1h
4h	5h	Output Payload Capability (OUTPAY)—Offset 4h	3Ch
6h	7h	Input Payload Capability (INPAY)—Offset 6h	1Dh
8h	Bh	Global Control (GCTL)—Offset 8h	0h
Ch	Dh	Wake Enable (WAKEEN)—Offset Ch	0h
Eh	Fh	Wake Status (WAKESTS)—Offset Eh	0h
10h	11h	Global Status (GSTS)—Offset 10h	0h
12h	13h	Global Capabilities 2 (GCAP2)—Offset 12h	1h
14h	15h	Linked List Capabilities Header (LLCH)—Offset 14h	C00h
18h	19h	Output Stream Payload Capability (OUTSTRMPAY)—Offset 18h	30h
1Ah	1Bh	Input Stream Payload Capability (INSTRMPAY)—Offset 1Ah	18h
20h	23h	Interrupt Control (INTCTL)—Offset 20h	0h
24h	27h	Interrupt Status (INTSTS)—Offset 24h	0h
30h	33h	Wall Clock Counter (WALCLK)—Offset 30h	0h
38h	3Bh	Stream Synchronization (SSYNC)—Offset 38h	0h
40h	43h	CORB Lower Base Address (CORBLBASE)—Offset 40h	0h
44h	47h	CORB Upper Base Address (CORBUBASE)—Offset 44h	0h
48h	49h	CORB Write Pointer (CORBWP)—Offset 48h	0h
4Ah	4Bh	CORB Read Pointer (CORBRP)—Offset 4Ah	0h
4Ch	4Ch	CORB Control (CORBCTL)—Offset 4Ch	0h
4Dh	4Dh	CORB Status (CORBSTS)—Offset 4Dh	0h
4Eh	4Eh	CORB Size (CORBSIZE)—Offset 4Eh	42h
50h	53h	RIRB Lower Base Address (RIRBLBASE)—Offset 50h	0h

Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
54h	57h	RIRB Upper Base Address (RIRBUBASE)—Offset 54h	0h
58h	59h	RIRB Write Pointer (RIRBWP)—Offset 58h	0h
5Ah	5Bh	Response Interrupt Count (RINTCNT)—Offset 5Ah	0h
5Ch	5Ch	RIRB Control (RIRBCTL)—Offset 5Ch	0h
5Dh	5Dh	RIRB Status (RIRBSTS)—Offset 5Dh	0h
5Eh	5Eh	RIRB Size (RIRBSIZE)—Offset 5Eh	42h
68h	69h	Immediate Command Status (ICS)—Offset 68h	0h
70h	73h	DMA Position Lower Base Address (DPLBASE)—Offset 70h	0h
74h	77h	DMA Position Upper Base Address (DPUBASE)—Offset 74h	0h
80h	83h	Input/Output Stream Descriptor x Control (ISD0CTL)—Offset 80h	40000h
83h	83h	Input/Output Stream Descriptor x Status (ISD0STS)—Offset 83h	0h
84h	87h	Input/Output Stream Descriptor x Link Position in Buffer (ISD0LPIB)—Offset 84h	0h
88h	8Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD0CBL)—Offset 88h	0h
8Ch	8Dh	Input/Output Stream Descriptor x Last Valid Index (ISD0LVI)—Offset 8Ch	0h
8Eh	8Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD0FIFOW)—Offset 8Eh	4h
90h	91h	Input/Output Stream Descriptor x FIFO Size (ISD0FIFOS)—Offset 90h	0h
92h	93h	Input/Output Stream Descriptor x Format (ISD0FMT)—Offset 92h	0h
94h	95h	Input/Output Stream Descriptor x FIFO Limit (ISD0FIFOL)—Offset 94h	0h
98h	9Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD0BDLPLBA)—Offset 98h	0h
9Ch	9Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD0BDLPUBA)—Offset 9Ch	0h
A0h	A3h	Input/Output Stream Descriptor x Control (ISD1CTL)—Offset A0h	40000h
A3h	A3h	Input/Output Stream Descriptor x Status (ISD1STS)—Offset A3h	0h
A4h	A7h	Input/Output Stream Descriptor x Link Position in Buffer (ISD1LPIB)—Offset A4h	0h
A8h	ABh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD1CBL)—Offset A8h	0h
ACh	ADh	Input/Output Stream Descriptor x Last Valid Index (ISD1LVI)—Offset ACh	0h
AEh	AFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD1FIFOW)—Offset AEh	4h
B0h	B1h	Input/Output Stream Descriptor x FIFO Size (ISD1FIFOS)—Offset B0h	0h
B2h	B3h	Input/Output Stream Descriptor x Format (ISD1FMT)—Offset B2h	0h
B4h	B5h	Input/Output Stream Descriptor x FIFO Limit (ISD1FIFOL)—Offset B4h	0h
B8h	BBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD1BDLPLBA)—Offset B8h	0h
BCh	BFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD1BDLPUBA)—Offset BCh	0h
C0h	C3h	Input/Output Stream Descriptor x Control (ISD2CTL)—Offset C0h	40000h
C3h	C3h	Input/Output Stream Descriptor x Status (ISD2STS)—Offset C3h	0h

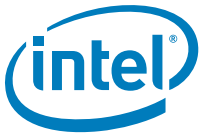


Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C4h	C7h	Input/Output Stream Descriptor x Link Position in Buffer (ISD2LPIB)—Offset C4h	0h
C8h	CBh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD2CBL)—Offset C8h	0h
CCh	CDh	Input/Output Stream Descriptor x Last Valid Index (ISD2LVI)—Offset CCh	0h
CEh	CFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD2FIFOW)—Offset CEh	4h
D0h	D1h	Input/Output Stream Descriptor x FIFO Size (ISD2FIFOS)—Offset D0h	0h
D2h	D3h	Input/Output Stream Descriptor x Format (ISD2FMT)—Offset D2h	0h
D4h	D5h	Input/Output Stream Descriptor x FIFO Limit (ISD2FIFOL)—Offset D4h	0h
D8h	DBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD2BDLPLBA)—Offset D8h	0h
DCh	DFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD2BDLPUBA)—Offset DCh	0h
E0h	E3h	Input/Output Stream Descriptor x Control (ISD3CTL)—Offset E0h	40000h
E3h	E3h	Input/Output Stream Descriptor x Status (ISD3STS)—Offset E3h	0h
E4h	E7h	Input/Output Stream Descriptor x Link Position in Buffer (ISD3LPIB)—Offset E4h	0h
E8h	EBh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD3CBL)—Offset E8h	0h
ECh	EDh	Input/Output Stream Descriptor x Last Valid Index (ISD3LVI)—Offset ECh	0h
EEh	EFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD3FIFOW)—Offset EEh	4h
F0h	F1h	Input/Output Stream Descriptor x FIFO Size (ISD3FIFOS)—Offset F0h	0h
F2h	F3h	Input/Output Stream Descriptor x Format (ISD3FMT)—Offset F2h	0h
F4h	F5h	Input/Output Stream Descriptor x FIFO Limit (ISD3FIFOL)—Offset F4h	0h
F8h	FBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD3BDLPLBA)—Offset F8h	0h
FCh	FFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD3BDLPUBA)—Offset FCh	0h
100h	103h	Input/Output Stream Descriptor x Control (ISD4CTL)—Offset 100h	40000h
103h	103h	Input/Output Stream Descriptor x Status (ISD4STS)—Offset 103h	0h
104h	107h	Input/Output Stream Descriptor x Link Position in Buffer (ISD4LPIB)—Offset 104h	0h
108h	10Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD4CBL)—Offset 108h	0h
10Ch	10Dh	Input/Output Stream Descriptor x Last Valid Index (ISD4LVI)—Offset 10Ch	0h
10Eh	10Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD4FIFOW)—Offset 10Eh	4h
110h	111h	Input/Output Stream Descriptor x FIFO Size (ISD4FIFOS)—Offset 110h	0h
112h	113h	Input/Output Stream Descriptor x Format (ISD4FMT)—Offset 112h	0h
114h	115h	Input/Output Stream Descriptor x FIFO Limit (ISD4FIFOL)—Offset 114h	0h
118h	11Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD4BDLPLBA)—Offset 118h	0h

Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
11Ch	11Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD4BDLPUBA)—Offset 11Ch	0h
120h	123h	Input/Output Stream Descriptor x Control (ISD5CTL)—Offset 120h	40000h
123h	123h	Input/Output Stream Descriptor x Status (ISD5STS)—Offset 123h	0h
124h	127h	Input/Output Stream Descriptor x Link Position in Buffer (ISD5LPIB)—Offset 124h	0h
128h	12Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD5CBL)—Offset 128h	0h
12Ch	12Dh	Input/Output Stream Descriptor x Last Valid Index (ISD5LVI)—Offset 12Ch	0h
12Eh	12Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD5FIFOW)—Offset 12Eh	4h
130h	131h	Input/Output Stream Descriptor x FIFO Size (ISD5FIFOS)—Offset 130h	0h
132h	133h	Input/Output Stream Descriptor x Format (ISD5FMT)—Offset 132h	0h
134h	135h	Input/Output Stream Descriptor x FIFO Limit (ISD5FIFOL)—Offset 134h	0h
138h	13Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD5BDLPLBA)—Offset 138h	0h
13Ch	13Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD5BDLPUBA)—Offset 13Ch	0h
140h	143h	Input/Output Stream Descriptor x Control (ISD6CTL)—Offset 140h	40000h
143h	143h	Input/Output Stream Descriptor x Status (ISD6STS)—Offset 143h	0h
144h	147h	Input/Output Stream Descriptor x Link Position in Buffer (ISD6LPIB)—Offset 144h	0h
148h	14Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (ISD6CBL)—Offset 148h	0h
14Ch	14Dh	Input/Output Stream Descriptor x Last Valid Index (ISD6LVI)—Offset 14Ch	0h
14Eh	14Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD6FIFOW)—Offset 14Eh	4h
150h	151h	Input/Output Stream Descriptor x FIFO Size (ISD6FIFOS)—Offset 150h	0h
152h	153h	Input/Output Stream Descriptor x Format (ISD6FMT)—Offset 152h	0h
154h	155h	Input/Output Stream Descriptor x FIFO Limit (ISD6FIFOL)—Offset 154h	0h
158h	15Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD6BDLPLBA)—Offset 158h	0h
15Ch	15Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD6BDLPUBA)—Offset 15Ch	0h
160h	163h	Input/Output Stream Descriptor x Control (OSD0CTL)—Offset 160h	40000h
163h	163h	Input/Output Stream Descriptor x Status (OSD0STS)—Offset 163h	0h
164h	167h	Input/Output Stream Descriptor x Link Position in Buffer (OSD0LPIB)—Offset 164h	0h
168h	16Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD0CBL)—Offset 168h	0h
16Ch	16Dh	Input/Output Stream Descriptor x Last Valid Index (OSD0LVI)—Offset 16Ch	0h
16Eh	16Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD0FIFOW)—Offset 16Eh	4h
170h	171h	Input/Output Stream Descriptor x FIFO Size (OSD0FIFOS)—Offset 170h	0h

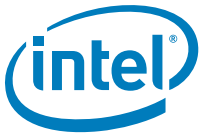

Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
172h	173h	Input/Output Stream Descriptor x Format (OSD0FMT)—Offset 172h	0h
174h	175h	Input/Output Stream Descriptor x FIFO Limit (OSD0FIFOL)—Offset 174h	0h
178h	17Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD0BDLPLBA)—Offset 178h	0h
17Ch	17Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD0BDLPUBA)—Offset 17Ch	0h
180h	183h	Input/Output Stream Descriptor x Control (OSD1CTL)—Offset 180h	40000h
183h	183h	Input/Output Stream Descriptor x Status (OSD1STS)—Offset 183h	0h
184h	187h	Input/Output Stream Descriptor x Link Position in Buffer (OSD1LPIB)—Offset 184h	0h
188h	18Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD1CBL)—Offset 188h	0h
18Ch	18Dh	Input/Output Stream Descriptor x Last Valid Index (OSD1LVI)—Offset 18Ch	0h
18Eh	18Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD1FIFOW)—Offset 18Eh	4h
190h	191h	Input/Output Stream Descriptor x FIFO Size (OSD1FIFOS)—Offset 190h	0h
192h	193h	Input/Output Stream Descriptor x Format (OSD1FMT)—Offset 192h	0h
194h	195h	Input/Output Stream Descriptor x FIFO Limit (OSD1FIFOL)—Offset 194h	0h
198h	19Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD1BDLPLBA)—Offset 198h	0h
19Ch	19Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD1BDLPUBA)—Offset 19Ch	0h
1A0h	1A3h	Input/Output Stream Descriptor x Control (OSD2CTL)—Offset 1A0h	40000h
1A3h	1A3h	Input/Output Stream Descriptor x Status (OSD2STS)—Offset 1A3h	0h
1A4h	1A7h	Input/Output Stream Descriptor x Link Position in Buffer (OSD2LPIB)—Offset 1A4h	0h
1A8h	1ABh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD2CBL)—Offset 1A8h	0h
1ACh	1ADh	Input/Output Stream Descriptor x Last Valid Index (OSD2LVI)—Offset 1ACh	0h
1AEh	1AFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD2FIFOW)—Offset 1AEh	4h
1B0h	1B1h	Input/Output Stream Descriptor x FIFO Size (OSD2FIFOS)—Offset 1B0h	0h
1B2h	1B3h	Input/Output Stream Descriptor x Format (OSD2FMT)—Offset 1B2h	0h
1B4h	1B5h	Input/Output Stream Descriptor x FIFO Limit (OSD2FIFOL)—Offset 1B4h	0h
1B8h	1BBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD2BDLPLBA)—Offset 1B8h	0h
1BCh	1BFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD2BDLPUBA)—Offset 1BCh	0h
1C0h	1C3h	Input/Output Stream Descriptor x Control (OSD3CTL)—Offset 1C0h	40000h
1C3h	1C3h	Input/Output Stream Descriptor x Status (OSD3STS)—Offset 1C3h	0h
1C4h	1C7h	Input/Output Stream Descriptor x Link Position in Buffer (OSD3LPIB)—Offset 1C4h	0h
1C8h	1CBh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD3CBL)—Offset 1C8h	0h

Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1CCh	1CDh	Input/Output Stream Descriptor x Last Valid Index (OSD3LVI)—Offset 1CCh	0h
1CEh	1CFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD3FIFOW)—Offset 1CEh	4h
1D0h	1D1h	Input/Output Stream Descriptor x FIFO Size (OSD3FIFOS)—Offset 1D0h	0h
1D2h	1D3h	Input/Output Stream Descriptor x Format (OSD3FMT)—Offset 1D2h	0h
1D4h	1D5h	Input/Output Stream Descriptor x FIFO Limit (OSD3FIFOL)—Offset 1D4h	0h
1D8h	1DBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD3BDLPLBA)—Offset 1D8h	0h
1DCh	1DFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD3BDLPUBA)—Offset 1DCh	0h
1E0h	1E3h	Input/Output Stream Descriptor x Control (OSD4CTL)—Offset 1E0h	40000h
1E3h	1E3h	Input/Output Stream Descriptor x Status (OSD4STS)—Offset 1E3h	0h
1E4h	1E7h	Input/Output Stream Descriptor x Link Position in Buffer (OSD4LPIB)—Offset 1E4h	0h
1E8h	1EBh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD4CBL)—Offset 1E8h	0h
1ECh	1EDh	Input/Output Stream Descriptor x Last Valid Index (OSD4LVI)—Offset 1ECh	0h
1EEh	1EFh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD4FIFOW)—Offset 1EEh	4h
1F0h	1F1h	Input/Output Stream Descriptor x FIFO Size (OSD4FIFOS)—Offset 1F0h	0h
1F2h	1F3h	Input/Output Stream Descriptor x Format (OSD4FMT)—Offset 1F2h	0h
1F4h	1F5h	Input/Output Stream Descriptor x FIFO Limit (OSD4FIFOL)—Offset 1F4h	0h
1F8h	1FBh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD4BDLPLBA)—Offset 1F8h	0h
1FCh	1FFh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD4BDLPUBA)—Offset 1FCh	0h
200h	203h	Input/Output Stream Descriptor x Control (OSD5CTL)—Offset 200h	40000h
203h	203h	Input/Output Stream Descriptor x Status (OSD5STS)—Offset 203h	0h
204h	207h	Input/Output Stream Descriptor x Link Position in Buffer (OSD5LPIB)—Offset 204h	0h
208h	20Bh	Input/Output Stream Descriptor x Cyclic Buffer Length (OSD5CBL)—Offset 208h	0h
20Ch	20Dh	Input/Output Stream Descriptor x Last Valid Index (OSD5LVI)—Offset 20Ch	0h
20Eh	20Fh	Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD5FIFOW)—Offset 20Eh	4h
210h	211h	Input/Output Stream Descriptor x FIFO Size (OSD5FIFOS)—Offset 210h	0h
212h	213h	Input/Output Stream Descriptor x Format (OSD5FMT)—Offset 212h	0h
214h	215h	Input/Output Stream Descriptor x FIFO Limit (OSD5FIFOL)—Offset 214h	0h
218h	21Bh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD5BDLPLBA)—Offset 218h	0h
21Ch	21Fh	Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD5BDLPUBA)—Offset 21Ch	0h
500h	503h	Global Time Synchronization Capability Header (GTSCH)—Offset 500h	11F00h

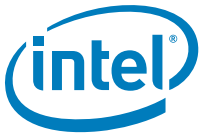

Table 12-2. Summary of HDAHC_MMREG Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
504h	507h	Global Time Synchronization Capability Declaration (GTSCD)—Offset 504h	0h
50Ch	50Fh	Global Time Synchronization Controller Adjust Control (GTSCTLAC)—Offset 50Ch	0h
520h	523h	Global Time Synchronization Capture Control (GTSCC0)—Offset 520h	0h
524h	527h	Wall Frame Counter Captured (WALFCC0)—Offset 524h	0h
528h	52Bh	Time Stamp Counter Captured Lower (TSCCL0)—Offset 528h	0h

21E4h	21E7h	Input Stream Descriptor 0 Link Position in Buffer Alias (OSD4LPIBA)—Offset 21E4h	0h
2204h	2207h	Input Stream Descriptor 0 Link Position in Buffer Alias (OSD5LPIBA)—Offset 2204h	0h

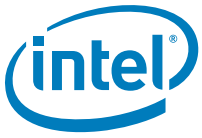
12.2.1 Global Capabilities (GCAP)—Offset 0h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 6701h



Bit Range	Default & Access	Field Name (ID): Description
15:12	6h RW/L	**Number of Output Streams Supported (OSS):** 0100b indicates that the Intel HD Audio controller supports four output streams. Reset value is hardcoded to parameter HSTOSC. Locked when FNCFG.BCLD = 1.
11:8	7h RW/L	**Number of Input Streams Supported (ISS):** 0100b indicates that the Intel HD Audio controller supports four input streams. Reset value is hardcoded to parameter HSTISC. Locked when FNCFG.BCLD = 1.
7:3	0h RO	**Number of Bidirectional Streams Supported (BSS):** 00000b indicates that the Intel HD Audio controller supports 0 bidirectional streams.
2:1	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. For the case in which multiple link segments are supported, this field indicates the number of SDOs for link 0. Locked when FNCFG.BCLD = 1.
0	1h RW/L	**64 Bit Address Supported (ADD64OK):** A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses, data buffer addresses, and command buffer addresses. Locked when FNCFG.BCLD = 1.

12.2.2 Minor Version (VMIN)—Offset 2h

Register to indicate minor version of Intel HD Audio specification.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Minor Version (VMIN):** Indicates the Intel HD Audio controller supports minor revision number 00h of the Intel HD Audio specification.

12.2.3 Major Version (VMAJ)—Offset 3h

Register to indicate major version of Intel HD Audio specification

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**Major Version (VMAJ):** Indicates the Intel HD Audio controller supports major revision number 1 of the Intel HD Audio specification.

12.2.4 Output Payload Capability (OUTPAY)—Offset 4h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 3Ch

Bit Range	Default & Access	Field Name (ID): Description
15:0	3Ch RW/L	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz (the data is double pumped) provides 1000 bits per frame, or 62.5 words in total. 40 bits are used for command and control, leaving 60 words available for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Note: In the event that multiple links are supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link. Locked when FNCFG.BCLD = 1.

12.2.5 Input Payload Capability (INPAY)—Offset 6h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1Dh

Bit Range	Default & Access	Field Name (ID): Description
15:0	1Dh RW/L	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link. This does not include bandwidth used for response. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz provides 500 bits per frame, or 31.25 words in total. 36 bits are used for response, leaving 29 words for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDI lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Note: In the event that multiple links are supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link. Locked when FNCFG.BCLD = 1.

12.2.6 Global Control (GCTL)—Offset 8h

CRSTB bit is not affected by controller reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD1):** Reserved.
8	0h RW	**Accept Unsolicited Response Enable (UNSOL):** If UNSOL is a 1, Unsolicited Responses from the codecs are accepted by the controller and placed into the Response Input Ring Buffer. If UNSOL is a 0, unsolicited responses are not accepted, and dropped on the floor.
7:2	0h RO	**Reserved (RSVD2):** Reserved.
1	0h RW/1S/V	**Flush Control (FCNTRL):** Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller, hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated, the DMA Position Buffer must be programmed with a valid memory address by software, but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also, all streams must be stopped (the associated RUN bit must be 0). When the flush is initiated, the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Controller Reset# (CRSTB):** Writing a 0 to this bit causes the Intel HD Audio controller to be reset. All state machines, FIFO's and non-suspend well memory mapped configuration registers (except ECAP, and not PCI Configuration Registers) in the controller will be reset. The Intel HD Audio link RESET# signal will be asserted and all other link signals will be driven to their "reset" values. After the hardware has completed sequencing into the reset state, it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and deassert the Intel HD Audio link RESET# signal. Software is responsible for setting/clearing this bit such that the minimum Intel HD Audio link RESET# signal assertion pulse width specification is met. When the controller hardware is ready to begin operation, it will report a 1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST# bit defaults to a 0 after hardware reset, therefore software needs to write a 1 to this bit to begin operation. Note that the CORB/RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST# is written to 0 (asserted) in order to assure a clean re-start. When setting or clearing CRST#, software must ensure that minimum link timing requirements (minimum RESET# assertion time, etc.) are met. When CRST# is 0 indicating that the controller is in reset, writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST# bit itself. The Global Control register is write-able as a DWord, Word, or Byte even when CRST# is 0 if the byte enable for the byte containing the CRST# bit (Byte Enable 0) is active. If Byte Enable 0 is not active, writes to the Global Control register will be ignored when CRST# is 0. When CRST# is 0, reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST# or on a D3hot to D0 transition.

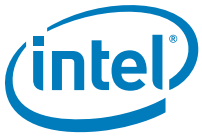
12.2.7 Wake Enable (WAKEEN)—Offset Ch

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by resume reset.
The number of WAKEEN bits in this register is depending on the total number of codec address implemented, represented as x in the register table.
The x value is determined by the parameter CADC.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1:0	0h RW	**SDIN Wake Enable Flags (WAKEEN):** Bits which control which SDI signal(s) may generate a wake event. A 1 bit in the bit mask indicates that the associated SDIN signal is enabled to generate a wake. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.

12.2.8 Wake Status (WAKESTS)—Offset Eh

This register resides in Primary well (always on), and reset by resume reset.
The number of WAKESTS bits in this register is depending on the total number of codec address implemented, represented as x in the register table. The x value is determined by the parameter CADC.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1:0	0h RW/1C/V	**SDIN State Change Status Flags (WAKESTS):** Flag bits that indicate which SDI signal(s) received a State Change event. The bits are cleared by writing 1's to them. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.

12.2.9 Global Status (GSTS)—Offset 10h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/1C/V	**Flush Status (FSTS):** This bit is set to a 1 by the hardware to indicate that the flush cycle initiated when the FCNTRL bit was set has completed. Software must write a 1to clear this bit before the next time FCNTRL is set.
0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.10 Global Capabilities 2 (GCAP2)—Offset 12h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/L	**Dynamic FIFO Limit Change Dapability (DFIFOLCC):** Indicates whether the energy efficient audio FIFOLC operation is static or dynamic. • 0: Static. FIFOLC bit only has effect before RUN bit is set for the first time. • 1: Dynamic. FIFOLC bit has effect before RUN bit is set for the first time, as well as after that. Locked when FNCFG.BCLD = 1.
0	1h RW/V/L	**Energy Efficient Audio Capability (EEAC):** Indicates whether the energy efficient audio with deeper buffering is supported or not. • 0: Not supported. FIFOL register and FIFOLC bit behave as RO. • 1: Supported. FIFOL register and FIFOLC bit behave as RW. Locked when FNCFG.BCLD = 1 or FUSVAL.CPPMD = 1.

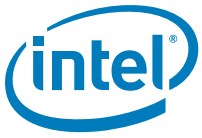
12.2.11 Linked List Capabilities Header (LLCH)—Offset 14h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: C00h



Bit Range	Default & Access	Field Name (ID): Description
15:0	C00h RW/L	**First Capability Pointer (PTR):** This field contains the offset to the first capability structure of the linked list capabilities, or 0000h if no linked list capabilities exist. Point to Multiple Links Capability. Locked when FNCFG.BCLD = 1.

12.2.12 Output Stream Payload Capability (OUTSTRMPAY)—Offset 18h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
15:0	30h RO	**Output Stream Payload Capability (OUTSTRMPAY):** Indicates maximum number of words per frame for any single output stream. This measurement is in 16 bit word quantities per 48 kHz frame. 48 Words (96B) is the maximum supported, therefore a value of 30h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Output Stream Descriptor register. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload

12.2.13 Input Stream Payload Capability (INSTRMPAY)—Offset 1Ah

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	18h RO	**Input Stream Payload Capability (INSTRMPAY):** Indicates maximum number of words per frame for any single input stream. This measurement is in 16-bit word quantities per 48 kHz frame. 24 Words (48B) is the maximum supported, therefore a value of 18h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Input Stream Descriptor register. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload

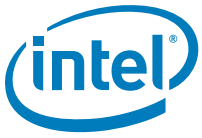
12.2.14 Interrupt Control (INTCTL)—Offset 20h

The Interrupt Status and Control register provides a central point for controlling and monitoring interrupt generation. The SIE (Stream Interrupt Enable) register controls the interrupt mask for each individual Input or Output Stream. Setting a 1 in the appropriate bit allows the particular interrupt source to generate a processor interrupt. The SIS (Stream Interrupt Status) register indicates the current interrupt status of each interrupt source. A 1 indicates that an interrupt is being requested. Note that the state of these bits is independent of the SIE bits; even if the corresponding bit is set to a 0 in the Stream Interrupt Enable register to disable processor interrupt generation, the Status bit may still be set to indicate that stream is requesting service. This can be used by polling software to determine which Streams need attention without incurring system interrupts.
The CIE (Controller Interrupt Enable) and CIS (Controller Interrupt Status) control and indicate the status of the general controller interrupt. General controller interrupt sources are to a Response Interrupt, a Response Buffer Overrun, and State Change events. Note that the CIS is independent of the CIE bit; even if the CIE bit is set to a 0 to disable processor interrupt generation, the CIS bit may still be set to indicate that stream is requesting service.
The GIE (Global Interrupt Enable) and GIS (Global Interrupt Status) control and indicate the status of all hardware interrupt sources in the Intel HD Audio controller. If GIS bit is a 1, a processor interrupt is currently being requested. If GIE is a 1, a processor interrupt may be requested; if GIE is a 0, then no processor interrupt may be requested. Note that the GIS is independent of the GIE bit; even if the GIE bit is set to a 0 to disable processor interrupt generation, the GIS bit may still be set to indicate that stream is requesting service.
GIE and CIE bits are not affected by controller reset.
The number of SIE bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Global Interrupt Enable (GIE):** Global bit to enable device interrupt generation. When set to 1 the Intel HD Audio function is enabled to generate an interrupt. This control is in addition to any bits in the bus specific address space, such as the Interrupt Enable bit in the PCI Configuration Space.
30	0h RW	**Controller Interrupt Enable (CIE):** Enables the general interrupt for controller functions. When set to 1 (and GIE is enabled), the controller generates an interrupt when the CIS bit gets set.
29:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW	**Stream Interrupt Enable (SIE):** When set to 1 the individual Streams are enabled to generate an interrupt when the corresponding stream status bits get set. A stream interrupt will be caused as a result of a buffer with IOC=1 in the BDL entry being completed, or as a result of a FIFO error (underrun or overrun) occurring. Control over the generation of each of these sources is in the associated Stream Descriptor. The streams are numbered and the SIE bits assigned sequentially, based on their order in the register set.

12.2.15 Interrupt Status (INTSTS)—Offset 24h

GIS and CIS bits are not affected by controller reset.
The number of SIS bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Global Interrupt Status (GIS):** This bit is an OR of all of the interrupt status bits in this register and PPSTS register.
30	0h RW/V	**Controller Interrupt Status (CIS):** Status of general controller interrupt. A 1 indicates that an interrupt condition occurred due to a Response Interrupt, a Response Buffer Overrun Interrupt, CORB Memory Error Interrupt, or a SDIN State Change event. The exact cause can be determined by interrogating other registers. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the stated interrupt status bits for this register.

Bit Range	Default & Access	Field Name (ID): Description
29:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW/V	**Stream Interrupt Status (SIS):** A 1 indicates that an interrupt condition occurred on the corresponding Stream. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of an individual stream s interrupt status bits. The streams are numbered and the SIS bits assigned sequentially, based on their order in the register set.

12.2.16 Wall Clock Counter (WALCLK)—Offset 30h

The 32-bit monotonic counter provides a 'wall clock' that can be used by system software to synchronize independent audio controllers. The counter must be implemented.

Access Method

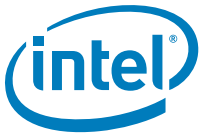
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Wall Clock Counter (WALCLK):** 32-bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition for this counter is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed, and reports the link 0 wall clock value.

12.2.17 Stream Synchronization (SSYNC)—Offset 38h

To synchronize two or more streams the corresponding SSYNC bits for the streams to be synchronized should be set to 1 before the 'RUN' bit for each stream is set.
The RUN bit for the corresponding stream must be set to 1 (and FIFORDY=1) prior to that stream's SSYNC bit being written to 0. To start multiple streams synchronously, the stream sync bits for those streams should be written to 0 at the same time. For all SSYNC bits on output engines that transition from 1 to 0 on the same write, the formatter will deliver a sample over the link in the same 48kHz frame. For all SSYNC bits on input engines that transition from 1 to 0 on the same write, the formatter will take stream data off the link and place it in the FIFO.
If synchronization is not desired, the stream synchronization bits may be left 0, and the



stream will simply begin running normally when the stream's 'RUN' bit is set.
In addition to platform reset, FLR, and controller reset, the register is also reset by stream reset.
The number of SSYNC bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW	**Stream Synchronization Bits (SSYNC):** The Stream Synchronization bits, when set to 1, block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor, bit 0 corresponds to the first Stream Descriptor, etc. To synchronously start a set of DMA engines, the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready (FIFORDY=1), the associated SSYNC bits can all be set to 0 at the same time, and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams, first the bits are set in the SSYNC register, and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially, based on their order in the register set.

12.2.18 CORB Lower Base Address (CORBLBASE)—Offset 40h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**CORB Lower Base Address (CORBLBASE):** Lower address of the Command Output Ring Buffer, allowing the CORB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RO	**CORB Lower Base Unimplemented Bits (RSVD):** Hardwired to 0. This requires the CORB to be allocated with 128-byte granularity to allow for cache line fetch optimizations.

12.2.19 CORB Upper Base Address (CORBUBASE)—Offset 44h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**CORB Upper Base Address (CORBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.ADD64OK = 0.

12.2.20 CORB Write Pointer (CORBWP)—Offset 48h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

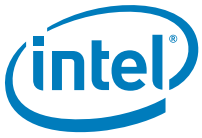
Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**CORB Write Pointer (CORBWP):** Software writes the last valid CORB entry offset into this field in Dword granularity. The DMA engine fetches commands from the CORB until the Read Pointer matches the Write Pointer. Supports 256 CORB entries (256 x 4B=1KB). This field may be written while the DMA engine is running.

12.2.21 CORB Read Pointer (CORBRP)—Offset 4Ah

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**CORB Read Pointer Reset (CORBRPRST):** Software writes a 1 to this bit to reset the CORB Read Pointer to 0 and clear any residual pre-fetched commands in the CORB hardware buffer within the Intel Audio controller. The hardware will physically update this bit to 1 when the CORB Pointer reset is complete. Software must read a 1 to verify that the reset completed correctly. Software must clear this bit back to 0 and read back the 0 to verify that the clear completed correctly. The CORB DMA engine must be stopped prior to resetting the Read Pointer or else DMA transfer may be corrupted.
14:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RO/V	**CORB Read Pointer (CORBRP):** Software reads this field to determine how many commands it can write to the CORB without over-running. The value read indicates the CORB Read Pointer offset in Dword granularity. The offset entry read from this field has been successfully fetched by the DMA controller and may be over-written by software. Supports 256 CORB entries (256 x 4B=1KB). This field may be read while the DMA engine is running.

12.2.22 CORB Control (CORBCTL)—Offset 4Ch

Length: 1 byte.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/V	**Enable CORB DMA Engine (CORBRUN):** • 0: DMA Stop • 1: DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**CORB Memory Error Interrupt Enable (CMEIE):** If this bit is set (and GIE and CIE are enabled), the controller will generate an interrupt if the MEI status bit is set.

12.2.23 CORB Status (CORBSTS)—Offset 4Dh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/1C/V	**CORB Memory Error Indication (CMEI):** If this status bit is set, the controller has detected an error in the pathway between the controller and memory. This may be an ECC bit error or any other type of detectable data error which renders the command data fetched invalid. Software can clear this bit by writing a 1 to it. However, this type of error leaves the audio subsystem in an unviable state and typically requires CRST#.

12.2.24 CORB Size (CORBSIZE)—Offset 4Eh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 42h

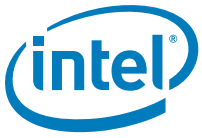
Bit Range	Default & Access	Field Name (ID): Description
7:4	4h RO	**CORB Size Capability (CORBSZCAP):** 0100b indicates that the ICH9 only supports a CORB size of 256 CORB entries (1024B).
3:2	0h RO	**Reserved (RSVD1):** Reserved.
1:0	2h RO	**CORB Size (CORBSIZE):** Hardwired to 10b which sets the CORB size to 256 entries (1024B).

12.2.25 RIRB Lower Base Address (RIRBLBASE)—Offset 50h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**RIRB Lower Base Address (RIRBLBASE):** Lower address of the Response Input Ring Buffer, allowing the RIRB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	0h RO	**RIRB Lower Base Unimplemented Bits (RSVD):** Hardwired to 0 to force 128-byte buffer alignment for cache line fetch optimizations.

12.2.26 RIRB Upper Base Address (RIRBUBASE)—Offset 54h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**RIRB Upper Base Address (RIRBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.27 RIRB Write Pointer (RIRBWP)—Offset 58h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h WO	**RIRB Write Pointer Reset (RIRBWPRST):** Software writes a 1 to this bit to reset the RIRB Write Pointer to 0's. The RIRB DMA engine must be stopped prior to resetting the Write Pointer or else DMA transfer may be corrupted. This bit will always be read as 0.
14:8	0h RO	**Reserved (RSVD1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**RIRB Write Pointer (RIRBWP):** Indicates the last valid RIRB entry written by the DMA controller. Software reads this field to determine how many responses it can read from the RIRB. The value read indicates the RIRB Write Pointer offset in 2 Dword RIRB entry units (since each RIRB entry is 2 Dwords long). Supports up to 256 RIRB entries (256 x 8B=2KB). This field may be read while the DMA engine is running.

12.2.28 Response Interrupt Count (RINTCNT)—Offset 5Ah

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**N Response Interrupt Count (RINTCNT):** • 0000_0001b: 1 Response sent to RIRB • ... • 1111_1111b: 255 Responses sent to RIRB • 0000_0000b: 256 Responses sent to RIRB The DMA engine should be stopped when changing this field or else an interrupt may be lost. Note that each Response occupies 2 Dwords in the RIRB. This is compared to the total number of responses that have been returned, as opposed to the number of frames in which there were responses. If more than one codec responds in one frame, then the count is increased by the number of responses received in the frame.

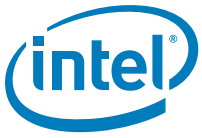
12.2.29 RIRB Control (RIRBCTL)—Offset 5Ch

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD1):** Reserved.
2	0h RW	**Response Overrun Interrupt Control (RIRBOIC):** If this bit is set (and GIE and CIE are enabled), the hardware will generate an interrupt when the Response Overrun Interrupt Status bit is set.



Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/V	**RIRB DMA Enable (RIRBRUN):** • 0: DMA Stop • 1: DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**Response Interrupt Control (RINTCTL):** • 0: Disable Interrupt. • 1: Generate an interrupt (if GIE and CIE are enabled) after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI_x inputs (whichever occurs first). The N counter is reset when the interrupt is generated.

12.2.30 RIRB Status (RIRBSTS)—Offset 5Dh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD1):** Reserved.
2	0h RW/1C/V	**Response Overrun Interrupt Status (RIRBOIS):** Hardware sets this bit to a 1 when the RIRB DMA engine is not able to write the incoming responses to memory before additional incoming responses overrun the internal FIFO. When the overrun occurs, the hardware will drop the responses which overrun the buffer. An interrupt may be generated if the Response Overrun Interrupt Control bit is set. Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.
1	0h RO	**Reserved (RSVD2):** Reserved.
0	0h RW/1C/V	**Response Interrupt (RINTFL):** Hardware sets this bit to a 1 when an interrupt has been generated after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI(x) inputs (whichever occurs first). Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.

12.2.31 RIRB Size (RIRBSIZE)—Offset 5Eh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 42h

Bit Range	Default & Access	Field Name (ID): Description
7:4	4h RO	**RIRB Size Capability (RIRBSZCAP):** 0100b indicates that the SoC only supports a RIRB size of 256 RIRB entries (2048B).
3:2	0h RO	**Reserved (RSVD1):** Reserved.
1:0	2h RO	**RIRB Size (RIRBSIZE):** Hard wired to 10b which sets the RIRB size to 256 entries (2048B).

12.2.32 Immediate Command Status (ICS)—Offset 68h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/1C/V	**Immediate Result Valid (IRV):** This bit is set to a 1 by hardware when a new response is latched into the IR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit (by writing a one to it) before issuing a new command so that the software may determine when a new response has arrived.
0	0h RW/V	**Immediate Command Busy (ICB):** When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 (via software writing a 1), the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register, the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB/RIRB mechanism is operating, otherwise the responses conflict. This must be enforced by software.

12.2.33 DMA Position Lower Base Address (DPLBASE)—Offset 70h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**DMA Position Lower Base Address (DPLBASE):** Lower 32 bits of the DMA Position Buffer Base Address. This register field must not be written when any DMA engine is running or the DMA transfer may be corrupted. This same address is used by the Flush Control, and must be programmed with a valid value before the FLCNRTL bit is set.
6:1	0h RO	**DMA Position Lower Base Unimplemented Bits (RSVD):** Hardwired to 0 to force 128 byte buffer alignment for cache line write optimizations.
0	0h RW	**DMA Position Buffer Enable (DPBE):** When this bit is set to a '1', the controller will write the DMA positions of each of the DMA engines to the buffer in main memory periodically (typically once/frame). Software can use this value to know what data in memory is valid data. The controller must guarantee that the values in the DMA Position Buffer that the software can read represent positions in the stream for which valid data exists in the Stream's DMA buffer. This has particular relevance in systems which support isochronous transfer, the stream positions in the software-visible memory buffer must represent stream data which has reached the Global Observation point.

12.2.34 DMA Position Upper Base Address (DPUBASE)—Offset 74h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**DMA Position Upper Base Address (DPUBASE):** Upper 32 bits of address of the DMA Position Buffer Base Address. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. Locked when GCAP.ADD64OK = 0.

12.2.35 Input/Output Stream Descriptor x Control (ISD0CTL)—Offset 80h

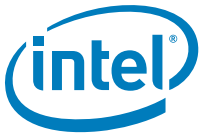
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.36 Input/Output Stream Descriptor x Status (ISD0STS)—Offset 83h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

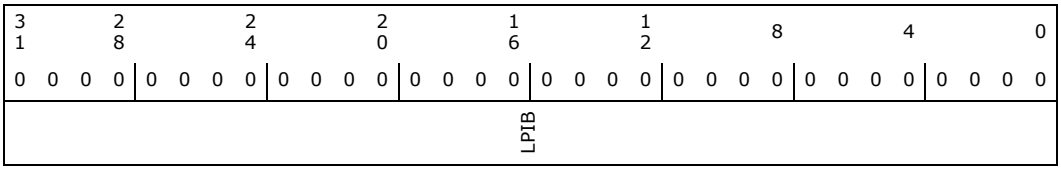
12.2.37 Input/Output Stream Descriptor x Link Position in Buffer (ISD0LPIB)—Offset 84h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.38 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD0CBL)—Offset 88h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.39 Input/Output Stream Descriptor x Last Valid Index (ISD0LVI)—Offset 8Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.40 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD0FIFOW)—Offset 8Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

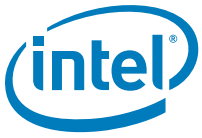
Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hard wired the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.41 Input/Output Stream Descriptor x FIFO Size (ISD0FIFOS)—Offset 90h

Register for Input/Output Stream Descriptor x FIFO Size.



Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.42 Input/Output Stream Descriptor x Format (ISD0FMT)—Offset 92h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

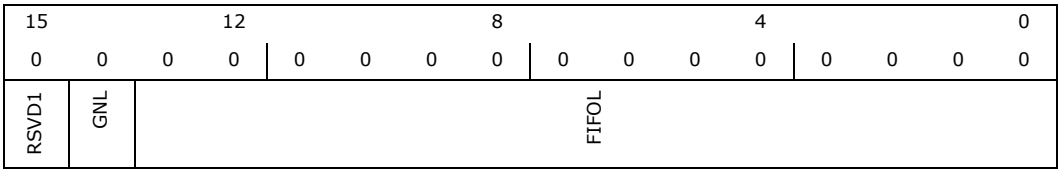
12.2.43 Input/Output Stream Descriptor x FIFO Limit (ISD0FIFOL)—Offset 94h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.44 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD0BDLPLBA)—Offset 98h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.45 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD0BDLPUBA)—Offset 9Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.46 Input/Output Stream Descriptor x Control (ISD1CTL)—Offset A0h

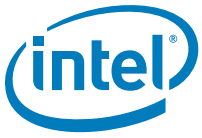
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.47 Input/Output Stream Descriptor x Status (ISD1STS)—Offset A3h

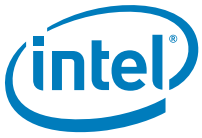
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.48 Input/Output Stream Descriptor x Link Position in Buffer (ISD1LPIB)—Offset A4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.49 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD1CBL)—Offset A8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

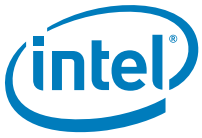
12.2.50 Input/Output Stream Descriptor x Last Valid Index (ISD1LVI)—Offset ACh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.51 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD1FIFOW)—Offset AEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.52 Input/Output Stream Descriptor x FIFO Size (ISD1FIFOS)—Offset B0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.53 Input/Output Stream Descriptor x Format (ISD1FMT)—Offset B2h

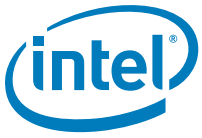
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.54 Input/Output Stream Descriptor x FIFO Limit (ISD1FIFOL)—Offset B4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.55 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD1BDLPLBA)—Offset B8h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.56 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD1BDLPUBA)—Offset BCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.57 Input/Output Stream Descriptor x Control (ISD2CTL)—Offset C0h

SRST bit is not affected by stream reset.

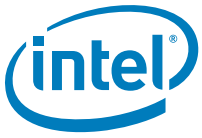
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.58 Input/Output Stream Descriptor x Status (ISD2STS)—Offset C3h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.59 Input/Output Stream Descriptor x Link Position in Buffer (ISD2LPIB)—Offset C4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.60 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD2CBL)—Offset C8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.61 Input/Output Stream Descriptor x Last Valid Index (ISD2LVI)—Offset CCh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.62 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD2FIFOW)—Offset CEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

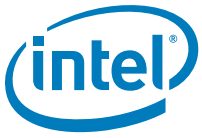
12.2.63 Input/Output Stream Descriptor x FIFO Size (ISD2FIFOS)—Offset D0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.64 Input/Output Stream Descriptor x Format (ISD2FMT)—Offset D2h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.65 Input/Output Stream Descriptor x FIFO Limit (ISD2FIFOL)—Offset D4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.66 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD2BDLPLBA)—Offset D8h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.67 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD2BDLPUBA)—Offset DCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.68 Input/Output Stream Descriptor x Control (ISD3CTL)—Offset E0h

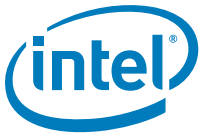
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.69 Input/Output Stream Descriptor x Status (ISD3STS)—Offset E3h

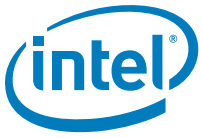
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.70 Input/Output Stream Descriptor x Link Position in Buffer (ISD3LPIB)—Offset E4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.71 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD3CBL)—Offset E8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.72 Input/Output Stream Descriptor x Last Valid Index (ISD3LVI)—Offset ECh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.73 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD3FIFOW)—Offset EEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.74 Input/Output Stream Descriptor x FIFO Size (ISD3FIFOS)—Offset F0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.75 Input/Output Stream Descriptor x Format (ISD3FMT)—Offset F2h

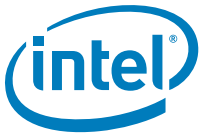
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.76 Input/Output Stream Descriptor x FIFO Limit (ISD3FIFOL)—Offset F4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.77 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD3BDLPLBA)—Offset F8h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.78 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD3BDLPUBA)—Offset FCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.79 Input/Output Stream Descriptor x Control (ISD4CTL)—Offset 100h

SRST bit is not affected by stream reset.

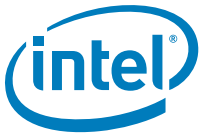
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.80 Input/Output Stream Descriptor x Status (ISD4STS)—Offset 103h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.81 Input/Output Stream Descriptor x Link Position in Buffer (ISD4LPIB)—Offset 104h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.82 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD4CBL)—Offset 108h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.83 Input/Output Stream Descriptor x Last Valid Index (ISD4LVI)—Offset 10Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.84 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD4FIFOW)—Offset 10Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

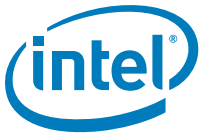
12.2.85 Input/Output Stream Descriptor x FIFO Size (ISD4FIFOS)—Offset 110h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.86 Input/Output Stream Descriptor x Format (ISD4FMT)—Offset 112h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.87 Input/Output Stream Descriptor x FIFO Limit (ISD4FIFOL)—Offset 114h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.88 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD4BDLPLBA)—Offset 118h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.89 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD4BDLPUBA)—Offset 11Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.90 Input/Output Stream Descriptor x Control (ISD5CTL)—Offset 120h

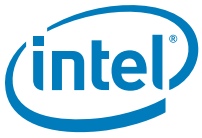
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.91 Input/Output Stream Descriptor x Status (ISD5STS)—Offset 123h

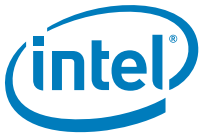
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.92 Input/Output Stream Descriptor x Link Position in Buffer (ISD5LPIB)—Offset 124h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.93 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD5CBL)—Offset 128h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.94 Input/Output Stream Descriptor x Last Valid Index (ISD5LVI)—Offset 12Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.95 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD5FIFOW)—Offset 12Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.96 Input/Output Stream Descriptor x FIFO Size (ISD5FIFOS)—Offset 130h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.97 Input/Output Stream Descriptor x Format (ISD5FMT)—Offset 132h

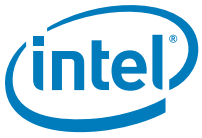
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.98 Input/Output Stream Descriptor x FIFO Limit (ISD5FIFOL)—Offset 134h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.99 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD5BDLPLBA)—Offset 138h

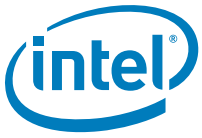
Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.



12.2.100 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD5BDLPUBA)—Offset 13Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.101 Input/Output Stream Descriptor x Control (ISD6CTL)—Offset 140h

SRST bit is not affected by stream reset.

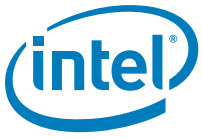
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.102 Input/Output Stream Descriptor x Status (ISD6STS)—Offset 143h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.103 Input/Output Stream Descriptor x Link Position in Buffer (ISD6LPIB)—Offset 144h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.104 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD6CBL)—Offset 148h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.105 Input/Output Stream Descriptor x Last Valid Index (ISD6LVI)—Offset 14Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.106 Input/Output Stream Descriptor x FIFO Eviction Watermark (ISD6FIFOW)—Offset 14Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

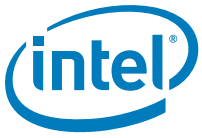
12.2.107 Input/Output Stream Descriptor x FIFO Size (ISD6FIFOS)—Offset 150h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.108 Input/Output Stream Descriptor x Format (ISD6FMT)—Offset 152h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.109 Input/Output Stream Descriptor x FIFO Limit (ISD6FIFOL)—Offset 154h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.110 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (ISD6BDLPLBA)—Offset 158h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.111 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (ISD6BDLPUBA)—Offset 15Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.112 Input/Output Stream Descriptor x Control (OSD0CTL)—Offset 160h

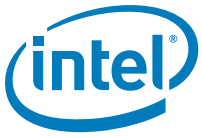
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.113 Input/Output Stream Descriptor x Status (OSD0STS)—Offset 163h

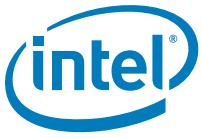
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.114 Input/Output Stream Descriptor x Link Position in Buffer (OSD0LPIB)—Offset 164h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.115 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD0CBL)—Offset 168h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.116 Input/Output Stream Descriptor x Last Valid Index (OSD0LVI)—Offset 16Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.117 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD0FIFOW)—Offset 16Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.118 Input/Output Stream Descriptor x FIFO Size (OSD0FIFOS)—Offset 170h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.119 Input/Output Stream Descriptor x Format (OSD0FMT)—Offset 172h

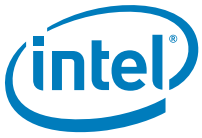
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.120 Input/Output Stream Descriptor x FIFO Limit (OSD0FIFOL)—Offset 174h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.121 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD0BDLPLBA)—Offset 178h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.122 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD0BDLPUBA)—Offset 17Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.123 Input/Output Stream Descriptor x Control (OSD1CTL)—Offset 180h

SRST bit is not affected by stream reset.

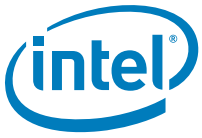
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.124 Input/Output Stream Descriptor x Status (OSD1STS)—Offset 183h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.125 Input/Output Stream Descriptor x Link Position in Buffer (OSD1LPIB)—Offset 184h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.126 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD1CBL)—Offset 188h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.127 Input/Output Stream Descriptor x Last Valid Index (OSD1LVI)—Offset 18Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.128 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD1FIFOW)—Offset 18Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

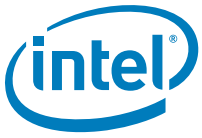
12.2.129 Input/Output Stream Descriptor x FIFO Size (OSD1FIFOS)—Offset 190h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.130 Input/Output Stream Descriptor x Format (OSD1FMT)—Offset 192h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.131 Input/Output Stream Descriptor x FIFO Limit (OSD1FIFOL)—Offset 194h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.132 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD1BDLPLBA)—Offset 198h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.133 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD1BDLPUBA)—Offset 19Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.134 Input/Output Stream Descriptor x Control (OSD2CTL)—Offset 1A0h

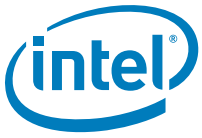
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.135 Input/Output Stream Descriptor x Status (OSD2STS)—Offset 1A3h

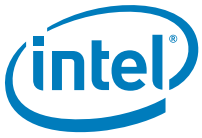
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.136 Input/Output Stream Descriptor x Link Position in Buffer (OSD2LPIB)—Offset 1A4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.137 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD2CBL)—Offset 1A8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.138 Input/Output Stream Descriptor x Last Valid Index (OSD2LVI)—Offset 1ACh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.139 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD2FIFOW)—Offset 1AEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.140 Input/Output Stream Descriptor x FIFO Size (OSD2FIFOS)—Offset 1B0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.141 Input/Output Stream Descriptor x Format (OSD2FMT)—Offset 1B2h

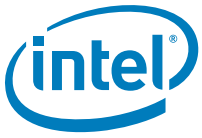
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.142 Input/Output Stream Descriptor x FIFO Limit (OSD2FIFOL)—Offset 1B4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.143 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD2BDLPLBA)—Offset 1B8h

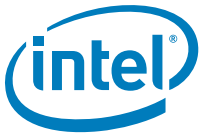
Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.



12.2.144 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD2BDLPUBA)—Offset 1BCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.145 Input/Output Stream Descriptor x Control (OSD3CTL)—Offset 1C0h

SRST bit is not affected by stream reset.

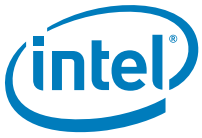
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.146 Input/Output Stream Descriptor x Status (OSD3STS)—Offset 1C3h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.147 Input/Output Stream Descriptor x Link Position in Buffer (OSD3LPIB)—Offset 1C4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.148 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD3CBL)—Offset 1C8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.149 Input/Output Stream Descriptor x Last Valid Index (OSD3LVI)—Offset 1CCh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.150 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD3FIFOW)—Offset 1CEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

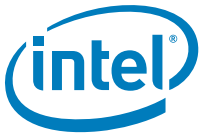
12.2.151 Input/Output Stream Descriptor x FIFO Size (OSD3FIFOS)—Offset 1D0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.152 Input/Output Stream Descriptor x Format (OSD3FMT)—Offset 1D2h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.153 Input/Output Stream Descriptor x FIFO Limit (OSD3FIFOL)—Offset 1D4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.154 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD3BDLPLBA)—Offset 1D8h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.155 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD3BDLPUBA)—Offset 1DCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.156 Input/Output Stream Descriptor x Control (OSD4CTL)—Offset 1E0h

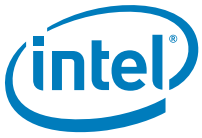
SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.157 Input/Output Stream Descriptor x Status (OSD4STS)—Offset 1E3h

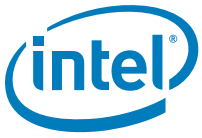
Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.158 Input/Output Stream Descriptor x Link Position in Buffer (OSD4LPIB)—Offset 1E4h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.159 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD4CBL)—Offset 1E8h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.160 Input/Output Stream Descriptor x Last Valid Index (OSD4LVI)—Offset 1ECh

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.161 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD4FIFOW)—Offset 1EEh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

12.2.162 Input/Output Stream Descriptor x FIFO Size (OSD4FIFOS)—Offset 1F0h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.163 Input/Output Stream Descriptor x Format (OSD4FMT)—Offset 1F2h

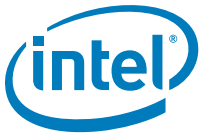
Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz



Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.164 Input/Output Stream Descriptor x FIFO Limit (OSD4FIFOL)—Offset 1F4h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.165 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD4BDLPLBA)—Offset 1F8h

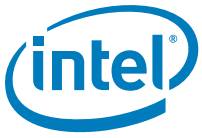
Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.



12.2.166 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD4BDLPUBA)—Offset 1FCh

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.167 Input/Output Stream Descriptor x Control (OSD5CTL)—Offset 200h

SRST bit is not affected by stream reset.

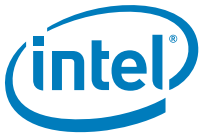
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RW/L	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across. Locked when GCAP.NSDO = 00b.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V/L	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GCAP2.EEAC = 0. If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

12.2.168 Input/Output Stream Descriptor x Status (OSD5STS)—Offset 203h

Register for Input/Output Stream Descriptor x Status.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
4	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
2	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.169 Input/Output Stream Descriptor x Link Position in Buffer (OSD5LPIB)—Offset 204h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.170 Input/Output Stream Descriptor x Cyclic Buffer Length (OSD5CBL)—Offset 208h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

12.2.171 Input/Output Stream Descriptor x Last Valid Index (OSD5LVI)—Offset 20Ch

Register for Input/Output Stream Descriptor x Last Valid Index.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**Last Valid Index (LVI):** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor, it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1, i.e., there must be at least two valid entries in the b uffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is '0'.

12.2.172 Input/Output Stream Descriptor x FIFO Eviction Watermark (OSD5FIFOW)—Offset 20Eh

Register for Input/Output Stream Descriptor x FIFO Eviction Watermark.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (for output) of data. The SoC HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description • 000-011 Reserved • 100 32 B Supported. The 32 B request is aligned to 32 B boundaries. • 101 64 B Supported. The 64 B request is aligned to 64 B boundaries. • 110-111 Reserved Input Stream: For input streams, the FIFOW value is determined by the EM3.ISRWS (SEM3.ISRWS) field. Output Stream: For output streams, the FIFOW value is determined by the EM4.OSRWS (SEM4.OSRWS) field.

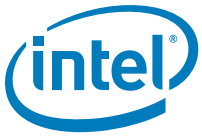
12.2.173 Input/Output Stream Descriptor x FIFO Size (OSD5FIFOS)—Offset 210h

Register for Input/Output Stream Descriptor x FIFO Size.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/V	**FIFO Size (FIFOS):** When GCAP2.EEAC = 0, indicates the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time. This is the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on the stream format programmed in (I/O)SDxFMT register, the min frame of buffering setting in EM(3/4)(SEM(3/4)).(I/O)SBSMFA[1:0] field, and the minimum buffer size threshold setting in EM2.BSMT[1:0] field. As the default value is zero, SW must write to the (I/O)SDxFMT register to kick off the FIFO size calculation, and read back to find out the HW allocated FIFO size. When GCAP2.EEAC = 1, this FIFOS value represent the minimum FIFO size HW required to operate efficiently. SW can program FIFOL register to extend the effective FIFO size in HW beyond this minimum value advertised. In this case, the maximum number of bytes that could be evicted (for input) or fetched (for output) by the controller at one time, the maximum number of bytes that may have been received into the HW buffer but not yet transferred out, and also the maximum possible value that the PICB count will increase by one time, all these maximum value could be larger than FIFOS value, depending on the FIFOL register setting. When EM2.HWFIFOL = 1, this FIFOS value will reflect the larger FIFO size of up to 10 ms, if extra buffer space is available.

12.2.174 Input/Output Stream Descriptor x Format (OSD5FMT)—Offset 212h

Register for Input/Output Stream Descriptor x Format.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW	**Sample Base Rate (BASE):** • 0: 48 kHz • 1: 44.1 kHz

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RW	**Sample Base Rate Multiple (MULT):** • 000: 48 kHz/44.1 kHz or less • 001: x2 (96 kHz, 88.2 kHz, 32 kHz) • 010: x3 (144 kHz) • 011: x4 (192 kHz, 176.4 kHz) • 100-111: Reserved
10:8	0h RW	**Sample Base Rate Divisor (DIV):** • 000: Divide by 1 (48 kHz, 44.1 kHz) • 001: Divide by 2 (24 kHz, 22.05 kHz) • 010: Divide by 3 (16 kHz, 32 kHz) • 011: Divide by 4 (11.025 kHz) • 100: Divide by 5 (9.6 kHz) • 101: Divide by 6 (8 kHz) • 110: Divide by 7 • 111: Divide by 8 (6 kHz)
7	0h RO	**Reserved (RSVD2):** Reserved.
6:4	0h RW	**Bits per Sample (BITS):** • 000: 8 bits. The data will be packed in memory in 8-bit containers on 16-bit boundaries • 001: 16 bits. The data will be packed in memory in 16-bit containers on 16-bit boundaries • 010: 20 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 011: 24 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.175 Input/Output Stream Descriptor x FIFO Limit (OSD5FIFOL)—Offset 214h

Register for Input/Output Stream Descriptor x FIFO Limit.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD1):** Reserved.
14	0h RW/L	**Granularity (GNL):** Granularity associated with LMT field definition. The LMT value needs to be multiplied with 125 us or 1 ms to get the access limit in time domain. • 0: 125 us • 1: 1 ms This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).
13:0	0h RW/L	**FIFO Limit (FIFOL):** Indicate how far the media player / application intend to process ahead, in units of time. HW can extend the effective FIFO size to fetch (for output stream) or evict (for input stream) more data in the cyclic buffer beyond the minimum FIFO size advertised in FIFOS register, up to this access limit. Need to multiply with the granularity (125 us vs. 1 ms) as defined in GNL bit, to get the actual processing ahead time. • 0 = Disabled (FIFOS is the limit) • 0001h 3FFFh = 1 16383 units When value) 0 (enabled), setting FIFOLC bit will trigger HW to evaluate the access limit change and update effective FIFO size (depending on the capability supported). SW shall make sure the FIFOL field is not changed in the progress of access limit change sequence. This bit is locked if GCAP2.EEAC = 0 (thus appear to be RO).

12.2.176 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address (OSD5BDLPLBA)—Offset 218h

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Lower Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Buffer Descriptor List Lower Base Address (BDLPLBA):** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted.
6:1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RO	Reserved.

12.2.177 Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address (OSD5BDLPUBA)—Offset 21Ch

Register for Input/Output Stream Descriptor x Buffer Descriptor List Pointer Upper Base Address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**Buffer Descriptor List Upper Base Address (BDLPUBA):** Upper 32-bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. Locked when GCAP.64OK = 0.

12.2.178 Global Time Synchronization Capability Header (GTSCH)—Offset 500h

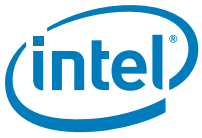
This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 11F00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.
27:16	1h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1.
15:0	1F00h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to DMA resume capability. Locked when FNCFG.BCLD = 1.



12.2.179 Global Time Synchronization Capability Declaration (GTSCD)—Offset 504h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD1):** Reserved.
2	0h RW/L	**Controller Based Synchronization Adjust Supported (CTLSAS):** When set, it indicates that the controller based synchronization adjustment is supported. By adjusting the global link clock which is used as reference clock for the codecs DAC / ADC, the codec will indirectly changing the rate of all its active streams. Locked when FNCFG.BCLD = 1.
1:0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.180 Global Time Synchronization Controller Adjust Control (GTSCTLAC)—Offset 50Ch

This register controls the fractional divider feature of the Audio PLL.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD1):** Reserved.
17	0h RW/L	**Strobe (STB):** SW set to 1 enables the Audio PLL latching in the EN bit and VAL field into the PLL CKT and reflect the new fractional divider state. SW must clear this bit to 0 after at least 200 ns to complete the strobe pulse sequence. For each strobing of a new fractional divider value, SW should wait for fractional divider settling time to reflect the new ppm value before initiating the next strobing of another new fractional divider value. Locked when GTSCD.CTLSAS = 0.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/L	**Enable (EN):** When set, it allows the fractional divider of the Audio PLL to operate, per the fractional value specified in VAL field. The value needs to be latched into the Audio PLL by pulsing the STB bit. Locked when GTSCD.CTLSAS = 0.
15	0h RW/L	**Direction (DIR):** Indicates the direction of the ppm shift adjustment. • 0: Positive direction. • 1: Negative direction. Locked when GTSCD.CTLSAS = 0.
14:0	0h RW/L	**Value (VAL):** Indicates the value of the fractional divider if enabled. Locked when GTSCD.CTLSAS = 0.

12.2.181 Global Time Synchronization Capture Control (GTSCC0)—Offset 520h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Time Stamp Counter Capture Done (TSCCD):** This bit is set when a valid TSC value has been captured: WALFCC, TSCCL, TSCCU, LLPFOC, LLPCL, and LLPCH contain valid data. The Intel HD Audio driver software must acknowledge the completion by writing 1 to clear this bit.
30	0h RW	**Time Stamp Counter Capture Done Interrupt Enable (TSCCDIE):** If set to 1, TSCCD bit can pass through to cause an interrupt status reported in INTSTS.CIS bit, and cause an interrupt to CPU if INTCTL.CIE = 1 and INTCTL.GIE = 1.
29:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/1S/V	**Time Stamp Counter Capture Initiate (TSCCI):** Write to 1 to initiate Global Time Synchronization capture for measuring TSC offset to local wall frame info. Cleared to 0 by hardware when the process is completed.
4:0	0h RW	**Capture DMA Select (CDMAS):** To select which DMA's LLPL, and LLPU value to be captured together with the TSC value. Bit 4 = 1 for ODMA, 0 for IDMA. Bit 3:0 indicates the respective DMA engine index. Programmed before TSCCI = 1.

12.2.182 Wall Frame Counter Captured (WALFCC0)—Offset 524h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO/V	**Frame Number (FN):** Indicates the 23-bit frame number captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.
8:0	0h RO/V	**Clock in Frame (CIF):** Indicates the 9-bit clock in frame value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.183 Time Stamp Counter Captured Lower (TSCCL0)—Offset 528h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Counter Captured Lower (CCL):** Indicates the lower 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.184 Time Stamp Counter Captured Upper (TSCCU0)—Offset 52Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Counter Captured Upper (CCU):** Indicates the upper 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.185 Linear Link Position Frame Offset Captured (LLPFOC0)—Offset 534h

This register is to report additional accuracy details for captures made in between of two updates of LLP values, in number of 48 KHz HD Audio frames of the corresponding link. Audio streams with 44.1 KHz base rate and non zero divider FMT value will skip frames periodically on the Intel HD Audio link and Intel iDisplay Audio link in order to normalize its sampling rate to the 48 KHz HD Audio frame rate; hence; the frame offset will be useful in these cases.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RO/V	**Frame Offset Captured (FOC):** When the LLPCL and LLPCU registers are updated, this field records the elapsed number of 48 KHz HD Audio frames since the last LLP value change. Valid and static when GTSCC.TSCCD = 1.

12.2.186 Linear Link Position Captured Lower (LLPCL0)—Offset 538h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Linear Link Position Captured Lower (LLPCL):** Indicates the lower 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCL value that is captured is the LLPL value at the previous HD Audio frame boundary, not the live LLPL register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

12.2.187 Linear Link Position Captured Upper (LLPCU0)—Offset 53Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Linear Link Position Captured Upper (LLPCU):** Indicates the upper 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCU value that is captured is the LLPU value at the previous HD Audio frame boundary, not the live LLPU register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

12.2.188 Global Time Synchronization Capture Control (GTSCC1)—Offset 540h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Time Stamp Counter Capture Done (TSCCD):** This bit is set when a valid TSC value has been captured: WALFCC, TSCCL, TSCCU, LLPFOC, LLPCL, and LLPCH contain valid data. The Intel HD Audio driver software must acknowledge the completion by writing 1 to clear this bit.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Time Stamp Counter Capture Done Interrupt Enable (TSCCDIE):** If set to 1, TSCCD bit can pass through to cause an interrupt status reported in INTSTS.CIS bit, and cause an interrupt to CPU if INTCTL.CIE = 1 and INTCTL.GIE = 1.
29:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/1S/V	**Time Stamp Counter Capture Initiate (TSCCI):** Write to 1 to initiate Global Time Synchronization capture for measuring TSC offset to local wall frame info. Cleared to 0 by hardware when the process is completed.
4:0	0h RW	**Capture DMA Select (CDMAS):** To select which DMA's LLPL, and LLPU value to be captured together with the TSC value. Bit 4 = 1 for ODMA, 0 for IDMA. Bit 3:0 indicates the respective DMA engine index. Programmed before TSCCI = 1.

12.2.189 Wall Frame Counter Captured (WALFCC1)—Offset 544h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

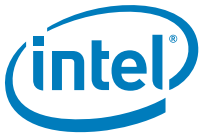
Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO/V	**Frame Number (FN):** Indicates the 23-bit frame number captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.
8:0	0h RO/V	**Clock in Frame (CIF):** Indicates the 9-bit clock in frame value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.190 Time Stamp Counter Captured Lower (TSCCL1)—Offset 548h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Counter Captured Lower (CCL):** Indicates the lower 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.191 Time Stamp Counter Captured Upper (TSCCU1)—Offset 54Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Counter Captured Upper (CCU):** Indicates the upper 32 bit TSC value captured as a result of Global Time Synchronization capture request. Valid and static when GTSCC.TSCCD = 1.

12.2.192 Linear Link Position Frame Offset Captured (LLPFOC1)—Offset 554h

This register is to report additional accuracy details for captures made in between of two updates of LLP values, in number of 48 KHz HD Audio frames of the corresponding link. Audio streams with 44.1 KHz base rate and non zero divider FMT value will skip frames periodically on the Intel HD Audio link and Intel iDisplay Audio link in order to normalize its sampling rate to the 48 KHz HD Audio frame rate; hence; the frame offset will be useful in these cases.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RO/V	**Frame Offset Captured (FOC):** When the LLPCL and LLPCU registers are updated, this field records the elapsed number of 48 KHz HD Audio frames since the last LLP value change. Valid and static when GTSCC.TSCCD = 1.

12.2.193 Linear Link Position Captured Lower (LLPCL1)—Offset 558h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Linear Link Position Captured Lower (LLPCL):** Indicates the lower 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCL value that is captured is the LLPL value at the previous HD Audio frame boundary, not the live LLPL register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

12.2.194 Linear Link Position Captured Upper (LLPCU1)—Offset 55Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Linear Link Position Captured Upper (LLPCU):** Indicates the upper 32 bit linear link position value of the link DMA captured as a result of Global Time Synchronization capture request. Note that the LLPCU value that is captured is the LLPU value at the previous HD Audio frame boundary, not the live LLPU register value which may be changing in the middle of the current frame. Valid and static when GTSCC.TSCCD = 1.

12.2.195 Software Position Based FIFO Capability Header (SPBFCH)—Offset 700h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.
27:16	4h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1.
15:0	0h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. This is the last capability in the linked list. Locked when FNCFG.BCLD = 1.

12.2.196 Software Position Based FIFO Control (SPBFCTL)—Offset 704h

The number of SPIBE bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table.
The x value is determined by the parameter equation: HSTISC + HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW	**Software Position in Buffer Enable (SPIBE):** When set to 1, the SPIB register is the limit where the DMA will not access beyond the value programmed. When clear to 0, the SPIB register is ignored and DMA will operate in legacy mode with the minimum FIFO size. Note that it is possible for SW to set this SPIBE bit after the RUN bit is set as SW may only update the SPIB after it fill up a large portion of the ring buffer. However, once set, it must remain set until SRST take place.

12.2.197 Input/Output Stream Descriptor x Software Position in Buffer (ISD0SPIB)—Offset 708h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.198 Input/Output Stream Descriptor x Max FIFO Size (ISD0MAXFIFOS)—Offset 70Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.199 Input/Output Stream Descriptor x Software Position in Buffer (ISD1SPIB)—Offset 710h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.200 Input/Output Stream Descriptor x Max FIFO Size (ISD1MAXFIFOS)—Offset 714h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.201 Input/Output Stream Descriptor x Software Position in Buffer (ISD2SPIB)—Offset 718h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.202 Input/Output Stream Descriptor x Max FIFO Size (ISD2MAXFIFOS)—Offset 71Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.203 Input/Output Stream Descriptor x Software Position in Buffer (ISD3SPIB)—Offset 720h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.204 Input/Output Stream Descriptor x Max FIFO Size (ISD3MAXFIFOS)—Offset 724h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.205 Input/Output Stream Descriptor x Software Position in Buffer (ISD4SPIB)—Offset 728h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.206 Input/Output Stream Descriptor x Max FIFO Size (ISD4MAXFIFOS)—Offset 72Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.207 Input/Output Stream Descriptor x Software Position in Buffer (ISD5SPIB)—Offset 730h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.208 Input/Output Stream Descriptor x Max FIFO Size (ISD5MAXFIFOS)—Offset 734h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.209 Input/Output Stream Descriptor x Software Position in Buffer (ISD6SPIB)—Offset 738h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

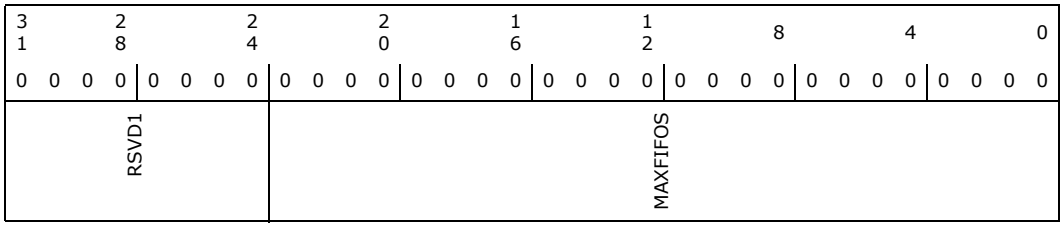
12.2.210 Input/Output Stream Descriptor x Max FIFO Size (ISD6MAXFIFOS)—Offset 73Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.211 Input/Output Stream Descriptor x Software Position in Buffer (OSD0SPIB)—Offset 740h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.212 Input/Output Stream Descriptor x Max FIFO Size (OSD0MAXFIFOS)—Offset 744h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.213 Input/Output Stream Descriptor x Software Position in Buffer (OSD1SPIB)—Offset 748h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.214 Input/Output Stream Descriptor x Max FIFO Size (OSD1MAXFIFOS)—Offset 74Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

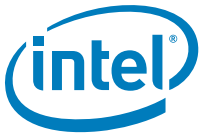
12.2.215 Input/Output Stream Descriptor x Software Position in Buffer (OSD2SPIB)—Offset 750h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.216 Input/Output Stream Descriptor x Max FIFO Size (OSD2MAXFIFOS)—Offset 754h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.217 Input/Output Stream Descriptor x Software Position in Buffer (OSD3SPIB)—Offset 758h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.218 Input/Output Stream Descriptor x Max FIFO Size (OSD3MAXFIFOS)—Offset 75Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

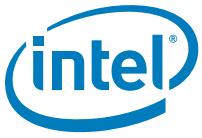
12.2.219 Input/Output Stream Descriptor x Software Position in Buffer (OSD4SPIB)—Offset 760h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.220 Input/Output Stream Descriptor x Max FIFO Size (OSD4MAXFIFOS)—Offset 764h

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.221 Input/Output Stream Descriptor x Software Position in Buffer (OSD5SPIB)—Offset 768h

This register specifies the current SW read (for input stream) or write (for output stream) location in the SW ring buffer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Software Position in Buffer (SPIB):** Indicates the number of bytes that SW has read from (for input stream) or write to (for output stream) the SW ring buffer. This register value should count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.222 Input/Output Stream Descriptor x Max FIFO Size (OSD5MAXFIFOS)—Offset 76Ch

Register for Input/Output Stream Descriptor x Max FIFO Size.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23:0	0h RO/V	**Max FIFO Size (MAXFIFOS):** Indicates the maximum FIFO size HW is able to buffer if SW allow through the use of SPIB register, hence reduce the interval of waking up the system to evict (for input) or fetch (for output) audio sample, achieving low power operation.

12.2.223 Processing Pipe Capability Header (PPCH)—Offset 800h

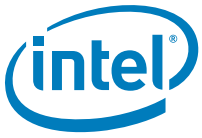
This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30500h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.



Bit Range	Default & Access	Field Name (ID): Description
27:16	3h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1.
15:0	500h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to Global Time Synchronization capability. Locked when FNCFG.BCLD = 1.

12.2.224 Processing Pipe Control (PPCTL)—Offset 804h

This register is not affected by stream reset.
Note that the PROCEN bit should only be modified when the corresponding host DMA and link DMA are idle, i.e. RUN bits are cleared, and the DMA contexts have been destroyed through SRST bits if it was previously activated.
Note that GPROCEN bit does not really enable or disable the Audio DSP operation, but mainly to workaround some legacy Intel HD Audio driver software such that if GPROCEN = 0, ADSPxBA (BAR2) is mapped to the Intel HD Audio memory mapped configuration registers, for complacency with some legacy SW implementation. If GPROCEN = 1, only then ADSPxBA (BAR2) is mapped to the actual Audio DSP memory mapped configuration registers.
The number of PROCEN bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table.
The x value is determined by the parameter equation: HSTISC + HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Processing Interrupt Enable (PIE):** Enables the general interrupt for the Audio DSP function. When set to 1 (and GIE is enabled), the Audio DSP generates an interrupt when the PIS bit gets set.
30	0h RW	**Global Processing Enable (GPROCEN):** When set to 1, it indicates that the Audio DSP is enabled for operation.
29:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW	**Processing Enable (PROCEN):** When set to 1 the DMA engine associated with this stream will be enabled to route the audio stream to DSP audio pipes in the Audio DSP for processing. When cleared to 0 the DMA engine associated with this stream will be bypassing the Audio DSP and route the audio stream directly to the audio link.

12.2.225 Processing Pipe Status (PPSTS)—Offset 808h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Processing Interrupt Status (PIS):** Status of general interrupt for the Audio DSP function. A 1 indicates that an interrupt condition occurred in the Audio DSP function. The exact cause can be determined by interrogating the ADSPIS register. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the interrupt status bits in ADSPIS register.
30:0	0h RO	**Reserved (RSVD1):** Reserved.

12.2.226 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC0LLPL)—Offset 810h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.227 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC0LLPU)—Offset 814h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.228 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC0LDPL)—Offset 818h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.229 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC0LDPU)—Offset 81Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.230 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC1LLPL)—Offset 820h

r

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

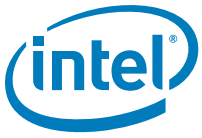
Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.231 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC1LLPU)—Offset 824h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.232 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC1LDPL)—Offset 828h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.233 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC1LDPU)—Offset 82Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.234 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC2LLPL)—Offset 830h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.235 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC2LLPU)—Offset 834h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.236 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC2LDPL)—Offset 838h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.237 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC2LDPU)—Offset 83Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.238 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC3LLPL)—Offset 840h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.239 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC3LLPU)—Offset 844h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.240 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC3LDPL)—Offset 848h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.241 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC3LDPU)—Offset 84Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.242 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC4LLPL)—Offset 850h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.243 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC4LLPU)—Offset 854h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

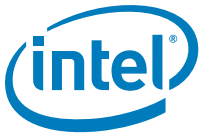
12.2.244 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (IPPHC4LDPL)—Offset 858h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.



12.2.245 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (IPPHC4LDPU)—Offset 85Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.246 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (IPPHC5LLPL)—Offset 860h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.247 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (IPPHC5LLPU)—Offset 864h

Access Method

Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.265 Input/Output Processing Pipe's Host Connection x Linear DMA Position Upper (OPPHC2LDPU)—Offset 8ACh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Offset Upper (LDPU):** Indicates the upper 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.266 Input/Output Processing Pipe's Host Connection x Linear Link Position Lower (OPPHC3LLPL)—Offset 8B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.267 Input/Output Processing Pipe's Host Connection x Linear Link Position Upper (OPPHC3LLPU)—Offset 8B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits relative linear link position value, w.r.t. to the associated processing pipe's link connection linear link position. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.268 Input/Output Processing Pipe's Host Connection x Linear DMA Position Lower (OPPHC3LDPL)—Offset 8B8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear DMA Position Lower (LDPL):** Indicates the lower 32 bits of the 64 bits linear DMA position value. Input Stream: For an input stream the 64 bits value is incremented when data is written to the SoC backbone. Output Stream: For an output stream the 64 bits value is incremented when a read completion is loaded into the DSP host gateway buffer. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.278 Input/Output Processing Pipe's Link Connection x Control (IPPLC0CTL)—Offset 8E0h

SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000: Reserved (Indicates Unused) • 0001: Stream 1 • ... • 1110: Stream 14 • 1111: Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000: Reserved (Indicates Unused) • 0001: Stream 1 • ... • 1110: Stream 14 • 1111: Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.309 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC0LLPU)—Offset 95Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.310 Input/Output Processing Pipe's Link Connection x Control (OPPLC1CTL)—Offset 960h

SRST bit is not affected by stream reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000: Reserved (Indicates Unused) • 0001: Stream 1 • ... • 1110: Stream 14 • 1111: Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream: When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this stream will be enabled to transfer data between FIFO and main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams, the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

The data will be packed in memory in 32-bit containers on 32-bit boundaries. • 100: 32 bits. The data will be packed in memory in 32-bit containers on 32-bit boundaries. • 101-111: Reserved
3:0	0h RW	**Number of Channels (CHAN):** Number of channels in each frame of the stream: • 0000: 1 • 0001: 2 • ... • 1111: 16

12.2.328 Input/Output Processing Pipe's Link Connection x Linear Link Position Lower (OPPLC5LLPL)—Offset 9A8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Lower (LLPL):** Indicates the lower 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

12.2.329 Input/Output Processing Pipe's Link Connection x Linear Link Position Upper (OPPLC5LLPU)—Offset 9ACh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Linear Link Position Upper (LLPU):** Indicates the upper 32 bits of the 64 bits linear link position value. The 64 bits linear link position value increments on every sample block being transferred over the audio link. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

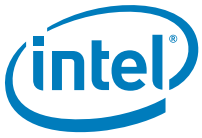
12.2.330 Multiple Links Capability Header (MLCH)—Offset C00h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20800h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.
27:16	2h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1.
15:0	800h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to Processing Pipe capability. Locked when FNCFG.BCLD = 1.

12.2.331 Multiple Links Capability Declaration (MLCD)—Offset C04h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD1):** Reserved.
3:0	1h RO	**Link Count (LCOUNT):** Indicates the number of links. Up to 15 links can be supported. A '0' indicates 1 link, and '1110' indicates 15 links. Note: '1111' is reserved. Note that this Link Count is the cumulative total number of links where the links can be heterogeneous. This field is hardcoded to parameter LNKC-1.

12.2.332 Link x Capabilities (LCAP0)—Offset C40h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Audio Link Type (ALT):** Indicates which Link Type this link belongs to. • 0001-1111: Reserved • 0000: Intel HD Audio Link Locked when FNCFG.BCLD = 1.
27:26	0h RO	**Reserved (RSVD1):** Reserved.
25:24	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. Locked when FNCFG.BCLD = 1.
23:6	0h RO	**Reserved (RSVD0):** Reserved.
5	0h RW/L	**192 MHz Supported (S192):** Indicates 192 MHz clock is supported. Locked when FNCFG.BCLD = 1.
4	0h RW/L	**96 MHz Supported (S96):** Indicates 96 MHz clock is supported. Locked when FNCFG.BCLD = 1.
3	0h RW/L	**48 MHz Supported (S48):** Indicates 48 MHz clock is supported. Locked when FNCFG.BCLD = 1.
2	1h RW/L	**24 MHz Supported (S24):** Indicates 24 MHz clock is supported. Locked when FNCFG.BCLD = 1.
1	1h RW/L	**12 MHz Supported (S12):** Indicates 12 MHz clock is supported. Locked when FNCFG.BCLD = 1.
0	1h RW/L	**6 MHz Supported (S6):** Indicates 6 MHz clock is supported. Locked when FNCFG.BCLD = 1.

