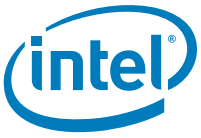
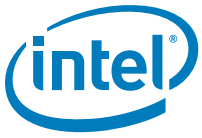
§ §





1 SoC Address Map

Note: Throughout this document Intel® Pentium® and Celeron® Processor N- and J- Series is referred as SoC.

Note: Throughout this document Intel® Pentium® and Celeron® Processor N- and J- Series processor families refers to:

- Intel® Pentium® N4200
- Intel® Pentium® J4205
- Intel® Celeron® N3350 and N3450
- Intel® Celeron® J3455 and J3355

1.1 Root Spaces

The SoC supports two root spaces: Host and CSE. Each root space contains an orthogonal address map. The Host address space is associated with the Atom CPUs. The CSE root space is associated with the CSE minute IA CPU.

Each root space supports an independent IA system. Within a given IA system (Host or CSE), the IA architecture defines several distinct address spaces that are accessible through different mechanisms. Some of these spaces have clean architectural definitions and others are less clean and overlap. It is not uncommon for a window in one address space to allow access to resources in another space. This is true both for address spaces within one root space (For example, a Host Memory Address Space window to Host PCI config space) and between Root spaces (For example, a CSE Memory Address Space window to DRAM that is also accessible from the Host Memory Space).

1.2 Super Set Architecture Definition

This Address MAP covers a super set of possible SoC configurations. Specifically, it refers to various address ranges that can be mapped to LPC or SPI. However, not all SoC instances will allow all of these configurations.

Note: The term “IAFW” is used throughout this document as a generic term for platform specific code that runs on the IA cores before the OS is loaded, often referred to as “BIOS”. The term “BIOS” is typically used for PC platforms, whereas mobile and Android* based platforms typically refer to IAFW.

§ §

2 Host Root Space

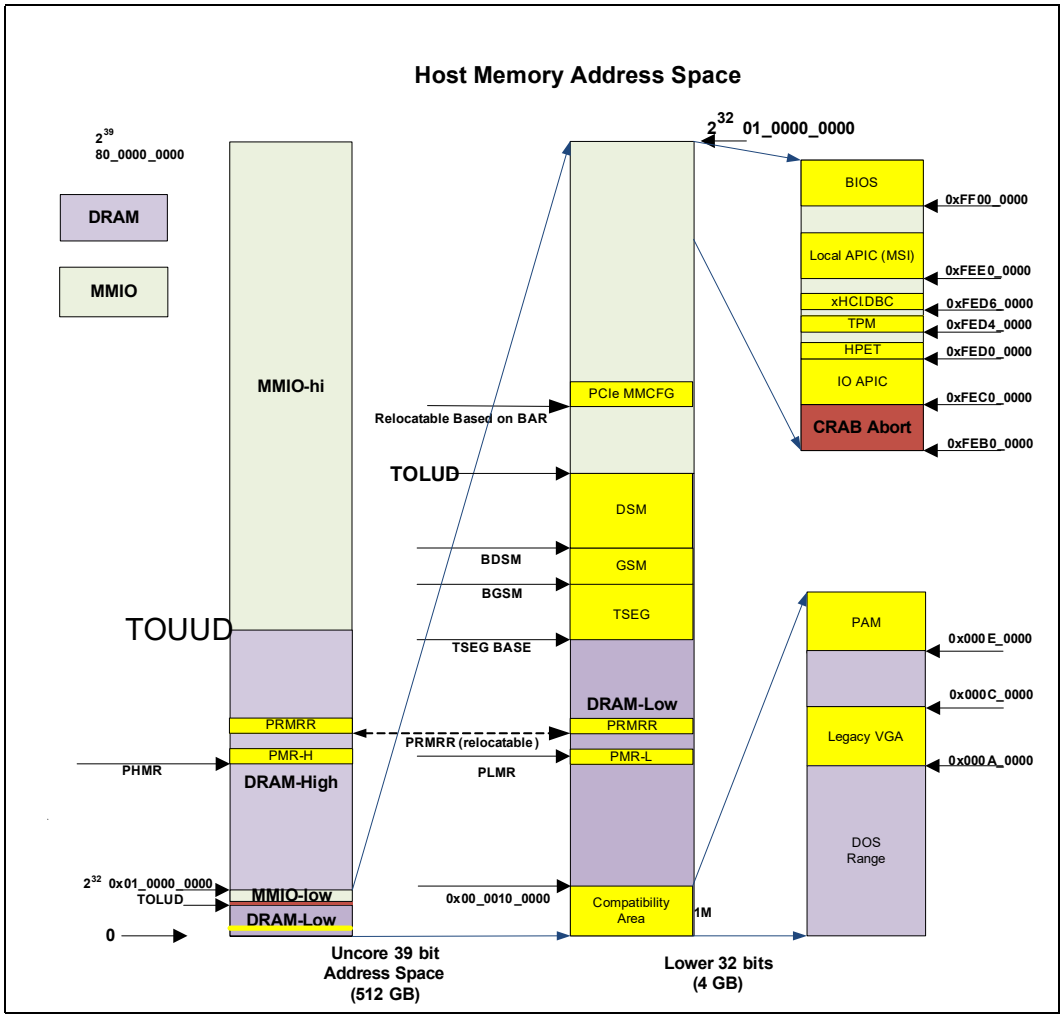
The following address spaces are available within the Host Root space:

- Memory
- I/O
- PCI Configuration
- Funny I/O
- IOSF SB Private CR space

2.1 Host Memory Address Space

The SoC implements 39 address bits providing 512 GiB of addressable memory space for use by the CPU and devices. This is the address space accessible by memory reads and writes and is the set of addresses as presented to the System Controllers or devices from either the CPU or devices. For PCI compliance the devices and IOSF fabric implement a full 64 b address space. Addresses greater than 512 GiB never address a physical resource in the SoC and are always terminated with an error.

Figure 2-1. Host Memory Address Map

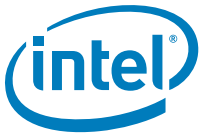


System DRAM memory is split into multiple independent architectural physical memory segments. In order to enable System DRAM to be addressed contiguously at the memory controller we define the “System DRAM address space”. A transformation is applied to the physical address to obtain the System DRAM address. Section 2.2, "System DRAM Address Space" provides details on Physical to System DRAM transformation. The SoC memory protection, security and coherency checks are performed on the Physical memory address before transformation.

VT-d adds the concept of Guest Physical Address or GPA and Host Physical address space or HPA. The Physical Address Space defined in this section corresponds to the HPA. A GPA is an un-translated address.

2.1.1 Host Memory Space Address Decode and Routing

Transactions in the Host Memory Space originate from two classes of sources: IDI attached and IOSF attached. These transactions must be routed, by address, to the appropriate resources. Address decode responsibilities are divided between the System



Agent and the IOSF fabric. This section will cover the details of System Agent address decode logic. The System Agent address decode logic is implemented in two parts. The B-Unit implements the majority of the address decode logic, with the A-Unit also implementing a first level address decode for upstream requests from IOSF.

The B-Unit system address decode logic will positively decode transactions to the following locations:

DRAM

- C-unit (Host Bridge functionality: Dev0 Fun0)
- SPI (BIOS, dTPM)
- LPC (BIOS, dTPM, misc non-standard ranges)
- CSE (BIOS and fTPM)
- Display
- I-Unit

Any transaction that arrives at the B-Unit from the A-Unit and is decoded to return to the A-Unit will be aborted. Transactions that are not positively decoded will be routed to PSF1.

The A-Unit system decode logic will positively decode upstream requests from IOSF agents as follows:

- Within MSI address range (0xFEEx_xxxx) ⇒ route to Tunit
- Within DRAM memory aperture ⇒ route to Bunit
- Otherwise ⇒ abort

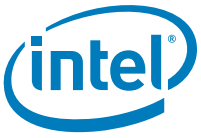
The Host memory address space is configurable. This document does not provide the detailed register definitions. This following table provides the names and a description of the primary registers used to control the memory configuration.

Table 2-1. Memory Map Configuration Registers

Register Name	Definition
TOUUD	Top of Upper Usable DRAM. Address above TOUUD target High MMIO. Address from 4 GiB up to TOUUD target DRAM.
TOLUD	Top of Low Usable DRAM. As a rule addresses below TOLUD target DRAM target DRAM and addresses between TOLUD and 4 GiB target devices in MMIO space. There are exceptions to the rule.
BDSM	Base of graphics Data Stolen Memory. A region used by the Integrated Graphics Device (IGD). BDSM specifies the base and TOLUD specifies the DSM region.
BGSM	Base of Graphics Stolen Memory. A region used by the IGD. BGSM specifies the base, and BDMS specifies the limit of the GSM region.
TSEGMB	T segment Memory Base. The region used for SMM protected DRAM. TSEGMB specifies the base, and BGSM specifies the limit.
BMISC	Contains fields for enabling various legacy regions including VGA and the BIOS PAM regions.