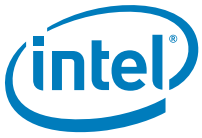
12.2.333 Link x Control (LCTL0)—Offset C44h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10002h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23	0h RO/V	**Current Power Active (CPA):** This value changes to the value set by SPA when the power of the link has reached that state. Software sets SPA, then monitors CPA to know when the link has changed state.
22:17	0h RO	**Reserved (RSVD2):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**Set Power Active (SPA):** Software sets this bit to '1' to turn the link on (provided CRSTB = 1), and clears it to '0' when it wishes to turn the link off. When CPA matches the value of this bit, the achieved power state has been reached. Software is expected to wait for CPA to match SPA before it can program SPA again. Any deviation may result in undefined behaviour.
15:8	0h RO	**Reserved (RSVD3):** Reserved.
7:4	0h RO/V	**Current Clock Frequency (CCF):** Indicates the current clock frequency. When SCF is changed, and the link has moved to the new frequency, CCF shall take SCF value.
3:0	2h RW	**Set Clock Frequency (SCF):** Indicates the frequency that software wishes the link to run at. Changing this value to a value not supported by Link Capabilities shall result in indeterminate results. The possible encodings are: Encoding | Frequency • 0000: 6 MHz • 0001: 12 MHz • 0010: 24 MHz • 0011: 48 MHz • 0100: 96 MHz • 0101: Reserved for 192 MHz • 0110-1111: Reserved When the frequency changes, CCF shall change to SCF, indicating to software that the frequency change occurred. Software is expected to wait for CCF to match SCF, indicating that the frequency change occurred.

12.2.334 Link x Output Stream ID Mapping Valid (LOSIDV0)—Offset C48h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFEh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD1):** Reserved.
15	1h RW	**Output Stream ID of 15 is Valid for this Link (L1OSIDV15):** This link will claim / forward output cycles with Stream ID = 1111b.
14	1h RW	**Output Stream ID of 14 is Valid for this Link (L1OSIDV14):** This link will claim / forward output cycles with Stream ID = 1110b.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW	**Output Stream ID of 13 is Valid for this Link (L1OSIDV13):** This link will claim / forward output cycles with Stream ID = 1101b.
12	1h RW	**Output Stream ID of 12 is Valid for this Link (L1OSIDV12):** This link will claim / forward output cycles with Stream ID = 1100b.
11	1h RW	**Output Stream ID of 11 is Valid for this Link (L1OSIDV11):** This link will claim / forward output cycles with Stream ID = 1011b.
10	1h RW	**Output Stream ID of 10 is Valid for this Link (L1OSIDV10):** This link will claim / forward output cycles with Stream ID = 1010b.
9	1h RW	**Output Stream ID of 9 is Valid for this Link (L1OSIDV9):** This link will claim / forward output cycles with Stream ID = 1001b.
8	1h RW	**Output Stream ID of 8 is Valid for this Link (L1OSIDV8):** This link will claim / forward output cycles with Stream ID = 1000b.
7	1h RW	**Output Stream ID of 7 is Valid for this Link (L1OSIDV7):** This link will claim / forward output cycles with Stream ID = 0111b.
6	1h RW	**Output Stream ID of 6 is Valid for this Link (L1OSIDV6):** This link will claim / forward output cycles with Stream ID = 0110b.
5	1h RW	**Output Stream ID of 5 is Valid for this Link (L1OSIDV5):** This link will claim / forward output cycles with Stream ID = 0101b.
4	1h RW	**Output Stream ID of 4 is Valid for this Link (L1OSIDV4):** This link will claim / forward output cycles with Stream ID = 0100b.
3	1h RW	**Output Stream ID of 3 is Valid for this Link (L1OSIDV3):** This link will claim / forward output cycles with Stream ID = 0011b.
2	1h RW	**Output Stream ID of 2 is Valid for this Link (L1OSIDV2):** This link will claim / forward output cycles with Stream ID = 0010b.
1	1h RW	**Output Stream ID of 1 is Valid for this Link (L1OSIDV1):** This link will claim / forward output cycles with Stream ID = 0001b.
0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.335 Link x SDI Identifier (LSDIID0)—Offset C4Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD1):** Reserved.
15	0h RO	**Reserved (RSVD):** Reserved.
14	0h RO	**SDI 14 (SDIID14):** This link uses SDI 14. This bit is hardcoded per parameter LSDIID14 assignment.
13	0h RO	**SDI 13 (SDIID13):** This link uses SDI 13. This bit is hardcoded per parameter LSDIID13 assignment.
12	0h RO	**SDI 12 (SDIID12):** This link uses SDI 12. This bit is hardcoded per parameter LSDIID12 assignment.
11	0h RO	**SDI 11 (SDIID11):** This link uses SDI 11. This bit is hardcoded per parameter LSDIID11 assignment.
10	0h RO	**SDI 10 (SDIID10):** This link uses SDI 10. This bit is hardcoded per parameter LSDIID10 assignment.
9	0h RO	**SDI 9 (SDIID9):** This link uses SDI 9. This bit is hardcoded per parameter LSDIID9 assignment.
8	0h RO	**SDI 8 (SDIID8):** This link uses SDI 8. This bit is hardcoded per parameter LSDIID8 assignment.
7	0h RO	**SDI 7 (SDIID7):** This link uses SDI 7. This bit is hardcoded per parameter LSDIID7 assignment.
6	0h RO	**SDI 6 (SDIID6):** This link uses SDI 6. This bit is hardcoded per parameter LSDIID6 assignment.
5	0h RO	**SDI 5 (SDIID5):** This link uses SDI 5. This bit is hardcoded per parameter LSDIID5 assignment.
4	0h RO	**SDI 4 (SDIID4):** This link uses SDI 4. This bit is hardcoded per parameter LSDIID4 assignment.
3	0h RO	**SDI 3 (SDIID3):** This link uses SDI 3. This bit is hardcoded per parameter LSDIID3 assignment.
2	0h RO	**SDI 2 (SDIID2):** This link uses SDI 2. This bit is hardcoded per parameter LSDIID2 assignment.
1	1h RO	**SDI 1 (SDIID1):** This link uses SDI 1. This bit is hardcoded per parameter LSDIID1 assignment.
0	1h RO	**SDI 0 (SDIID0):** This link uses SDI 0. This bit is hardcoded per parameter LSDIID0 assignment.

12.2.336 Link x Per Stream Output Overhead (LPSOO0)—Offset C50h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Per Stream Output Overhead (PSOO):** Indicates the SDO Output Overhead on a per stream basis. This does not include bandwidth used for command and control. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LOUTPAY) - (NumOfStreams * LPSOO).

12.2.337 Link x Per Stream Input Overhead (LPSIO0)—Offset C52h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Per Stream Input Overhead (PSIO):** Indicates the SDI Input Overhead on a per stream basis. This does not include bandwidth used for response. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LINPAY) - (NumOfStreams * LPSIO).

12.2.338 Link x Wall Frame Counter (LWALFC0)—Offset C58h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO/V	**Frame Number (FN):** 23-bit counter that is incremented when CIF rolls over from 499 to 0. This counter will roll over to zero with a period of approximately 174 seconds.

Bit Range	Default & Access	Field Name (ID): Description
8:0	0h RO/V	**Clock in Frame (CIF):** 9-bit counter that is incremented on each link BCLK period and rolls over from 499 to 0. This counter will roll over to zero with a period of 48 KHz HD Audio frame. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed.

12.2.339 Link x Output Payload Capability (LOUTPAY6M0)—Offset C60h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.340 Link x Output Payload Capability (LOUTPAY12M0)—Offset C62h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.341 Link x Output Payload Capability (LOUTPAY24M0)—Offset C64h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.342 Link x Output Payload Capability (LOUTPAY48M0)—Offset C66h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.343 Link x Output Payload Capability (LOUTPAY96M0)—Offset C68h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.344 Link x Output Payload Capability (LOUTPAY192M0)—Offset C6Ah

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

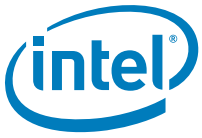
Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.345 Link x Input Payload Capability (LINPAY6M0)—Offset C70h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.346 Link x Input Payload Capability (LINPAY12M0)—Offset C72h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

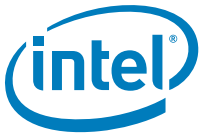
Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.347 Link x Input Payload Capability (LINPAY24M0)—Offset C74h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.348 Link x Input Payload Capability (LINPAY48M0)—Offset C76h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. 12.2.351 Link x Capabilities (LCAP1)—Offset C80h

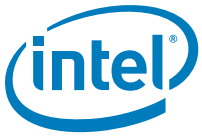
This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1Fh

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Audio Link Type (ALT):** Indicates which Link Type this link belongs to. • 0001-1111: Reserved • 0000: Intel HD Audio Link Locked when FNCFG.BCLD = 1.
27:26	0h RO	**Reserved (RSVD1):** Reserved.
25:24	0h RW/L	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. Locked when FNCFG.BCLD = 1.
23:6	0h RO	**Reserved (RSVD0):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/L	**192 MHz Supported (S192):** Indicates 192 MHz clock is supported. Locked when FNCFG.BCLD = 1.
4	1h RW/L	**96 MHz Supported (S96):** Indicates 96 MHz clock is supported. Locked when FNCFG.BCLD = 1.
3	1h RW/L	**48 MHz Supported (S48):** Indicates 48 MHz clock is supported. Locked when FNCFG.BCLD = 1.
2	1h RW/L	**24 MHz Supported (S24):** Indicates 24 MHz clock is supported. Locked when FNCFG.BCLD = 1.
1	1h RW/L	**12 MHz Supported (S12):** Indicates 12 MHz clock is supported. Locked when FNCFG.BCLD = 1.
0	1h RW/L	**6 MHz Supported (S6):** Indicates 6 MHz clock is supported. Locked when FNCFG.BCLD = 1.

12.2.352 Link x Control (LCTL1)—Offset C84h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10004h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1):** Reserved.
23	0h RO/V	**Current Power Active (CPA):** This value changes to the value set by SPA when the power of the link has reached that state. Software sets SPA, then monitors CPA to know when the link has changed state.
22:17	0h RO	**Reserved (RSVD2):** Reserved.
16	1h RW	**Set Power Active (SPA):** Software sets this bit to '1' to turn the link on (provided CRSTB = 1), and clears it to '0' when it wishes to turn the link off. When CPA matches the value of this bit, the achieved power state has been reached. Software is expected to wait for CPA to match SPA before it can program SPA again. Any deviation may result in undefined behaviour.
15:8	0h RO	**Reserved (RSVD3):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO/V	**Current Clock Frequency (CCF):** Indicates the current clock frequency. When SCF is changed, and the link has moved to the new frequency, CCF shall take SCF value.
3:0	4h RW	**Set Clock Frequency (SCF):** Indicates the frequency that software wishes the link to run at. Changing this value to a value not supported by Link Capabilities shall result in indeterminate results. The possible encodings are: Encoding | Frequency • 0000: 6 MHz • 0001: 12 MHz • 0010: 24 MHz • 0011: 48 MHz • 0100: 96 MHz • 0101: Reserved for 192 MHz • 0110-1111: Reserved When the frequency changes, CCF shall change to SCF, indicating to software that the frequency change occurred. Software is expected to wait for CCF to match SCF, indicating that the frequency change occurred.

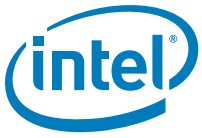
12.2.353 Link x Output Stream ID Mapping Valid (LOSIDV1)—Offset C88h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFEh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD1):** Reserved.
15	1h RW	**Output Stream ID of 15 is Valid for this Link (L1OSIDV15):** This link will claim / forward output cycles with Stream ID = 1111b.
14	1h RW	**Output Stream ID of 14 is Valid for this Link (L1OSIDV14):** This link will claim / forward output cycles with Stream ID = 1110b.
13	1h RW	**Output Stream ID of 13 is Valid for this Link (L1OSIDV13):** This link will claim / forward output cycles with Stream ID = 1101b.
12	1h RW	**Output Stream ID of 12 is Valid for this Link (L1OSIDV12):** This link will claim / forward output cycles with Stream ID = 1100b.
11	1h RW	**Output Stream ID of 11 is Valid for this Link (L1OSIDV11):** This link will claim / forward output cycles with Stream ID = 1011b.



Bit Range	Default & Access	Field Name (ID): Description
10	1h RW	**Output Stream ID of 10 is Valid for this Link (L1OSIDV10):** This link will claim / forward output cycles with Stream ID = 1010b.
9	1h RW	**Output Stream ID of 9 is Valid for this Link (L1OSIDV9):** This link will claim / forward output cycles with Stream ID = 1001b.
8	1h RW	**Output Stream ID of 8 is Valid for this Link (L1OSIDV8):** This link will claim / forward output cycles with Stream ID = 1000b.
7	1h RW	**Output Stream ID of 7 is Valid for this Link (L1OSIDV7):** This link will claim / forward output cycles with Stream ID = 0111b.
6	1h RW	**Output Stream ID of 6 is Valid for this Link (L1OSIDV6):** This link will claim / forward output cycles with Stream ID = 0110b.
5	1h RW	**Output Stream ID of 5 is Valid for this Link (L1OSIDV5):** This link will claim / forward output cycles with Stream ID = 0101b.
4	1h RW	**Output Stream ID of 4 is Valid for this Link (L1OSIDV4):** This link will claim / forward output cycles with Stream ID = 0100b.
3	1h RW	**Output Stream ID of 3 is Valid for this Link (L1OSIDV3):** This link will claim / forward output cycles with Stream ID = 0011b.
2	1h RW	**Output Stream ID of 2 is Valid for this Link (L1OSIDV2):** This link will claim / forward output cycles with Stream ID = 0010b.
1	1h RW	**Output Stream ID of 1 is Valid for this Link (L1OSIDV1):** This link will claim / forward output cycles with Stream ID = 0001b.
0	0h RO	**Reserved (RSVD2):** Reserved.

12.2.354 Link x SDI Identifier (LSDIID1)—Offset C8Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD1):** Reserved.

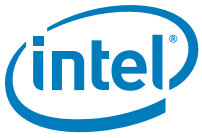
Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD):** Reserved.
14	0h RO	**SDI 14 (SDIID14):** This link uses SDI 14. This bit is hardcoded per parameter LSDIID14 assignment.
13	0h RO	**SDI 13 (SDIID13):** This link uses SDI 13. This bit is hardcoded per parameter LSDIID13 assignment.
12	0h RO	**SDI 12 (SDIID12):** This link uses SDI 12. This bit is hardcoded per parameter LSDIID12 assignment.
11	0h RO	**SDI 11 (SDIID11):** This link uses SDI 11. This bit is hardcoded per parameter LSDIID11 assignment.
10	0h RO	**SDI 10 (SDIID10):** This link uses SDI 10. This bit is hardcoded per parameter LSDIID10 assignment.
9	0h RO	**SDI 9 (SDIID9):** This link uses SDI 9. This bit is hardcoded per parameter LSDIID9 assignment.
8	0h RO	**SDI 8 (SDIID8):** This link uses SDI 8. This bit is hardcoded per parameter LSDIID8 assignment.
7	0h RO	**SDI 7 (SDIID7):** This link uses SDI 7. This bit is hardcoded per parameter LSDIID7 assignment.
6	0h RO	**SDI 6 (SDIID6):** This link uses SDI 6. This bit is hardcoded per parameter LSDIID6 assignment.
5	0h RO	**SDI 5 (SDIID5):** This link uses SDI 5. This bit is hardcoded per parameter LSDIID5 assignment.
4	0h RO	**SDI 4 (SDIID4):** This link uses SDI 4. This bit is hardcoded per parameter LSDIID4 assignment.
3	0h RO	**SDI 3 (SDIID3):** This link uses SDI 3. This bit is hardcoded per parameter LSDIID3 assignment.
2	1h RO	**SDI 2 (SDIID2):** This link uses SDI 2. This bit is hardcoded per parameter LSDIID2 assignment.
1	0h RO	**SDI 1 (SDIID1):** This link uses SDI 1. This bit is hardcoded per parameter LSDIID1 assignment.
0	0h RO	**SDI 0 (SDIID0):** This link uses SDI 0. This bit is hardcoded per parameter LSDIID0 assignment.

12.2.355 Link x Per Stream Output Overhead (LPSOO1)—Offset C90h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Per Stream Output Overhead (PSOO):** Indicates the SDO Output Overhead on a per stream basis. This does not include bandwidth used for command and control. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LOUTPAY) - (NumOfStreams * LPSOO).

12.2.356 Link x Per Stream Input Overhead (LPSIO1)—Offset C92h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Per Stream Input Overhead (PSIO):** Indicates the SDI Input Overhead on a per stream basis. This does not include bandwidth used for response. This measurement is in byte quantities per 48 kHz frame. Software calculates available link bandwidth in bytes with the following formula: (2 * LINPAY) - (NumOfStreams * LPSIO).

12.2.357 Link x Wall Frame Counter (LWALFC1)—Offset C98h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO/V	**Frame Number (FN):** 23-bit counter that is incremented when CIF rolls over from 499 to 0. This counter will roll over to zero with a period of approximately 174 seconds.

Bit Range	Default & Access	Field Name (ID): Description
8:0	0h RO/V	**Clock in Frame (CIF):** 9-bit counter that is incremented on each link BCLK period and rolls over from 499 to 0. This counter will roll over to zero with a period of 48 KHz HD Audio frame. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed.

12.2.358 Link x Output Payload Capability (LOUTPAY6M1)—Offset CA0h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.359 Link x Output Payload Capability (LOUTPAY12M1)—Offset CA2h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] | Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] | Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.360 Link x Output Payload Capability (LOUTPAY24M1)—Offset CA4h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link at a given frequency. This does not include bandwidth used for command and control. 12.2.365 Link x Input Payload Capability (LINPAY12M1)—Offset CB2h

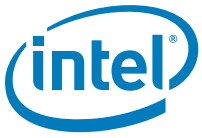
Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.366 Link x Input Payload Capability (LINPAY24M1)—Offset CB4h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

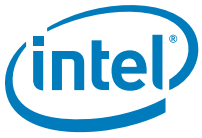
Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Offset | Frequency Encoding | Frequency • 40h+(40h*x) + 20h[15:0] | 6 MHz | 40h+(40h*x) + 28h[15:0] Reserved for 96 MHz • 40h+(40h*x) + 22h[15:0] | 12 MHz | 40h+(40h*x) + 2Ah[15:0] Reserved for 192 MHz • 40h+(40h*x) + 24h[15:0] | 24 MHz • 40h+(40h*x) + 26h[15:0] | Reserved for 48 MHz The audio bus driver queries this lookup register & LPSOO to derive the potential net output bandwidth before deciding whether to switch frequency.

12.2.367 Link x Input Payload Capability (LINPAY48M1)—Offset CB6h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link at a given frequency. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. Reset value is dependent on the default clock frequency specified in parameter DEFLOUTPAY[x*96+95:x*96]. 12.2.370 DMA Resume Capability Header (DRSMCH)—Offset 1F00h

This register resides in Primary well (always on), or resides in Primary well (gated-controller) with state retention, and reset by platform reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 50700h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**Capability Version (VER):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.
27:16	5h RW/L	**Capability Identifier (ID):** This field is an Intel HD Audio Specification defined ID number that indicates the nature and format of the capability. Locked when FNCFG.BCLD = 1.
15:0	700h RW/L	**Next Capability Pointer (PTR):** This field contains the offset to the next capability structure or 000h if no other items exist in the linked list of capabilities. Point to SW position based FIFO capability. Locked when FNCFG.BCLD = 1.

12.2.371 DMA Resume Control (DRSMCTL)—Offset 1F04h

The number of RSM bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the parameter equation: HSTISC + HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW/1S/V	**Resume (RSM):** This field is an Intel HD Audio Specification defined version number that indicates the version of the capability structure present. Locked when FNCFG.BCLD = 1.

12.2.372 DMA Position in Buffer Resume (ISD0DPIBR)—Offset 1F08h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

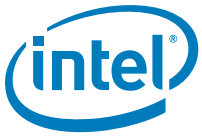
12.2.373 DMA Position in Buffer Resume (ISD1DPIBR)—Offset 1F10h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.374 DMA Position in Buffer Resume (ISD2DPIBR)—Offset 1F18h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.375 DMA Position in Buffer Resume (ISD3DPIBR)—Offset 1F20h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.376 DMA Position in Buffer Resume (ISD4DPIBR)—Offset 1F28h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.377 DMA Position in Buffer Resume (ISD5DPIBR)—Offset 1F30h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.378 DMA Position in Buffer Resume (ISD6DPIBR)—Offset 1F38h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

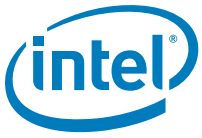
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.379 DMA Position in Buffer Resume (OSD0DPIBR)—Offset 1F40h

This register specifies the DPIB resume position.

Access Method



Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.380 DMA Position in Buffer Resume (OSD1DPIBR)—Offset 1F48h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.381 DMA Position in Buffer Resume (OSD2DPIBR)—Offset 1F50h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.382 DMA Position in Buffer Resume (OSD3DPIBR)—Offset 1F58h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.383 DMA Position in Buffer Resume (OSD4DPIBR)—Offset 1F60h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.384 DMA Position in Buffer Resume (OSD5DPIBR)—Offset 1F68h

This register specifies the DPIB resume position.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DMA Position in Buffer Resume (DPIBR):** Indicates the DPIB resume position when DRSMCTL.RSM bit is set. Note that SW must program this register before setting the RUN bit.

12.2.385 Wall Clock Alias (WLCLKA)—Offset 2030h

This register is shadowed from the WALCLK register. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Wall Clock Counter Alias (WALCLK):** This is an alias of the WALCK register. 32-bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition for this counter is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed, and reports the link 0 wall clock value.

12.2.386 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD0LPIBA)—Offset 2084h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.387 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD1LPIBA)—Offset 20A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.388 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD2LPIBA)—Offset 20C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

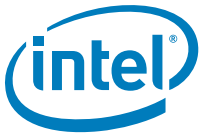
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.389 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD3LPIBA)—Offset 20E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.390 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD4LPIBA)—Offset 2104h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.391 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD5LPIBA)—Offset 2124h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.392 Input Stream Descriptor 0 Link Position in Buffer Alias (ISD6LPIBA)—Offset 2144h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

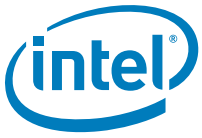
12.2.393 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD0LPIBA)—Offset 2164h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.394 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD1LPIBA)—Offset 2184h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.395 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD2LPIBA)—Offset 21A4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.396 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD3LPIBA)—Offset 21C4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.397 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD4LPIBA)—Offset 21E4h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

12.2.398 Input Stream Descriptor 0 Link Position in Buffer Alias (OSD5LPIBA)—Offset 2204h

These registers are shadowed from the (I/O)SD(x/y)LPIB registers. Please refer to the corresponding section for register details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Link Position in Buffer Alias (LPIB):** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds.

13 Power Management Controller (PMC)

13.1 Registers Summary

Table 13-1. Summary of ACPI CR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Power Management 1 Status and Enable (PM1_STS_EN)—Offset 0h	0h
4h	7h	Power Management 1 Control (PM1_CNT)—Offset 4h	0h
8h	Bh	Power Management 1 Timer (PM1_TMR)—Offset 8h	0h
20h	23h	General Purpose Event 0 Status (GPE0a_STS)—Offset 20h	0h
24h	27h	General Purpose Event 0 Status (GPE0b_STS)—Offset 24h	0h
28h	2Bh	General Purpose Event 0 Status (GPE0c_STS)—Offset 28h	0h
2Ch	2Fh	General Purpose Event 0 Status (GPE0d_STS)—Offset 2Ch	0h
30h	33h	General Purpose Event 0 Enables (GPE0a_EN)—Offset 30h	0h
34h	37h	General Purpose Event 0 Enable (GPE0b_EN)—Offset 34h	0h
38h	3Bh	General Purpose Event 0 Enable (GPE0c_EN)—Offset 38h	0h
3Ch	3Fh	General Purpose Event 0 Enable (GPE0d_EN)—Offset 3Ch	0h
40h	43h	SMI Control and Enable (SMI_EN)—Offset 40h	2h
44h	47h	SMI Status Register (SMI_STS)—Offset 44h	0h
4Ch	4Fh	Device Trap Status (DEVTRAP_STS)—Offset 4Ch	0h
50h	53h	General Purpose Event Control (GPE_CTRL)—Offset 50h	0h
60h	63h	TCO Reload Register (TCO_RLD)—Offset 60h	0h
64h	67h	TCO Timer Status (TCO_STS)—Offset 64h	0h
68h	6Bh	TCO Timer Control (TCO1_CNT)—Offset 68h	0h
70h	73h	TCO Timer Register (TCO_TMR)—Offset 70h	40000h
74h	77h	Advanced Power Management Status (APM_STS)—Offset 74h	0h
78h	7Bh	Advanced Power Management Control Port (APM_CNT)—Offset 78h	0h
7Ch	7Fh	Direct IRQ Enables (DIRECT_IRQ_EN)—Offset 7Ch	0h
200h	203h	"PCI Configuration Control 1 Register(PCICFGCTR1)—Offset 200h"	100h
204h	207h	"PCI Configuration Control 2 Register(PCICFGCTR2)—Offset 204h"	100h

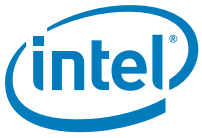
13.1.1 Power Management 1 Status and Enable (PM1_STS_EN)—Offset 0h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (reserved4):** Reserved.
30	0h RW	**PCI Express Wake Disable (pciexp_wake_dis):** This bit is a scratchbit. The value written can be read back but there is not functionality behind the bit. Windows and Linux have confirmed that they dont use this bit but require it to save and return the written state. Historical reference only: This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit reset_type=Resume Well Reset#
29	0h RO	**Reserved**
28:27	0h RO	**Reserved (reserved5):** Reserved.
26	0h RW/V	**RTC Alarm Enable (rtc_en):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit: RTC_EN | SCI_EN | Effect when RTC_STS is set 0 | x | No SMI# or SCI. If system was in S1-S5, no wake even occurs. 1 | 0 | SMI#. If system was in S1-S5, then a wake event occurs before the SMI#. 1 | 1 | SCI. If system was in S1-S5, then a wake event occurs before the SCI. Note: To clarify, If rtc_en is set and and RTC_STS gets set during S0/S0ix and SCI/SMI will be sent depending on the state of SCI_EN and GBL_SMI_EN. In addition to being reset by SRTCRST_B assertion (on the removal of coin battery), PMC also clears this bit due to emergency shutdown events: - Power button override - CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
25	0h RO	**Reserved (reserved6):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V	**Power Button Enable (pwrbtn_en):** This bit is the power button enable. It works in conjunction with these bits: PWRBTN_EN | SCI_EN | Effect when PWRBTN_STS is set 0 | x | No SMI#, SCI or S0ix wake. 1 | 0 | SMI# and an S0ix wake. 1 | 1 | SCI and an S0ix wake. Note: PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as an SX Wake event. reset_type=Resume Well Reset#. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
23:22	0h RO	**Reserved (reserved7):** Reserved.
21	0h RW	**Global Enable (gbl_en):** The global enable bit. When both the GBL_EN and the GBL_STS are set, PMC generates an SCI. This field is reset on cold boot, cold reset, and warm reset, and Sx. On architectures that support a host partition reset this bit is reset on PMU_PLTRST_B. pltrst_b is the physical pin on the board. It's driven at the same time as host_prim_rst_b.
20:17	0h RO	**Reserved (reserved8):** Reserved.
16	0h RO	**Reserved**
15	0h RW/1C/V	**Wake Status (wak_sts):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Wake event occurs. Upon setting this bit, the PMC will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case This is based on discussions with Microsoft. That behavior is not in the ACPI spec. According to ACPI spec 5.0 If the system does not support the S1 sleeping state, the WAK_STS bit can always return zero. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. On older SOCs this bit is reset on RSMRST_B

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO	**Reserved: PCI Express Wake Status (rsvd_pciexp_wake_sts):** Reference only: This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pins (PMU_WAKE_B, PCI_WAKE1_B, PCI_WAKE2_B, PCI_WAKE3_B) being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If one of the WAKE# pins is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain Power Management active (i.e. all inputs to this bit are level sensitive). Note: This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake. reset_type = earlybootside_rst, (global_rst_b when arch available.)
13	0h RO	**Reserved: USB clockless Wake Status (rsvd_usb_clkless_sts):** Reference only: This bit is set by hardware to indicate that the system woke due to change in USB serial lines. This bit is set independent of the USB_CLKLESS_EN bit. Software writes a 1 to clear this bit. This field is reset on Global Reset.
12	0h RO	**Reserved (rsvd):** Reserved.
11	0h RW/1C/V	**Power Button Override (pwrbtnor_sts):** This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds- These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. This bit is not affected by hard resets via CF9h writes, and is not reset by RSMRST_B. Thus, this bit is preserved through power failures. Note that this bit is still asserted when the global SCI_EN is set to '1' then an SCI will be generated. reset_type=SRTCRST_B (on the removal of coin battery). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
10	0h RW/1C/V	**RTC Status (rtc_sts):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. On older SOCs this bit is reset on RSMRST_B.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**Reserved (reserved1):** Reserved.
8	0h RW/1C/V	**Power Button Status (pwrbtn_sts):** This bit is set when the PMU_PWRBTN_B signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If the PMU_PWRBTN_B signal is held low for more than 4 seconds, the PMC clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PMU_PWRBTN_B is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PMU_PWRBTN_B pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PMU_PWRBTN_B signal must go inactive and active again to set the PWRBTN_STS bit. Note that the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Power Button Override, which includes clearing this bit. reset_type=RSMRST_B. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. On older SOCs this bit is reset on RSMRST_B.
7:6	0h RO	**Reserved (reserved2):** Reserved.
5	0h RW/1C/V	**Global Status (gbl_sts):** This bit is set when an SCI is generated due to the BIOS wanting the attention of theSCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. This field is reset on cold boot, cold reset, warm reset, global reset, and Sx. On architectures that support a host partition reset this bit is reset on PMU_PLTRST_B. pltrst_b is the physical pin on the board. It's driven at the same time as host_prim_rst_b.
4:1	0h RO	**Reserved (rserved3):** Reserved.
0	0h RO	**Reserved: Timer Overflow Status (rsvd_tmrof_sts):** Reference only: This is the timer overflow status bit. This bit gets set anytime bit 22 of the 24 bit timer goes low (bits are counted from 0 to 23). This will occur every 2.3435 seconds. See TMROF_EN for the effect when TMROF_STS goes active. Software clears this bit by writing a 1 to it. This field is reset on cold boot, cold reset, warm reset, global reset, and Sx. On architectures that support a host partition reset this bit is reset on PMU_PLTRST_B. pltrst_b is the physical pin on the board. It's driven at the same time as host_prim_rst_b.

13.1.2 Power Management 1 Control (PM1_CNT)—Offset 4h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

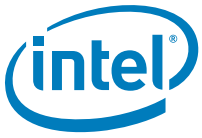
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (rsvd):** Reserved.
13	0h WO	**Sleep Enable (slp_en):** This is a write-only bit and reads to it always return a zero. Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field.
12:10	0h RW/V	**Sleep Type (slp_typ):** This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. Bits | Mode | Typical Mapping 000 | ON | S0 001 | Reserved 010 | Reserved 011 | Reserved 100 | Reserved 101 | Suspend-To-RAM | S3 110 | Suspend-To-Disk | S4 111 | Soft Off | S5 This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
9:3	0h RO	**Reserved (reserved1):** Reserved.
2	0h WO	**Global RLS (gbl_rls):** This bit is used by the ACPI software to raise an event to the BIOS software. BIOS software has a corresponding enable and status bits to control its ability to receive ACPI events. This bit always reads as 0.
1	0h RW	**BM RLD (bm_rld):** This bit is treated as a scratch pad bit. Reset: cold boot, cold reset, warm reset, and Sx.
0	0h RW	**SCI Enable (sci_en):** Selects the SCI interrupt or the SMI# for various events. When this bit is 1, then the events will generate an SCI interrupt. When this bit is 0, these events will generate an SMI#. Reset: cold boot, cold reset, warm reset, and Sx.

13.1.3 Power Management 1 Timer (PM1_TMR)—Offset 8h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (rsvd):** Reserved.
23:0	0h RO	**Reserved**

13.1.4 General Purpose Event 0 Status (GPE0a_STS)—Offset 20h

Note: This register is symmetrical to the General Purpose Event 0a Enable Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the PMC will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the PMC will also generate an SCI if the SCI_EN bit is set, or an SMI# if the SCI_EN bit is not set. This register should not be reset by CF9 write. reset_type=RSMRST_B
This register is reset on RSM_RST_N de-assertion. This register is not reset on cold reset, warm reset, and Sx.

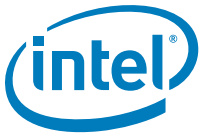
Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

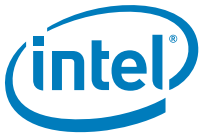
Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (rsvd31):** Reserved.
17	0h RW/1C/V	**SATA PME Status (sata_pme_sts):** This bit will be set to 1 by the PMC when SATA asserts its PME wire signal. Additionally, if the SATA_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the SATA _PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/1C/V	**SMBUS Wake Status (smb_wak_sts):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the SoC SMBus logic (SMBALERT# signal going active). Notes: 1. The SMBus controller will independently cause an SMI message so this bit does not need to do so (unlike the other bits in this register). 2. This bit is set by the SMBus slave command 01h (Wake/SMI#) even when the system is in the S0 state. Therefore, to avoid an instant wake on subsequent transitions to sleep states, software must clear this bit after each reception of the Wake/SMI# command or just prior to entering the sleep state. Note: This is a TCO Slave Write initiated function and not supported in the SoC. 3. The SMBALERT_STS bit (D31:F3:I/O Offset 00h:bit 5) should be cleared . This is not applicable to the SoC where the SMBUS alert wire is a no-connect. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
15	0h RW/1C/V	**GPIO Tier1 SCI Status (gpio_tier1_sci_sts):** This bit is a logical OR of sci_wake wires from tier 1 GPIO's. Additionally, if the GPIO_TIER1_SCI_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the GPIO_TIER1_SCI_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. If the GPIO_TIER1_SCI_EN is set this bit is a SX and S0ix wake source. There may be additional PMU wake mask bits for SX and SOix wakes. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
14	0h RW/1C/V	**AVS PME Status (avs_pme_sts):** This bit will be set to 1 by the PMC when AVS asserts its PME wire signal. Additionally, if the AVS_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the AVS_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
13	0h RW/1C/V	**USB XHCI PME Status (xhci_pme_sts):** This bit will be set to 1 by the PMC when USB XHCI asserts its PME wire signal. Additionally, if the XHCI_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the XHCI_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.



Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/1C/V	**USB XDCI PME Status (xdci_pme_sts):** This bit will be set to 1 by the PMC when USB XDCI asserts its PME wire signal. Additionally, if the XDCI_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the XDCI_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
11	0h RW/1C/V	**CSE PME Message Status (cse_pme_sts):** This bit will be set to 1 by the PMC when CSE sends Assert_PME message to PMC. Additionally, if the CSE_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the CSE_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
10	0h RW/1C/V	**Battery Low Status (batlow_sts):** This bit will be set to 1 by hardware when the PMU_BATLOW_B signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
9	0h RW/1C/V	**PCIE GPE Message Status (pcie_gpe_sts):** This bit will be set to 1 by hardware to indicate that the PMC received an Assert_GPE message from one or more of the PCI-Express Ports. The GPE messages represents a PME event message from one or more of the PCI-Express Ports. Software attempts to clear this bit by writing a 1 to this bit position. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the level triggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
8	0h RW/1C/V	**PCI Express Wake3 Status (pcie_wake3_sts):** This bit is set by hardware to indicate that the pci_wake3_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake3_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C/V	**PCI Express Wake2 Status (pcie_wake2_sts):** This bit is set by hardware to indicate that the pci_wake2_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake2_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
6	0h RW/1C/V	**PCI Express Wake1 Status (pcie_wake1_sts):** This bit is set by hardware to indicate that the pci_wake1_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake1_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
5	0h RO	**Reserved (rsvd5):** Reserved.
4	0h RW/1C/V	**PUNIT SCI status (punit_sci_sts):** This bit will be set if the Power Management Unit requests SCI or and SMI if PUNIT_SCI_EN and !SCI_EN and GBL_SMI_EN is set. This bit is cleared by writing a 1 to this bit position. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
3	0h RW/1C/V	**PCI Express Wake0 Status (pcie_wake0_sts):** This bit is set by hardware to indicate that the pci_wake0_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake0_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
2	0h RW/1C/V	**Software GPE Status (swgpe_sts):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
1	0h RO	**Reserved (rsvd):** Reserved.
0	0h RW/1C/V	**PCIE SCI Message Status (pcie_sci_sts):** This bit will be set to 1 by the PMC when Pcie sends Assert_SCI message to PMC. Additionally, if the pcie_sci_en and sci_en bits are set, and the system is in an S0 state, then the setting of the pcie_sci_sts bit will generate an SCI (or SMI# if sci_en is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. Note: TAG field of Assert_SCI message is ignored. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.



13.1.5 General Purpose Event 0 Status (GPE0b_STS)—Offset 24h

Note: This register is symmetrical to the General Purpose Event 0b Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw1 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 1 (gpe0b_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw1.

13.1.6 General Purpose Event 0 Status (GPE0c_STS)—Offset 28h

Note: This register is symmetrical to the General Purpose Event 0c Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw2 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 2 (gpe0c_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw2.

13.1.7 General Purpose Event 0 Status (GPE0d_STS)—Offset 2Ch

Note: This register is symmetrical to the General Purpose Event 0d Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw3 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 3 (gpe0d_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw3.

13.1.8 General Purpose Event 0 Enables (GPE0a_EN)—Offset 30h

Note: This register is symmetrical to the General Purpose Event 0a Status Register.reset_type=Resume Well Reset#.
This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.

Access Method

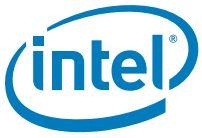
Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (rsvd31):** Reserved.
17	0h RW	**SATA PME Enable (sata_pme_en):** Enables the setting of the SATA_PME_STS bit to generate a wake event and/or an SCI or SMI#. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
16	0h RW/V	**SMBUS WAKE Enable (smb_wak_en):** Enables the setting of the SMB_WAK_STS bit to generate a wake event BUT NOT an SCI or SMI#. SMB_WAK is a special case in that it cannot cause an SCI or SMI. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B, (on the removal of coin battery) Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**GPIO Tier1 SCI Enable (gpio_tier1_sci_en):** Enables the setting of the GPIO_TIER1_SCI_STS bit to generate a wake event and/or an SCI or SMI#. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
14	0h RW/V	**AVS PME Enable (avs_pme_en):** Enables the setting of the AVS PME STS bit to generate a wake event and/or an SCI or SMI#. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
13	0h RW/V	**USB XHCI PME Enable (xhci_pme_en):** Enables the setting of the XHCI_PME_STS bit to generate a wake event and/or an SCI or SMI#. reset_type = SRTCRST_B - (on the removal of coin battery), Power button override, or CPU thermal trip, when arch available and relevant. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
12	0h RW/V	**USB XDCI PME Enable (xdci_pme_en):** Enables the setting of the XDCI_PME_STS bit to generate a wake event and/or an SCI or SMI#. reset_type = SRTCRST_B (on the removal of coin battery), Power button override, or CPU thermal trip, when arch available and relevant. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
11	0h RW	**CSE PME Message Enable (cse_pme_en):** Enables the setting of the CSE_PME_EN bit to generate a wake event and/or an SCI or SMI#.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V	**Battery Low Enable (batlow_en):** This bit enables the PMU_BATLOW_B signal to cause an SMI# or SCI (depending on the SCI_EN bit) when it goes low.This bit does not prevent the PMU_BATLOW_B signal from inhibiting the wake event. On desktop platforms this pin should be tied high to ensure proper functionality. In addition to being reset by SRTCRST_B assertion, the PMC also clears this bit due to certain events: - Power button override. - CPU thermal trip reset_type=SRTCRST_B (on the removal of coin battery). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
9	0h RW	**PCIE GPE Message Enable (pcie_gpe_en):** Enables the PMC to cause an SCI or SMI when the PCIE_GPE_STS bit is set. This is used to allow the PCI Express ports to cause an SCI or SMI due to pmc receiving an Assert_GPE from PCIE0 or PCIE1. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
8	0h RW/V	**PCI Express Wake3 Enable (pcie_wake3_en):** This bit, when set to 1, enables the PCIE_WAKE3_STS to to cause an SCI. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B, (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
7	0h RW/V	**PCI Express Wake2 Enable (pcie_wake2_en):** This bit, when set to 1, enables the PCIE_WAKE2_STS to to cause an SCI. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B, (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
6	0h RW/V	**PCI Express Wake1 Enable (pcie_wake1_en):** This bit, when set to 1, enables the PCIE_WAKE1_STS to to cause an SCI. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B, (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
5	0h RO	**Reserved (rsvd5):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**PUnit SCI Enable (punit_sci_en):** This bit enables the corresponding PUNIT_SCI_STS bit being set to cause an SCI and/or wake event.
3	0h RW/V	**PCI Express Wake0 Enable (pcie_wake0_en):** This bit, when set to 1, enables the PCIE_WAKE0_STS to to cause an SCI. On platforms that support an on-die RTC well, this field is reset on SRTCRST_B, (on the removal of coin battery). Additionally on those platforms where this affects SX wake events the PMC must clear this field on powerbutton and CPU thermal trip. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
2	0h RW	**Software GPE Enable (swgpe_en):** This bit, when set to 1, enables the SW GPE function. If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input). If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated. If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1 then an SMI# will be generated.
1	0h RO	**Reserved (rsvd):** Reserved.
0	0h RW	**PCIE SCI Message Enable (pcie_sci_en):** Enables the setting of the PCIE_SCI_EN bit to generate a wake event and/or an SCI or SMI#. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.

13.1.9 General Purpose Event 0 Enable (GPE0b_EN)—Offset 34h

Note: This register is symmetrical to the General Purpose Event 0b Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw1 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 1 (gpe0b_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw1.

13.1.10 General Purpose Event 0 Enable (GPE0c_EN)—Offset 38h

Note: This register is symmetrical to the General Purpose Event 0c Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw2 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 2 (gpe0c_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw2.

13.1.11 General Purpose Event 0 Enable (GPE0d_EN)—Offset 3Ch

Note: This register is symmetrical to the General Purpose Event 0d Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw3 register configuration.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

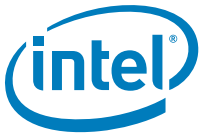
Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 3 (gpe0d_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw3.

13.1.12 SMI Control and Enable (SMI_EN)—Offset 40h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 2h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (rsvd):** Reserved.
27	0h RW	**OCP Fabric and CSE SMI Enable (ocp_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set. This enables SMI logic for two sources: the PMC OCP fabric (via the PMC IOSF2OCP bridge) and CSE. This is reset on cold boot, cold reset, warm reset, and Sx.
26	0h RW	**SPI SMI Enable (spi_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
25	0h RW	**SPI SSMI Enable (spi_ssmi_en):** Enables SMI logic to cause Sync SMI if gbl_smi_en is set.
24:22	0h RO	**Reserved (reserved24_22):** Reserved.
21	0h RW	**SCC2 SMI Enable (scc2_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
20	0h RW	**PCIE SMI Enable (pcie_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set. This is reset on cold boot, cold reset, warm reset, and Sx.
19	0h RW	**SCS SMI Enable (scs_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
18	0h RW	**Host SMBUS SMI Enable (host_smbus_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
17	0h RW	**XHCI SMI Enable (xhci_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
16	0h RW	**SMBUS SMI Enable (smbus_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
15	0h RW	**SERIRQ SMI Enable (serirq_smi_en):** Enables SMI logic to cause Sync SMI if gbl_smi_en is set.
14	0h RW	**Periodic Enable (periodic_en):** Setting this bit will cause the PMC to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register.
13	0h RW/L	**TCO Enable (tco_en):** When set, enables the TCO logic to generate SMI#. When cleared, disables TCO logic generating an SMI#. Note: This bit cannot be written once the TCO_LOCK bit is set. This prevents unauthorized software from disabling the generation of TCO-based SMIs.
12	0h RW	**MCSMI Enable (mcsmi_en):** Software sets this bit to 1 to enables SoC to trap access to the microcontroller range (62h or 66h). A 'trapped' cycles will be claimed by SoC, but not forwarded to LPC. An SMI# will also be generated.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/1S	**GPIO Unlock SSMI EN (gpio_unlock_ssmi_en):** Enables SSMI logic to cause SSMI if gbl_smi_en is set and parallel STS bit is set. Once written to '1', this bit can only be cleared by the reset condition for this bit. Reset on cold boot, cold reset, warm reset, and Sx. On architectures that support partitioned resets this bit is reset on the host reset (host_prim_rst_b).
10	0h RW	**GPIO SMI Enable (gpio_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
9:8	0h RO	**Reserved (reserved5):** Reserved.
7	0h WO	**BIOS RLS (bios_rls):** Enables the generation of an SCI interrupt for ACPI software when a one is written to this bit position by BIOS software. This bit always reads a zero. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
6	0h RW	**Software SMI Timer Enable (swsmi_tmr_en):** Software sets this bit to a 1 to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0.
5	0h RW	**APMC Enable (apmc_en):** If set, this enables writes to the APM register to cause an SMI#.
4	0h RW	**SMI On Sleep Enable (smi_on_slp_en):** If this bit is set, the PMC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the PMC will not put the system to a sleep state. This allows the SMI# handler work around chip-level bugs. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.
3	0h RW	**Legacy USB Enable (legacy_usb_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
2	0h RW	**BIOS Enable (bios_en):** Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.
1	1h RW/1S/V	**End of SMI (eos):** SMI handler sets this bit when it finishes handling the SMI. Setting this bit will force the PMC internal SMI request to zero for 1 clock.Thus if the internal SMI request is still asserted due to new SMI trigger and SMI_ACK was received for the previous SMI, a new SMI will be sent. Hardware clears this bit, SW/FW sets.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Global SMI Enable (gbl_smi_en):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. If this bit is not set, no SMI# will be generated.Note: When the SMI_LOCK bit is set, this bit cannot be changed. On architectures that support a host partition reset this bit is reset on PMU_PLTRST_B. pltrst_b is the physical pin on the board. It's driven at the same time as host_prim_rst_b. The SoC does not have a host partition reset.

13.1.13 SMI Status Register (SMI_STS)—Offset 44h

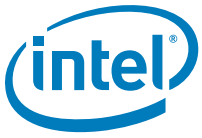
Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (rsvd):** Reserved.
27	0h RW/1C/V	**PMC OCP Fabric and CSE SMI Status (ocp_smi_sts):** This bit will be set if PMC OCP fabric (via PMC IOSF2OCP bridge) or CSE request an SMI#. Writing a '1' to this bit position clears this bit to '0'. This bit is overloaded to include CSE SMI in addition to PMC OCP fabric SMI in order to implement CSE SMI support with minimal hardware impact, due to the late addition of this support. Because this status bit is overloaded for multiple sources, the SMI handler must disambiguate between OCP and CSE sources. This can be done by: (1) Read ocp_smi_sts, store the result and clear ocp_smi_sts. (2) Read PMC OCP fabric and CSE status registers to determine if one or both of the sources requested an SMI. This is reset on cold boot, cold reset, warm reset, and Sx.
26	0h RW/1C/V	**SPI SMI Status (spi_smi_sts):** This bit will be set when the SPI logic is requesting an SMI#.
25	0h RW/1C/V	**SPI SSMI Status (spi_ssmi_sts):** This bit will be set when the SPI logic is requesting an Sync SMI#. The FW controlled ACPI_CTL.SPI_SSMI_CTRL bit acts as a rising edge input to this bit. SSMI is a FW flow in the SoC. Host clears this bit.
24:22	0h RO	**Reserved (reserved2):** Reserved.
21	0h RW/1C/V	**SCC2 SMI Status (scc2_smi_sts):** This bit will be set if SCC2 unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW/1C/V	**PCIE_SMI Status (pcie_smi_sts):** PCIE SMI event occurred. Set with Assert_SMI from PCIE0 or PCIE1. Writing a '1' to this bit position clears this bit to '0' SoC does not support Hot Plug Event. This is reset on cold boot, cold reset, warm reset, and Sx.
19	0h RW/1C/V	**SCS SMI Status (scs_smi_sts):** This bit will be set if SCS unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
18	0h RW/1C/V	**Host SMBUS SMI Status (host_smbus_smi_sts):** The PMC sets this bit to 1 to indicate that the SMI# was triggered when Host initiated SMBUS transaction encounters failure such as device error or bus collision or upon the completion of a valid transaction on the bus but with SMBUS SIP SMB_SMI_EN = 1. Further clarification of the cause of this SMI should be queried from SMBUS IPs HOST STATUS register. PMC sets this bit on receiving an SMI message with tag 0x1.
17	0h RW/1C/V	**USB XHCI SMI Status (xhci_smi_sts):** This bit will be set when the USB logic is requesting an SMI#.
16	0h RW/1C/V	**SMBUS SMI Status (smbus_smi_sts):** The PMC sets this bit to 1 to indicate that the SMI# was caused by: 1. The SMBUS Slave receiving a message that an SMI# should be caused. This implies that the PMC received an SMI message from SMBUS with tag 0x3. Note: This is a TCO Slave Write initiated function and not supported in the SoC. 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared. This implies that the PMC received an SMI message from SMBUS with tag 0x2. 3. The SMBUS Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set. Where HOST_NOTIFY_INTREN is available via the SMBUS IP not in the PMC. This implies that the PMC received an SMI message from SMBUS with tag 0x2. 4. The SMBUS Slave receiving a SMI in S0 message. This implies that the PMC received an SMI message from SMBUS with tag 0x2. Note: This is a TCO Slave Write initiated function and not supported in the SoC This bit is sticky. It is cleared by writing a 1 to this bit position. Note that this bit is set from the 64 KHz clock domain used by the SMBUS. Software must wait at least 15.63 microseconds
15	0h RW/1C/V	**SERIRQ SMI Status (serirq_smi_sts):** 1: Indicates the SMI# was caused by the SERIRQ decoder. This implies that the PMC received an SMI message from LPC. 0: SMI# not caused by SERIRQ decoder. This bit will remain 1 until the software writes a 1 to this bit.
14	0h RW/1C/V	**Periodic Status (periodic_sts):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the PMC will generate an SMI#. This bit is cleared by writing a 1 to this bit position.



Bit Range	Default & Access	Field Name (ID): Description
13	0h RW/1C/V	**TCO Status (tco_sts):** Indicates SMI was caused by the TCO logic. This bit is cleared by writing a 1 to this bit position, Causes would be: 1. Century rollover from SMBUS. Not applicable in the SoC. This functionality comes from the RTC. 2. TCO_TMR 1st & 2nd expiration in PMC. 3. OS writes to TCO_DAT_IN register. Sent to PMC as a SMI message with tag 0x0 from SMBUS. 4. NMI occurred and mapped to SMI. Sent to PMC as a SMI message with not tag from ITSS. 5. INTRUDER# signal goes active. Wire to the PMC from SMBUS. 6. Illegal attempt to write to BIOS located in the FWH accessed over LPC. Sent to PMC as a SMI msg with tag 0x0 from SMBUS. 7. Changes of BC.WPD (Write Protect Disable) bit from 0 to 1. Sent to PMC as an SyncSMI message with tag 0x1 from LPC.
12	0h RW/1C/V	**Microcontroller SMI Status (mcsmi_sts):** This bit is set if there is an access to the power management microcontroller range (62h or 66h). If this bit is set, and the MCSMI_EN bit is also set, the SoC will generate an SMI#. This bit is set by hardware and cleared by software writing a 1 to its bit position. This bit will be set when the LPC logic is requesting an Sync SMI# with tag 0x0. The FW controlled ACPI_CTL.MCSMI_CTRL bit acts as a rising edge input to this bit. SSMI is a FW flow in the SoC.
11	0h RW/1C/V	**GPIO Unlock SSMI STS (gpio_unlock_ssmi_sts):** This bit will be set if the GIO registers lockdown logic is requested an SSMI. Writing a '1' to this bit position clears this bit to '0'.
10	0h RW/1C/V	**GPIO SMI STS (gpio_smi_sts):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted. GPIOs that are not routed to cause an SMI will have no effect on this bit.
9	0h RO	**Reserved**
8	0h RO	**Reserved**
7	0h RO	**Reserved (reserved4):** Reserved. No corresponding status bit to BIOS_RLS.
6	0h RW/1C/V	**Software SMI Timer Status (swsmi_tmr_sts):** This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit.
5	0h RW/1C/V	**Advanced Power Management Status (apm_sts):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position. Reset on cold boot, cold reset, warm reset, and Sx. On architectures that support a partitioned resets this bit is reset on the host reset (host_prim_rst_b).
4	0h RW/1C/V	**SMI ON SLP EN Status (smi_on_slp_en_sts):** This bit will be set by the PMC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**Legacy USB Status (legacy_usb_sts):** Logical OR of each of the SMI status bits in the USB Legacy Keybd Register in the LPC IP ANDed with the corresponding enable bits in the LPC IP. SMI_EN.LEGACY_USB_EN must be set for this bit to cuase and SMI. This bit is cleared by writing a 1 to this bit position. This bit will be set when the LPC logic is requesting an Sync SMI# with tag 0x2. The FW controlled ACPI_CTL.LEGACY_USB_CTRL bit acts as a rising edge input to this bit. SSMI is a FW flow in the SoC.
2	0h RW/1C/V	**BIOS Status (bios_sts):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position.
1:0	0h RO	**Reserved (reserved7):** Reserved.

13.1.14 Device Trap Status (DEVTRAP_STS)—Offset 4Ch

Each bit indicates if an access has occurred to the corresponding device's trap range or for bits 6:9 if the corresponding PCI interrupt is active. Write 1 to the same bit position to clear it. This register is used by APM power management software to see if there has been system activity. The periodic SMI# timer indicates if it is the right time to read the DEVTRAP_STS register.

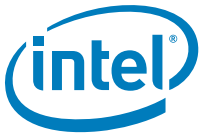
On architectures that support a host partition reset this register is reset on host_prim_rst_b. The SoC does not have a host partition reset.
This is reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd16):** Reserved.
15:13	0h RO	**Reserved (rsvd15):** Reserved.
12	0h RW/1C/V	**Device Trap Status Bit 12 (d12_trp_sts):** KBC (60/64h)
11:6	0h RO	**Reserved (rsvd11):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/1C/V	**Device Trap Status Bit 5 (d5_trp_sts):** This will be set if any of the following are accessed (as determined by the I/O ranges in the LPC decoder (even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC.
4:0	0h RO	**Reserved (rsvd4):** Reserved.

13.1.15 General Purpose Event Control (GPE_CTRL)—Offset 50h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (rsvd):** Reserved.
17	0h RW	**Software General Purpose Event Control (swgpe_ctrl):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0a_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0. This is reset on cold boot, cold reset, warm reset, and Sx.
16:0	0h RO	**Reserved (reserved1):** Reserved.

13.1.16 TCO Reload Register (TCO_RLD)—Offset 60h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (rsvd):** Reserved.
9:0	0h RO/V	**TCO Timer Value (tco_val):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

13.1.17 TCO Timer Status (TCO_STS)—Offset 64h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (reserved2):** Reserved.
17	0h RW/1C/V	**Second Timeout Status (second_to_sts):** PMC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the PMC will reboot the system after the second timeout. The reboot is done by interrupting the Arc and starting a reset flow based on the OS_POLICY. This bit is only cleared by writing a 1 to this bit or by a reset. On some prior platforms, this field is reset on RSMRST_B, a reset signal based on a RSMRST# pin that indicates the suspend/ resume voltages are stable. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
16:4	0h RO	**Reserved (reserved1):** Reserved.
3	0h RW/1C/V	**TCO Timeout (tco_timeout):** Bit set to 1 by PMC to indicate that the SMI was caused by TCO timer reaching 0. Reset: On cold boot, cold reset, warm reset, and Sx.
2:0	0h RO	**Reserved (rsvd):** Reserved.

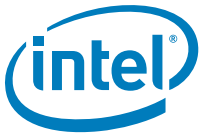
13.1.18 TCO Timer Control (TCO1_CNT)—Offset 68h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (rsvd):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**OS Policy (os_policy):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00: Boot normally 01: Shut down 10: Don't load OS. Hold in pre-boot state and use LAN to determine next step. 11: Reserved Reset on RSM_RST_N de-assertion only.
19:13	0h RO	**Reserved (reserved2):** Reserved.
12	0h RW/L	**TCO Lock (tco_lock):** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it cannot be cleared by software writing a 0 to this bit location. Reset is required to change this bit from 1 to 0. This bit defaults to 0. On some prior platforms, this field is reset on cold reset. This is reset on cold boot, cold reset, warm reset, and Sx.
11	0h RW	**TCO Timer Halt (tco_tmr_halt):** 1: The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0: The TCO timer is enabled to count. This is the default. This is reset on cold boot, cold reset, warm reset, and Sx.
10:0	0h RO	**Reserved (reserved1):** Reserved.

13.1.19 TCO Timer Register (TCO_TMR)—Offset 70h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (reserved1):** Reserved.
25:16	4h RW	**TCO Timer Reload Value (tco_trld_val):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. Note: The timer has an error of +/- 1 tick (0.6s). The TCO Timer will only count down in the S0 and S0IX state.
15:0	0h RO	**Reserved (rsvd):** Reserved.

13.1.20 Advanced Power Management Status (APM_STS)—Offset 74h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Advanced Power Management Status Port (apm_sts):** Used to pass data between the OS and the SMI handler. Basically, this is a scratch pad register and is not effected by any other register or function (other reset). Writes can come through ACPI register writes or from IO Port write to port 0xB3. On architectures that support a host partition reset this bit is reset on a host partition reset. This is reset on cold boot, cold reset, warm reset, and Sx.
23:0	0h RO	**Reserved (rsvd):** Reserved.

13.1.21 Advanced Power Management Control Port (APM_CNT)—Offset 78h

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (reserved0):** Reserved.
23:16	0h RW	**Advanced Power Management Control Port (apm_cnt):** Used to pass an APM command between the OS and the SMI handler. Writes to this bit field not only store data in the APMC register, but also generates an SMI# when the APMC_EN bit is set. Writes can come through ACPI register writes or from IO Port write to port 0xB2. On architectures that support a host partition reset this bit is reset on a host partition reset. This is reset on cold boot, cold reset, warm reset, and Sx.
15:0	0h RO	**Reserved (reserved1):** Reserved.

13.1.22 Direct IRQ Enables (DIRECT_IRQ_EN)—Offset 7Ch

This register is reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (reserved0):** Reserved.
9	0h RW	**Direct IRQ Enable for PMIC (pmic_en):** This bit enables generation of De/AssertIRQn message based on SVID's interrupt signal (which reflects PMIC's alert signal). The resulting De/AssertIRQn will have an IRQ vector, as programmed in the corresponding GCR.IRQ_SEL_0/1/2 field.
8	0h RW	**Direct IRQ Enable for XHCI (xhci_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on XHCI's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
7	0h RW	**Direct IRQ Enable for XDCI (xdci_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on XDCI's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
6	0h RW	**Reserved**
5	0h RW	**Direct IRQ Enable for SCC (sdcard_cd_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on SCC's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
4	0h RW	**Direct IRQ Enable for SCC (sdcard_d1_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on SCC's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field. Usage of this bit is not supported on the SoC because of the capabilities in the SCC IP.
3	0h RW	**Direct IRQ Enable for UART[3] (uart3_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
2	0h RW	**Direct IRQ Enable for UART[2] (uart2_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Direct IRQ Enable for UART[1] (uart1_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
0	0h RW	**Direct IRQ Enable for UART[0] (uart0_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.

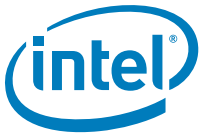
13.1.23 PCI Configuration Control 1 Register(PCICFGCTR1)—Offset 200h

Controls the PCI configuration space

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:29	RO	0x0 (rst)	**Reserved0** Reserved
28:28	RW	0x0 (rst)	**DIS_PCI_IDLE_CAP1**
27:20	RW	0x0 (rst)	**PCI_IRQ1** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	RW	0x0 (rst)	**ACPI_IRQ1** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	RW	0x1 (rst)	**IPIN1** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7:7	RW	0x0 (rst)	**BAR1_DISABLE1** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	RW	0x0 (rst)	**PME_Support1** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1:1	RW	0x0 (rst)	**ACPI_INTR_EN1** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0:0	RW	0x0 (rst)	**PCI_CFG_DIS1** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported



13.1.24 PCI Configuration Control 2 Register(PCICFGCTR2)—Offset 204h

Controls the PCI configuration space

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:29	RO	0x0 (rst)	**Reserved0** Reserved
28:28	RW	0x0 (rst)	**DIS_PCI_IDLE_CAP2**
27:20	RW	0x0 (rst)	**PCI_IRQ2** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	RW	0x0 (rst)	**ACPI_IRQ2** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	RW	0x1 (rst)	**IPIN2** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7:7	RW	0x0 (rst)	**BAR1_DISABLE2** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	RW	0x0 (rst)	**PME_Support2** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1:1	RW	0x0 (rst)	**ACPI_INTR_EN2** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0:0	RW	0x0 (rst)	**PCI_CFG_DIS2** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

13.1.25 PCI Configuration Control 3 Register(PCICFGCTR3)—Offset 208h

Controls the PCI configuration space

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:29	RO	0x0 (rst)	**Reserved0** Reserved
28:28	RW	0x0 (rst)	**DIS_PCI_IDLE_CAP3**
27:20	RW	0x0 (rst)	**PCI_IRQ3** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	RW	0x0 (rst)	**ACPI_IRQ3** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	RW	0x1 (rst)	**IPIN3** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7:7	RW	0x0 (rst)	**BAR1_DISABLE3** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	RW	0x0 (rst)	**PME_Support3** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1:1	RW	0x0 (rst)	**ACPI_INTR_EN3** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0:0	RW	0x0 (rst)	**PCI_CFG_DIS3** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

13.2 Registers Summary

This space contains registers for use by the BIOS for configuring PMC behavior.

Table 13-2. Summary of GCR CR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1000h	1003h	Power and Reset Status (PRSTS)—Offset 1000h	0h
1008h	100Bh	PM CFG - Power Management Configuration (PMC_CFG)—Offset 1008h	0h
100Ch	100Fh	Power Management Configuration (PMC_CFG2)—Offset 100Ch	0h
1010h	1013h	SOC Power Management Status (SOC_PM_STS)—Offset 1010h	0h
1020h	1023h	General PM Configuration 1 (GEN_PMCON1)—Offset 1020h	4004h

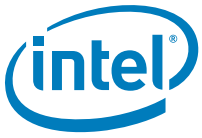


Table 13-2. Summary of GCR CR Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1024h	1027h	General PM Configuration 2 (GEN_PMCON2)—Offset 1024h	3800h
1028h	102Bh	General PM Configuration 3 (GEN_PMCON3)—Offset 1028h	0h
1030h	1033h	Configured Revision ID (CRID)—Offset 1030h	0h
1034h	1037h	Function Disable 0 (FUNC_DIS_0)—Offset 1034h	0h
1038h	103Bh	Function Disable 1 (FUNC_DIS_1)—Offset 1038h	0h
1048h	104Bh	Extended Test Mode Register (ETR)—Offset 1048h	18000h
1050h	1053h	GPIO Group to General Purpose Event Register Configuration (GPIO_GPE_CFG)—Offset 1050h	6300h
1064h	1067h	IRQ Select 0 (IRQ_SEL_0)—Offset 1064h	0h
1068h	106Bh	IRQ Select 1 (IRQ_SEL_1)—Offset 1068h	0h
106Ch	106Fh	IRQ Select 2 (IRQ_SEL_2)—Offset 106Ch	0h
1070h	1073h	Function ACPI Enumeration 0 (FUNC_ACPI_ENUM_0)—Offset 1070h	0h
1074h	1077h	Function ACPI Enumeration 1 (FUNC_ACPI_ENUM_1)—Offset 1074h	0h
1078h	107Bh	Fixed Deep S0Ix Counter Lower 32 Bits (TELEM_DEEP_S0IX_LO_HOST)—Offset 1078h	0h
107Ch	107Fh	Fixed Deep S0Ix Counter Upper 32 Bits (TELEM_DEEP_S0IX_HI_HOST)—Offset 107Ch	0h
1080h	1083h	Fixed Shallow S0Ix Counter Lower 32 Bits (TELEM_SHALLOW_S0IX_LO_HOST)—Offset 1080h	0h
1084h	1087h	Fixed Shallow S0Ix Counter Upper 32 Bits (TELEM_SHALLOW_S0IX_HI_HOST)—Offset 1084h	0h
1088h	108Bh	Reserved (TELEM_MISC_FIXED_LO_HOST)—Offset 1088h	0h
108Ch	108Fh	Reserved register for sharing data with software upper 32 bits (TELEM_MISC_FIXED_HI_HOST)—Offset 108Ch	0h
1090h	1093h	Scratchpad for sharing data between BIOS and PMC Firmware (BIOS_SCRATCHPAD)—Offset 1090h	0h
1094h	1097h	Display Hot Plug Detect Control (DISPLAY_HPD_CTL)—Offset 1094h	F0h
10C8h	10CBh	OBFF Control and Status (OBFF_CTL_STS)—Offset 10C8h	6450280Fh
10CCh	10CFh	Lock Register (LOCK)—Offset 10CCh	0h

13.2.1 Power and Reset Status (PRSTS)—Offset 1000h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well is down, they are marked as suspend well bits. All suspend well bits in this register are reset by global reset#.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:16	0h RO	**Reserved**
15	0h RO	**Reserved**
14:8	0h RO	**Reserved (reserved2):** Reserved.
7	0h RW/1C/V	**CSE Clear Reset Status (cse_cldrst_sts):** This bit will be set to '1' when the CSE FW triggers a reset. It will be cleared by a write of '1' by software. BIOS should read GEN_PMCON1 to determine what type of reset CSE requested. Reset by pwrgood.
6	0h RO	**Reserved**
5:0	0h RO	**Reserved (reserved1):** Reserved.

13.2.2 PM CFG - Power Management Configuration (PMC_CFG)—Offset 1008h

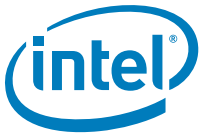
This register contains misc. fields used to configure the SOC's power management behavior.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

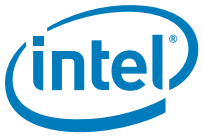
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (reserved4):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (rsvd_slp_sus_min_asst_wdth):** SLP_SUS# Minimum Assertion Width. Reference only - This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS Well power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 2'b00: 0 ms (i.e. stretching disabled - default) 2'b01: 500 ms 2'b10: 1 s 2'b11: 4 s This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. This field is ignored when exiting a G3 state if the Disable SLP_X Stretching After SUS Power Failure bit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit. Programming Note: For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_LAN#, or SLP_A#). This bit is only fully cleared by the RTEST# pin. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
17:16	0h RO	**Reserved (rsvd_slp_sus_a_asst_wdth):** SLP_A# Minimum Assertion Width. Reference only - This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 2'b00: 0 ms (i.e. stretching disabled - default) 2'b01: 4 s 2'b10: 98 ms 2'b11: 2 s This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. This field is ignored when exiting a G3 state if the Disable SLP_X Stretching After SUS Power Failure bit is set. This bit is only fully cleared by the RTEST# pin. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved (reserved3):** Reserved.
9:8	0h RW/V/L	**Reset Power Cycle Duration (pwr_cyc_dur):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_LAN# asserted if applicable) during a host partition reset (if applicable) with power cycle or a global reset. The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. Valid values are: 2'b11: 1-2 seconds 2'b10: 2-3 seconds 2'b01: 3-4 seconds 2'b00: 4-5 seconds (default) This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers: GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH GEN_PMCON_3.S4MAW PM_CFG.SLP_A_MIN_ASST_WDTH (if applicable) PM_CFG_SLP_LAN_MIN_ASST_WDTH (if applicable) This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well. These bits are fully cleared by RTCRST# assertion
7:6	0h RO	**Reserved (reserved2):** Reserved.
5	0h RO	**Reserved**
4	0h RW	**No Reboot (no_reboot):** FW will set this bit when TCO_NO_REBOOT SMIP is set.SW might also set this bit.When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout. Reset by: cold boot, cold reset, warm reset, and Sx.
3	0h RW	**S1/3/4/5 Entry Timeout Enable (sx_ent_to_en):** This policy bit determines whether the SOC will apply a timeout to the S3/S4/S5 entry flow. If this timeout is enabled and the entry flow appears to be hung, the SOC will trigger a global reset. Encodings: 0: Timeout Disabled (default) 1: Timeout Enabled On some prior platforms, this field is reset on RSMRST_B, a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. Note: The active SMIP value to continue will override timeout bit for S4/S5 only.



Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RO	**Reserved (reserved1):** Reserved.

13.2.3 Power Management Configuration (PMC_CFG2)—Offset 100Ch

This register contains misc. fields used to configure the SOC's power management behavior.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**Power Button Override Period (pwrbtn_ovr_per):** This field determines, while the power button remains asserted, how long the PMC will wait before initiating a global reset. Encoding: 3'b000: 4 seconds 3'b001: 6 seconds 3'b010: 8 seconds 3'b011: 10 seconds 3'b100: 12 seconds 3'b101: 14 seconds Others: Reserved This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.
28	0h RW/V/L	**Power Button Native Mode Disable (pwrbtn_dis):** When this bit is '0' (default), the PMC's power button logic will act upon the input value from the GPIO unit, as normal. When this bit is set to '1', the PMC must force its internal version of the power button pin to '1'. This will result in the PMC logic constantly seeing the pin as de-asserted. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
27:11	0h RO	**Reserved (reserved0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V	**Power Button Debounce Mode (pwrbtn_db_mode):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PWRBTN# pin. This bit's values cause the following behavior: 0: The 16 ms debounce period applies to all usages of the PWRBTN# pin (legacy behavior). 1: When a falling edge occurs on the PWRBTN# pin, an interrupt is generated and the 16 ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running. Note: Power button override logic always samples the post-debounce version of the pin. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
9:0	0h RO	**Reserved (reserved1):** Reserved.

13.2.4 SOC Power Management Status (SOC_PM_STS)—Offset 1010h

This register contains misc. fields used to record events pertaining to SOC power management. Unless otherwise indicated, all RWC bits are cleared with a write of 1 by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

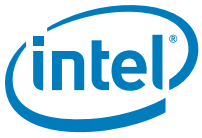
Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (rsvd):** Reserved.
2	0h RO	**Reserved**
1	0h RO	**Reserved**
0	0h RO	**Reserved (reserved1):** Reserved.

13.2.5 General PM Configuration 1 (GEN_PMCON1)—Offset 1020h

Access Method

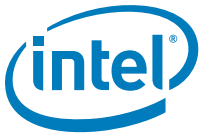
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4004h



Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (reserved6):** Reserved.
27	0h RW/1C/V	**Cold Boot Status (cold_boot_sts):** FW will populate this BIOS visible bit based on a COLD BOOT. This bit acts as notification to BIOS of the type of boot/reset. Reset by: cold boot, cold reset, warm reset, and Sx.
26	0h RW/1C/V	**Cold Reset Status (cold_reset_sts):** FW will populate this BIOS visible bit based on a COLD RESET. This bit acts as notification to BIOS of the type of boot/reset. Reset by: cold boot, cold reset, warm reset, and Sx.
25	0h RW/1C/V	**Warm Reset Status (warm_reset_sts):** FW will populate this BIOS visible bit based on a WARM RESET. This bit acts as notification to BIOS of the type of boot/reset. Reset by: cold boot, cold reset, warm reset, and Sx.
24	0h RW/1C/V	**Global Reset Status (global_reset_sts):** FW will populate this BIOS visible bit based on a GLOBAL RESET. This bit acts as notification to BIOS of the type of boot/reset. Reset by: cold boot, cold reset, warm reset, and Sx.
23	0h RW	**DRAM Initialization Scratchpad Bit (disb):** This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted. On some prior platforms, this field is reset on RSMRST_B, a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. This field is reset on RSM_RST_N de-assertion that is based on the PMIC_PWRGOOD, , PCH_PWROK, or COREPWROK pin, depending on the platform config. This field is not reset on cold reset, warm reset, and Sx.
22	0h RO	**Reserved (reserved5):** Reserved.
21	0h RO	**Reserved**
20	0h RW/1C/V	**System Reset Status (srs):** This bit will be set based on an asserting edge of the PMU_RESETBUTTON_B pin (post 16 ms HW debounce if PMU_RESETBUTTON_B Debounce Disable SMIP is 0) BIOS is expected to read this bit and clear it if it is set. This bit is also reset by RSMRST_B and CF9h resets. reset_type=Resume Well Reset#. RSMRST_B is a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. This reset would correspond to RSM_RST_N
19	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW/1C/V	**Minimum PMU SLP S4 B Assertion Width Violation Status (ms4v):** Hardware sets this bit when the PMU_SLP_S4_B assertion width is less than the time programmed in the PMU_SLP_S4_B Minimum Assertion Width field. The SOC begins the timer when PMU_SLP_S4_B pin is asserted during S4/S5 entry, or when the RSMRST_B input is deasserted during SUS well power-up. The status bit is cleared by software writing a 1 to the bit. Note that this bit is functional regardless of the value in the PMU_SLP_S4_B Assertion Stretch Enable and the Disable-SLP_X-Stretching-After-SUS-Power-Failure bits. This bit is reset by the assertion of the RSMRST_B pin, but can be set in some cases before the default value is readable. RSMRST_B is a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. This reset would correspond to RSM_RST_N. Note: Relevant only for no PMIC mode.
17	0h RO	**Reserved (reserved4):** Reserved
16	0h RO	**Reserved**
15	0h RW/V	**PME B0 S5 Disable (pme_b0_s5_dis):** When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. The SoC does not PME_B0_STS. It has a separate STS and EN for each source. Therefore this bit affects GPE0a_STS/EN bits for: XDCI, XHCI, and AVS. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well. This bit is only fully cleared by the SRTCRST_B pin (on the removal of coin battery).
14	1h RO	**Reserved**
13:10	0h RO	**Reserved (Reserved3):** Reserved
9	0h RO	**Reserved**
8	0h RO	**Reserved (Reserved2):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW/V	**SWSMI Rate Select (swsmi_ratesel):** This 2-bit value indicates when the SWSMI timer will time out. Valid values are: 00 1.5 ms +/- 0.6 ms 01 16 ms +/- 4 ms 10 32 ms +/- 4 ms 11 64 ms +/- 4 ms reset_type = SRTCRST_B pin (removal of coin battery). This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
5:3	0h RO	**Reserved (reserved1):** Reserved.
2	1h RW/V	**RTC Power Status (rps):** Intel SOC will set this bit to 1 when RTEST_B indicates a weak or missing battery. The bit will remain set until the software clears it by writing a 0 back to this bit position. This bit is not cleared by any type of reset because a cleared shadowed value will be restored prior to this bit being visible. Note: Relevant only for no PMIC mode while SoC includes RTC well. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well.
1	0h RO	**Reserved (reserved0):** Reserved.
0	0h RW/V/L	**After G3 Enable (ag3e):** Determines what state to go to when power is reapplied after a power failure (G3 state). 0: System will return to an S0 state (boot) after power is re-applied. 1: System will return to the S5 state (except if it was in S4, in which case it will return to S4-like state). In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. This bit is in the RTC well and is only cleared by SRTCRST_B assertion (on the removal of coin battery). Note: Relevant only for no PMIC mode. This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This field is shadowed in the PMC RTC Well

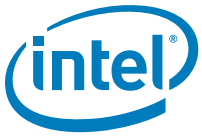
13.2.6 General PM Configuration 2 (GEN_PMCON2)—Offset 1024h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3800h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (reserved1):** Reserved.
13:11	7h RW/L	**LPC Loopback Clock Control (lpc_lpb_clk_ctrl):** Delay for LPC loopback clock (to match board latency to and from the embedded controller. 000: RESERVED (This setting is not supported and may lead to inconsistent behavior on silicon) 001: 1.25 ns 010: 3.75 ns 011: 6.25 ns 100: 8.75 ns 101: 11.25 ns 110: 12.50 ns 111: 13.75 ns This field is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx. This register is locked by GCR.LOCK.lpc_lpb_clk_ctrl.
10	0h RO	**Reserved**
9	0h RO/V	**Power Button Level (pwrbtn_lvl):** This read-only bit indicates the current state of the PWRBTN# signal. 1: High 0: Low The value reflected in this bit is dependent upon PM_CFG1.PB_DB_MODE. The PB_DB_MODE bit's value causes the following behavior: 0: PWRBTN_LVL is taken from the debounced PWRBTN# pin value that is seen at the output of a 16 ms debouncer. 1: PWRBTN_LVL is taken from the raw PWRBTN# pin (before the debouncer).
8:5	0h RO	**Reserved (reserved3):** Reserved.
4	0h RW/L	**SMI Lock (smi_lock):** When this bit is set, writes to the GBL_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by reset). Reset: Reset on cold boot, cold reset, warm reset, Sx. In architectures that support partitioned resets, this bit reset on host partition reset. The SoC does not have a host partition reset.
3:2	0h RO	**Reserved (reserved4):** Reserved.
1:0	0h RW/L	**Period SMI Select (per_smi_sel):** Software sets these bits to control the rate at which the periodic SMI# is generated: 00: 64 seconds (default) 01 = 32 seconds 10 = 16 seconds 11 = 8 seconds Tolerance for the timer is +/- 1 second. Reset: Reset on cold boot, cold reset, warm reset, Sx.



13.2.7 General PM Configuration 3 (GEN_PMCON3)—Offset 1028h

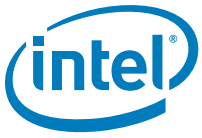
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (reserved1):** Reserved.
12	0h RO	**Reserved**
11:10	0h RW/L	**PMU SLP S3 B Minimum Assertion Width (slp_s3_min_asst_wdth):** Reference only: This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_B signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the RSMRST_B pin. Note: Relevant only for no PMIC mode. RSMRST_B is a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. This would correspond to RSM_RST_N based on the PMIC_PWRGOOD signal.
9:6	0h RO	**Reserved (reserved2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW/V/L	**PMU SLP S4 B Minimum Assertion Width (s4maw):** This 2-bit value indicates the minimum assertion width of the PMU_SLP_S4_B signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: 11: 1 second 10: 2 seconds 01: 3 seconds 00: 4 seconds This value is used in two ways: If the PMU_SLP_S4_B assertion width is ever shorter than this time, a status bit is set for BIOS to read when S0 is entered. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S4_B signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the suspend power well. Therefore, when leaving a G3 state, the minimum time is measured from the deassertion of the internal suspend well reset (unless the Disable SLP_X Stretching After SUS Power Failure bit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. SRTCRST_B forces this field to the conservative default state (00b). Note: Relevant only for no PMIC mode. SRTCRST_B is a secure version of the RTC reset and is asserted only on the removal of coin battery. The SoC does not have an on-die RTC well. This field is shadowed in the PMC RTC Well



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/V/L	**PMU SLP S4 B Assertion Stretch Enable (s4ase):** When set to 1, the PMU_SLP_S4_B pin will minimally assert for the time specified in bits 5:4 of this register. When 0, the reset flow still includes the SLP_S3_MIN_ASST_WDTH but no additional time is included for S4ASE. This bit is provided so that all DIMMs in the system can deterministically detect a power-cycle event for proper initialization. Note that there are behavioral changes that may be noticeable to the end-user when this bit is set. Resume times from S4 and S5 and power-up times from G3 may be delayed by several seconds. Cases in which this feature may not be desirable and therefore keeping the bit cleared are: A customer decides the user confusion due to the hardware delay is a bigger issue than the potential DRAM issue A customer decides the software status bit solution is adequate A different DRAM type is used or the platform provides an external solution to solve the power-cycling issue Validation regressions are impacted by the delay (especially after RSMRST_B deassertion) Avoid potential resume time WHQL violations This bit is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by SRTCRST_B. Note: Relevant only for no PMIC mode. SRTCRST_B is a secure version of the RTEST_B RTC reset and is asserted only on the removal of coin battery. The SoC does not have an on-die RTC well. This field is shadowed in the PMC RTC Well
2:0	0h RO	**Reserved (reserved3):** Reserved.

13.2.8 Configured Revision ID (CRID)—Offset 1030h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW/L	**RID Select (rid_sel):** Software writes this field to select the fuse sets reflected in PCI config space Revision ID. The decoding is: 00: Revision ID 01: CRID 0 10: CRID 1 11: CRID 2 This is reset on cold boot, cold reset, warm reset, and Sx. Reset: Reset on cold boot, cold reset, warm reset, Sx. In architectures that support partitioned resets, this bit reset on host partition reset. The SoC does not have a host partition reset. (setid multicast sends this out)

13.2.9 Function Disable 0 (FUNC_DIS_0)—Offset 1034h

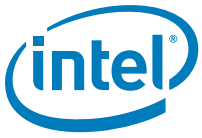
BIOS uses this register to disable specific function. PMC FW consults this register during reset to determine whether to bring an IP out of reset. These are only reset on RSM_RST_N de-assertion.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**RSVD**
30	0h RW/L	**SPI Disable (spi):** Set by BIOS to inform PMC SPI is disabled.
29	0h RW/L	**SSRAM Disable (ssram):** Set by BIOS to inform PMC SSRAM is disabled.
28	0h RW/L	**AVS Disable (avs):** Set by BIOS to inform PMC AVS is disabled.
27	0h RW/L	**CSE HECI1 Disable (cse_heci1):** Set by BIOS to inform PMC CSE_HECI1 is disabled. CSE_HECI1 is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
26	0h RW/L	**CSE HECI2 Disable (cse_heci2):** Set by BIOS to inform PMC CSE_HECI2 is disabled.
25	0h RW/L	**CSE HECI3 Disable (cse_heci3):** Set by BIOS to inform PMC CSE_HECI3 is disabled.
24	0h RW/L	**ISH Disable (ish):** Set by BIOS to inform PMC ISH is disabled.
23	0h RW/L	**PCIE0P0 Disable (pcie0p0):** Set by BIOS to inform PMC PCIE0 port 0 is disabled.