2.1.2 Abort Handling

The term “abort” is used in this document to handle a few different error handling mechanisms.



2.1.2.1 B-Unit Abort Handling

Non-posted Transactions that are aborted in the B-Unit will have a completion returned: to the IDI originator with bogus data (all '1's), to IOSF agents the completion is a UR with no data. Posted transactions that are aborted in the B-Unit are dropped without altering the contents of system memory. Depending on the reason for the abort, the B-Unit will follow different error logging behaviors.

2.1.2.2 IOSF Abort Handling

Transactions routed to IOSF will be aborted in the fabric or in the P2SB. Non-posted transactions are completed with a UR completion. The A-Unit converts the zero-length UR completion into a completion with all '1's. Posted transactions that are aborted are dropped. Error handling in the IOSF fabric follows the rules of the IOSF fabric and if errors are detected in the fabric the error message is sent to the ITSS error collector logic over sideband.

2.1.3 Low DRAM Address Range (0 to (TOLUD - 1)

As a rule all addresses from 0 to Top of Low Usable DRAM (TOLUD - 1) are routed to DRAM. There are exceptions to this rule. The following sub sections describe the exceptions to the rule.

Table 2-2. Low DRAM Default Address Decode Rule

Name	Low DRAM
Range	0 to (TOLUD – 1)
From IDI	DRAM, unless a specific rule supersedes this rule.
From IOSF	DRAM, unless a specific rule supersedes this rule.
Security	IMR ranges are SAI protected.

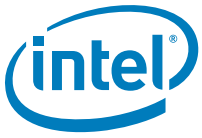
2.1.3.1 Legacy Video Area (A_0000h to B_FFFFh)

The legacy 128 KiB VGA memory range, (000A_0000h to 000B_FFFFh, also known as ASEG and BSEG) can be mapped to IGD or to a PCIe root port; the mapping is configured in the B-Unit BMISC register. The appropriate mapping depends on which devices are enabled and the programming of the VGA steering bits. If the VGA region is enabled and the transactions are not targeting the IGD, then they will be routed to the PCIe root port with the VGA enable bit of the bridge control register set.

The VGA range can be divided into three sub-ranges. Each range is either routed to the IGD or a PCIe root port based on the steering bits.

The following conditions are used to determine where to route addresses within this range:

- ABSegInDRAM:
  BMISC.ABSegInDRAM = 1
- IGDEnabled:
  (0.0.0.PCI.DEVEN.D2F0EN = 1)
  AND (0.2.0.PCI.PMCSR.PSRSTAT = 2'b00)
  AND (0.2.0.PCI.PCICMD2.MAE = 1)



- VGAAtoIGD:
  ((VGAAtoIGD1 = 1) OR (VGAAtoIGD2 = 1))
- VGAAtoIGD1:
  (GGC.GGMS ≠ 5'b00000)
  AND (GGC.IVD = 0)
  AND (VGADEC.VGAMSR1 = 1)
  AND (VGADEC.VGAGR10 = 1)
- VGAAtoIGD2:
  (!VGAAtoIGD1)
  AND ((VGADEC.VGAGR6 = 2'b00) OR (VGADEC.VGAGR6 = 2'b01))
- MDAtoIGD:
  (!VGAAtoIGD1)
  AND (VGADEC.VGAGR6 = 2'b10)
- VGABtoIGD:
  (!VGAAtoIGD1)
  AND (VGADEC.VGAGR6 = 2'b11)

Table 2-3. Legacy VGA A

Name	VGA A
Range	0xA_0000 to 0xA_FFFF

From IDI	IF (ABSegInDRAM)
	Route to DRAM
	ELSE IF (IGDEnabled and VGAAtoIGD)
	Route to Display
	ELSE
	Route to PSF1

From IOSF	IF (ABSegInDRAM)
	Route to DRAM
	ELSE
	Abort: Send to System Agent.
	
	Note: No A-Unit decode is required for this range.