Bit Range	Default & Access	Field Name (ID): Description
22	0h RW/L	**PCIE0P1 Disable (pcie0p1):** Set by BIOS to inform PMC PCIE0 port 1 is disabled.
21	0h RW/L	**LPSS I2C0 Disable (lpss_i2c0):** Set by BIOS to inform PMC LPSS_I2C0 is disabled. LPSS_I2C0 is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
20	0h RW/L	**LPSS I2C1 Disable (lpss_i2c1):** Set by BIOS to inform PMC LPSS_I2C1 is disabled.
19	0h RW/L	**LPSS I2C2 Disable (lpss_i2c2):** Set by BIOS to inform PMC LPSS_I2C2 is disabled.
18	0h RW/L	**LPSS I2C3 Disable (lpss_i2c3):** Set by BIOS to inform PMC LPSS_I2C3 is disabled.
17	0h RW/L	**LPSS I2C4 Disable (lpss_i2c4):** Set by BIOS to inform PMC LPSS_I2C4 is disabled. LPSS_I2C4 is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
16	0h RW/L	**LPSS I2C5 Disable (lpss_i2c5):** Set by BIOS to inform PMC LPSS_I2C5 is disabled.
15	0h RW/L	**LPSS I2C6 Disable (lpss_i2c6):** Set by BIOS to inform PMC LPSS_I2C6 is disabled.
14	0h RW/L	**LPSS I2C7 Disable (lpss_i2c7):** Set by BIOS to inform PMC LPSS_I2C7 is disabled.
13	0h RW/L	**LPSS UART0 Disable (lpss_uart0):** Set by BIOS to inform PMC LPSS_UART0 is disabled. LPSS_UART0 is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
12	0h RW/L	**LPSS UART1 Disable (lpss_uart1):** Set by BIOS to inform PMC LPSS_UART1 is disabled.
11	0h RW/L	**LPSS UART2 Disable (lpss_uart2):** Set by BIOS to inform PMC LPSS_UART2 is disabled.
10	0h RW/L	**LPSS UART3 Disable (lpss_uart3):** Set by BIOS to inform PMC LPSS_UART3 is disabled.
9	0h RW/L	**LPSS SPI0 Disable (lpss_spi0):** Set by BIOS to inform PMC LPSS_SPI0 is disabled. LPSS_SPI0 is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
8	0h RW/L	**LPSS SPI1 Disable (lpss_spi1):** Set by BIOS to inform PMC LPSS_SPI1 is disabled.
7	0h RW/L	**LPSS SPI2 Disable (lpss_spi2):** Set by BIOS to inform PMC LPSS_SPI2 is disabled.
6	0h RW/L	**PWM Disable (pwm):** Set by BIOS to inform PMC PWM is disabled.
5	0h RW/L	**SDCARD Disable (sdcard):** Set by BIOS to inform PMC SDCARD is disabled.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/L	**Reserved**
3	0h RW/L	**eMMC Disable (emmc):** Set by BIOS to inform PMC eMMC is disabled.
2	0h RW/L	**Rsvd**
1	0h RW/L	**xHCI Disable (xhci):** Set by BIOS to inform PMC xHCI is disabled. xHCI is function 0 of a Multi-function device. If this function is disabled all functions of this device must be disabled.
0	0h RW/L	**xDCI Disable (xdci):** Set by BIOS to inform PMC xDCI is disabled.

13.2.10 Function Disable 1 (FUNC_DIS_1)—Offset 1038h

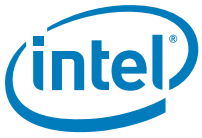
BIOS uses this register to disable specific function. PMC FW consults this register during reset to determine whether to bring an IP out of reset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (rsvd31):** Reserved.
9	0h RW/L	**SATA Disable (sata):** Set by BIOS to inform PMC SATA is disabled.
8:7	0h RO	**Reserved PCIE Disable (rsvd_pcie):** Reserved for PCIe expansion.
6	0h RW/L	**PCIE1 Port 3 Disable (pcie1p3):** Set by BIOS to inform PMC PCIE1 port 3 is disabled.
5	0h RW/L	**PCIE1 Port 2 Disable (pcie1p2):** Set by BIOS to inform PMC PCIE1 port 2 is disabled.
4	0h RW/L	**PCIE1 Port 1 Disable (pcie1p1):** Set by BIOS to inform PMC PCIE1 port 1 is disabled.
3	0h RW/L	**PCIE1 Port 0 Disable (pcie1p0):** Set by BIOS to inform PMC PCIE1 port 0 is disabled.
2	0h RW/L	**Rsvd**
1:0	0h RO	**Reserved (rsvd0):** Reserved.



13.2.11 Extended Test Mode Register (ETR)—Offset 1048h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 18000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**CF9h Lockdown (cf9lock):** When set, this will lock the CF9h-Global-Reset bit. When set, this register locks itself. On architectures that support partitioned resets, this bit is reset on a host partition reset. Reset: Reset on cold boot, cold reset, warm reset, Sx.
30:21	0h RO	**Reserved (reserved3):** Reserved.
20	0h RW/L	**CF9h Global Reset (cf9gr):** When this bit is set, a CF9h write of 6h or Eh will cause a Global Reset (of the Host partition where the designation is applicable). If this bit is cleared, a CF9h write of 6h or Eh will only reset the Host partition (Cold or Warm reset were no Host partition.) It is recommended that BIOS should set this bit early on in the boot sequence, and then clear it and set the CF9LOCK bit prior to loading the OS. When this bit is set, the hardware assumes that bit 18 (CF9h Without Resume Well Reset Enable) is cleared. This register is locked by the CF9 Lockdown (CF9LOCK) bit. On architectures that support resume well reset, this bit is resets on RSMRST_B. RSMRST_B is a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable. The SoC does not have a host partition reset or a resume well. Reset: Reset on cold boot, cold reset, warm reset, Sx.
19:18	0h RO	**Reserved (reserved2):** Reserved.
17:15	3h RW/L	**Max S0IX (max_s0ix):** Indicated the maximum S0i state SOC can go. 111: LTR/TNTE L6 threshold (S0i3) - Deepest S0ix state allowed 110: LTR/TNTE L6 threshold (S0i3) 101: LTR/TNTE L5 threshold 100: LTR/TNTE L4 threshold 011: LTR/TNTE L3 threshold 010: LTR/TNTE L2 threshold (Fastest Exit/Highest Pwr) 001: LTR/TNTE L1 threshold 000: No S0ix state allowed Reset Type: cold boot, cold reset, warm reset, and Sx.
14:0	0h RO	**Reserved (reserved1):** Reserved.

13.2.12 GPIO Group to General Purpose Event Register Configuration (GPIO_GPE_CFG)—Offset 1050h

Maps the ACPI GPE0[b-d] registers to GPIO groups. Each of gpe0_dw[1-3] is a lookup which maps a read/write to gpe0[b-d]_[en,sts] to a particular GPIO community and offset.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd31):** Reserved.
15:12	6h RW	**GPIO Group to General Purpose Event Dword 3 (gpe0_dw3):** This register assigns a specific GPIO Group to the ACPI GPE0d (i.e. GPE0[127:96]). The value in this field determines which GPIO group is assigned to dword 3 (gpe0d).
11:8	3h RW	**GPIO Group to General Purpose Event Dword 2 (gpe0_dw2):** This register assigns a specific GPIO Group to the ACPI GPE0c (i.e. GPE0[95:64]). The value in this field determines which GPIO group is assigned to dword 2 (gpe0c).
7:4	0h RW	**GPIO Group to General Purpose Event Dword 1 (gpe0_dw1):** This register assigns a specific GPIO Group to the ACPI GPE0b (i.e. GPE0[63:32]). The value in this field determines which GPIO group is assigned to dword 1 (gpe0b).
3:0	0h RO	**Reserved (rsvd_gpe0_dw0):** GPIO Group to General Purpose Event Dword 0. This register assigns a specific GPIO Group to the ACPI GPE0a (i.e. GPE0[31:0]). The value in this field determines which GPIO group is assigned to dword 0 (gpe0a). This register is reserved / unused, because gpe0a is a local ACPI register.

13.2.13 IRQ Select 0 (IRQ_SEL_0)—Offset 1064h

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**IRQ Vector For UART 3 (dir_irq_sel_uart3)**
23:16	0h RW	**IRQ Vector For UART 2 (dir_irq_sel_uart2)**
15:8	0h RW	**IRQ Vector For UART 1 (dir_irq_sel_uart1)**
7:0	0h RW	**IRQ Vector For UART 0 (dir_irq_sel_uart0)**

13.2.14 IRQ Select 1 (IRQ_SEL_1)—Offset 1068h

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**IRQ Vector For XHCI (dir_irq_sel_xhci)**
23:16	0h RW	**IRQ Vector For XDCI (dir_irq_sel_xdci)**
15:8	0h RW	**IRQ Vector For SDCARD CD (dir_irq_sel_sdcard_cd)**
7:0	0h RW	**IRQ Vector For SDCARD D1 (dir_irq_sel_sdcard_d1)**

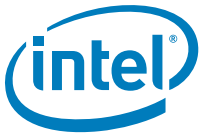
13.2.15 IRQ Select 2 (IRQ_SEL_2)—Offset 106Ch

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.
On architectures that support a partitioned resets this bit is reset on the host reset (host_prim_rst_b).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**SCI IRQ Select (scis):** Specifies on which IRQ the SCI will internally appear. ACPI uses this field to fill the IRQ vector of the De/Assert_IRQn message for IOAPIC IRQ for PMIC interrupts. If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not shareable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts. This field fully defines the IRQ number to be sent. When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.
23:16	0h RW	**PMIC Direct IRQ Select (dir_irq_sel_pmic):** ACPI uses this field to fill the IRQ vector of the De/Assert_IRQn message for IOAPIC IRQ for PMIC interrupts.
15:0	0h RO	**Reserved (rsvd):** Reserved.

13.2.16 Function ACPI Enumeration 0 (FUNC_ACPI_ENUM_0)—Offset 1070h

BIOS uses this register to enumerate ACPI functions. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved Enable (rsvd31):** Reserved.
30	0h RW	**SPI Enable (spi):** If set by BIOS the named function is exposed to the OS via ACPI.
29	0h RW	**SSRAM Enable (ssram):** If set by BIOS the named function is exposed to the OS via ACPI.
28	0h RW	**AVS Enable (avs):** If set by BIOS the named function is exposed to the OS via ACPI.
27	0h RW	**CSE HECI1 Enable (cse_heci1):** If set by BIOS the named function is exposed to the OS via ACPI.
26	0h RW	**CSE HECI2 Enable (cse_heci2):** If set by BIOS the named function is exposed to the OS via ACPI.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**CSE HECI3 Enable (cse_heci3):** If set by BIOS the named function is exposed to the OS via ACPI.
24	0h RW	**ISH Enable (ish):** If set by BIOS the named function is exposed to the OS via ACPI.

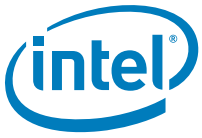
12	0h RW	**LPSS UART1 Enable (lpss_uart1):** If set by BIOS the named function is exposed to the OS via ACPI.
11	0h RW	**LPSS UART2 Enable (lpss_uart2):** If set by BIOS the named function is exposed to the OS via ACPI.
10	0h RW	**LPSS UART3 Enable (lpss_uart3):** If set by BIOS the named function is exposed to the OS via ACPI.
9	0h RW	**LPSS SPI0 Enable (lpss_spi0):** If set by BIOS the named function is exposed to the OS via ACPI.
8	0h RW	**LPSS SPI1 Enable (lpss_spi1):** If set by BIOS the named function is exposed to the OS via ACPI.
7	0h RW	**LPSS SPI2 Enable (lpss_spi2):** If set by BIOS the named function is exposed to the OS via ACPI.
6	0h RW	**PWM Enable (pwm):** If set by BIOS the named function is exposed to the OS via ACPI.
5	0h RW	**SDCARD Enable (sdcard):** If set by BIOS the named function is exposed to the OS via ACPI.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Reserved**
3	0h RW	**eMMC Enable (emmc):** If set by BIOS the named function is exposed to the OS via ACPI.
2	0h RW	**RSVD**
1	0h RO	**Reserved (rsvd1):** Reserved.
0	0h RW	**xDCI Enable (xdci):** If set by BIOS the named function is exposed to the OS via ACPI.

13.2.17 Function ACPI Enumeration 1 (FUNC_ACPI_ENUM_1)—Offset 1074h

BIOS uses this register to enumerate ACPI functions. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (rsvd31):** Reserved.
2	0h RW	**Rsvd**
1	0h RW	**PMC PCI Enable (pmc_pci):** If set by BIOS the named function is exposed to the OS via ACPI.
0	0h RW	**P2SB Enable (p2sb):** If set by BIOS the named function is exposed to the OS via ACPI.

13.2.18 Fixed Deep S0Ix Counter Lower 32 Bits (TELEM_DEEP_S0IX_LO_HOST)—Offset 1078h

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Deep S0Ix Counter (telem_deep_s0ix_lo_host)**

13.2.19 Fixed Deep S0Ix Counter Upper 32 Bits (TELEM_DEEP_S0IX_HI_HOST)—Offset 107Ch

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Deep S0Ix Counter Upper 32 Bits (telem_deep_s0ix_hi_host)**

13.2.20 Fixed Shallow S0Ix Counter Lower 32 Bits (TELEM_SHALLOW_S0IX_LO_HOST)—Offset 1080h

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Shallow S0Ix Counter (telem_shallow_s0ix_lo_host)**

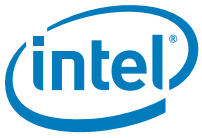
13.2.21 Fixed Shallow S0Ix Counter Upper 32 Bits (TELEM_SHALLOW_S0IX_HI_HOST)—Offset 1084h

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Shallow S0Ix Counter (telem_shallow_s0ix_hi_host)**

13.2.22 Reserved (TELEM_MISC_FIXED_LO_HOST)—Offset 1088h

Register for sharing data with software lower 32 bits. For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Reserved (telem_misc_fixed_lo_host):** Reserved register for sharing data with software.

13.2.23 Reserved register for sharing data with software upper 32 bits (TELEM_MISC_FIXED_HI_HOST)—Offset 108Ch

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Reserved (telem_misc_fixed_hi_host):** Reserved register for sharing data with software.

13.2.24 Scratchpad for sharing data between BIOS and PMC Firmware (BIOS_SCRATCHPAD)—Offset 1090h

For the SoC, reset on cold boot, cold reset, warm reset, and Sx.
This register is reset on RSM_RST_N de-assertion. This field is not reset on cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Scratchpad 31 (scratchpad31):** This field is shadowed in the PMC RTC Well.
30	0h RW/V	**Scratchpad 30 (scratchpad30):** This field is shadowed in the PMC RTC Well.

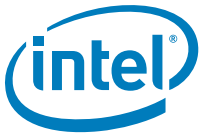
11	0h RW	**Scratchpad 11 (scratchpad11)**
10	0h RW	**Scratchpad 10 (scratchpad10)**



Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Scratchpad 9 (scratchpad9)**
8	0h RW	**Scratchpad 8 (scratchpad8)**
7	0h RW	**Scratchpad 7 (scratchpad7)**
6	0h RW	**Scratchpad 6 (scratchpad6)**
5	0h RW	**Scratchpad 5 (scratchpad5)**
4	0h RW	**Scratchpad 4 (scratchpad4)**
3	0h RW	**Scratchpad 3 (scratchpad3)**
2	0h RW	**Scratchpad 2 (scratchpad2)**
1	0h RW	**S0IX Inhibit (s0ix_inhibit):** Used by PCIE ASL code
0	0h RW	**MOT Enable (mot_enable):** Indicates that MOT is enabled. When set to '1', PMC firmware will only switch ART to RTC after receiving the VnnOffPrepAck from pcode. This ensures proper time sync handling all the way until PCS is down.

13.2.25 Display Hot Plug Detect Control (DISPLAY_HPD_CTL)—Offset 1094h

Controls for PMC display hot plug detect logic. Hot plug detect is offloaded from display during S0ix, is used to gate S0ix entry, is an S0ix wake condition, and may result in notification to display controller. PMC implements a simplified hot plug detect, where the input is deglitched and edges are detected.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RW	**Edge Rising (edge_rising):** Enable detection of rising edges. One bit per GPIO HPD wire. More than one GPIO can be enabled. One or both edges may be of interest, and the edge of interest may change based on polarity of GPIO HPD wire. edge_rising = 3'b001: ddi0 rising edges enabled edge_rising = 3'b010: ddi1 rising edges enabled ... edge_rising = 3'b111: ddi2, ddi1 and ddi0 rising edges enabled
12:10	0h RW	**Edge Falling (edge_falling):** Enable detection of falling edges. One bit per GPIO HPD wire. More than one GPIO can be enabled. One or both edges may be of interest, and the edge of interest may change based on polarity of GPIO HPD wire. edge_falling = 3'b001: ddi0 falling edges enabled edge_falling = 3'b010: ddi1 falling edges enabled ... edge_falling = 3'b111: ddi2, ddi1 and ddi0 falling edges enabled
9:5	7h RW	**Deglitch (deglitch):** Deglitch time, in 60 us steps. HPD logic will ignore any pulses shorter than the deglitch time. A transition which is held longer than the deglitch time will be considered an edge, and will result in an HPD event, which may prevent S0ix entry or wake from S0ix and notify display controller. All settings have an error of +/- 1 tick (60 us). 4'd0: 000 us (invalid configuration) 5'd1: 60 us (invalid configuration) 5'd2: 120 us ... 5'd7: 420 us (default) ... 5'd31: 1.86 ms
4:0	10h RW	**Recent Edge Detect (edge_det_rcnt):** Recent event time, in 10 ms steps. HPD logic will hold a wire asserted for a programmable period of time after an enabled edge has been detected, in order to prevent S0ix entry for this period of time. All settings have an error of +/- 1 tick (10 ms). Default: 160 ms Max: 310 ms

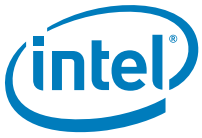
13.2.26 OBFF Control and Status (OBFF_CTL_STS)—Offset 10C8h

Through this register, BIOS controls the External OBFF feature through this register and, PMC indicates that it is currently processing an OBFF state change. The timing parameters for GPIO WAKE pin indication are also present in this register.
For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6450280Fh



Bit Range	Default & Access	Field Name (ID): Description
31:24	64h RW/L	**Tobff3 (Tobff3):** Minimum time between two consecutive state changes (to avoid misinterpretation of pattern). Programmable timer to control Tobff3. Timer counts 10 ns clock cycles. Tobff3(min) = 700 ns Default = 0x64 = 100 clocks = 1000 ns
23:16	50h RW/L	**Tobff2 (Tobff2):** Time between two falling WAKE# edges when signaling CPU Active. Programmable timer to control Tobff2. Timer counts 10 ns clock cycles. Tobff2(min) = 700 ns Tobff2(max) = 1000 ns Default = 0x50 = 80 clocks = 800 ns Note: Tobff2 must be programmed to a value at least 2x of Tobff1.
15:8	28h RW/L	**Tobff1 (Tobff1):** Minimum/Maximum WAKE# pulse width; applies to both active-inactive-active and inactive-active-inactive cases. Programmable timer to control Tobff1. Timer counts 10 ns clock cycles. Tobff1(min) = 300 ns Tobff1(max) = 500 ns Default = 0x28 = 40 clocks = 400 ns
7	0h RO/V	**PORT3 OBFF Status (PORT3_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
6	0h RO/V	**PORT2 OBFF Status (PORT2_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
5	0h RO/V	**PORT1 OBFF Status (PORT1_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
4	0h RO/V	**PORT0 OBFF Status (PORT0_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
3	1h RW/L	**PORT3 OBFF Disable (PORT3_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/ Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/L	**PORT2 OBFF Disable (PORT2_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/ Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI
1	1h RW/L	**PORT1 OBFF Disable (PORT1_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/ Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI
0	1h RW/L	**PORT0 OBFF Disable (PORT0_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/ Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI

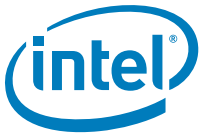
13.2.27 Lock Register (LOCK)—Offset 10CCh

Register | Field | Lock bit GEN_PMCON1 | PME_B0_S5_DIS | LOCK.Sx_WAKE]
GEN_PMCON1 | AG3E | LOCK.Sx_WAKE]
RSVD[GEN_PMCON2 | BIOS_PCI_EXP_EN | LOCK.PCIE]
GEN_PMCON2 | lpc_lpb_clk_ctrl | LOCK.lpc_lpb_clk_ctrl
GEN_PMCON3 | slp strch bits | LOCK.slpsx_str_pol_lock
PM_CFG | PWR_CYC_DUR | LOCK.slpsx_str_pol_lock
PM_CFG2 | pwrbtn_dis | LOCK.pwrbtn
IRQ_SEL_0 | all | LOCK.IRQ_SEL
IRQ_SEL_1 | all | LOCK.IRQ_SEL
IRQ_SEL_2 | all | LOCK.IRQ_SEL
CRID | all | LOCK.CRID
GEN_PMCON2 | PER_SMI_SEL | LOCK.PER_SMI
FUNC_DIS_0 | all | LOCK.FUNC_DIS
FUNC_DIS_1 | all | LOCK.FUNC_DIS
S0IX_WAKE_EN | all | LOCK.SOIX
ETR | MAX_S0IX | LOCK.SOIX
For the SoC, reset on cold boot, cold reset, warm reset, and Sx.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (rsvd):** Reserved.
12	0h RW/L	**OBFF Lock (obff):** Locks GCR.OBFF_CTL_STS.Tobff1, Tobff2, Tobff3, PORT0_OBFF_DISABLE, PORT1_OBFF_DISABLE, PORT2_OBFF_DISABLE, PORT3_OBFF_DISABLE. This field is also self-locking.
11	0h RW/L	**Power Button Lock (pwrbtn):** Locks GCR.PMC_CFG2.pwrbtn_dis. This field is also self-locking.
10	0h RW/L	**LPC Loopback Clock Control Lock (lpc_lpb_clk_ctrl):** Locks GCR.GEN_PMCON2.lpc_lpb_clk_ctrl. This field is also self-locking.
9	0h RW/L	**ASLP Sx# Stretching Policy Lock-Down (slpsx_str_pol_lock):** When set to 1, this bit locks down the following fields: GEN_PMCON3.DIS_SLP_X_STRCH_SUSPF GEN_PMCON3.SLP_S3_MIN_ASST_WDTH GEN_PMCON3.S4MAW GEN_PMCON3.S4ASE PM_CFG.SLP_A_MIN_ASST_WDTH (if applicable) PM_CFG.SLP_LAN_MIN_ASST_WDTH (if applicable) PM_CFG.PWR_CYC_DUR Those bits become read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset. This lockdown bit is available in both desktop and mobile. Note: Relevant only for no PMIC mode.
8	0h RW/L	**IRQ Select Lock (irq_sel)**
7	0h RW/L	**CRID Lock (crid)**
6	0h RW/L	**SX Wake Lock (sx_wake)**

4	0h RW/L	**Periodic SMI Lock (per_smi)**
3	0h RW/L	**Func Dis Lock (func_dis)**
2	0h RW/L	**Reserved (s0ix):** Reserved.
1:0	0h RO	**Reserved (reserved1):** Reserved.

13.3 Registers Summary

IPC provides a general mechanism for interprocessor communication. IPC1 is used by the IA processor to send messages to the PMC.

Table 13-3. Summary of IPC Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	IPC Command (IPC_CMD)—Offset 0h	0h
4h	7h	IPC Status (IPC_STS)—Offset 4h	0h
8h	Bh	IPC Source Pointer (IPC_SPTR)—Offset 8h	0h
Ch	Fh	IPC Destination Pointer (IPC_DPTR)—Offset Ch	0h
80h	83h	IPC Write Buffer (IPC_WBUF0)—Offset 80h	0h
84h	87h	IPC Write Buffer (IPC_WBUF1)—Offset 84h	0h
88h	8Bh	IPC Write Buffer (IPC_WBUF2)—Offset 88h	0h
8Ch	8Fh	IPC Write Buffer (IPC_WBUF3)—Offset 8Ch	0h
90h	93h	IPC Read Buffer (IPC_RBUF0)—Offset 90h	0h
94h	97h	IPC Read Buffer (IPC_RBUF1)—Offset 94h	0h
98h	9Bh	IPC Read Buffer (IPC_RBUF2)—Offset 98h	0h
9Ch	9Fh	IPC Read Buffer (IPC_RBUF3)—Offset 9Ch	0h

13.3.1 IPC Command (IPC_CMD)—Offset 0h

The IPC CMD register is used for conveying the type of commands to the IPC block. This is a special kind of register and a write to this register always results in Interrupt to the ARC and Setting of the busy bit in the IPC_STS register. The setting of busy bit in the IPC_STS register results in blocking of all transaction from the IA host. The ARC FW is expected to read the IPC_CMD register, whenever interrupted, interpret it and follow the instructions as ordered by the IA host. The IA host may optionally prefer to be interrupted, when the command is complete by sending an MSI. When the ARC FW is done with the command, it is expected to update the IPC_STS register and clear the busy bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Reserved (Reserved0):** Reserved.
23:16	0h RW	**Size (size):** Size of the transaction in bytes. This 8-bit field can potentially specify 256 Bytes, but the hardware based write_buffer and read_buffer are both only 16 bytes deep. So the size should not be greater than 16bytes for normal reads and normal write operation. However, larger sizes can be used for indirect operations.
15:12	0h RW	**Command ID (cmd_ID):** ID or Tag associated with this command. When the IPC command is completed, this value is copied in the IPC_STS register by the hardware.

Bit Range	Default & Access	Field Name (ID): Description
11:9	0h RW	**Reserved (rsvd):** Reserved.
8	0h RW	**MSI (msi):** Send an MSI once the command is executed.
7:0	0h RW	**Command (Command):** Following are defined commands: • 00h: Normal Write • 01h: Message Write • 02h: Indirect Read • 03h: Reserved • 04h: Read DMA • 05h: Indirect write • 06h: FFh - Reserved

13.3.2 IPC Status (IPC_STS)—Offset 4h

The IPC status register provides information related to the status of the IPC block and also some information related to the last executed command.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (rsvd):** Reserved.
23:16	0h RW/V	**Error Code (error_code):** If the err bit is set, this field may contain some error code. ARC FW is responsible for updating this value.
15:8	0h RO/V	**Initiator ID (Initiator_ID):** ID of the initiator, whose command was executed last. The initiator_ID information is available through the CONNID OCP. This bits are captured by the IPC hardware and placed in this field. This information could be used by the ARC FW to figure out the initiator for any particular IPC command and whether to service it or not. It may also be used for debug purpose, when the ARC FW is unable to service some IPC command and sets the error bit in the IPC_STC register.
7:4	0h RO/V	**Command ID (cmd_ID):** ID of the last command. The PMU Hardware copies this same field from the IPC_CMD register and places it in this reg.
3	0h RO/V	**Reserved (rsvd1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	**IRQ (irq):** This bit is set when FW clears IPC_STS.Busy if IPC_CMD.msi is set.
1	0h RW/V	**Error (Error):** There was some error in executing the last command. This value is written by the ARC FW.
0	0h RW/V	**Busy (Busy):** IPC block is busy executing some command. When done, this bit would be unset. This bit is set, whenever the IPC hardware receives a new command on IPC_CMD register. ARC FW is responsible for unsetting this bit. For IPC2, the IPC hardware blocks any new transactions from cDMI, to the IPC block until this bit is cleared.

13.3.3 IPC Source Pointer (IPC_SPTR)—Offset 8h

This is a 32-bit register containing the address of the read transaction. The IPC Source Pointer Register is used by the IA host to perform indirect reads. The IA host would first write to this IPC_SPTR register and specify the read address location. Next, the IA host would issue an Indirect Read command on the IPC_CMD register. The ARC FW is responsible to decode this transaction and issue a read on the address specified by the IPC_SPTR register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Source Pointer (SPTR):** Read transaction source address.

13.3.4 IPC Destination Pointer (IPC_DPTR)—Offset Ch

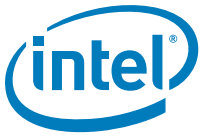
This register contains the destination address of indirect read or indirect write transaction. Please refer to IPC_CMD register for detailed usage of this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Destination Pointer (DPTR):** Read or write transaction destination address.



13.3.5 IPC Write Buffer (IPC_WBUF0)—Offset 80h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

13.3.6 IPC Write Buffer (IPC_WBUF1)—Offset 84h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

13.3.7 IPC Write Buffer (IPC_WBUF2)—Offset 88h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

13.3.8 IPC Write Buffer (IPC_WBUF3)—Offset 8Ch

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

13.3.9 IPC Read Buffer (IPC_RBUF0)—Offset 90h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

13.3.10 IPC Read Buffer (IPC_RBUF1)—Offset 94h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

13.3.11 IPC Read Buffer (IPC_RBUF2)—Offset 98h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

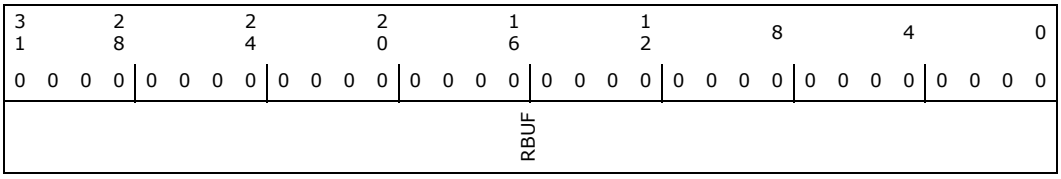
13.3.12 IPC Read Buffer (IPC_RBUF3)—Offset 9Ch

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

13.4 Registers Summary

Table 13-4. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	0h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	0h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.4.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	0h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

13.4.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.4.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.4.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.4.5 BAR -Base Address Register (BAR)—Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

13.4.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.4.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.4.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

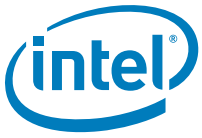
Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones



13.4.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.4.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.4.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.4.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

13.4.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

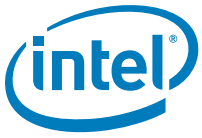
Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.



Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.4.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.4.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.4.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.4.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

13.4.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.4.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.4.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

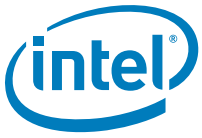
D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value



13.5 Registers Summary

Table 13-5. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	A948086h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	FF000000h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.5.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: A948086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	A94h RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

13.5.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

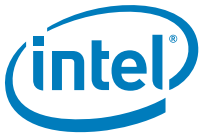
Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable



Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.5.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: FF000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	FF0000h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.5.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.5.5 BAR -Base Address Register (BAR)—Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

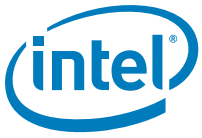
13.5.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.5.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.5.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

13.5.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.5.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

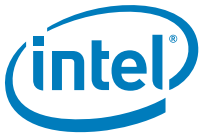
Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.5.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.5.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

13.5.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.5.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.5.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

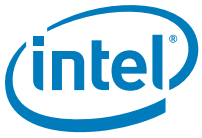
power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved



Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.5.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.5.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

13.5.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.5.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.5.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 1

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

13.6 Registers Summary

The Pulse Width Modulation block allows control of frequency and duty cycle of an output signal.

Table 13-6. Summary of Pulse Width Modulator Controller Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	PWM Control Register (PWMCTRL_0)—Offset 0h	400000h
100h	103h	PWM D0i3 Control Register (PWMD0i3C)—Offset 100h	8h
400h	403h	PWM Control Register (PWMCTRL_1)—Offset 400h	400000h
800h	803h	PWM Control Register (PWMCTRL_2)—Offset 800h	400000h
C00h	C03h	PWM Control Register (PWMCTRL_3)—Offset C00h	400000h

13.6.1 PWM Control Register (PWMCTRL_0)—Offset 0h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Enable the PWM Output by setting PWM Enable.
- Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.

Bit Range	Default & Access	Field Name (ID): Description
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

13.6.2 PWM D0i3 Control Register (PWMD0i3C)—Offset 100h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Rsvd):** Reserved.
3	1h RW/1C/V	**Restore Required (rr)**
2	0h RW	**D0i3 (i3)**
1	0h RO	**Interrupt Request (ir)**
0	0h RO/V	**Command in Progress (cip):** Set on a transition of i3.

13.6.3 PWM Control Register (PWMCTRL_1)—Offset 400h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Enable the PWM Output by setting PWM Enable.
- Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256p)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

13.6.4 PWM Control Register (PWMCTRL_2)—Offset 800h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Enable the PWM Output by setting PWM Enable.
- Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 2p56)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

13.6.5 PWM Control Register (PWMCTRL_3)—Offset C00h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Enable the PWM Output by setting PWM Enable.
- Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

- Program the Base Unit and On Time Divisor values.
- Set the Software Update Bit.
- Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit /p 256)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

13.7 Registers Summary

Table 13-7. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	0h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	0h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h

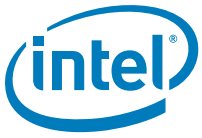


Table 13-7. Summary of soc_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.7.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	0h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

13.7.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort

Bit Range	Default & Access	Field Name (ID): Description
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.7.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.7.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.7.5 BAR -Base Address Register (BAR)—Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

13.7.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.7.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

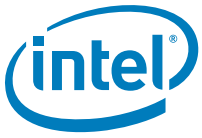
Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range



Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.7.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

13.7.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.7.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.7.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.7.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

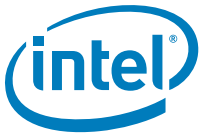
Capabilities Pointer register indicates what the next capability is

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.



13.7.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register is not used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.7.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.7.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.7.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.7.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

13.7.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.7.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.7.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

13.8 Registers Summary

Table 13-8. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	AC88086h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	C800000h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h

Table 13-8. Summary of soc_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.8.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: AC88086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AC8h RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

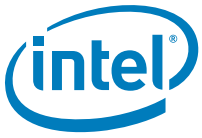
13.8.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.8.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: C800000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C8000h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.8.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.8.5 BAR -Base Address Register (BAR)—Offset 10h

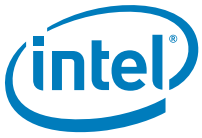
Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones



Bit Range	Default & Access	Field Name (ID): Description
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

13.8.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.8.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.8.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

13.8.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.8.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.8.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.8.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

13.8.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.8.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

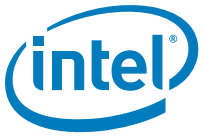
PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.8.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.8.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.8.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

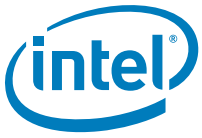
13.8.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.8.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.8.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 26 **Function:** 0

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

13.9 Registers Summary

Table 13-9. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	0h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	0h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h

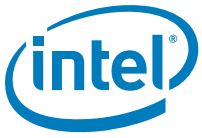


Table 13-9. Summary of soc_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.9.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	0h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

13.9.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.9.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.9.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.9.5 BAR -Base Address Register (BAR)—Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones

Bit Range	Default & Access	Field Name (ID): Description
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

13.9.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.9.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.9.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

13.9.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.9.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.9.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.9.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

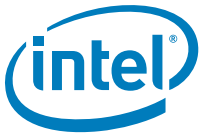
Capabilities Pointer register indicates what the next capability is

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.



13.9.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.9.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 48030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.9.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.9.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.9.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

13.9.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.9.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.9.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

13.10 Registers Summary

Table 13-10. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	AEC8086h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	5000000h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	0h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
20h	23h	(BAR2)—Offset 20h	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	30001h

Table 13-10. Summary of soc_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h

13.10.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: AEC8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AECh RO/V	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO/V	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

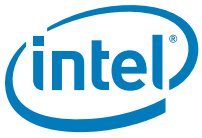
13.10.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 100000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C/V	**RMA:** Received Master Abort
28	0h RW/1C/V	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RW/V	**IOSE:** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

13.10.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 5000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	50000h RO/V	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO/V	**RID:** Revision ID identifies the revision of particular PCI device.

13.10.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

13.10.5 BAR -Base Address Register (BAR)—Offset 10h

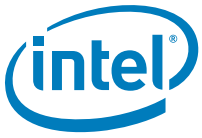
Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones



Bit Range	Default & Access	Field Name (ID): Description
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

13.10.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

13.10.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

13.10.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

13.10.9 (BAR2)—Offset 20h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR**
1	0h RO	**Reserved0**
0	0h RO	**MESSAGE_SPACE**

13.10.10 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

13.10.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

13.10.12 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

13.10.13 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

13.10.14 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

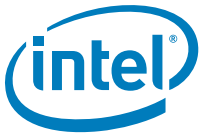
PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 30001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

13.10.15 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved
15	0h RW/1C/V	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

13.10.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

13.10.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

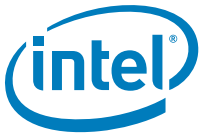
13.10.18 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

13.10.19 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

13.10.20 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 13 **Function:** 3

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

§ §

14 Power Management Controller (P-Unit)

14.1 Registers Summary

Table 14-1. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
54h	57h	Device Enable Register (P_CR_DEVEN_0_0_0_PCI)—Offset 54h	33h
E4h	E7h	Capability ID0 A (P_CR_CAPID0_A_0_0_0_PCI)—Offset E4h	0h
E8h	EBh	Capability ID0 B (P_CR_CAPID0_B_0_0_0_PCI)—Offset E8h	0h

14.1.1 Device Enable Register (P_CR_DEVEN_0_0_0_PCI)—Offset 54h

The Device Enable register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 33h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
5	1h RW/V	**Device 3 Function 0 Enable (Imaging) (D3F0EN):** 0 = Imaging Device 0/3/0 is disabled and hidden 1 = Imaging Device 0/3/0 is enabled and visible Software may write a 0b to this register to disable the imaging device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
4	1h RW/V	**Device 2 Function 0 Enable (Graphics/Display) (D2F0EN):** 0 = Graphics/Display Device 0/2/0 is disabled and hidden 1 = Graphics/Display Device 0/2/0 is enabled and visible Software may write a 0b to this register to disable the graphics / display device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	Reserved.
2	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
1	1h RW/V	**Device 0 Function 1 Enable (Thermal) (D0F1EN):** 0 = Thermal Device 0/0/1 is disabled and hidden 1 = Thermal Device 0/0/1 is enabled and visible Software may write a '0 to this register to disable the thermal device. Writes to '1 are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
0	1h RO	**Device 0 Function 0 Enable (Memory / System Agent) (D0F0EN):** Device enable for MCHBAR device. This device not be disabled and is therefore hardwired to 1.

14.1.2 Capability ID0 A (P_CR_CAPID0_A_0_0_0_PCI)—Offset E4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**SPARE31_24 (SPARE31_24):** Reserved for future capabilities.
23	0h RW/V	**VTd Disable (VTDD):** 0 = Enable VTd 1 = Disable VTd
22	0h RW/V	**FUSE_SPARE22 (FUSE_SPARE22):** Fuse backed spare.
21	0h RW/V	**FUSE_SPARE21 (FUSE_SPARE21):** Fuse backed spare.
20	0h RW/V	**FUSE_SPARE20 (FUSE_SPARE20):** Fuse backed spare.
19	0h RW/V	**FUSE_SPARE19 (FUSE_SPARE19):** Fuse backed spare.
18	0h RW/V	**FUSE_SPARE18 (FUSE_SPARE18):** Fuse backed spare.
17	0h RW/V	**FUSE_SPARE17 (FUSE_SPARE17):** Fuse backed spare.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/V	**FUSE_SPARE16 (FUSE_SPARE16):** Fuse backed spare.
15	0h RW/V	**Thermal Device Disable (CDD):** 0 = Thermal associated memory spaces are accessible. 1 = Thermal associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF cannot be set.
14	0h RW/V	**FUSE_SPARE14 (FUSE_SPARE14):** Fuse backed spare.
13	0h RW/V	**FUSE_SPARE13 (FUSE_SPARE13):** Fuse backed spare.
12	0h RW/V	**FUSE_SPARE12 (FUSE_SPARE12):** Fuse backed spare.
11	0h RW/V	**Internal Graphics and Display Disable (IGD):** 0 = There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. 1 = There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.
10	0h RO	**DIDOE (DIDOE):** Controls if there is an override of Dev2 (GFX) device ID. 0 = Disable ability to override DID - For production 1 = Enable ability to override DID - For debug and samples only

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RO	**CDID (CDID):** Controls the value of Dev2 (GFX) device ID. Identifier assigned to the core/primary PCI device.The corresponding two bit capability ID programming is: 00b = Desktop 01b = Mobile 10b = Server 11b = Marketing Spare
7:0	0h RW	**SPARE7_0 (SPARE7_0):** Reserved for future capabilities

14.1.3 Capability ID0 B (P_CR_CAPID0_B_0_0_0_PCI)—Offset E8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**IMGU_DIS (IMGU_DIS):** 0: Imaging Unit associated memory spaces are accessible. 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for I-unit can not be set.
30	0h RW/V	**FUSE_SPARE30 (FUSE_SPARE30):** Fuse backed spare.
29	0h RW/V	**FUSE_SPARE29 (FUSE_SPARE29):** Fuse backed spares, potentially to be used for PKGTYP encoding.
28	0h RW/V	**FUSE_SPARE28 (FUSE_SPARE28):** Fuse backed spares potentially to be used for PKGTYP encoding.
27	0h RW/V	**FUSE_SPARE27 (FUSE_SPARE27):** Fuse backed spares potentially to be used for PKGTYP encoding.
26	0h RW/V	**FUSE_SPARE26 (FUSE_SPARE26):** Fuse backed spares potentially to be used for PKGTYP encoding.
25	0h RW/V	**FUSE_SPARE25 (FUSE_SPARE25):** Fuse backed spares potentially to be used for PKGTYP encoding.
24	0h RW/V	**Shared Virtual Memory Disable (SVMDIS):** 0 = Enable Shared Virtual Memory mode 1 = Disable Shared Virtual Memory mode

Bit Range	Default & Access	Field Name (ID): Description
23:0	0h RW	**Spare (SPARE23_0):** Reserved for future capabilities.

14.2 Registers Summary

Table 14-2. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID Register (P_CR_DEVICE_ID_VENDOR_ID_0_0_1_PCI)—Offset 0h	A8C8086h
4h	7h	PCI_STATUS_COMMAND_0_0_1_PCI (P_CR_PCI_STATUS_COMMAND_0_0_1_PCI)—Offset 4h	900000h
8h	Bh	PCI Revision ID and PCI Class Code Register (P_CR_REVISION_ID_CLASS_CODE_0_0_1_PCI)—Offset 8h	11800000h
Ch	Fh	Master Latency Timer and Header Type Register (P_CR_MASTER_LATENCY_TIME_0_0_1_PCI)—Offset Ch	0h
10h	13h	Thermal Management Base Address Register (P_CR_TMBAR_LO_0_0_1_PCI)—Offset 10h	4h
14h	17h	Thermal Management Base Address Register (P_CR_TMBAR_HI_0_0_1_PCI)—Offset 14h	0h
2Ch	2Fh	PCI Subsystem Vendor ID and PCI Subsystem ID (P_CR_SVID_SID_0_0_1_PCI)—Offset 2Ch	0h
34h	37h	CAPPTR_0_0_1_PCI (P_CR_CAPPTR_0_0_1_PCI)—Offset 34h	D0h
3Ch	3Fh	Interrupt and Latency Configuration (P_CR_INTR_LAT_0_0_1_PCI)—Offset 3Ch	100h
54h	57h	Device Enable Register (P_CR_DEVEN_0_0_1_PCI)—Offset 54h	33h
88h	8Bh	SCISTS_0_0_1_PCI (P_CR_SCISTS_0_0_1_PCI)—Offset 88h	0h
CCh	CFh	SCI Command (P_CR_SCICMD_0_0_1_PCI)—Offset CCh	0h
D0h	D3h	Power Management Capabilities (P_CR_PMCAPID_0_0_1_PCI)—Offset D0h	3E001h
D4h	D7h	Power Management Control and Status (P_CR_PMCS_0_0_1_PCI)—Offset D4h	8h
DCh	DFh	Interrupt Status (P_CR_INTSTS_0_0_1_PCI)—Offset DCh	0h
E0h	E3h	Capability ID0 Capability Control (P_CR_CAPID0_CAPCTRL0_0_0_1_PCI)—Offset E0h	10C0009h
E4h	E7h	Capability ID0 A (P_CR_CAPID0_A_0_0_1_PCI)—Offset E4h	0h
E8h	EBh	Capability ID0 B (P_CR_CAPID0_B_0_0_1_PCI)—Offset E8h	0h

14.2.1 Device ID and Vendor ID Register (P_CR_DEVICE_ID_VENDOR_ID_0_0_1_PCI)—Offset 0h

This register uniquely identifies any PCI device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: A8C8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	A8Ch RO/V	**Device ID (DEVICE_ID):** Identifier assigned to the SoC Thermal Management Controller.
15:0	8086h RO	**Vendor ID (VENDOR_ID):** Hardwired to Intel's Vendor ID value.

14.2.2 PCI_STATUS_COMMAND_0_0_1_PCI (P_CR_PCI_STATUS_COMMAND_0_0_1_PCI)—Offset 4h

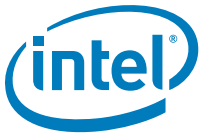
PCI Status is used to record status information for PCI bus related events, including the occurrence of a PCI compliant Master Abort (MA) and PCI compliant Target Abort (TA). PCISTS also indicates the DEVSEL# timing that has been set by the thermal device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 900000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** The Thermal device does not implement this bit and it is hardwired to a 0.
30	0h RO	**Signaled System Error (SSE):** This bit is hardwired to zero. The Thermal device never asserts SERR#, and therefore it has no need to implement this bit.
29	0h RO	**Received Master Abort (RURS):** The Thermal device does not implement this bit and it is hardwired to a 0.
28	0h RO	**Received Target Abort (RCAS):** The Thermal device does not implement this bit and it is hardwired to a 0.
27	0h RO	**Signaled Target Abort (STAS):** his bit is hardwired to 0. The Thermal device will not generate a Target Abort DMI completion packet or Special Cycle, and therefore it has no need to implement this bit.
26:25	0h RO	**DEVSEL Timing (DEVT):** These bits are hardwired to 0. Device 4 does not physically connect to PCI_A.
24	0h RO	**Master Data Parity Error (DPD):** This bit is hardwired to 0. PERR signaling and messaging are not implemented by the Thermal Device, and therefore it has no need to implement this bit.
23	1h RO	**Fast Back to Back Capable (FB2B_CAPABLE):** This bit is hardwired to 1. Device 4 does not physically connect to PCI_A, so this bit is set to 1 (indicating fast back-to-back capability) so that the optimum setting for PCI_A is not limited by the Thermal device.



Bit Range	Default & Access	Field Name (ID): Description
22	0h RO	Reserved.
21	0h RO	**66MHz Capable (PCI66M):** The Thermal device does not implement this bit and it is hardwired to a 0.
20	1h RO	**Capabilities List (CLIST):** This bit is set to 1 to indicate that the register at 34h provides an offset into the function. PCI Configuration Space containing a pointer to the location of the first item in the list.
19	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTA# signal at the input of the enable/disable circuit. This bit is set by HW to 1 when the INTA# is asserted and reset by HW to 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the 0.0.1.PCICMD register).
18:11	0h RO	Reserved.
10	0h RW	**INTx# Disable (INTDIS):** This bit, when set, disables the device from asserting INTx#, where 'x' is configured in the INTPIN register.
9	0h RO	**Fast Back to Back Enable (FB2B_ENABLE):** The Thermal device does not implement this bit and it is hardwired to a 0.
8	0h RO	**SERR# Enable (SERRE):** The Thermal device does not implement this bit and it is hardwired to a 0.
7	0h RO	**ADSTEP (ADSTEP):** The Thermal device does not implement this bit and it is hardwired to a 0.
6	0h RO	**Parity Error Enable (PERRE):** This bit is hardwired to 0. The Thermal device belongs to the category of devices that does not corrupt programs or data in system memory or hard drives. It therefore ignores any parity error that it detects and continues with normal operation.
5	0h RO	**VGA Snoop (VGASNOOP):** The Thermal device does not implement this bit and it is hardwired to a 0.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** This bit is hardwired to 0. The Thermal device will never issue memory write and invalidate commands, and therefore has no need to implement this bit.
3	0h RO	**Special Cycle Enable (SCE):** The Thermal device does not implement this bit and it is hardwired to a 0.
2	0h RW	**Bus Master Enable (BME):** The Thermal device is enabled to function as a PCI-compliant bus master when this bit is set. If it is not set, bus mastering is disabled.
1	0h RW	**Memory Access Enable (MAE):** The Thermal device will allow access to thermal registers when this bit is set. If it is not set, access to memory mapped thermal registers is disabled.
0	0h RO	**I/O Access Enable (IOAE):** The Thermal device does not implement this bit and it is hardwired to a 0.

14.2.3 PCI Revision ID and PCI Class Code Register (P_CR_REVISION_ID_CLASS_CODE_0_0_1_PCI)—Offset 8h

Revision ID contains the revision number of the device. Class Code identifies the basic function of the device.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 11800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	11h RO	**Base Class Code (BASE_CLASS_CODE):** This is an 8-bit value that indicates the base class code for the Thermal Controller. This code has the value 11h, indicating a device that is used for data acquisition and signal processing.
23:16	80h RO	**Sub-class Code (SUB_CLASS_CODE):** The code is 80h which indicates 'Other Data Acquisition and Signal Processing Controllers.'
15:8	0h RO	**Programming Interface (PI):** This is an 8-bit value that indicates the programming interface of this device. This value does not specify a particular register set layout and provides no practical use for this device.
7:0	0h RO/V	**Revision ID (REVISION_ID):** Revision ID.

14.2.4 Master Latency Timer and Header Type Register (P_CR_MASTER_LATENCY_TIME_0_0_1_PCI)—Offset Ch

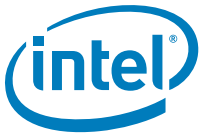
This register defines Latency Timer and layout of the device Configuration Space header.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BIST Support (BS):** This bit is hardwired to zero. The Thermal device does not support BIST.
30:24	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO	**Header Type (HDR):** This field always returns 0 to indicate that the Thermal device is a single function device with standard header layout.
15:8	0h RO	**Master Latency Timer (MLT):** This field is hardwired to 0. The Thermal device does not support perform bursts.
7:0	0h RO	**Cache Line Size (CLS):** This field is hardwired to 0. The Thermal Device as a PCI compliant master does not use the Memory Write and Invalidate command and, in general, does not perform operations based on cache line size.

14.2.5 Thermal Management Base Address Register (P_CR_TMBAR_LO_0_0_1_PCI)—Offset 10h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**Base Address of TMBAR (TMMBA):** This field corresponds to bits 31 to 15 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.'
14:4	0h RO	**Address Map (ADM):** Hardwired to 0 to indicate at least 32KB address range.
3	0h RO	**Prefetch Memory (PM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Type (MT):** Hardwired to '10 to indicate 64-bit address.
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

14.2.6 Thermal Management Base Address Register (P_CR_TMBAR_HI_0_0_1_PCI)—Offset 14h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Reserved (RSVDRW):** Must be set to 0 since addressing above 512GB is not supported.
6:0	0h RW	**Base Address of TMBAR (TMMBA):** This field corresponds to bits 38 to 32 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.

14.2.7 PCI Subsystem Vendor ID and PCI Subsystem ID (P_CR_SVID_SID_0_0_1_PCI)—Offset 2Ch

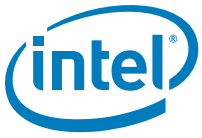
This register is used to uniquely identify the subsystem where the PCI device resides.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Subsystem ID (SUBSYSTEM_ID):** PCI Subsystem ID: This field should be programmed during BIOS initialization.
15:0	0h RW	**Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID):** PCI Subsystem Vendor ID: This field should be programmed by BIOS during bootup to indicate the vendor of the system board.



14.2.8 CAPPTR_0_0_1_PCI (P_CR_CAPPTR_0_0_1_PCI)—Offset 34h

CAPPOINT provides the offset that is the pointer to the location of the first device capability in the capability list.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: D0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	D0h RO	**Base Address of First Capability Register (BASE_ADDR):** This pointer is an 8-bit address to an offset within this device's Configuration Space that holds the first Capability Register (CAPID0_CAPCTRL).

14.2.9 Interrupt and Latency Configuration (P_CR_INTR_LAT_0_0_1_PCI)—Offset 3Ch

This register is used for specifying how often the device needs to gain access to the PCI bus.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Maximum Latency Value (MLV):** These bits are hardwired to zero. The Thermal device has no specific requirements for how often it needs to access the PCI bus.
23:16	0h RO	**Minimum Grant Value (MGV):** These bits are hardwired to zero. The Thermal device does not burst as a PCI compliant master.
15:8	1h RW/L	**Interrupt Pin (INTPIN):** As a single function device, the Thermal device specifies INTA as its interrupt pin. 01h = INTA by default. BIOS may need to reconfigure this in order allow software to disambiguate multiple functions within MCHBAR. Recommended setting is 02h = INTB. This field is locked from future writes when the THERMAL_DEVICE_IRQ.LOCK

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTCON):** Used to communicate interrupt line routing information. BIOS Requirement: POST software writes the routing information into this register as it initializes and configures the system. The value indicates to which input of the system interrupt controller this device's interrupt pin is connected.

14.2.10 Device Enable Register (P_CR_DEVEN_0_0_1_PCI)—Offset 54h

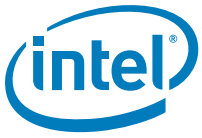
The Device Enable register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 33h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
5	1h RW/V	**Device 3 Function 0 Enable (Imaging) (D3F0EN):** 0 = Imaging Device 0/3/0 is disabled and hidden 1 = Imaging Device 0/3/0 is enabled and visible Software may write a 0b to this register to disable the imaging device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
4	1h RW/V	**Device 2 Function 0 Enable (Graphics/Display) (D2F0EN):** 0 = Graphics/Display Device 0/2/0 is disabled and hidden 1 = Graphics/Display Device 0/2/0 is enabled and visible Software may write a 0b to this register to disable the graphics / display device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
3	0h RO	Reserved.
2	0h RO	**RESERVED_0 (RESERVED_0):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
1	1h RW/V	**Device 0 Function 1 Enable (Thermal) (D0F1EN):** 0 = Thermal Device 0/0/1 is disabled and hidden 1 = Thermal Device 0/0/1 is enabled and visible Software may write a '0 to this register to disable the thermal device. Writes to '1 are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
0	1h RO	**Device 0 Function 0 Enable (Memory / System Agent) (D0F0EN):** Device enable for MCHBAR device. This device not be disabled and is therefore hardwired to 1.

14.2.11 SCISTS_0_0_1_PCI (P_CR_SCISTS_0_0_1_PCI)—Offset 88h

This register is used to report various error conditions via the SCI messaging mechanism. An SCI message is generated on a zero to one transition of any of these flags (if enabled by the SCICMD and PCICMD registers). This bit is set regardless of whether or not the SCI event is enabled and generated. After the event processing is complete, the error logging mechanism can be unlocked by clearing the appropriate status bit by software writing a 1 to it.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/1C/V	**CTED (CTED):** If set, indicates a thermal event was detected and SCI has optionally been generated. If this bit is already set, then an interrupt message will not be sent on a new event. ACPI software will write this bit to 1b to clear the event.

14.2.12 SCI Command (P_CR_SCICMD_0_0_1_PCI)—Offset CCh

This register enables various event conditions to generate an SCI event message. When an event log is observed, it will generate an SCI message when enabled by the SCICMD register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**SCI Event Enable (SCICE):** 0 = SCI messaging in response to thermal events is disabled. 1 = Generate an SCI event message on detection of a hardware thermal event, as configured by software.
15:0	0h RO	Reserved.

14.2.13 Power Management Capabilities (P_CR_PMCAPID_0_0_1_PCI)—Offset D0h

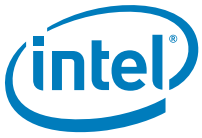
The Power Management Capabilities register is a 16-bit read-only register which provides information on the capabilities of the function related to power management. The information in this register is generally static and known at design time.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 3E001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** This field indicates the power states in which the thermal device may assert PME#. It is hardwired to 0 to indicate that the Thermal device does not support nor assert the PME# signal.
26	0h RO	**D2 (D2):** Hardwired to 0 to indicate that the D2 power management state is not supported.
25	0h RO	**D1 (D1):** Hardwired to 0 to indicate that the D1 power management state is not supported.
24:22	0h RO	Reserved.
21	0h RO	**Device Specific Initialization (DSI):** Indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. This bit is not used by some operating systems. Microsoft Windows and Windows NT, for instance, do not use this bit to determine whether to use D3. Instead, they use the driver's capabilities to determine this. 1b indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.



Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**APS (APS):** The Thermal device does not implement this bit and it is hardwired to a 0.
19	0h RO	**PME# Capbility (PMEC):** Hardwired to 0 to indicate the thermal device does not support PME# generation.
18:16	3h RO	**Version (VER):** This device complies with revision 1.2 of the PCI Power Management Interface Specification.
15:8	E0h RO	**Next Capability Pointer (NCP):** This contains a pointer to next item in capabilities list. The next capability is E0h which is device 0 / func 0 capability mirror.
7:0	1h RO	**Capability ID (CID):** 01h indicates that this is a power management capability

14.2.14 Power Management Control and Status (P_CR_PMCS_0_0_1_PCI)—Offset D4h

The Data register is an optional, 8-bit read-only register that provides a mechanism for the function to report state dependent operating data such as power consumed or heat dissipation. Typically the data returned through the Data register is a static copy (look up table, for example) of the function's worst case 'DC characteristics' data sheet. This data, when made available to system software, could then be used to intelligently make decisions about power budgeting, cooling requirements, etc.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**DATA (DATA):** The data register, data scale and data select registers are not supported. Hardwired to zero.
23:16	0h RO	Reserved.
15	0h RO	**PME# Status (PMES):** This bit is set when the function would normally assert the PME# signal independent of the state of the PME_En bit. This bit is hardwired to 0b to indicate that PME# assertion from D3 (cold) is not supported.
14:13	0h RO	**Data Scale (DS):** The data register, data scale and data select registers are not supported
12:9	0h RO	**Data Select (DSEL):** The data register, data scale and data select registers are not supported
8	0h RO	**PME# Enable (PMEEN):** This bit is hardwired to 0b to indicate that PME# assertion from D3 (cold) is disabled.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** 1 = Devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration Context beyond writing the PowerState bits. 0 = Devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full initialization sequence is needed to return the device to D0 initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW/V	**Power State (PS):** This field indicates the current power state of the thermal device and can be used to set the thermal device into a new power state. If software attempts to write an unsupported state to this field, the write operation must complete normally on the bus, but the data is discarded and no state change occurs. 00b = D0 Default 01b = D1 Not Supported 10b = D2 Not Supported 11b = D3

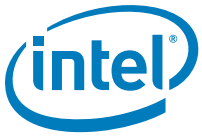
14.2.15 Interrupt Status (P_CR_INTSTS_0_0_1_PCI)—Offset DCh

This register is used to report interrupt pending event status. Upon event detection, if enabled, an interrupt message will be delivered to the IOAPIC. Upon processing that event, software may clear the event to enable future event signaling by writing a 1 to the INTSTAT bit in this register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/1C/V	**Interrupt Status (INTSTAT):** If set, indicates a thermal event was detected. If this bit is already set, then an interrupt message will not be sent upon detection of a new event.

14.2.16 Capability ID0 Capability Control (P_CR_CAPID0_CAPCTRL0_0_0_1_PCI)—Offset E0h

Control bits in this register describe the attributes of CAPID0_A and CAPID0_B capability registers.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 10C0009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	1h RO	**Capability ID Version (CAPID_VER):** This field has the value 0001b to identify the first revision of the CAPID register definition.
23:16	Ch RO	**Capability ID0 Structure Length (CAPIDLEN):** This field has the value 0Ch to indicate the structure length 12 bytes. This is the total size of this CAPCTRL and the CAPID0_A and CAPID0_B registers in the following bytes.
15:8	0h RO	**Next Capability Register Pointer (NCP):** This field is hardwired to 00h, indicating the end of the capabilities linked list.
7:0	9h RO	**Capability ID (CAP_ID):** This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers.

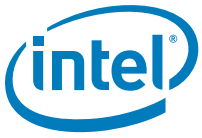
14.2.17 Capability ID0 A (P_CR_CAPID0_A_0_0_1_PCI)—Offset E4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**SPARE31_24 (SPARE31_24):** Reserved for future capabilities.
23	0h RW/V	**VTd Disable (VTDD):** 0 = Enable VTd 1 = Disable VTd
22	0h RW/V	**FUSE_SPARE22 (FUSE_SPARE22):** Fuse backed spare.
21	0h RW/V	**FUSE_SPARE21 (FUSE_SPARE21):** Fuse backed spare.
20	0h RW/V	**FUSE_SPARE20 (FUSE_SPARE20):** Fuse backed spare.
19	0h RW/V	**FUSE_SPARE19 (FUSE_SPARE19):** Fuse backed spare.
18	0h RW/V	**FUSE_SPARE18 (FUSE_SPARE18):** Fuse backed spare.
17	0h RW/V	**FUSE_SPARE17 (FUSE_SPARE17):** Fuse backed spare.
16	0h RW/V	**FUSE_SPARE16 (FUSE_SPARE16):** Fuse backed spare.
15	0h RW/V	**Thermal Device Disable (CDD):** 0 = Thermal associated memory spaces are accessible. 1 = Thermal associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF cannot be set.
14	0h RW/V	**FUSE_SPARE14 (FUSE_SPARE14):** Fuse backed spare.
13	0h RW/V	**FUSE_SPARE13 (FUSE_SPARE13):** Fuse backed spare.
12	0h RW/V	**FUSE_SPARE12 (FUSE_SPARE12):** Fuse backed spare.



Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/V	**Internal Graphics and Display Disable (IGD):** 0 = There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. 1 = There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.
10	0h RO	**DIDOE (DIDOE):** Controls if there is an override of Dev2 (GFX) device ID. 0 = Disable ability to override DID - For production 1 = Enable ability to override DID - For debug and samples only
9:8	0h RO	**CDID (CDID):** Controls the value of Dev2 (GFX) device ID. Identifier assigned to the core/primary PCI device.The corresponding two bit capability ID programming is: 00b = Desktop 01b = Mobile 10b = Server 11b = Marketing Spare
7:0	0h RW	**SPARE7_0 (SPARE7_0):** Reserved for future capabilities

14.2.18 Capability ID0 B (P_CR_CAPID0_B_0_0_1_PCI)—Offset E8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 0 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**IMGU_DIS (IMGU_DIS):** 0: Imaging Unit associated memory spaces are accessible. 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for I-unit can not be set.
30	0h RW/V	**FUSE_SPARE30 (FUSE_SPARE30):** Fuse backed spare.
29	0h RW/V	**FUSE_SPARE29 (FUSE_SPARE29):** Fuse backed spares, potentially to be used for PKGTYP encoding.
28	0h RW/V	**FUSE_SPARE28 (FUSE_SPARE28):** Fuse backed spares potentially to be used for PKGTYP encoding.
27	0h RW/V	**FUSE_SPARE27 (FUSE_SPARE27):** Fuse backed spares potentially to be used for PKGTYP encoding.
26	0h RW/V	**FUSE_SPARE26 (FUSE_SPARE26):** Fuse backed spares potentially to be used for PKGTYP encoding.
25	0h RW/V	**FUSE_SPARE25 (FUSE_SPARE25):** Fuse backed spares potentially to be used for PKGTYP encoding.
24	0h RW/V	**Shared Virtual Memory Disable (SVMDIS):** 0 = Enable Shared Virtual Memory mode 1 = Disable Shared Virtual Memory mode
23:0	0h RW	**Spare (SPARE23_0):** Reserved for future capabilities.

14.3 Registers Summary

Table 14-3. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
805Ch	805Fh	THREAD_STATUS (P_CR_GT_THREAD_STATUS_0_2_0_GTTMMADR)—Offset 805Ch	7FF07h
8060h	8063h	CORE_STATUS (P_CR_GT_CORE_STATUS_0_2_0_GTTMMADR)—Offset 8060h	1100FF07h
8064h	8067h	GT_SLICE_INFO (P_CR_GT_SLICE_INFO_0_2_0_GTTMMADR)—Offset 8064h	0h
8068h	806Bh	GT Hardware P-state Control Request (P_CR_GT_HWP_REQ_0_2_0_GTTMMADR)—Offset 8068h	0h
8070h	8073h	GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR (P_CR_GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR)—Offset 8070h	0h
8074h	8077h	GT_SQ_OCCUPANCY_0_2_0_GTTMMADR (P_CR_GT_SQ_OCCUPANCY_0_2_0_GTTMMADR)—Offset 8074h	0h
8078h	807Bh	GT_RW_DRAM_0_2_0_GTTMMADR (P_CR_GT_RW_DRAM_0_2_0_GTTMMADR)—Offset 8078h	0h
807Ch	807Fh	GT_P_REQ (P_CR_GT_THREAD_P_REQ_0_2_0_GTTMMADR)—Offset 807Ch	0h

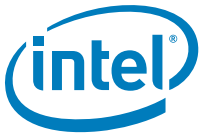


Table 14-3. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
8080h	8087h	GT_ARAT_TTT (P_CR_GT_ARAT_TTT_0_2_0_GTTMMADR)—Offset 8080h	1FFFFFFFFFFFFFFFh
8088h	808Bh	GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR (P_CR_GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR)—Offset 8088h	0h
8090h	8093h	GT_DISP_PWRON_0_2_0_GTTMMADR (P_CR_GT_DISP_PWRON_0_2_0_GTTMMADR)—Offset 8090h	0h
8108h	810Bh	GT_GFX_RC6_0_2_0_GTTMMADR (P_CR_GT_GFX_RC6_0_2_0_GTTMMADR)—Offset 8108h	0h
8124h	8127h	GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8124h	0h
8128h	812Bh	GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR)—Offset 8128h	0h
812Ch	812Fh	GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR)—Offset 812Ch	0h
8130h	8133h	P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8130h	0h
8134h	8137h	P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 8134h	0h
8138h	813Bh	PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8138h	0h
813Ch	813Fh	PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 813Ch	0h
8140h	8143h	GT_PM_CONFIG_0_2_0_GTTMMADR (P_CR_GT_PM_CONFIG_0_2_0_GTTMMADR)—Offset 8140h	0h
8150h	8153h	Graphics Interrupt Response Latency Tolerance (P_CR_GRAPHICS_INTERRUPT_RESPONSE_TIME_0_2_0_GTTMMADR)—Offset 8150h	0h
8160h	8163h	GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR)—Offset 8160h	0h
8164h	8167h	GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR)—Offset 8164h	0h
816Ch	816Fh	CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 816Ch	0h
8170h	8173h	GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8170h	0h
8174h	8177h	SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8174h	0h
8178h	817Bh	Memory Frequency Status (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8178h	0h

Table 14-3. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
8184h	8187h	GT_PERF_LIMIT_REASONS (P_CR_GT_PERF_LIMIT_REASONS_0_2_0_GTTMMADR)—Offset 8184h	0h
8190h	8197h	GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR (P_CR_GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR)—Offset 8190h	0h
8198h	819Bh	ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR (P_CR_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8198h	0h
819Ch	819Fh	GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR (P_CR_GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR)—Offset 819Ch	0h

14.3.1 THREAD_STATUS (P_CR_GT_THREAD_STATUS_0_2_0_GTTMMADR)—Offset 805Ch

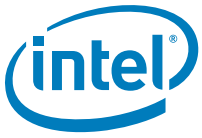
Per thread status register THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**THREAD_ACTIVE (THREAD_ACTIVE):** Tied to same value as CORE_STATUS.CORE_ACTIVE, updated by PMA.
30	0h RO/V	**VOTE_REQUEST (VOTE_REQUEST):** This bit will be set on TC0TC1 and cleared on TC1ETC7.
29:19	0h RO	**RESERVED_2 (RESERVED_2):** reserved
18:16	7h RO/V	**THREAD_WISH_ALLOW (THREAD_WISH_ALLOW):** This field contains the allowed core C-state limit. It is read by Ucode on C-state entry to clip its wish_state request. Pcode updates this field (via IO_CORE_DEMOTED_C1) based on demotion algorithm and: fuse, DFX, SW limits in PKG_C_STATE_LIMIT_REQ, probe mode and patch load (via Ucode Mbox).
15:12	Fh RW	**THREAD_WISH_SUB_STATE (THREAD_WISH_SUB_STATE):** Ucode updates this field with the desired Thread CState SubState.
11:8	Fh RW	**THREAD_WISH_STATE (THREAD_WISH_STATE):** Ucode updates this field with the parameters of the MWAIT instruction.



Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**RESERVED_1 (RESERVED_1):** Reserved.
6:4	0h RW	**THREAD_TPD_STATE (THREAD_TPD_STATE):** Thread power down state
3	0h RO	**RESERVED_0 (RESERVED_0):** Reserved.
2:0	7h RW	**THREAD_STATE (THREAD_STATE):** Resolved thread_state updated by Ucode after it has completed entry/exit.

14.3.2 CORE_STATUS (P_CR_GT_CORE_STATUS_0_2_0_GTTMMADR)—Offset 8060h

Per core (including GT) status register.
Used by Ucode/GT and P-Unit/PMA HW to communicate core status to Pcode. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

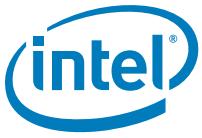
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1100FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**CORE_ACTIVE (CORE_ACTIVE):** Virtual signal indicating core is active. Value is updated by writes to RCSM_CORE_RESPONSE.CORE_ACTIVE from GT/GLM PMA. When set to '1', Pcode ignores value in CORE_STATE field and assumes C0, additionally P-Unit HW will delay fast path due to CORE_STATE field to non-C0 values until CORE_ACTIVE is '0'
30	0h RO/V	**WAKEUP_REQUEST (WAKEUP_REQUEST):** WAKEUP_REQUEST is set by interrupt wakes from T-Unit (via T2P_INT_WAKE) or Pcode via IO_PCODE_WAKEUP_REQUEST. WAKEUP_REQUEST is cleared by T-Unit (via T2P_INT_WAKE) when INT_READY vector is set. Fastpath (IO_FASTPATH_CORE_C) is set on WAKEUP_REQUEST, or when WAKEUP_REQUEST is '1' and CORE_IN_C3_C6 asserts.
29	0h RO	**RESERVED_3 (RESERVED_3):** Reserved
28	1h RO/V	**CORE_IN_C3_C6 (CORE_IN_C3_C6):** Virtual signal indicating core is in electrical (post RCSM flow) C3/C6. Value is updated by writes to RCSM_CORE_RESPONSE.CORE_IN_C3C6 from GT/GLM PMA. Must be asserted for WAKEUP_REQUEST to trigger fastpath.

Bit Range	Default & Access	Field Name (ID): Description
27	0h WO	**PROBE_MODE_DONE (PROBE_MODE_DONE):** Sent by Ucode to inform P-Unit that probe mode seqeunce is complete, used to clear pending probe mode request in P-Unit HW.
26	0h RW	**DISABLE_WAKEUP_REQ (DISABLE_WAKEUP_REQ):** Reserved.
25	0h RO/V	**S1_ACK (S1_ACK):** Reserved.
24	1h RW/V	**PM_BLOCK_REQ (PM_BLOCK_REQ):** Controls the status of the Interrupt Ready mask in the T-Unit. Set by Ucode before Piclet setup during C6 entry. On assertion of this bit P-Unit will send P2T_INT_CONTROL_ADDR.INT_READY_CLEAR to T-Unit. Any interrupts received after this point will cause T-Unit to send a interrupt wake request via T2P_INT_WAKE.SET_CORE_MASK Cleared by Ucode after Piclet replay during C6 exit. On deassertion of this bit, P-Unit will send P2T_INT_CONTROL_ADDR.INT_READY_SET to T-Unit. This will cause T-Unit to clear any pending interrupt wakes via T2P_INT_WAKE.CLEAR_CORE_MASK.
23	0h RO/V	**RFO_EN (RFO_EN):** For GT this bit indicates the status of read-for ownership (RFOs). If it is '1' RFOs are enabled and if it is '0' RFOs are disabled. This field only has meaning for the GT register instance. It is a dont care for the IA register instances.
22:16	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
15:12	Fh RW	**CORE_WISH_SUB_STATE (CORE_WISH_SUB_STATE):** Ucode updates this field with the desired Core CState SubState.
11:8	Fh RW	**CORE_WISH_STATE (CORE_WISH_STATE):** Ucode updates this field with the parameters of the MWAIT instruction.
7	0h RO	**RESERVED_1 (RESERVED_1):** Reserved.
6:4	0h RW	**CORE_CPD_STATE (CORE_CPD_STATE):** Updated by Ucode on Core Power Down (CPD) exit or entry. CPD is used during GV Flows to quiesce core.
3	0h RO	**RESERVED_0 (RESERVED_0):** Reserved.
2:0	7h RW/V	**CORE_STATE (CORE_STATE):** Updated with the current core C-state, by Ucode on C6 entry/exit, at the end of the respective flow.



14.3.3 GT_SLICE_INFO (P_CR_GT_SLICE_INFO_0_2_0_GTTMMADR)—Offset 8064h

Status register describing GT slice state.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10	0h RO/V	**UNSLICESTAT (UNSLICESTAT):** Status of GT unslice power plane 0 = GT has unslice powered off 1 = GT has unslice powered on
9:3	0h RO	Reserved.
2:0	0h RO/V	**SLICESTAT (SLICESTAT):** Status of GT power planes. 000b = GT is powered off C6 or not yet booted 001b = GT has slice 0 powered 011b = GT has slices 0 and 1 powered 111b = GT has slices 0, 1 and 2 powered

14.3.4 GT Hardware P-state Control Request (P_CR_GT_HWP_REQ_0_2_0_GTTMMADR)—Offset 8068h

This register is used as an interface for the graphics driver to communicate hardware managed P-state control requests and/or hints specific to the graphics domain. These requests are used by silicon power management firmware to implement SOC and platform level power and thermal control algorithms.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Reserved3 (RSVD3):** This field is reserved for future use
23:16	0h RW	**Reserved2 (RSVD2):** This field is reserved for future use
15:8	0h RW	**Reserved1 (RSVD1):** This field is reserved for future use
7:0	0h RW	**Quality of Service P-state (QOS_RATIO):** GT Quality of Service P-state request. The GT driver programs this to define a desired performance floor. This floor is useful as a hint to power and thermal control algorithms to balance system resources appropriately in order to ensure a minimum graphics performance floor. Described in 16.67MHz reference clock units, e.g., a ratio of 24 results in a clock frequency of 400MHz.

14.3.5 GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR (P_CR_GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR)—Offset 8070h

GT memory bound counter. Holds the accumulated number of CS clks that GT has been waiting for memory grants.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated cycles GT has been waiting for memory grants.

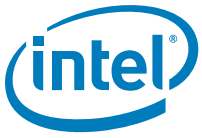
14.3.6 GT_SQ_OCCUPANCY_0_2_0_GTTMMADR (P_CR_GT_SQ_OCCUPANCY_0_2_0_GTTMMADR)—Offset 8074h

Accumulated GT super queue (SQ) occupancy. This is accumulated by GT and pushed to P-Unit from the GT PMA.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated SQ occupancy.

14.3.7 GT_RW_DRAM_0_2_0_GTTMMADR (P_CR_GT_RW_DRAM_0_2_0_GTTMMADR)—Offset 8078h

This register contains the the sum of the cycles GT has read or written DRAM. It contains a 32-bit accumulation of data sent via the Pushbus. Values exceeding 32 bits will wrap around.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** RW GT cycles to DRAM

14.3.8 GT_P_REQ (P_CR_GT_THREAD_P_REQ_0_2_0_GTTMMADR)—Offset 807Ch

GT Pstate request. This register is written by driver/GT with the desired P-State request. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**UNSLICE_RATIO (UNSLICE_RATIO):** UnSlice Ratio Multiple of 33.33MHz 2xclk 16 MHz 1xclk
22:14	0h RW	**SLICE_RATIO (SLICE_RATIO):** Slice Ratio Multiple of 33.33MHz 2xclk 16 MHz 1xclk
13:4	0h RO	**RESERVED_1 (RESERVED_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**SLICE_UNSLICE_POLICY (SLICE_UNSLICE_POLICY):** Specifies policy of slice and unslice ratios: 0x0 = Use unslice ratio for slice also ignore slice ratio field 0x1 = Maintain ratio between slice/unslice 0x2 = Attempt to throttle slice only maintain unslice ratio

14.3.9 GT_ARAT_TTT (P_CR_GT_ARAT_TTT_0_2_0_GTTMMADR)—Offset 8080h

Always Running APIC Timer 'Timer Target Time' (TTT) value. This is an absolute desired wakeup time. GT copies the local TTT to the P-Unit on RC6 entry. Pcode will wake GT via IO_PCODE_WAKEUP_REQUEST, such that the wake is finished when the URT reaches the value in this register.
To account for wake delay, Pcode will also take into account the prewake value that can be written via driver into GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR.
If ARAT is invalid, GT will write all 1's (infinity).
GT writes this register via the MMIO alias GT_ARAT_TTT_0_2_0_GTTMMADR THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 1FFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:61	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
60:0	1FFFFFFFFFFFFFFFh RW	**DATA (DATA):** The 61 bits of the TTT. GT will update this field with TTT value before entering RC6.

14.3.10 GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR (P_CR_GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR)—Offset 8088h

This register is used in conjuction with GT_ARAT_TTT. It contains the enable and value for a prewake offset that the GT driver can program to prewake GT from C6 with reference to its TTT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
15	0h RW	**TMR_ENABLE (TMR_ENABLE):** Enable for the GT prewake, the driver sets this bit to 1 to enable the offset.
14:0	0h RW	**TMR_VALUE (TMR_VALUE):** Prewake timer value in microseconds, this will be subtracted from the GT_ARAT_TTT.

14.3.11 GT_DISP_PWRON_0_2_0_GTTMMADR (P_CR_GT_DISP_PWRON_0_2_0_GTTMMADR)—Offset 8090h

Used by GT driver to control aspects of PHY power-on (MIPIO, eDP, DDI).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**RESERVED_0 (RESERVED_0):** reserved
2	0h RW	**MIPIO_RST_CTRL (MIPIO_RST_CTRL):** MIPIO reset control. Driver clears on reset exit which deasserts side_rst to MIPI PHY and starts periodic RCOMPS from P-Unit. Driver sets on PHY disabling, which should occur prior to dev2 D3.
1	0h RW	**CH1_PWRREQ1P0_SUS (CH1_PWRREQ1P0_SUS):** GT Display eDP Power On. Written by GT driver to start eDP PHY initialization sequence.
0	0h RW	**CH0_PWRREQ1P0_SUS (CH0_PWRREQ1P0_SUS):** GT Display DDI Power On. Written by GT driver to start DDI PHY initialization sequence.

14.3.12 GT_GFX_RC6_0_2_0_GTTMMADR (P_CR_GT_GFX_RC6_0_2_0_GTTMMADR)—Offset 8108h

Wrapping counter containing the total GT RC6 residency time since boot.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RC6 (RC6):** GT RC6 residency, value is specified in 833.33ns increments. Counter will wrap around.

14.3.13 GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8124h

Control and Status register for the GFXDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GT Driver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_DATA_{HIGH and LOW}. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** SW may write to the two mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode. After setting this bit SW will poll this bit until it is cleared. Alternatively PCODE can generate an interrupt to SW via GTDRIVER_P2G_EVENTS. PCODE will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:16	0h RO	Reserved.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

14.3.14 GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR)—Offset 8128h

Data register for lower 32b of data for the GTDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GTDriver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the lower 32b of data associated with specific commands.

14.3.15 GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR)—Offset 812Ch

Data register for upper 32b of data for the GFXDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GT Driver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the upper 32b of data associated with specific commands.

14.3.16 P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8130h

Control and status register for the P24CtoPCODE mailbox. This mailbox is implemented as a way for the GT P24C to contact the P-unit and is accessible via MMIO. This register is used in conjunction with P24C_PCODE_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** Software may write to the mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a fastpath even to Pcode. After setting this bit software polls until it is cleared. Pcode clears the bit after updating the mailbox registers with the result and error code.
30:24	0h RO	Reserved.
23:16	0h RW/V	**PARAM2 (PARAM2):** This field is used to specify a second additional parameter to extend the command when needed.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

14.3.17 P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 8134h

Data register for the P24CtoPCODE mailbox. This register is used in conjunction with P24C_PCODE_MAILBOX_INTERFACE THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

14.3.18 PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8138h

Control and status register for the PCODEtoP24C mailbox. This mailbox is implemented as a way for pcode to sendi commands to the P24C GT microcontroller. This register is used in conjunction with PCODE_P24C_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**RUN_BUSY (RUN_BUSY):** Pcode may write to the mailbox registers only when RUN_BUSY is clear(0). After setting RUN_BUSY to 1 PCode generates a PMLink command to shift in an uncore trap message to the GT P24C uC. GT P24C clears the RUN_BUSY bit after updating the mailbox registers with the result and error code. This clear of RUN_BUSY creates pends a fast path event to pcode.
30:24	0h RO	Reserved.
23:16	0h RW/V	**PARAM2 (PARAM2):** This field is used to specify a second additional parameter to extend the command when needed.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the PCODE request command or the GT P24C response code depending on the setting of RUN_BUSY. Command Encodings: 01h

14.3.19 PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 813Ch

Data register for the PCODEtoP24C mailbox. This register is used in conjunction with PCODE_P24C_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

14.3.20 GT_PM_CONFIG_0_2_0_GTTMMADR (P_CR_GT_PM_CONFIG_0_2_0_GTTMMADR)—Offset 8140h

Interface for GT driver to configure power management.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
0	0h RW	**DOORBELL_EN (DOORBELL_EN):** Set by driver to enable doorbell mode. This must be set after GT is in and held in RC0 (force-wake). This field must be cleared prior to dev2 D3.

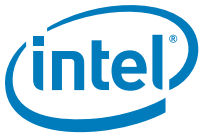
14.3.21 Graphics Interrupt Response Latency Tolerance (P_CR_GRAPHICS_INTERRUPT_RESPONSE_TIME_0_2_0_GTTMMADR)—Offset 8150h

This register is used by the graphics driver to communicate any interrupt latency tolerance (IRT/IRTL) requirements from the software. The P-unit is responsible for ensuring that the graphics worst-case interrupt response latency is always lower than what is programmed in this register.
Some components of worst-case exit latency for the graphics domain are outside the control of the P-unit, and therefore there is a physical floor below which the interrupt response tolerance may not be guaranteed. That floor is usually in the 100us range.
IRT is used only for S0i3 entry if Dev2 is not in D3. If Dev2 is in D3, its assumed latency tolerance is infinity.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RO	Reserved.
12:10	0h RW	**Multiplier (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) 000b = 1ns (2^0) 001b = 32ns (2^5) 010b = 1024ns (2^10) 011b = 32.768us (2^15) 100b = 1.048ms (2^20) 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

14.3.22 GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR)—Offset 8160h

This extended capability allows PCODE to send an interrupt notification upon completion of a mailbox command received from the GTDRIVER. It is enabled via the GTDriver Mailbox. PCODE will set the appropriate bit in this register to 1 and will then write to 0.2.0.GTTMMADR.PIM[PCU_MBOXE]. The GFX Driver will clear the appropriate bit in this register by writing a 1 to the bit. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C/V	**EVENT7 (EVENT7):** Placeholder for Event
6	0h RW/1C/V	**EVENT6 (EVENT6):** Placeholder for Event
5	0h RW/1C/V	**EVENT5 (EVENT5):** Placeholder for Event
4	0h RW/1C/V	**EVENT4 (EVENT4):** Placeholder for Event
3	0h RW/1C/V	**EVENT3 (EVENT3):** Placeholder for Event
2	0h RW/1C/V	**EVENT2 (EVENT2):** Placeholder for Event
1	0h RW/1C/V	**EVENT1 (EVENT1):** Placeholder for Event
0	0h RW/1C/V	**EVENT0 (EVENT0):** This event indicates that the command previously sent by the GTDriver via the Mailbox mechanism is complete.