Security	No restrictions

Table 2-4. Legacy MDA (Sheet 1 of 2)

Name	MDA (Monochrome Display Adaptor)
Range	0xB_0000 to 0xB_7FFF

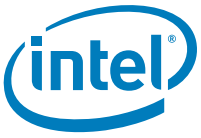


Table 2-4. Legacy MDA (Sheet 2 of 2)

Name	MDA (Monochrome Display Adaptor)

From IDI	IF (ABSegInDRAM)
	  Route to DRAM
	ELSE IF (IGDEnabled and MDAtoIGD)
	  Route to Display
	ELSE
	  Route to PSF1

From IOSF	IF (ABSegInDRAM)
	  Route to DRAM
	ELSE
	  Abort: Send to System agent.
	
	Note: No A-Unit decode is required for this range.

Security	No restrictions

Table 2-5. Legacy VGA B

Name	VGA B
Range	0xB_8000 to 0xB_FFFF

From IDI	IF (ABSegInDRAM)
	  Route to DRAM
	ELSE IF (IGDEnabled and VGABtoIGD)
	  Route to Display
	ELSE
	  Route to PSF1

From IOSF	IF (ABSegInDRAM)
	  Route to DRAM
	ELSE
	  Abort: Send to System agent.
	
	Note: No A-Unit decode is required for this range.

Security	No restrictions

2.1.3.1.1 Legacy VGA and Compatible Mode SMM

The SoC does not support legacy SMM usage of the VGA range.

2.1.3.2 Expansion Area (C_0000h to D_FFFFh)

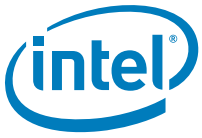
The SoC does not Support the ISA Expansion region. This area always maps to system DRAM.

2.1.3.3 PAM Memory Area (E_0000h to F_FFFFh)

The SoC does NOT support the PAM regions. The PAM Memory Area has historically been used for accessing IAFW code from flash.

ISA Hole (15 MiB to 16 MiB)

The SoC Does **NOT** support the ISA Hole Feature. This range is always mapped to DRAM.



2.1.3.4 Protected Memory Range (PMR-L: Programmable)

VT-d defines a protected memory range. This range is re-locatable. This range must be protected by IMRs to ensure only the IA core has access to this range before VT-d translation is enabled.

There is one range per VT-d engine. So the SoC has two PMR-L ranges.

In addition to PMR-L (below 4 GiB) there is a PMR-H above 4 GiB with the same access restrictions.

Table 2-6. PMR-L

Name	PMR-L
Range	0.0.0.DefVTdBAR.PMRLBASE to 0.0.0DefVTdBAR.PMRLLIMIT and 0.0.0.GfxVTdBAR.PMRLBASE to 0.0.0GfxVTdBAR.PMRLLIMIT
From IDI	DRAM
From IOSF	DRAM or ABORT (based on security)
Security	GT has a copy of GfxVTd PMR. It will make sure that only VT-d walks are allowed to touch PMR and hence get onto IDI. Other tnx that hit PMR are killed before they get onto IDI. Display will add GfxVTd PMR. It will make sure that only VTd walks are allowed to go to PMR range and all other tnx will be killed before they get onto IOSF primary. DefVTd PMR will be implemented in Bunit.

2.1.3.5 DMA Protected Range (DPR: Programmable)

The SoC Address map does not support DPR. This range is used in big core systems as part of the TXT security model.

2.1.3.6 TSEG SMM Range (Programmable)

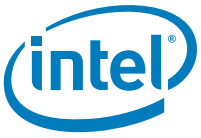
This range is set up by IAFW and must match the range specified for SMM in the core MSRs. TSEGMB is the base of the range, and the limit is defined by BGSM (Bottom of Graphics Stolen Memory). This range is SAI protected and only transactions originating in SMM mode from the IA cores are allowed access. See Section 2.3, "System Management Mode (SMM)" for further discussion on SMM and access restrictions.

Table 2-7. TSEG

Name	TSEG
Range	0.0.0.TSEGMB to (0.0.0.BGSM - 1)
From IDI	DRAM or ABORT
From IOSF	DRAM or ABORT (Abort if enabled by SAI check)
Security	SAI protected.

2.1.3.7 Graphics Stolen Memory (Programmable)

The base of graphics stolen memory is defined by BGSM (Base of Graphics Stolen Memory). The limit is defined by TOLUD. This region is SAI protected and only Display and GT are allowed access.