14.3.23 GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR)—Offset 8164h

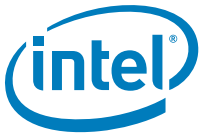
This extended capability allows the GTDriver to send a request to PCODE. The GTDriver will set the appropriate bit in this register to 1 when it wants to generate an event to PCODE. This will pend a Fast Path event to pcode. PCODE will clear the appropriate bit in this register after servicing the request. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/1S/V	**EVENT7 (EVENT7):** Placeholder for Event
6	0h RW/1S/V	**EVENT6 (EVENT6):** Placeholder for Event
5	0h RW/1S/V	**EVENT5 (EVENT5):** Placeholder for Event
4	0h RW/1S/V	**EVENT4 (EVENT4):** Placeholder for Event



Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1S/V	**EVENT3 (EVENT3):** Placeholder for Event
2	0h RW/1S/V	**EVENT2 (EVENT2):** Placeholder for Event
1	0h RW/1S/V	**EVENT1 (EVENT1):** Placeholder for Event
0	0h RW/1S/V	**EVENT0 (EVENT0):** Placeholder for Event

14.3.24 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 816Ch

PUNIT_MMIO: Core Frequency Capabilities
This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.

14.3.25 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8170h

PUNIT_MMIO: Graphics Engine Frequency Capabilities
This register describes the frequency capabilities of the integrated graphics engine. Units are 50MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.

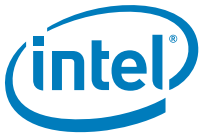
14.3.26 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8174h

PUNIT_MMIO: System Agent Frequency Capabilities
This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio.
Last resolved ratio is updated upon changes to the System Agent frequency.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

14.3.27 Memory Frequency Status (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8178h

This register reports out the LPDDR memory frequency. The actual capabilities of the SOC with respect to LPDDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Last Resolved Memory Frequency (LAST_RESOLVED_RATIO):** This field reports out the LPDDR memory frequency in integer multiple of 133.33MHz. This register reflects what BIOS has programmed as the default LPDDR frequency in products that do not support run-time memory frequency control. For products supporting run-time memory frequency control, this field describes the last resolved frequency.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

14.3.28 GT_PERF_LIMIT_REASONS (P_CR_GT_PERF_LIMIT_REASONS_0_2_0_GTTMMADR)—Offset 8184h

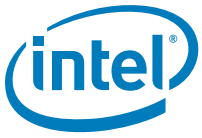
This register reports reasons for performance limitations on the integrated graphics engine. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**QOS_LOG (QOS_LOG):** Logged indication that frequency was clamped below the software-defined quality-of-service floor. This bit is set by firmware, and is clearable by software.
30	0h RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG (MAX_EFFICIENCY_FREQ_LOG):** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency. This bit is set by firmware, and is clearable by software.
29	0h RW/0C/V	**SPARE13_LOG (SPARE13_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
28	0h RW/0C/V	**EDP_LOG (EDP_LOG):** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint. This bit is set by firmware, and is clearable by software.
27	0h RW/0C/V	**SPARE11_LOG (SPARE11_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
26	0h RW/0C/V	**VR_THERMALERT_LOG (VR_THERMALERT_LOG):** Logged indication that frequency was clamped due to a voltage regulator thermal excursion. This bit is set by firmware, and is clearable by software.
25	0h RW/0C/V	**SPARE9_LOG (SPARE9_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
24	0h RW/0C/V	**SPARE8_LOG (SPARE8_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
23	0h RW/0C/V	**SPARE7_LOG (SPARE7_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
22	0h RW/0C/V	**SPARE6_LOG (SPARE6_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
21	0h RW/0C/V	**SPARE5_LOG (SPARE5_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
20	0h RW/0C/V	**SPARE4_LOG (SPARE4_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
19	0h RW/0C/V	**PL2_LOG (PL2_LOG):** Logged indication that frequency was clamped due to a package-level PL2 excursion. This bit is set by firmware, and is clearable by software.
18	0h RW/0C/V	**PL1_LOG (PL1_LOG):** Logged indication that frequency was clamped due to a package-level PL1 excursion. This bit is set by firmware, and is clearable by software.



Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/0C/V	**THERMAL_LOG (THERMAL_LOG):** Logged indication that frequency was clamped due to a thermal excursion. This bit is set by firmware, and is clearable by software.
16	0h RW/0C/V	**PROCHOT_LOG (PROCHOT_LOG):** Logged indication that frequency was clamped due to PROCHOT assertion. This bit is set by firmware, and is clearable by software.
15	0h RO/V	**QOS_STATUS (QOS_STATUS):** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	0h RO/V	**MAX_EFFICIENCY_FREQ_STATUS (MAX_EFFICIENCY_FREQ_STATUS):** Frequency is limited below the maximum efficiency frequency.
13	0h RO/V	**SPARE13_STATUS (SPARE13_STATUS):** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit).
12	0h RO/V	**EDP_STATUS (EDP_STATUS):** Frequency is limited due to a package-level EDP constraint.
11	0h RO/V	**SPARE11_STATUS (SPARE11_STATUS):** Spare status bit.
10	0h RO/V	**VR_THERMALERT_STATUS (VR_THERMALERT_STATUS):** Frequency is limited due to a voltage regulator thermal excursion.
9	0h RO/V	**SPARE9_STATUS (SPARE9_STATUS):** Spare status bit.
8	0h RO/V	**SPARE8_STATUS (SPARE8_STATUS):** Spare status bit.
7	0h RO/V	**SPARE7_STATUS (SPARE7_STATUS):** Spare status bit.
6	0h RO/V	**SPARE6_STATUS (SPARE6_STATUS):** Spare status bit.
5	0h RO/V	**SPARE5_STATUS (SPARE5_STATUS):** Spare status bit.
4	0h RO/V	**SPARE4_STATUS (SPARE4_STATUS):** Spare status bit.
3	0h RO/V	**PL2_STATUS (PL2_STATUS):** Frequency is limited due to a package-level PL2 excursion.
2	0h RO/V	**PL1_STATUS (PL1_STATUS):** Frequency is limited due to a package-level PL1 excursion.
1	0h RO/V	**THERMAL_STATUS (THERMAL_STATUS):** Frequency is limited due to thermal excursion.
0	0h RO/V	**PROCHOT_STATUS (PROCHOT_STATUS):** Frequency is limited due to external PROCHOT assertion.

14.3.29 GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR (P_CR_GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR)—Offset 8190h

PUNIT_MMIO: GTDRIVER_HWP_REQUEST
This register allows the graphics driver to dictate the minimum and maximum performance of the IA cores. The driver may also change the behavior of any autonomous IA P-state controller, if supported by firmware. Non-zero values override default firmware behavior.

Access Method

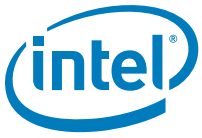
Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:42	0h RW	**RESERVED_0 (RESERVED_0):** Reserved
41:32	0h RW	**ACTIVITY_WINDOW (ACTIVITY_WINDOW):** This field defines the time window over which the autonomous IA P-state controller (if supported) will manage IA core frequency. Units are microseconds.
31:24	0h RW	**AGGRESSIVENESS (AGGRESSIVENESS):** This field defines the performance/energy bias for the autonomous IA P-state controller, if supported.
23:16	0h RW	**MULTIPLIER (MULTIPLIER):** This field defines the IA frequency target: IA ratio = MULTIPLER * GT ratio. The format is U8.3.5 (e.g. 1.0 is 8h'20).
15:8	0h RW	**MAX_PERF (MAX_PERF):** Maximum IA core frequency allowed by the graphics driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.
7:0	0h RW	**MIN_PERF (MIN_PERF):** Minimum IA core frequency allowed by the graphics driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.

14.3.30 ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR (P_CR_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8198h

PUNIT_MMIO: Image Processing System Frequency Capabilities
This register describes the frequency capabilities of the image processing system. Units are 25MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved ratio for the image processing system. Units are 25MHz multiplied by the ratio. This value is updated dynamically whenever the processing system frequency changes.
23:16	0h RO/V	**MAX_RATIO (MAX_RATIO):** Maximum ratio for the image processing system. Units are 25MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_RATIO (EFFICIENT_RATIO):** Firmware-calculated efficient ratio for the image processing system. Units are 25MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_RATIO (MIN_RATIO):** Minimum ratio for the image processing system. Units are 25MHz multiplied by the ratio.

14.3.31 GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR (P_CR_GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR)—Offset 819Ch

GT video busy counter. Holds the accumulated number of CS clks that GT video functions have been busy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated cycles GT video functions have been busy.

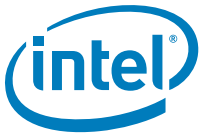
74D0h	74D3h	I-unit Processing System C0 Residency Counter (P_CR_ISPDRIVER_TELEM_IUNIT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 74D0h	0h
74D4h	74D7h	I-unit Processing System C0 Residency Counter (P_CR_ISPDRIVER_TELEM_IUNIT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 74D4h	0h

14.4.1 ISPDRIVER_MAILBOX_INTERFACE_0_0_0_MCHBAR (P_CR_ISPDRIVER_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7480h

Control and Status register for the ISPDRIVERtoPCODE mailbox. This mailbox is implemented as a means for tuning parameters for specific ISP workloads. This register is used in conjunction with ISPDRIVER_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** SW may write to the mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to pcode. After setting this bit SW will poll this bit until it is cleared. Alternatively PCODE can generate an interrupt to SW via ISPDRIVER_P2I_EVENTS. PCODE will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:29	0h RO	Reserved.
28:8	0h RW/V	**ADDR_CNTL (ADDR_CNTL):** This field is used to specify an additional parameters to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

14.4.2 ISPDRIVER_MAILBOX_DATA_LOW_0_0_0_MCHBAR (P_CR_ISPDRIVER_MAILBOX_DATA_LOW_0_0_0_MCHBAR)—Offset 7484h

Data register for lower 32b of data for the ISPDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the ISPDriver running on the IA cores to tune parameters for specific ISP workloads. This register is used in conjunction with ISPDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

14.4.3 ISPDRIVER_MAILBOX_DATA_HIGH_0_0_0_MCHBAR (P_CR_ISPDRIVER_MAILBOX_DATA_HIGH_0_0_0_MCHBAR)—Offset 7488h

Data register for upper 32b of data for the ISPDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the ISPDriver running on the IA cores to tune parameters for specific ISP workloads. This register is used in conjunction with ISPDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

14.4.4 ISPDRIVER_P2I_EVENTS_0_0_0_MCHBAR (P_CR_ISPDRIVER_P2I_EVENTS_0_0_0_MCHBAR)—Offset 748Ch

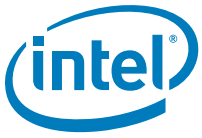
This extended capability allows PCODE to send an interrupt notification upon completion of a mailbox command. It is enabled via the ISP Driver Mailbox. PCODE will set the appropriate bit in this register to 1 and will then write to 0.3.0.ISPMMIOBAR.PIM[PCU_MBOX]. The ISP Driver will clear the appropriate bit in this register by writing a 1 to the bit. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/1C/V	**EVENT7 (EVENT7):** Placeholder for Event
6	0h RW/1C/V	**EVENT6 (EVENT6):** Placeholder for Event
5	0h RW/1C/V	**EVENT5 (EVENT5):** Placeholder for Event



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1C/V	**EVENT4 (EVENT4):** Placeholder for Event
3	0h RW/1C/V	**EVENT3 (EVENT3):** Placeholder for Event
2	0h RW/1C/V	**EVENT2 (EVENT2):** Placeholder for Event
1	0h RW/1C/V	**EVENT1 (EVENT1):** Placeholder for Event
0	0h RW/1C/V	**EVENT0 (EVENT0):** This event indicates that the command previously sent by the ISP Driver via the Mailbox mechanism is complete.

14.4.5 ISPDRIVER_I2P_EVENTS_0_0_0_MCHBAR (P_CR_ISPDRIVER_I2P_EVENTS_0_0_0_MCHBAR)—Offset 7490h

This extended capability allows the ISP Driver to send a request to PCODE. The ISP Driver will set the appropriate bit in this register to 1b when it wants to generate an event to PCODE. This will pend a Fast Path event to pcode. PCODE will clear the appropriate bit in this register after servicing the request. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/1S/V	**EVENT7 (EVENT7):** Placeholder for Event
6	0h RW/1S/V	**EVENT6 (EVENT6):** Placeholder for Event
5	0h RW/1S/V	**EVENT5 (EVENT5):** Placeholder for Event
4	0h RW/1S/V	**EVENT4 (EVENT4):** Placeholder for Event
3	0h RW/1S/V	**EVENT3 (EVENT3):** Placeholder for Event
2	0h RW/1S/V	**EVENT2 (EVENT2):** Placeholder for Event
1	0h RW/1S/V	**EVENT1 (EVENT1):** Placeholder for Event

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1S/V	**EVENT0 (EVENT0):** Placeholder for Event

14.4.6 ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR (P_CR_ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR)—Offset 7498h

PUNIT_MMIO: Image Processing System Frequency Capabilities
This register describes the frequency capabilities of the image processing system. Units are 25MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved ratio for the image processing system. Units are 25MHz multiplied by the ratio. This value is updated dynamically whenever the processing system frequency changes.
23:16	0h RO/V	**MAX_RATIO (MAX_RATIO):** Maximum ratio for the image processing system. Units are 25MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_RATIO (EFFICIENT_RATIO):** Firmware-calculated efficient ratio for the image processing system. Units are 25MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_RATIO (MIN_RATIO):** Minimum ratio for the image processing system. Units are 25MHz multiplied by the ratio.

14.4.7 ISPDRIVER_HWP_REQUEST_0_0_0_MCHBAR (P_CR_ISPDRIVER_HWP_REQUEST_0_0_0_MCHBAR)—Offset 74A0h

PUNIT_MMIO: ISPDRIVER_HWP_REQUEST
This register allows the imaging unit driver to dictate the minimum and maximum performance of the IA cores. The driver may also change the behavior of any autonomous IA P-state controller, if supported by firmware. Non-zero values override default firmware behavior.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:42	0h RW	**RESERVED_0 (RESERVED_0):** Reserved
41:32	0h RW	**ACTIVITY_WINDOW (ACTIVITY_WINDOW):** This field defines the time window over which the autonomous IA P-state controller (if supported) will manage IA core frequency. Units are microseconds.
31:24	0h RW	**AGGRESSIVENESS (AGGRESSIVENESS):** This field defines the performance/energy bias for the autonomous IA P-state controller, if supported.
23:16	0h RW	**MULTIPLIER (MULTIPLIER):** This field defines the IA frequency target: IA ratio = MULTIPLER * processing system ratio. The format is U8.3.5 (e.g. 1.0 is 8h'20).
15:8	0h RW	**MAX_PERF (MAX_PERF):** Maximum IA core frequency allowed by the imaging unit driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.
7:0	0h RW	**MIN_PERF (MIN_PERF):** Minimum IA core frequency allowed by the graphics driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.

14.4.8 ISPDRIVER_SPARE_RW_0_0_0_MCHBAR (P_CR_ISPDRIVER_SPARE_RW_0_0_0_MCHBAR)—Offset 74A8h

Spare RW MMIO Register for IUNIT Driver.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SPARE_RW (SPARE_RW):** Spare RW MMIO space for I-Unit driver to Pcode/P-Unit interaction.

14.4.9 ISPDRIVER_SPARE_RO_0_0_0_MCHBAR (P_CR_ISPDRIVER_SPARE_RO_0_0_0_MCHBAR)—Offset 74ACh

Spare RO MMIO Register for IUNIT Driver.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SPARE_RO (SPARE_RO):** Spare RO MMIO space for I-Unit driver to Pcode/P-Unit interaction.

14.4.10 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_ISPDRIVER_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 74B0h

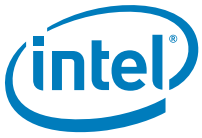
PUNIT_MMIO: Core Frequency Capabilities
This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.



14.4.11 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_ISPDRIVER_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 74B4h

PUNIT_MMIO: Graphics Engine Frequency Capabilities
This register describes the frequency capabilities of the integrated graphics engine. Units are 50MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.

14.4.12 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_ISPDRIVER_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 74B8h

PUNIT_MMIO: System Agent Frequency Capabilities
This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio.
Last resolved ratio is updated upon changes to the System Agent frequency.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

14.4.13 Memory Frequency Status (P_CR_ISPDRIVER_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 74BCh

This register reports out the LPDDR memory frequency. The actual capabilities of the SOC with respect to LPDDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Last Resolved Memory Frequency (LAST_RESOLVED_RATIO):** This field reports out the LPDDR memory frequency in integer multiple of 133.33MHz. This register reflects what BIOS has programmed as the default LPDDR frequency in products that do not support run-time memory frequency control. For products supporting run-time memory frequency control, this field describes the last resolved frequency.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

14.4.14 ISP_PERF_LIMIT_REASONS (P_CR_ISPDRIVER_ISP_PERF_LIMIT_REASONS_0_0_0_MCHBAR)—Offset 74CCh

This register reports reasons for performance limitations on the image processing system. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

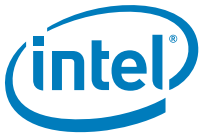
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**QOS_LOG (QOS_LOG):** Logged indication that frequency was clamped below the software-defined quality-of-service floor. This bit is set by firmware, and is clearable by software.
30	0h RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG (MAX_EFFICIENCY_FREQ_LOG):** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency. This bit is set by firmware, and is clearable by software.
29	0h RW/0C/V	**SPARE13_LOG (SPARE13_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
28	0h RW/0C/V	**EDP_LOG (EDP_LOG):** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint. This bit is set by firmware, and is clearable by software.
27	0h RW/0C/V	**SPARE11_LOG (SPARE11_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
26	0h RW/0C/V	**VR_THERMALERT_LOG (VR_THERMALERT_LOG):** Logged indication that frequency was clamped due to a voltage regulator thermal excursion. This bit is set by firmware, and is clearable by software.
25	0h RW/0C/V	**SPARE9_LOG (SPARE9_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
24	0h RW/0C/V	**SPARE8_LOG (SPARE8_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
23	0h RW/0C/V	**SPARE7_LOG (SPARE7_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
22	0h RW/0C/V	**SPARE6_LOG (SPARE6_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
21	0h RW/0C/V	**SPARE5_LOG (SPARE5_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
20	0h RW/0C/V	**SPARE4_LOG (SPARE4_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
19	0h RW/0C/V	**PL2_LOG (PL2_LOG):** Logged indication that frequency was clamped due to a package-level PL2 excursion. This bit is set by firmware, and is clearable by software.
18	0h RW/0C/V	**PL1_LOG (PL1_LOG):** Logged indication that frequency was clamped due to a package-level PL1 excursion. This bit is set by firmware, and is clearable by software.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/0C/V	**THERMAL_LOG (THERMAL_LOG):** Logged indication that frequency was clamped due to a thermal excursion. This bit is set by firmware, and is clearable by software.
16	0h RW/0C/V	**PROCHOT_LOG (PROCHOT_LOG):** Logged indication that frequency was clamped due to PROCHOT assertion. This bit is set by firmware, and is clearable by software.
15	0h RO/V	**QOS_STATUS (QOS_STATUS):** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	0h RO/V	**MAX_EFFICIENCY_FREQ_STATUS (MAX_EFFICIENCY_FREQ_STATUS):** Frequency is limited below the maximum efficiency frequency.
13	0h RO/V	**SPARE13_STATUS (SPARE13_STATUS):** Spare status bit.
12	0h RO/V	**EDP_STATUS (EDP_STATUS):** Frequency is limited due to a package-level EDP constraint.
11	0h RO/V	**SPARE11_STATUS (SPARE11_STATUS):** Spare status bit.
10	0h RO/V	**VR_THERMALERT_STATUS (VR_THERMALERT_STATUS):** Frequency is limited due to a voltage regulator thermal excursion.
9	0h RO/V	**SPARE9_STATUS (SPARE9_STATUS):** Spare status bit.
8	0h RO/V	**SPARE8_STATUS (SPARE8_STATUS):** Spare status bit.
7	0h RO/V	**SPARE7_STATUS (SPARE7_STATUS):** Spare status bit.
6	0h RO/V	**SPARE6_STATUS (SPARE6_STATUS):** Spare status bit.
5	0h RO/V	**SPARE5_STATUS (SPARE5_STATUS):** Spare status bit.
4	0h RO/V	**SPARE4_STATUS (SPARE4_STATUS):** Spare status bit.
3	0h RO/V	**PL2_STATUS (PL2_STATUS):** Frequency is limited due to a package-level PL2 excursion.
2	0h RO/V	**PL1_STATUS (PL1_STATUS):** Frequency is limited due to a package-level PL1 excursion.
1	0h RO/V	**THERMAL_STATUS (THERMAL_STATUS):** Frequency is limited due to thermal excursion.
0	0h RO/V	**PROCHOT_STATUS (PROCHOT_STATUS):** Frequency is limited due to external PROCHOT assertion.



14.4.15 I-unit Processing System C0 Residency Counter (P_CR_ISPDRIVER_TELEM_IUNIT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 74D0h

This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the I-unit Frequency Accumulator to calculate the average active clock ratio multiplier on the I-unit domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

14.4.16 I-unit Processing System C0 Residency Counter (P_CR_ISPDRIVER_TELEM_IUNIT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 74D4h

This counter integrates the current clock ratio multiplier for the I-unit processing system domain at the same rate as the corresponding C0 residency counter. Its primary utility is in assessing the average active frequency of the domain **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Clock Ratio Multiplier Accumulator (DATA):** This counter integrates the current clock ratio of the domain at the same rate as the corresponding C0 residency counter

3330h		ITSS Power Reduction Control (ITSSPRC)—Offset 3300h	0h
3334h		SIDE Clock Timing (SIDECT)—Offset 3304h	33h

15.1.1 Version (VS)—Offset 1h

*offset 01h - 01h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 770020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:16	77h RW/O	**Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table. In PCH this field is defaulted to 17h to indicate 24 interrupts. This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lockdown the value. This allows BIOS to utilize some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Entries to OS. BIOS may to program this field up to 78h (maximum 120 entries) .
15	0h RO	**Pin Assertion Register Supported (PRQ):** Indicate that the IOxAPIC does not implement the Pin Assertion Register.
14:8	0h RO	**Reserved (RSVD_1):** Reserved
7:0	20h RO	**Version (VS):** Identifies the implementation version as IOxAPIC.

15.1.2 Redirection Table Entry 0 (RTE0)—Offset 10h

*offset 10h - 11h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.3 Redirection Table Entry 1 (RTE1)—Offset 12h

*offset 12h - 13h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.4 Redirection Table Entry 2 (RTE2)—Offset 14h

*offset 14h - 15h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC

Bit Range	Default & Access	Field Name (ID): Description
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.15 Redirection Table Entry 13 (RTE13)—Offset 2Ah

*offset 2Ah - 2Bh

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.16 Redirection Table Entry 14 (RTE14)—Offset 2Ch

*offset 2Ch - 2Dh

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

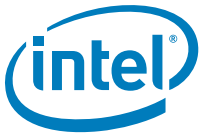
15.1.27 Redirection Table Entry 25 (RTE25)—Offset 42h

*offset 42h - 43h

Access Method



Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC

55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.51 Redirection Table Entry 49 (RTE49)—Offset 72h

*offset 72h - 73h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.

Bit Range	Default & Access	Field Name (ID): Description

Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.62 Redirection Table Entry 60 (RTE60)—Offset 88h

*offset 88h - 89h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.63 Redirection Table Entry 61 (RTE61)—Offset 8Ah

*offset 8Ah - 8Bh

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.74 Redirection Table Entry 72 (RTE72)—Offset A0h

*offset A0h - A1h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC

Bit Range	Default & Access	Field Name (ID): Description
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.75 Redirection Table Entry 73 (RTE73)—Offset A2h

*offset A2h - A3h

Access Method

16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.121 Redirection Table Entry 119 (RTE119)—Offset FEh

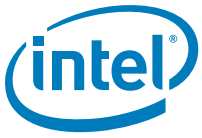
*offset FEh - FFh

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC.
47:17	0h RO	**Reserved (RSVD):** Reserved
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.



Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported (see Section 13.2.3 for details). 011 Reserved 100 NMI Not supported (see Section 13.2.3 for details). 101 INIT Not supported (see Section 13.2.3 for details). 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

15.1.122 PIRQA Routing Control (PARC)—Offset 3100h

PIRQA Routing Control Register

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.123 PIRQB Routing Control (PBRC)—Offset 3101h

Routing for PIRQB#. Uses the same programming values as PARC.

Note that external PIRQB# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.124 PIRQC Routing Control (PCRC)—Offset 3102h

Routing for PIRQC#. Uses the same programming values as PARC.

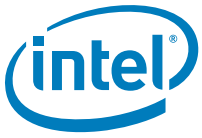
Note that external PIRQC# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.



Range	Access Type	Default (reset)	Description
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.125 PIRQD Routing Control (PDRC)—Offset 3103h

Routing for PIRQD#. Uses the same programming values as PARC.

Note that external PIRQD# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.126 PIRQE Routing Control (PERC)—Offset 3104h

Routing for PIRQE#. Uses the same programming values as PARC.

Note that external PIRQE# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.127 PIRQF Routing Control (PFRC)—Offset 3105h

Routing for PIRQF#. Uses the same programming values as PARC.

Note that external PIRQF# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.128 PIRQG Routing Control (PGRC)—Offset 3106h

Routing for PIRQG#. Uses the same programming values as PARC.

Note that external PIRQG# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.129 PIRQH Routing Control (PHRC)—Offset 3107h

Routing for PIRQH#. Uses the same programming values as PARC.

Note that external PIRQH# is no longer supported.

Access Method

Type: CR Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Range	Access Type	Default (reset)	Description
7:7	RW	0x1 (Core)	**REN (Interrupt Routing Enable)** When cleared, the corresponding PIRQ is routed to one of the legacy interrupts specified in bits[3:0]. When set, the PIRQ is not routed to the 8259.
6:4	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
3:0	RW	0x0 (Core)	**IR (IRQ Routing)** Bits Mapping Bits Mapping 0000 Reserved 1000 Reserved 0001 Reserved 1001 IRQ9 0010 Reserved 1010 IRQ10 0011 IRQ3 1011 IRQ11 0100 IRQ4 1100 IRQ12 0101 IRQ5 1101 Reserved 0110 IRQ6 1110 IRQ14 0111 IRQ7 1111 IRQ15

15.1.130 PCI Interrupt Route 0 (PIR0)—Offset 3140h

PCI Interrupt Route 0 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.131 PCI Interrupt Route 1 (PIR1)—Offset 3142h

PCI Interrupt Route 1 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.

Range	Access Type	Default (reset)	Description
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.132 PCI Interrupt Route 2 (PIR2)—Offset 3144h

PCI Interrupt Route 2 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.133 PCI Interrupt Route 3(PIR3)—Offset 3146h

PCI Interrupt Route 3 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.134 PCI Interrupt Route 4 (PIR4)—Offset 3148h

PCI Interrupt Route 4 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.135 PCI Interrupt Route 5 (PIR5)—Offset 314Ah

PCI Interrupt Route 5 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#

Range	Access Type	Default (reset)	Description
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.136 PCI Interrupt Route 6 (PIR6)—Offset 314Ch

PCI Interrupt Route 6 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.137 PCI Interrupt Route 7 (PIR7)—Offset 314Eh

PCI Interrupt Route 7 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.138 PCI Interrupt Route 8 (PIR8)—Offset 3150h

PCI Interrupt Route 8 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.139 PCI Interrupt Route 9 (PIR9)—Offset 3152h

PCI Interrupt Route 9 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.140 PCI Interrupt Route 10 (PIR10)—Offset 3154h

PCI Interrupt Route 10 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.141 PCI Interrupt Route 11 (PIR11)—Offset 3156h

PCI Interrupt Route 11 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#

Range	Access Type	Default (reset)	Description
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.142 PCI Interrupt Route 12 (PIR12)—Offset 3158h

PCI Interrupt Route 12 Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 3210h

Range	Access Type	Default (reset)	Description
15:15	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
14:12	RW	0x3 (Core)	**IDR (Interrupt D Pin Route)** Indicates which PIRQ in PCH is connected to the INTD# pin reported for device 31 functions: Bits Pin Bits Pin 0h PIRQA# 4h PIRQE# 1h PIRQB# 5h PIRQF# 2h PIRQC# 6h PIRQG# 3h PIRQD# 7h PIRQH#
11:11	RO	0x0 (Core)	**RSVD_1 (Reserved)** Reserved
10:8	RW	0x2 (Core)	**ICR (Interrupt C Pin Route)** See the IDR description. This field applies to INTC#
7:7	RO	0x0 (Core)	**RSVD_2 (Reserved)** Reserved

Range	Access Type	Default (reset)	Description
6:4	RW	0x1 (Core)	**IBR (Interrupt B Pin Route)** See the IDR description. This field applies to INTB#.
3:3	RO	0x0 (Core)	**RSVD_3 (Reserved)** Reserved
2:0	RW	0x0 (Core)	**IAR (Interrupt A Pin Route)** See the IDR description. This field applies to INTA#.

15.1.143 Interrupt Polarity Control 0 (IPC0)—Offset 3200h

Interrupt Polarity Control 0 Register.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: FFh

Range	Access Type	Default (reset)	Description
31:0	RW	0xFF0000 (Core)	**IPC0_IRQxAHPOLDIS (IRQ 31-0 Active High Polarity Disable)** IRQ 31-0 Active High Polarity Disable (IPC0.IRQxAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ31 down to IRQ0 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

15.1.144 Interrupt Polarity Control 1 (IPC1)—Offset 3204h

Interrupt Polarity Control 1 Register.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:0	RW	0xFF0000 (Core)	**IPC1_IRQAHPOLDIS (IRQ 63-32 Active High Polarity Disable)** IRQ 63-32 Active High Polarity Disable (IPC1.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ63 down to IRQ32 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

15.1.145 Interrupt Polarity Control 2 (IPC2)—Offset 3208h

Interrupt Polarity Control 2 Register.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:0	RW	0xFF0000 (Core)	**IPC2_IRQAHPOLDIS (IRQ 95-64 Active High Polarity Disable)** IRQ 95-64 Active High Polarity Disable (IPC2.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ95 down to IRQ64 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

15.1.146 Interrupt Polarity Control 3 (IPC3)—Offset 320Ch

Interrupt Polarity Control 3 Register.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:0	RW	0xFF0000 (Core)	**IPC3_IRQAHPOLDIS (IRQ 119-96 Active High Polarity Disable)** IRQ 119-96 Active High Polarity Disable (IPC3.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ119 down to IRQ96 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

15.1.147 ITSS Power Reduction Control (ITSSPRC)—Offset 3300h

Power controls for the entire interrupt and timer subsystem.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:5	RO	0x0 (Core)	**RSVD (Reserved)** Reserved
4:4	RW	0x0 (Core)	**PGCBDCGE (PGCB Dynamic Clock Gating Enable)** When set, the ITSS enables dynamic clock gating of the PGCB clock domain. BIOS is requested to program this field to 1.

Range	Access Type	Default (reset)	Description
3:3	RW	0x0 (Core)	**HPETDCGE (HPET Dynamic Clock Gating Enable)** When set, the HPET enables dynamic clock gating. BIOS is requested to program this field to 1.
2:2	RW	0x0 (Core)	**CGE8254 (8254 Static Clock Gating Enable)** When set, the 8254 timer is disabled statically. This bit shall be set by BIOS if the 8254 feature is not needed in the system or before BIOS hands off the system that supports C11. Normal operation of 8254 requires this bit to 0.
1:1	RW	0x0 (Core)	**SBDCGE (Sideband Dynamic Clock Gating Enable)** Setting this bit will enable all dynamic clock gating of the Sideband Clock domain. BIOS is requested to program this field to 1.
0:0	RW	0x0 (Core)	**PCIDCGE (PCI Dynamic Clock Gating Enable)** Setting this bit will enable dynamic clock gating for the ITSS Core Logic that uses PCI Clock. BIOS is requested to program this field to 1.

15.1.148 SIDE Clock Timing (SIDECT)—Offset 3304h

SIDE Clock Timing Register.

Access Method

Type: CR Register (Size: 16 bits)	**Device:** **Function:**

Default: 33h

Range	Access Type	Default (reset)	Description
15:7	RO	0x0 (Core)	**RSVD1 (Reserved)** Reserved
6:4	RW	0x3 (Core)	**CLKREQHO (Clock Request Hold-Off)** Defines the amount of idle time required between locking for power gate preparation and deassertion of the prim_clkreq signal. This field defines the exponent such that the actual delay = 2^ CLKREQHO. WARNING: This value should not be updated unless the Sideband Interface Clock Gating Enable (ITSSPRC.SBDCGE) control register bit is set to 0.
3:3	RO	0x0 (Core)	**RSVD2 (Reserved)** Reserved
2:0	RW	0x3 (Core)	**CLKGATEHO (Clock Gating Hold-Off)** Defines the amount of idle time required before local clock gating will be engaged (if enabled). This field defines the exponent such that the actual delay = 2^ CLGATEHO. WARNING: This value should not be updated unless the Sideband Interface Clock Gating Enable (ITSSPRC.SBDCGE) control register bit is set to 0.

15.2 Registers Summary

Table 15-2. Summary of 0_31_0_APIC MEM REG Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FEC00000h	FEC00003h	Index Register (IDX)—Offset FEC00000h	0h
FEC00010h	FEC00013h	Window Register (WDW)—Offset FEC00010h	0h
FEC00040h	FEC00043h	EOI Register (EOI)—Offset FEC00040h	0h

15.2.1 Index Register (IDX)—Offset FEC00000h

This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved.
7:0	0h RW	**Index Register (IDX):** Index Register for APIC

15.2.2 Window Register (WDW)—Offset FEC00010h

This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DW quantities. The registers are described in Section 13.2.1.2.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Window Register (WDW):** Window Register for APIC

15.2.3 EOI Register (EOI)—Offset FEC00040h

When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. Only bits 7:0 are used. Bits 31:8 are ignored.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved.
7:0	0h WO	**EOI Register (EOI):** EOI Register.

15.3 Registers Summary

Table 15-3. Summary of 0_31_0_CPU IO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
61h	61h	NMI Status and Control (NMI_STS_CNT)—Offset 61h	0h
70h	70h	NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h	80h
92h	92h	Init Register (PORT92)—Offset 92h	0h
CF9h	CF9h	Reset Control Register (RST_CNT)—Offset CF9h	0h

15.3.1 NMI Status and Control (NMI_STS_CNT)—Offset 61h

NMI Status and Control Register

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**SERR# NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR on the PCH backbone, this includes SERR assertions forwarded from the secondary PCI bus, error from a PCIe port, Do_SERR or standard PCIe error message from DMI, or internal Bus 0 functions that generate SERR#. Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0. To reset the interrupt, set bit 2 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be 0.
6	0h RO	**IOCHK# NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0. To reset the interrupt, set bit 3 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be a 0.
5	0h RO	**Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value. When writing to port 61h, this bit must be a 0.
4	0h RO	**Reserved (RSVD):** Will return 0 when read. Writes to this bit will be ignored.
3	0h RW	**IOCHK# NMI Enable (IOCHK_NMI_EN):** When this bit is a 1, IOCHK# NMIs are disabled and cleared. When this bit is a 0, IOCHK# NMIs are enabled.
2	0h RW	**PCI SERR# Enable (PCI_SERR_EN):** When this bit is a 1, the SERR# NMIs are disabled and cleared. When this bit is a 0, SERR# NMIs are enabled.
1	0h RW	**Speaker Data Enable (SPKR_DAT_EN):** When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0h RW	**Timer Counter 2 Enable (TIM_CNT2_EN):** When this bit is a 0, Counter 2 counting is disabled. Counting is enabled when this bit is 1.

15.3.2 NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h

This register is write-only for normal operation. In Alt-Access mode, this register can be read to find the NMI Enable status and the RTC index value. *WO for normal operation, RW if Alternate access mode is enabled. Use RW because there is no equivalent register access attribute in RDL

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**NMI_EN# (NMI_EN):** When this bit is a 1, all NMI sources are disabled. When this bit is a 0, NMI sources are enabled.
6:0	0h RW	**Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed.

15.3.3 Init Register (PORT92)—Offset 92h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW	**INIT NOW (INIT_NOW):** When this bit transitions from a 0 to a 1, the PCH will force INIT# active for 16 PCI clocks.

15.3.4 Reset Control Register (RST_CNT)—Offset CF9h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PCH will do a full reset, including driving SLP_S3#, SLP_S4# and SLP_S5# active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (SLP_S3/4/5# assertion) in response to SYSRESET#, PWROK#, and Watchdog timer reset sources.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0h RW	**System Reset (SYS_RST):** Ths bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PCH will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PCH will force PCI reset active for about 1 ms, however the SLP_S3#, SLP_S4# and SLP_S5# signals assertion is dependent on the value of the FULL_RST (bit3 of this register).
0	0h RO	**Reserved (RSVD_1):** Reserved

15.4 Registers Summary

Table 15-4. Summary of 0_31_0_HPET MEM SPT Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FED000 00h	FED000 07h	General Capabilities and ID Register (GEN_CAP_ID)—Offset FED00000h	31ABA858086A701h

FED001 48h	FED001 4Fh	Timer 2 Comparator Value (TMR2_CMP_VAL)—Offset FED00148h	FFFFFFFFh
FED001 50h	FED001 57h	Timer 2 FSB Interrupt Rout Register (TMR2_FSB_INT_ROUT)—Offset FED00150h	0h
FED001 60h	FED001 67h	Timer 3 Config and Capabilities (TMR3_CNF_CAP)—Offset FED00160h	F0100000008000h
FED001 68h	FED001 6Fh	Timer 3 Comparator Value (TMR3_CMP_VAL)—Offset FED00168h	FFFFFFFFh
FED001 70h	FED001 77h	Timer 3 FSB Interrupt Rout Register (TMR3_FSB_INT_ROUT)—Offset FED00170h	0h

FED000F0h	FED000F7h	Main Counter Value (MAIN_CNTR)—Offset FED000F0h	0h
FED00100h	FED00107h	Timer 0 Config and Capabilities (TMR0_CNF_CAP)—Offset FED00100h	F0000000008030h
FED00108h	FED0010Fh	Timer 0 Comparator Value (TMR0_CMP_VAL)—Offset FED00108h	FFFFFFFFFFFFFFFFh
FED00110h	FED00117h	Timer 0 FSB Interrupt Rout Register (TMR0_FSB_INT_ROUT)—Offset FED00110h	0h
FED00120h	FED00127h	Timer 1 Config and Capabilities (TMR1_CNF_CAP)—Offset FED00120h	F0000000008000h
FED00128h	FED0012Fh	Timer 1 Comparator Value (TMR1_CMP_VAL)—Offset FED00128h	FFFFFFFFh
FED00130h	FED00137h	Timer 1 FSB Interrupt Rout Register (TMR1_FSB_INT_ROUT)—Offset FED00130h	0h
FED00140h	FED00147h	Timer 2 Config and Capabilities (TMR2_CNF_CAP)—Offset FED00140h	F0080000008000h
FED00148h	FED0014Fh	Timer 2 Comparator Value (TMR2_CMP_VAL)—Offset FED00148h	FFFFFFFFh
FED00150h	FED00157h	Timer 2 FSB Interrupt Rout Register (TMR2_FSB_INT_ROUT)—Offset FED00150h	0h
FED00160h	FED00167h	Timer 3 Config and Capabilities (TMR3_CNF_CAP)—Offset FED00160h	F0100000008000h
FED00168h	FED0016Fh	Timer 3 Comparator Value (TMR3_CMP_VAL)—Offset FED00168h	FFFFFFFFh
FED00170h	FED00177h	Timer 3 FSB Interrupt Rout Register (TMR3_FSB_INT_ROUT)—Offset FED00170h	0h

15.4.1 General Capabilities and ID Register (GEN_CAP_ID)—Offset FED00000h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 000h or 004h. 64-bit accesses may only be done to 000h. Writes to this register will have no effect.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 31ABA858086A701h

Bit Range	Default & Access	Field Name (ID): Description
63:32	31ABA85h RO	**Main Counter Tick Period (COUNTER_CLK_PER_CAP):** This read-only field indicates the period at which the counter increments in femtoseconds (10^-15 seconds). The PCH HPET timers use a 24 MHz clock, which has a period of 41,666,667 femtoseconds. Therefore this register will always return 031ABA85h when read.
31:16	8086h RO	**Vendor ID (VENDOR_ID_CAP):** These bits will return 8086h when read to reflect Intel as the vendor.
15	1h RO	**Legacy Rout Capable (LEG_RT_CAP):** This bit will always be 1 when read,indicating support for the Legacy Interrupt Rout.
14	0h RO	**Reserved (RSV):** These bits will return 0 when read. Writes will have no effect.
13	1h RO	**Counter Size (COUNT_SIZE_CAP):** This bit will return 1 when read to indicate support for 64-bit counters allowing 64 or 32-bit mode operation.
12:8	7h RO	**Number of Timers (NUM_TIM_CAP):** This value in this field will be 07h to indicate support for 8 timers in the timer block.
7:0	1h RO	**Revision ID (REV_ID):** The value in this field will be 01h to indicate for revision 1.0 of the HPET specification.