The IGD further subdivides this range, however outside of the IGD the access protections are the same and the system is not aware of the further sub-division. These divisions include a Data segment and a PCM segment. The enforcement of access restrictions within GSM to the data segment or the PCM segment is the responsibility of the GT logic and Display.

Table 2-8. GSM

Name	GSM
Range	0.0.0.MCHBAR.BGSM to (0.0.0.MCHBAR.TOLUD - 1)
From IDI	DRAM or ABORT
From IOSF	DRAM or ABORT
Security	SAI protected.

2.1.4 Low MMIO Address Range (TOLUD to 4 GiB)

This address range, from BUNIT.BMBOUND to 4 GiB is primarily used for devices in MMIO space. Section 2.1.6, "High MMIO Address Range (TOUUD to 0x7F_FFFF_FFFF)" provides a summary of all legacy fixed and programmable MMIO address ranges in the SoC.

Root complex integrated PCI devices have memory space BARs that can be configured to claim memory within this region. Root Ports (PCIe or Mobile Express) have Base and limit range registers that can be configured to claim memory within this region. IAFW and the OS ensure that the PCI BARs are not programmed to overlap with any of the legacy address ranges.

Table 2-9. Low MMIO Address Range

Name	Low MMIO
Range	0.0.0.MCHBAR.TOLUD to 0xFFFF_FFFF
From IDI	PSF1 on VC0b, unless a specific rule supersedes this rule.

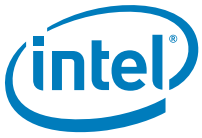
From IOSF	IF (VC0a)
	PSF1 on VC0b, unless a specific rule supersedes this rule.
	ELSE IF (VC0b)
	Abort, Send to system agent, unless a specific rule supersedes this rule.
	ELSE

Security	No restrictions, unless a specific rule supersedes this rule.

2.1.4.1 PCIe Memory Mapped Config Range (Programmable)

A 256 MiB range used to access PCI configuration registers. See Section 2.5.1.2, "PCI Express Enhanced Configuration Mechanism".

Note: A fixed PCI config MM space of 256 MiB is overkill and would waste DRAM space on a 32 b (4 GiB) system. Ideally the MM window would be configurable to match the needs of the system and minimize DRAM waste. This needs to be investigated for future derivatives.



The System Agent is responsible for converting the transactions to PCI config transactions. The B-Unit does some address decode of PCI config space, but most transactions are forwarded subtractively to PSF1 and the IOSF fabric is responsible for decode.

Note: When I-Unit is configured as a "child of graphics", the I-Unit PCI config space will be disabled and configuration transactions to B/D/F 0/3/0 will be routed to the IOSF fabric and aborted.

Table 2-10. PCIe MMCFG

Name	PCIeMMCFG
Range	BAR: 0.0.0.MCHBAR.PCIEXBAR (size 256 MiB)

From IDI	IF (0.0.0.MCHBAR.PCIEXBAR.ECEnable = 1)
	  Convert to PCI configuration cycle
	
	IF (B/D/F = 0/0/0)
	  C-unit on VC0b
	ELSE IF ((B/D/F = 0/2/0) AND (DEVEN.D2F0EN))
	  Display on VC0a
	ELSE IF ((B/D/F = 0/3/0) AND (DEVEN.D3F0EN))
	  I-Unit on VC0a
	ELSE
	  PSF1

From IOSF	Default (see Low MMIO range)
Security	GT is not allowed to access this range. If GT does attempt access the transaction is forwarded to IOSF as a Memory transaction.

2.1.4.2 Host Bridge

The host bridge located at Bus0, Dev0, Fn0 contains three non-standard BARs. MCHBAR is defined in a PCI configuration register. The Two VTd BARs are MMIO registers in the MCHBAR range. Each of these BARs has an enable bit. If the BAR is not enabled, the address decoder should ignore the value programmed in the upper bits of the BAR.

MCHBAR is the BAR for all System Agent memory mapped registers. Transactions are routed on IOSF primary to the C-unit and from the C-unit they are distributed as needed on IOSF SB.

The A-Unit TAD should not decode for MCHBAR, DefVTDBAR or GFxVTdBAR. This will prevent P2P transactions from VC0a targeting the C-unit. These 3 BARs are source decoded by B-Unit.