15.4.2 General Config Register (GEN_CFG)—Offset FED00010h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 010h or 014h. 64-bit accesses may only be done to 010h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:2	0h RO	**Reserved (RSV_63_2):** These bits will return 0 when read. Writes will have no effect.
1	0h RW	**Legacy Rout (LEG_RT_CNF):** If the LEG_RT_CNF bit is set, then the interrupts will be routed as follows: Timer 0 will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC Timer 1 will be routed to IRQ8 in 8259 or IRQ8 in the I/O APIC Timer 2-7 will be routed as per the routing in that timers config register. If the LEG_RT_CNF bit is set, the individual routing bits for timers 0 and 1 (APIC or FSB) will have no impact. Otherwise, if the LEG_RT_CNF bit is not set, the individual routing bits for each of the timers are used. This bit will default to 0. BIOS can set it to 1 to enable the legacy routing, or 0 to disable the legacy routing. When changing other bits in this register, this bit should be left unchanged. Otherwise, a spurious interrupt may occur.
0	0h RW	**Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts. If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers. For level-triggered interrupts, if an interrupt is pending when the ENABLE_CNF bit is changed from 1 to 0, the interrupt status indications (in the various Txx_INT_STS bits) will not be cleared. Software must write to the Txx_INT_STS bits to clear the interrupts. Intel Specific: This bit will default to 0. BIOS can set it to 1 or 0.

15.4.3 Main Counter Value (MAIN_CNTR)—Offset FED000F0h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 0F0h or 0F4h. 64-bit accesses may only be done to 0F0h. Writes to this register should only be done while the counter is halted. Reads to this register return the current value of the main counter. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW/V	**Counter Value (COUNTER_VAL):** Reads return the current value of the counter. Writes load the new value to the counter.

15.4.4 Timer 0 Config and Capabilities (TMR0_CNF_CAP)—Offset FED00100h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F0000000008030h

Bit Range	Default & Access	Field Name (ID): Description
63:32	F00000h RO	**Timer 0 Interrupt Rout (TIMER0_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.
15	1h RO	**FSB Interrupt Delivery Capability (TIMER0_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoCSoC HPET implementation supports the direct FSB interrupt delivery.
14	0h RW	**Timer 0 FSB Interrupt Delivery Enable (TIMER0_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
13:9	0h RW	**Interrupt Route (TIMER0_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RW	**Timer 0 32-bit Mode (TIMER0_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.
6	0h RO	**Timer 0 Value Set (TIMER0_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	1h RO	**Timer 0 Size (TIMER0_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	1h RO	**Periodic Interrupt Capable (TIMER0_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Timer 0 Type (TIMER0_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 0 Interrupt Enable (TIMER0_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RW	**Timer Interrupt Type (TIMER0_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.5 Timer 0 Comparator Value (TMR0_CMP_VAL)—Offset FED00108h

Timer 0 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RW/V	**Timer 0 Comparator Value (TMR0_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.6 Timer 0 FSB Interrupt Rout Register (TMR0_FSB_INT_ROUT)—Offset FED00110h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 0 FSB Interrupt Address (TIMER0_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 0 FSB Interrupt Value (TIMER0_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.7 Timer 1 Config and Capabilities (TMR1_CNF_CAP)—Offset FED00120h

Timer 1 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F0000000008000h

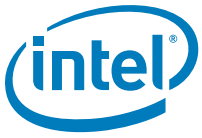
Bit Range	Default & Access	Field Name (ID): Description
63:32	F00000h RO	**Timer 1 Interrupt Rout (TIMER1_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**FSB Interrupt Delivery Capability (TIMER1_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	0h RW	**Timer 1 FSB Interrupt Delivery Enable (TIMER1_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.
13:9	0h RW	**Interrupt Route (TIMER1_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 1 32-bit Mode (TIMER1_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Timer 1 Value Set (TIMER1_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 1 Size (TIMER1_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER1_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.
3	0h RO	**Timer 1 Type (TIMER1_TYPE_CNF):** Setting this bit to 1 enables the timer togenerate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 1 Interrupt Enable (TIMER1_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RW	**Timer Interrupt Type (TIMER1_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.8 Timer 1 Comparator Value (TMR1_CMP_VAL)—Offset FED00128h

Timer 1 Comparator Value Register



Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.
31:0	FFFFFFFFh RW	**Timer 1 Comparator Value (TMR1_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.9 Timer 1 FSB Interrupt Rout Register (TMR1_FSB_INT_ROUT)—Offset FED00130h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 1 FSB Interrupt Address (TIMER1_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 1 FSB Interrupt Value (TIMER1_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.10 Timer 2 Config and Capabilities (TMR2_CNF_CAP)—Offset FED00140h

Timer 2 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F0080000008000h

Bit Range	Default & Access	Field Name (ID): Description
63:32	F00800h RO	**Timer 2 Interrupt Rout (TIMER2_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.
15	1h RO	**FSB Interrupt Delivery Capability (TIMER2_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	0h RW	**Timer 2 FSB Interrupt Delivery Enable (TIMER2_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
13:9	0h RW	**Interrupt Route (TIMER2_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 2 32-bit Mode (TIMER2_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.
6	0h RO	**Timer 2 Value Set (TIMER2_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 2 Size (TIMER2_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER2_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Timer 2 Type (TIMER2_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 2 Interrupt Enable (TIMER2_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RW	**Timer Interrupt Type (TIMER2_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.11 Timer 2 Comparator Value (TMR2_CMP_VAL)—Offset FED00148h

Timer 2 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Timer 2 Comparator Value (TMR2_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.12 Timer 2 FSB Interrupt Rout Register (TMR2_FSB_INT_ROUT)—Offset FED00150h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 2 FSB Interrupt Address (TIMER2_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 2 FSB Interrupt Value (TIMER2_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.13 Timer 3 Config and Capabilities (TMR3_CNF_CAP)—Offset FED00160h

Timer 3 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F0100000008000h

Bit Range	Default & Access	Field Name (ID): Description
63:32	F01000h RO	**Timer 3 Interrupt Rout (TIMER3_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**FSB Interrupt Delivery Capability (TIMER3_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	0h RW	**Timer 3 FSB Interrupt Delivery Enable (TIMER3_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.
13:9	0h RW	**Interrupt Route (TIMER3_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 3 32-bit Mode (TIMER3_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Timer 3 Value Set (TIMER3_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 3 Size (TIMER3_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER3_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.
3	0h RO	**Timer 3 Type (TIMER3_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 3 Interrupt Enable (TIMER3_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RW	**Timer Interrupt Type (TIMER3_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.14 Timer 3 Comparator Value (TMR3_CMP_VAL)—Offset FED00168h

Timer 3 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.
31:0	FFFFFFFFh RW	**Timer 3 Comparator Value (TMR3_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.15 Timer 3 FSB Interrupt Rout Register (TMR3_FSB_INT_ROUT)—Offset FED00170h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 3 FSB Interrupt Address (TIMER3_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 3 FSB Interrupt Value (TIMER3_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.16 Timer 4 Config and Capabilities (TMR4_CNF_CAP)—Offset FED00180h

Timer 4 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C000h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Timer 4 Interrupt Rout (TIMER4_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.
15	1h RO	**FSB Interrupt Delivery Capability (TIMER4_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	1h RO	**Timer 4 FSB Interrupt Delivery Enable (TIMER4_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
13:9	0h RO	**Interrupt Route (TIMER4_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 4 32-bit Mode (TIMER4_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.
6	0h RO	**Timer 4 Value Set (TIMER4_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 4 Size (TIMER4_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER4_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Timer 4 Type (TIMER4_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 4 Interrupt Enable (TIMER4_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RO	**Timer Interrupt Type (TIMER4_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.17 Timer 4 Comparator Value (TMR4_CMP_VAL)—Offset FED00188h

Timer 4 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Timer 4 Comparator Value (TMR4_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.18 Timer 4 FSB Interrupt Rout Register (TMR4_FSB_INT_ROUT)—Offset FED00190h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 4 FSB Interrupt Address (TIMER4_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 4 FSB Interrupt Value (TIMER4_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.19 Timer 5 Config and Capabilities (TMR5_CNF_CAP)—Offset FED001A0h

Timer 5 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C000h

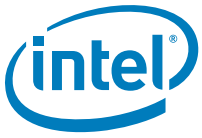
Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Timer 5 Interrupt Rout (TIMER5_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**FSB Interrupt Delivery Capability (TIMER5_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	1h RO	**Timer 5 FSB Interrupt Delivery Enable (TIMER5_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.
13:9	0h RO	**Interrupt Route (TIMER5_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 5 32-bit Mode (TIMER5_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Timer 5 Value Set (TIMER5_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 5 Size (TIMER5_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER5_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.
3	0h RO	**Timer 5 Type (TIMER5_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 5 Interrupt Enable (TIMER5_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RO	**Timer Interrupt Type (TIMER5_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.20 Timer 5 Comparator Value (TMR5_CMP_VAL)—Offset FED001A8h

Timer 5 Comparator Value Register



Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.
31:0	FFFFFFFFh RW	**Timer 5 Comparator Value (TMR5_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.21 Timer 5 FSB Interrupt Rout Register (TMR5_FSB_INT_ROUT)—Offset FED001B0h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 5 FSB Interrupt Address (TIMER5_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 5 FSB Interrupt Value (TIMER5_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.22 Timer 6 Config and Capabilities (TMR6_CNF_CAP)—Offset FED001C0h

Timer 6 Config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C000h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Timer 6 Interrupt Rout (TIMER6_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.
15	1h RO	**FSB Interrupt Delivery Capability (TIMER6_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	1h RO	**Timer 6 FSB Interrupt Delivery Enable (TIMER6_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
13:9	0h RO	**Interrupt Route (TIMER6_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 6 32-bit Mode (TIMER6_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.
6	0h RO	**Timer 6 Value Set (TIMER6_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). This bit will return 0 when read. Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1-7 as they do not support the periodic mode.
5	0h RO	**Timer 6 Size (TIMER6_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER6_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Timer 6 Type (TIMER6_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 6 Interrupt Enable (TIMER6_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RO	**Timer Interrupt Type (TIMER6_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.23 Timer 6 Comparator Value (TMR6_CMP_VAL)—Offset FED001C8h

Timer 6 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Timer 6 Comparator Value (TMR6_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.24 Timer 6 FSB Interrupt Rout Register (TMR6_FSB_INT_ROUT)—Offset FED001D0h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 6 FSB Interrupt Address (TIMER6_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 6 FSB Interrupt Value (TIMER6_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.4.25 Timer 7 Config and Capabilities (TMR7_CNF_CAP)—Offset FED001E0h

Timer 7 config and Capabilities Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C000h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Timer 7 Interrupt Rout (TIMER7_INT_ROUT_CAP):** This 32-bit read-only field indicates to which interrupts in the 8259 or I/O (x) APIC this timers interrupt can be routed to. This is used in conjunction with the TIMERn_INT_ROUT_CNF field. Writes to this field will have no effect. Note: If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Each bit in this field corresponds to a particular interrupt. For example, if this timers interrupt can be mapped to interrupts 16, 18, 20, 22, or 24, then bits 16, 18, 20, 22, and 24 in this field will be set to 1. All other bits will be 0. Timer 0,1 : Bits 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. Timer 2 : Bits 11, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 11 is used, software should ensure IRQ 11 is not shared with any other devices to guarantee the proper operation of this timer. Timer 3 : Bits 12, 20, 21, 22, and 23 in this field will have a value of 1. All other bits will be 0. If IRQ 12 is used, software should ensure IRQ 12 is not shared with any other devices to guarantee the proper operation of this timer. Timer 4-7: This field is always 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
31:16	0h RO	**Reserved (RSV_31_16):** These bits will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**FSB Interrupt Delivery Capability (TIMER7_FSB_INT_DEL_CAP):** This bit is always read as 1, since the SoC HPET implementation supports the direct FSB interrupt delivery.
14	1h RO	**Timer 7 FSB Interrupt Delivery Enable (TIMER7_FSB_EN_CNF):** When set, this will force the interrupts for Timer n to be delivered directly as FSB messages, rather than using the 8259 or I/O (x) APIC. In this case, the TIMERn_INT_ROUTE_CNF field in this register will be ignored and the TIMERn_FSB_ROUT register will be used instead. Timer 0, 1, 2, 3: This bit is a read/write bit. Timer 4, 5, 6, 7: This bit is always Read-Only 1 as interrupt from these timers can only be delivered via direct FSB interrupt messages.
13:9	0h RO	**Interrupt Route (TIMER7_INT_ROUT_CNF):** This 5-bit field indicates the routing for the interrupt to the 8259 or I/O APIC. A maximum of 32 interrupts are supported. Software writes to this field to select which interrupt in the 8259 or I/O (x)APIC will be used for this timers interrupt. The default value for this register is 00h. If the Legacy Rout bit is set, then Timers 0 and 1 will have a different routing, and this bit field has no effect for those two timers. If the TIMERn_FSB_EN_CNF bit is set, then the interrupt will be delivered directly to the FSB, and this bit field has no effect. If interrupt is handled via 8259, only interrupts 0-15 are applicable and valid. Software must not program any value other than 0-15 in this field. Software must ensure that the value is valid for a particular timer as indicated by the TIMERn_INT_ROUTE_CAP field for that timer. The PCH logic does not check the validity of the value written. For Timers 4-7, this field is always Read-Only 0 as interrupts from these timers can only be delivered via direct FSB interrupt messages.
8	0h RO	**Timer 7 32-bit Mode (TIMER7_32_MODE_CNF):** Software can set this bit to force a 64-bit timer to behave as a 32-bit timer. This is typically needed if the software is not willing to halt the main counter to read or write a particular timer, and the software not capable of do an atomic 64-bit read to the timer. When TIMER0_32MODE_CNF is set to '1', the hardware counter will essentially be doing 32-bit operation on comparator match and rollovers. I.e. the upper 32-bit of the Timer 0 Comparator Value register is ignored. The upper 32-bit of the main counter is not involved in any roll over from lower 32-bit of the main counter and becomes all zero's. For timer 0, this bit will be read/write and default to 0. For timers 1-7, this bit will always read as 0 and writes will have no effect (since these seven timers are 32-bits).
7	0h RO	**Reserved (RSV_7):** This bit will return 0 when read. Writes will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Timer 7 Value Set (TIMER7_VAL_SET_CNF):** Software uses this bit only for timers that have been set to periodic mode. By writing this bit to a 1, the software is then allowed to directly set the timers accumulator. Software does NOT have to write this bit back to 0 (it automatically clears). Software should not write a 1 to this bit position if the timer is set to non-periodic mode. Intel Specific: This bit will return 0 when read. Writes will only have an effect for Timer 0 if it is set to periodic mode. Writes will have no effect for Timers 1, 2, 3, 4, 5, 6, and 7.
5	0h RO	**Timer 7 Size (TIMER7_SIZE_CAP):** Read-only Indicator of the timers size capability. 1: 64-bits 0: 32-bits. The value is 1 (64-bits) for timer 0, and 0 (32-bits) for timers 1-7.
4	0h RO	**Periodic Interrupt Capable (TIMER7_PER_INT_CAP):** If this read-only bit is 1, then the hardware supports a periodic mode for this timers interrupt. The value is 1 (periodic supported) for timer 0, and 0 (not supported) for timers 1-7.
3	0h RO	**Timer 7 Type (TIMER7_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2	0h RW	**Timer 7 Interrupt Enable (TIMER7_INT_ENB_CNF):** This bit must be set to 1 to enable timer n to cause an interrupt when it times out. If this bit is 0, the timer can still count and generate appropriate status bits, but will not cause an interrupt. Default value is 0.
1	0h RO	**Timer Interrupt Type (TIMER7_INT_TYPE_CNF):** Determines whether an edge or level interrupt will be used for this timer (when enabled). 0: Edge-triggered. If another interrupt occurs, another edge will be generated. 1: Level-triggered. The interrupt will be held active until it is cleared by writing to the bit in the General Interrupt Status Register. If another interrupt occurs before the interrupt is cleared, the interrupt will remain active. The default value is 0, edge-triggered. The interrupt type for any timer should be set before that timer generates any interrupts. If the interrupt type is changed dynamically, there will be some delay before the new type takes effect. That delay is not specified. Timer 0-3: This bit is a read/write bit as both edge and level triggered modes are supported. Timer 4-7: This bit is always Read-Only 0 as only edge-triggered mode is supported.
0	0h RO	**Reserved (RSV_0):** These bits will return 0 when read. Writes will have no effect.

15.4.26 Timer 7 Comparator Value (TMR7_CMP_VAL)—Offset FED001E8h

Timer 7 Comparator Value Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	**Reserved (RSV):** Reserved.
31:0	FFFFFFFFh RW	**Timer 7 Comparator Value (TMR7_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

15.4.27 Timer 7 FSB Interrupt Rout Register (TMR7_FSB_INT_ROUT)—Offset FED001F0h

Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x0h or 1x4h. 64-bit accesses may only be done to 1x0h.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:34	0h RW	**Timer 7 FSB Interrupt Address (TIMER7_FSB_INT_ADDR):** Software sets this 32-bit field to indicate the location that the FSB interrupt message should be written. Intel-Specific: This register is implemented for timer 0:7.
33:32	0h RO	**Reserved (RSV):** Bit(33:32) are read-only and hard-wired to 0.
31:0	0h RW	**Timer 7 FSB Interrupt Value (TIMER7_FSB_INT_VAL):** Software sets this 32-bit field to indicate that value that is written during the FSB interrupt message. Intel-Specific: This register is implemented for timer 0:7.

15.5 Registers Summary

Table 15-5. Summary of 0_31_0_INTR IO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
20h	20h	Master Initialization Command Word 1 (MICW1)—Offset 20h	11h
20h	20h	Master Operational Control Word 2 (MOCW2)—Offset 20h	0h
20h	20h	Master Operational Control Word 3 (MOCW3)—Offset 20h	8h
21h	21h	Master Initialization Command Word 2 (MICW2)—Offset 21h	0h
21h	21h	Master Initialization Command Word 3 (MICW3)—Offset 21h	7h
21h	21h	Master Initialization Command Word 4 (MICW4)—Offset 21h	0h
21h	21h	Master Operational Control Word 1 (MOCW1)—Offset 21h	0h
A0h	A0h	Slave Operational Control Word 3 (SOCW3)—Offset A0h	8h
A0h	A0h	Slave Initialization Command Word 1 (SICW1)—Offset A0h	11h
A0h	A0h	Slave Operational Control Word 2 (SOCW2)—Offset A0h	0h
A1h	A1h	Slave Initialization Command Word 3 (SICW3)—Offset A1h	7h
A1h	A1h	Slave Initialization Command Word 4 (SICW4)—Offset A1h	0h
A1h	A1h	Slave Operational Control Word 1 (SOCW1)—Offset A1h	0h
A1h	A1h	Slave Initialization Command Word 2 (SICW2)—Offset A1h	0h
4D0h	4D0h	Master Edge/Level Control (ELCR1)—Offset 4D0h	0h
4D1h	4D1h	Slave Edge/Level Control (ELCR2)—Offset 4D1h	0h

15.5.1 Master Initialization Command Word 1 (MICW1)—Offset 20h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:
1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.

3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.
Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI-IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

15.5.2 Master Operational Control Word 2 (MOCW2)—Offset 20h

*address should be 20h
Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 Rotate in Auto EOI Mode (Clear) 001 Non-specific EOI command 010 No Operation 011 *Specific EOI Command 100 Rotate in Auto EOI Mode (Set) 101 Rotate on Non-Specific EOI Command 110 *Set Priority Command 111 *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	0h WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00
2:0	0h WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case.

15.5.3 Master Operational Control Word 3 (MOCW3)—Offset 20h

*address should be 20h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Must be 0.
6	0h WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	0h WO	**Enable Special Mask Mode (ESMM):** When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a "don't care".
4:3	1h WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01

Bit Range	Default & Access	Field Name (ID): Description
2	0h WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	0h WO	**Register Read Command (RRC):** These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be "read IRR". To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. Value Command 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

15.5.4 Master Initialization Command Word 2 (MICW2)—Offset 21h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

15.5.5 Master Initialization Command Word 3 (MICW3)—Offset 21h

*address should be 21h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h WO	**MICW3 [7:3] (MICW3_7_3):** These bits must be programmed to zero.
2	1h WO	**Cascaded Controller Connection (CCC):** This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 - 15 is cascaded on IRQ2.
1:0	3h WO	**MICW [1:0] (MICW3_1_0):** These bits must be programmed to zero.

15.5.6 Master Initialization Command Word 4 (MICW4)—Offset 21h

*address should be 21h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**Reserved (RSVD):** Must be 0.
4	0h WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0h WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0h WO	**Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.
1	0h WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2
0	0h WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1

15.5.7 Master Operational Control Word 1 (MOCW1)—Offset 21h

*address should be 21h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

15.5.8 Slave Operational Control Word 3 (SOCW3)—Offset A0h

*address should be A0h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Must be 0.
6	0h WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	0h WO	**Enable Special Mask Mode (ESMM):** When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a "don't care".
4:3	1h WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01
2	0h WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	0h WO	**Register Read Command (RRC):** These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be "read IRR". To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. Value Command 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

15.5.9 Slave Initialization Command Word 1 (SICW1)—Offset A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:
1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI-IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

15.5.10 Slave Operational Control Word 2 (SOCW2)—Offset A0h

*address should be A0h
Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 Rotate in Auto EOI Mode (Clear) 001 Non-specific EOI command 010 No Operation 011 *Specific EOI Command 100 Rotate in Auto EOI Mode (Set) 101 Rotate on Non-Specific EOI Command 110 *Set Priority Command 111 *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	0h WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case.

15.5.11 Slave Initialization Command Word 3 (SICW3)—Offset A1h

*address should be A1h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h WO	**Reserved (RSVD):** Must be 0.
2:0	7h WO	**Slave Identification Code (SIC):** This field must be programmed to 02h to match the code broadcast by the master controller during the INTA# sequence.

15.5.12 Slave Initialization Command Word 4 (SICW4)—Offset A1h

*address should be A1h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h WO	**Reserved (RSVD):** Must be 0.
4	0h WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0h WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0h WO	**Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.

Bit Range	Default & Access	Field Name (ID): Description
1	0h WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2
0	0h WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1

15.5.13 Slave Operational Control Word 1 (SOCW1)—Offset A1h

*address should be A1h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.

15.5.14 Slave Initialization Command Word 2 (SICW2)—Offset A1h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

15.5.15 Master Edge/Level Control (ELCR1)—Offset 4D0h

Master Edge/Level Control Register

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RW	**Edge Level Control (ELC_7_3):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level.
2:0	0h RO	**Reserved (RSVD):** The cascade channel(IRQ2), heart beat timer (IRQ0), and keyboard controller (IRQ1), cannot be put into level mode

15.5.16 Slave Edge/Level Control (ELCR2)—Offset 4D1h

Slave Edge/Level Control Register

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**Edge Level Control (ELC_15_14):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14.
5	0h RW	**Edge Level Control (ELC_13):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. This bit applies to IRQ13.
4:1	0h RW	**Edge Level Control (ELC_12_9):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 4 applies to IRQ12, bit 3 to IRQ11, bit 2 to IRQ10, and bit 1 to IRQ9.
0	0h RO	**Reserved (RSVD):** The Real Time Clock (IRQ8#) cannot be programmed for level mode.

15.6 Registers Summary

Table 15-6. Summary of 0_31_0_LEG_8254_TIMER IO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
40h	40h	Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h	C4h
40h	40h	Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h	0h
42h	42h	Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h	C4h
42h	42h	Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h	0h
43h	43h	Timer Control Word Register (TCW)—Offset 43h	0h
43h	43h	Read Back Command (RBC)—Offset 43h	C0h
43h	43h	Counter Latch Command (CLC)—Offset 43h	0h

15.6.1 Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following:

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: C4h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1. When this bit is a 0, the OUT pin of the counter is also a 0.
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading. 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading.
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

15.6.2 Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h

*Address should be 40h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

15.6.3 Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following:

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: C4h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1. When this bit is a 0, the OUT pin of the counter is also a 0.
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading. 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading.
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB

Bit Range	Default & Access	Field Name (ID): Description
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

15.6.4 Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h

*Address should be 42h

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

15.6.5 Timer Control Word Register (TCW)—Offset 43h

This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state. There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h WO	**Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1 00 Counter 0 select 01 Reserved 10 Counter 2 select 11 Read Back Command
5:4	0h WO	**Read/Write Select: (RW_SLT):** These bits are the read/write control bits. The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2) 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	0h WO	**Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h WO	**Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):** 0 Binary countdown is used. The largest possible binary count is 2^16 1 Binary coded decimal (BCD) count is used.The largest possible BCD count is 10^4

15.6.6 Read Back Command (RBC)—Offset 43h

*Address should be 43h
The Read Back Command is used to determine the count value, programmed mode, and current states of the OUT pin and Null count flag of the selected counter or counters. Status and/or count may be latched in any or all of the counters by selecting the counter during the register write. The count and status remain latched until read, and further latch commands are ignored until the count is read.
Both count and status of the selected counters may be latched simultaneously by setting both bit 5 and bit 4 to 0. If both are latched, the first read operation from that counter returns the latched status. The next one or two reads, depending on whether the counter is programmed for one or two byte counts, returns the latched count. Subsequent reads return an unlatched count.

Access Method

Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: C0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	3h WO	**Read Back Command (RBC):** Must be 11 to select the Read Back Command
5	0h WO	**Latch Count of Selected Counters (LCSC):** 0 Current count value of the selected counters will be latched 1 Current count will not be latched
4	0h WO	**Latch Status of Selected Counters (LSSC):** 0 Status of the selected counters will be latched 1 Status will not be latched
3	0h WO	**Counter 2 Select (CNT_2_SLT):** When set to 1, Counter 2 count and/or status will be latched
2	0h WO	**Reserved (RSVD):** Reserved
1	0h WO	**Counter 0 Select (CNT_0_SLT):** When set to 1, Counter 0 count and/or status will be latched.
0	0h WO	**Reserved (RSVD_1):** Must be 0.

15.6.7 Counter Latch Command (CLC)—Offset 43h

*Address should be 43h
The Counter Latch Command latches the current count value. This command is used to insure that the count read from the counter is accurate. The count value is then read from each counter's count register through the Counter Ports Access Ports Register (40h for counter 0 and 42h for counter 2). The count must be read according to the programmed format, i.e. if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other (read, write, or programming operations for other counters may be inserted between the reads). If a counter is latched once and then latched again before the count is read, the second Counter Latch Command is ignored.

Access Method

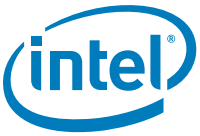
Type: IO Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h WO	**Counter Selection (CNT_SLT):** These bits select the counter for latching. If 11 is written, then the write is interpreted as a read back command. 00 = Counter 0 01 = Reserved 10 = Counter 2
5:4	0h WO	**Counter Latch Command (CLC):** Write 00 to select the Counter Latch Command.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h WO	**Reserved (RSVD):** Must be 0.

§ §



16 IOSF2OCP

16.1 Registers Summary

Table 16-1. Summary of map_iosf2ocp_pci_configreg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h	22D88086h
4h	7h	STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h	6h
Ch	Fh	CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	BAR -Base Address Register (BAR)—Offset 10h	4h
14h	17h	BAR -Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	BAR1 -Base Address Register1 (BAR1)—Offset 18h	4h
1Ch	1Fh	BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch	0h
80h	83h	POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h	39001h
84h	87h	PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	6D01h
A0h	A3h	D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	0h

16.1.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID)—Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the XXX Device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 22D88086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	22D8h RO	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

16.1.2 STATUSCOMMAND- Status and Command (STATUSCOMMAND)—Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0:** Reserved 0
29	0h RW/1C	**RMA:** Received Master Abort
28	0h RW/1C	**RTA:** Received Target Abort
27:21	0h RO	**Reserved1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**Reserved2:** Reserved
15:11	0h RO	**Reserved3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RO	**Reserved6:** Reserved

16.1.3 REVCLASSCODE - Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	6h RO	**RID:** Revision ID identifies the revision of particular PCI device.

16.1.4 CLLATHEADERBIST - Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device

Bit Range	Default & Access	Field Name (ID): Description
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

16.1.5 BAR -Base Address Register (BAR)—Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

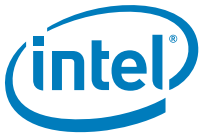
16.1.6 BAR -Base Address Register High (BAR_HIGH)—Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

16.1.7 BAR1 -Base Address Register1 (BAR1)—Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

16.1.8 BAR1 -Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

16.1.9 SUBSYSTEMID -Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

16.1.10 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

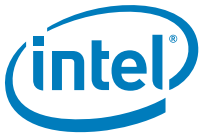
16.1.11 CAPABILITYPTR - Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 80h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

16.1.12 INTERRUPTREG - Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**Reserved0:** Reserved
11:8	0h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

16.1.13 POWERCAPID - PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 39001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

16.1.14 PMECTRLSTATUS_type Power Management Control and status register (PMECTRLSTATUS)—Offset 84h

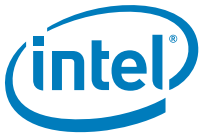
power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0:** Reserved
15	0h RW/1C	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state



16.1.15 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

16.1.16 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

16.1.17 D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

16.1.18 DEVICE_IDLE_POINTER_REG - Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 6D01h

Bit Range	Default & Access	Field Name (ID): Description
31:4	6D0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

16.1.19 D0I3_MAX_POW_LAT_PG_CONFIG - DEVICE PG CONFIG (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 17 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0:** Reserved
21	0h RO	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved1:** Reserved
19	0h RO	**SLEEP_EN:** Sleep Enable
18	0h RO	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RO	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RO	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved2:** Reserved
12:10	0h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

§ §

17.1 Registers Summary

Table 17-1. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h

Table 17-1. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h

578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h
1010h		PCLKD_L1TREF_CFG—Offset 1010h	0h

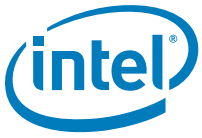
17.1.1 Device Command; Primary Status (CMD_PSPCLKD_L1TREF_CFG—Offset 1010hTS)—Offset 4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.



Bit Range	Default & Access	Field Name (ID): Description
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

17.1.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.1.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.1.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secodary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

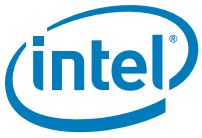
17.1.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.



Bit Range	Default & Access	Field Name (ID): Description
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

17.1.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.1.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

17.1.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

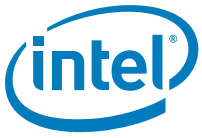
Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.



17.1.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.1.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

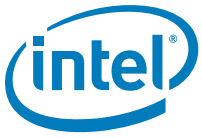
17.1.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's



Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.1.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

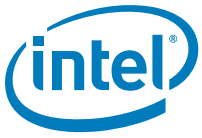
17.1.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

17.1.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

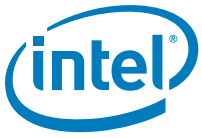
17.1.15 Link Capabilities (LCAP)—Offset 4Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.



Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.1.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

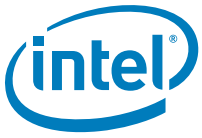
Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.



Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

17.1.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.

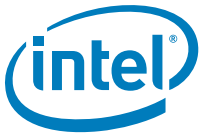
Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.1.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.1.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.1.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.1.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

17.1.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.1.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.1.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

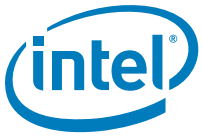
Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate. Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

17.1.25 Slot Capabilities 2 (SLCAP2)—Offset 74h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

17.1.26 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

17.1.27 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.

Bit Range	Default & Access	Field Name (ID): Description
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.1.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.1.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.1.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

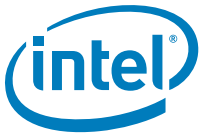
17.1.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: C8030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

17.1.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.1.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.1.34 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.1.35 Uncorrectable Error Mask (UEM)—Offset 108h

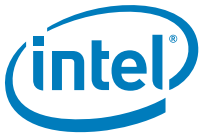
When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.1.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.1.37 Correctable Error Status (CES)—Offset 110h

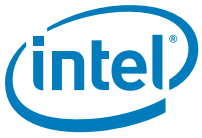
This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.1.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.1.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.1.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.1.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.1.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.1.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.1.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.1.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.1.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

17.1.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.1.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.1.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.1.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.1.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.1.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.1.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.1.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.1.55 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 28h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

17.1.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

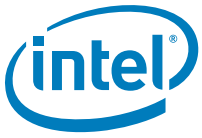
Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.



Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.1.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.1.58 Lane Error Status (LES)—Offset 228h

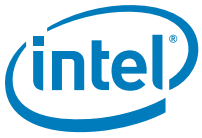
The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.



17.1.59 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 7F7F7F7Fh

15	0h RO	**Reserved (RSVD_2):** Reserved
14:12	7h RW	**Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH):** Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 2 Transmitter Preset (UPL2TP):** Upstream Port Lane 2 Transmitter Preset (UPL2TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved (RSVD_3):** Reserved
6:4	7h RW	**Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH):** Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.

Bit Range	Default & Access	Field Name (ID): Description
3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.1.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: A64F96h

Note: This bit must be set prior to enabling Intel CMM, by setting the PCIECMMPC.START. Note: When operating in Mobile Express mode, this field is not applicable.
30	0h RO	**Reserved (RSVD):** Reserved
29	1h RW	**CMM Symbol[3] Select (SYM3SEL):** 0: selects CMM Symbol [lb]3[rb] to a control character 1: selects CMM Symbol [lb]3[rb] as a data character
28	0h RW	**CMM Symbol[2] Select (SYM2SEL):** 0: selects CMM Symbol [lb]2[rb] to a control character 1: selects CMM Symbol [lb]2[rb] as a data character
27	1h RW	**CMM Symbol[1] Select (SYM1SEL):** 0: selects CMM Symbol [lb]1[rb] to a control character 1: selects CMM Symbol [lb]1[rb] as a data character
26	0h RW	**CMM Symbol[0] Select (SYM0SEL):** 0: selects CMM Symbol [lb]0[rb] to a control character 1: selects CMM Symbol [lb]0[rb] as a data character
25:24	2h RW	**CMM Sync Header (CMMSH):** CMM Sync Header(CMMSH): Specifies the Sync Header for the Intel CMM pattern specified in PCIECMMSB. Note: Due to implementation limitation, only a value of 10b is supported. All the other values are not supported.
23:22	0h RO/V	**CMM Error Lane Number (ERRLANENUM):** This field contains the lane number of the failing lane. Only valid when CMM Error Detected is 1.
21:16	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO/V	**CMM Invert (INVERT):** Indicates which lanes are inverted 000: No inversion 001: Lanes 0 010: Lanes 1 011: Lanes 2 100: Lanes 3 This field is only valid when CMM Error Detected (bit 7) is asserted. Additionally, when CMM Error Detected is asserted this field is locked (will not be updated)
12:10	0h RO/V	**CMM Symbol Error Number Invert (SYMERRNUMINV):** Indicates which register number miscompared on the failing lane, if the failing lane was an inverted lane. Only valid when CMM Error Detected is 1. 000: CMM Data D0 001: CMM Data D0 010: CMM Data D0 011: CMM Data D1 100: CMM Data D2 101: CMM Data D3 110: CMM Data D0 111: CMM Data D0
9:8	0h RO/V	**CMM Symbol Error Number (SYMERRNUM):** Indicates which register number miscompared on the failing lane, if the failing lane was not inverted. Only valid when CMM Error Detected is 1. 00: CMM Data 0 01: CMM Data 1 10: CMM Data 2 11: CMM Data 3
7	0h RW/1C/V	**CMM Error Detected (ERRDET):** 1: An error was detected 0: No error detected Note: This bit will be shadowed to an observability pin that can be used for IRQ generation.
6:5	0h RW	**Select Lane Number to be inverted for CMM (SLNINVCMM):** Select Lane Number to be inverted for CMM
4	1h RW	**CMM AutoInvert (AUTOINVERT):** 1: CMM autosequences through the inversion 0: CMM does not sequence inversion
3	0h RO/V	**CMM Status (STAT):** This bit is set when the CMM Start bit is set and cleared when the CMM mode has been entered successfully. 0: Compliance Measurement Mode is not active or CMM mode has been entered successfully. 1: Set as a result of CMM Start bit being set.
2	1h RW	**CMM Invert Enable (INVEN):** 1: Enables the Inversion of the lane 0: Lane not inverted
1	1h RW	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/L	**CMM Start (START):** 1: Start CMM 0: Stop CMM

17.1.66 PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 4ABCB5BCh

Bit Range	Default & Access	Field Name (ID): Description
31:24	4Ah RW	**CMM Data [3] (DATA3):** This character contains CMM Data [lb]3[rb] that will be transmitted on the link.
23:16	BCh RW	**CMM Data [2] (DATA2):** This character contains CMM Data [lb]2[rb] that will be transmitted on the link.
15:8	B5h RW	**CMM Data [1] (DATA1):** This character contains CMM Data [lb]1[rb] that will be transmitted on the link.
7:0	BCh RW	**CMM Data [0] (DATA0):** This character contains CMM Data [lb]0[rb] that will be transmitted on the link.

17.1.67 PTM Propagation Delay (PTMPD)—Offset 390h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current PTM Propagation Delay Value (CPTMPDV):** Current PTM Propagation Delay Value(CPTMPDV): This field reports the current PTM Propagation Delay value captured from the last successful PTM dialog.

17.1.68 PTM Lower Local Master Time (PTMLLMT)—Offset 394h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current PTM Lower Local Master Time Value (CPTMLLMTV):** Current PTM Lower Local Master Time Value(CPTMLLMTV): This field reports the lower fields bits 31:0 of the Local TSC time value.

17.1.69 PTM Upper Local Master Time (PTMULMT)—Offset 398h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current PTM Upper Local Master Time Value (CPTMULMTV):** Current PTM Upper Local Master Time Value(CPTMULMTV): This field reports the upper fields bits 63:32 of the Local TSC time value.

17.1.70 PTM Pipe Stage Delay Configuration 1 (PTMPSDC1)—Offset 39Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**GEN1 X2 RX Pipe Stage Delay (G1X2RPSD):** GEN1 X2 RX Pipe Stage Delay(G1X2RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
23:16	0h RW	**GEN1 X2 TX Pipe Stage Delay (G1X2TPSD):** GEN1 X2 TX Pipe Stage Delay(G1X2TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
15:8	0h RW	**GEN1 X1 RX Pipe Stage Delay (G1X1RPSD):** GEN1 X1 RX Pipe Stage Delay(G1X1RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
7:0	0h RW	**GEN1 X1 TX Pipe Stage Delay (G1X1TPSD):** GEN1 X1 TX Pipe Stage Delay(G1X1TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.

17.1.71 PTM Pipe Stage Delay Configuration 2 (PTMPSDC2)—Offset 3A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**GEN2 X1 RX Pipe Stage Delay (G2X1RPSD):** GEN2 X1 RX Pipe Stage Delay(G2X1RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
23:16	0h RW	**GEN2 X1 TX Pipe Stage Delay (G2X1TPSD):** GEN2 X1 TX Pipe Stage Delay(G2X1TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
15:8	0h RW	**GEN1 X4 RX Pipe Stage Delay (G1X4RPSD):** GEN1 X4 RX Pipe Stage Delay(G1X4RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
7:0	0h RW	**GEN1 X4 TX Pipe Stage Delay (G1X4TPSD):** GEN1 X4 TX Pipe Stage Delay(G1X4TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.

17.1.72 PTM Pipe Stage Delay Configuration 3 (PTMPSDC3)—Offset 3A4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**GEN2 X4 RX Pipe Stage Delay (G2X4RPSD):** GEN2 X4 RX Pipe Stage Delay(G2X4RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
23:16	0h RW	**GEN2 X4 TX Pipe Stage Delay (G2X4TPSD):** GEN2 X4 TX Pipe Stage Delay(G2X4TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
15:8	0h RW	**GEN2 X2 RX Pipe Stage Delay (G2X2RPSD):** GEN2 X2 RX Pipe Stage Delay(G2X2RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
7:0	0h RW	**GEN2 X2 TX Pipe Stage Delay (G2X2TPSD):** GEN2 X2 TX Pipe Stage Delay(G2X2TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.

17.1.73 PTM Pipe Stage Delay Configuration 4 (PTMPSDC4)—Offset 3A8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**GEN3 X2 RX Pipe Stage Delay (G3X2RPSD):** GEN3 X2 RX Pipe Stage Delay(G3X2RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
23:16	0h RW	**GEN3 X2 TX Pipe Stage Delay (G3X2TPSD):** GEN3 X2 TX Pipe Stage Delay(G3X2TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
15:8	0h RW	**GEN3 X1 RX Pipe Stage Delay (G3X1RPSD):** GEN3 X1 RX Pipe Stage Delay(G3X1RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
7:0	0h RW	**GEN3 X1 TX Pipe Stage Delay (G3X1TPSD):** GEN3 X1 TX Pipe Stage Delay(G3X1TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.

17.1.74 PTM Pipe Stage Delay Configuration 5 (PTMPSDC5)—Offset 3ACh

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RW	**GEN3 X4 RX Pipe Stage Delay (G3X4RPSD):** GEN3 X4 RX Pipe Stage Delay(G3X4RPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.
7:0	0h RW	**GEN3 X4 TX Pipe Stage Delay (G3X4TPSD):** GEN3 X4 TX Pipe Stage Delay(G3X4TPSD): 00h: 1 link clock delay. 01h: 2 link clock delay. 02h: 3 link clock delay. : : FFh: 256 link clock delay.

17.1.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