Table 2-11. MCHBAR (Sheet 1 of 2)

Name	MCHBAR
Range	BAR: 0.0.0.PCI.MCHBAR size (32 KiB)

Table 2-11. MCHBAR (Sheet 2 of 2)

Name	MCHBAR

From IDI	IF (0.0.0.PCI.MCHBAR.MCHBAREnable = 1)
	C-unit
	ELSE

From IOSF	Default (see Low MMIO range)
Security	B-Unit

The Default VTd BAR is the BAR for the Default IOMMU memory mapped registers. Transactions are routed on IOSF primary to the C-unit. The C-unit forwards the transaction to the Default IOMMU on IOSF SB.

Table 2-12. Default VTd BAR

Name	DefVTdBAR
Range	BAR: 0.0.0.MCHBAR.DefVTdBAR (4 KiB)

From IDI	IF (0.0.0.PCI.DefVTdBAR.DefVtdBAREnable = 1)
	C-unit
	ELSE

From IOSF	Default (see Low MMIO range)
Security	No restrictions.

The Graphics VTd BAR is the BAR for the Graphics IOMMU memory mapped registers. Transactions are routed on IOSF primary to Display.

Although this is a dev0 owned memory BAR, the registers live in dev2 and dev2 must be enabled to access this memory range.

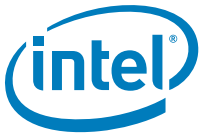
- IGDEnabled:
  (0.0.0.PCI.DEVEN.D2F0EN = 1)
  AND (0.2.0.PCI.PMCSR.PSRSTAT = 2'b00)
  AND (0.2.0.PCI.PCICMD2.MAE = 1)

Table 2-13. Graphics VTd BAR

Name	GfxVTdBAR
Range	BAR: 0.0.0.MCHBAR.GfxVTdBAR (4 KiB)

From IDI	IF (0.0.0.MCHBAR.GFxVTdBAR.VtdBAREnable = 1) && IGDEnabled
	Display
	ELSE

From IOSF	Default (see Low MMIO range)
Security	No restrictions.



2.1.4.3 Integrated Graphics Device (IGD)

Notes:

1. The IGD BARs are not restricted to Low MMIO space and could be programmed in High MMIO space.
2. The Integrated graphics device has two Host Memory Space BARs. These are standard PCI BARs.
3. Address decode to these BARs are valid if the Integrated Graphics device is enabled and system software has enabled the Memory Access to the device:

- IGDEnabled:
  (0.0.0.PCI.DEVEN.D2F0EN = 1)
  AND (0.2.0.PCI.PMCSR.PSRSTAT = 2'b00)
  AND (0.2.0.PCI.PCICMD2.MAE = 1)
- MCHBARAlias:
  offsets 0x14_0000 to 0x14_7FFF from GTTMADDR BASE

The registers in the IGD that live behind the GTTMMADR BAR are accessible in three ways:

- By IA or peer transactions through the MMIO BAR described in Section 2.4.2.1, "Integrated Graphics Device (IGD)")
- By GT using Funny I/O transactions (see Section 2.6, "Funny I/O Space")
- By IA using an I/O BAR. (see Section 2.1.4.3, "Integrated Graphics Device (IGD)")

Table 2-14. GTTMMADR

Name	GTTMMADR
Range	BAR: 0.2.0.PCI.GTTMMADR (16 MiB)

From IDI	IF (IGDEnabled)
	IF (MCHBARAlias and Read)
	Cunit
	ELSE IF (MCHBARAlias and Write)
	Abort
	ELSE
	Display
	ELSE

From IOSF	IF (VC0a)
	PSF1
	ELSE IF (VC0b and IGDEnabled)
	Display
	ELSE

Security	No Restrictions.

Table 2-15. GMADR (Sheet 1 of 2)

Name	GMADR
Range	BAR: 0.2.0.PCI.GMADR (re-sizeable by 0.2.0.PCI.MSAC 128 MiB to 4 GiB)

Table 2-15. GMADR (Sheet 2 of 2)

Name	GMADR

From IDI	IF (IGDEnabled)
	Display
	ELSE

From IOSF	Default (see Low MMIO range)
Security	No restrictions.

2.1.4.4 I-Unit

The I-Unit contains one standard PCI BAR.

Note: The I-Unit BARs are not restricted to Low MMIO space and could be programmed in High MMIO space.

Table 2-16. I-Unit BAR

Name	IBAR
Range	BAR: 0.3.0.PCI.IBAR (16 MiB)

From IDI	IF ((0.0.0.PCI.DEVEN.D3F0EN = 1)
	AND (0.3.0.PCI.PMCSR.PSRSTAT = 2'b00)
	AND (0.3.0.PCI.PCICMD2.MAE = 1))
	I-Unit
	ELSE
	Default (See Low MMIO Range)

From IOSF	Default (see Low MMIO range)
Security	No restrictions.

2.1.4.5 LPC Generic Memory Range

The LPC logic has a non-standard memory range. The system agent performs source decoding on this range. The destination is LPC. If the SoC has no LPC, then these ranges are n/a.

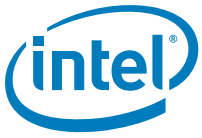
LPC Generic Memory Range. Enable via setting bit[0] of the LPC Generic Memory Range register (D31:F0:offset 98h).

Table 2-17. LPC Generic Memory Range

Name	LPC Generic Memory Range
Range	BAR: 0.31.0.PCI.LGMR (offset 98h)

From IDI	IF (0.31.0.PCI.LGMR.bit0 = 1)
	IF (LPC enabled)
	LPC
	ELSE
	Default (See Low MMIO Range)
	ELSE

From IOSF	Default (see Low MMIO range)
Security	No restrictions.



2.1.4.6 CRAB_ABORT (0xFEB0_0000 to 0xFEBF_FFFF)

The CPU will re-map various access violations to target the CRAB_ABORT page.

Table 2-18. CRAB_ABORT

Name	CRAB ABORT
Range	0xFEB0_0000 to 0xFEBF_FFFF
From IDI	Abort
From IOSF	Abort—Route to B-Unit no decode required in A-Unit
Security	No restrictions.

2.1.4.7 IOAPIC (0xFEC0_0000 to 0xFECF_FFFF)

The IOAPIC has a small MMIO window that is located at 0xFECX_X000-FECX_X040. IAFW configures the exact location using the APIC Range Select (ASEL) field and APIC Enable (AEN) bit. For the SoC only ASEL programming placing the range at 0xFEC0_0000 to 0xFEC0_0040 will be validated.

Table 2-19. IOAPIC

Name	IOAPIC
Range	0xFECX_X000 to 0xFECX_X040
From IDI	Subtractive to PSF1
From IOSF	Default (see Low MMIO range)
Security	No restrictions.

2.1.4.8 HPET (0xFED0_0000 – 0xFED0_33FF)

IAFW can configure the HPET timers to be located at one of four locations: 0xFED0_X000 to 0xFED0_X3FF where X = {0, 1, 2, or 3}. For the SoC we will only validate with X = 0.

Table 2-20. HPET

Name	HPET
Range	0xFFD0_X000 to 0xFED0_X3FF (X = {0, 1, 2, or 3})
From IDI	PSF1
From IOSF	Default (see Low MMIO range)
Security	No restrictions.

2.1.4.9 TPM (0xFED4_0000 to 0xFED4_0FFF)

The range from 0xFED4_0000 to 0xFED4_0FFF is reserved for use by the TPM. The location of the TPM is determined by a strap and transactions to this address are routed towards the TPM (CSE, SPI or LPC).

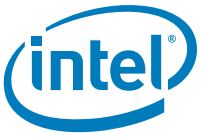


Table 2-21. TPM locality 0

Name	TPM
Range	0xFED4_0000 to 0xFED4_0FFF

From IDI	IF (TPM at CSE)
	  CSE
	ELSE IF (TPM_at_LPC)
	  LPC
	ELSE
	  PSF error handler.

From IOSF	Default (see Low MMIO range)
Security	No restrictions.

2.1.4.10 TXT (0xFED2_0000 to 0xFED3_FFFF)

The range from 0xFED2_0000 to 0xFED3_FFFF is the TXT public and private ranges. This range is not used on the SoC and is aborted in the system agent.

Table 2-22. TPM Locality 1-3

Name	TPM
Range	0xFED2_0000 to 0xFED3_FFFF
From IDI	Abort
From IOSF	Default (see Low MMIO range)
Security	Always aborted

2.1.4.11 TPM (0xFED4_1000 to 0xFED4_3FFF)

The range from 0xFED4_1000 to 0xFED4_3FFF is the TPM locality 1 to 3 range. These are not used on the SoC and are aborted in the system agent.

Table 2-23. TPM Locality 1-3

Name	TPM
Range	0xFED4_1000 to 0xFED4_3FFF
From IDI	Abort
From IOSF	Default (see Low MMIO range)
Security	Always aborted

2.1.4.12 xHCI.DBC (0xFED6_0000 to 0xFED6_0FFF)

The range from 0xFED6_0000 to 0xFED6_0FFF is reserved for P2P traffic targeting the xHCI DBC endpoint. The OS must be informed that this address range is reserved, and no other MMIO address should overlap with this range. There is not address decode awareness of this address range. Addresses in this range must use source decode on the PSF fabric. A transaction in this range without source decode will be subtractively aborted.

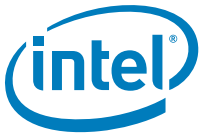

Table 2-24. xHCI.DBC

Name	TPM
Range	0xFED6_0000 to 0xFED6_0FFF
From IDI	Default (see Low MMIO range)
From IOSF	Default (see Low MMIO range)
Security	Always aborted

2.1.4.13 Local APIC (0xFEE0_0000 to 0xFEEF_FFFF)

The range from 0xFEE0_0000 to 0xFEEF_FFFF is reserved signaling interrupts to the local APICs inside the CPU cores. Accesses to this range from I/O devices are routed upstream to the cores.

Table 2-25. IOAPIC

Name	Local APIC
Range	0xFEE0_0000 to 0xFEEF_FFFF
From IDI	Subtractive to PSF1
From IOSF	T-Unit
Security	No requirements

2.1.4.14 IAFW (BIOS) (0xFFXX_0000 to 0xFFFF_FFFF)

The range of memory at the top of Low MMIO is used to access IAFW (aka BIOS) during boot. The size of this range is configurable from 256 KiB to 16 MiB. The range is always aligned to end at 4 GiB - 1. The first instruction fetch after reset targets address 0xFFFF_FFF0.

The on die SRAM size is limited to 256 KiB. When booting from LPC or SPI, the controls to configure the size of the region are in either the BIOS Decode Register in LPC or SPI (depending on which is enabled).

The IAFW region can be mapped to one of three physical locations: CSE SRAM, LPC, or SPI flash.

- BIOSinSRAM
- BIOSinLPC
- BIOSinSPI

The IAFW range is broken into four sub-ranges. BIOS1 always is used for BIOS. BIOS2, BIOS3 and BIOS4 may be used for BIOS or may be used as default MMIO addresses.

The BIOS3 and BIOS4 range is controlled by the BDE (BIOS Decode Enable) register. When LPC is enabled the system agent should use the LPC BDE register. When SPI is enabled the LPC should use the SPI BDE register.

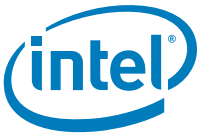

Table 2-26. BIOS1

Name	BIOS
Range	0xFFFC_0000 to 0xFFFF_FFFF

From IDI	IF (BIOSinLPC)
	  LPC
	ELSE IF (BIOSinSPI)
	  SPI
	ELSE
	  CSE SRAM (note use IOSF DestID for CSE)

From IOSF	Default (see Low MMIO range)
Security	Perform SAI Completion check in system agent. Perform SAI check at CSE SRAM.

Table 2-27. BIOS2

Name	BIOS2
Range	0xFFF8_0000 to 0xFFFB_FFFF

	SPI
	ELSE
	PSF1

From IOSF	Default (see Low MMIO range)
Security	No requirements.

2.1.4.14.1 BIOS Decode Enable Register Restrictions

To simplify the decoder in the B-Unit we restricting the legal programming of BDE.

BDE[14:8] must be set or cleared together. This creates one region from 0xFF80_0000 to 0xFFF7_FFFF (7.5 MiB in size).

- BDE[3:0] must be set or cleared together. This creates one 8 MiB range from 0xFF00_0000 to 0xFF7F_FFFF.

Base	Limit	Enable
0xFFF8_0000	0xFFFB_FFFF	
0xFFF0_0000	0xFFF7_FFFF	bde[14]
0xFFE8_0000	0xFFEF_FFFF	bde[13]
0xFFE0_0000	0xFFE7_FFFF	bde[12]
0xFFD8_0000	0xFFDF_FFFF	bde[11]
0xFFD0_0000	0xFFD7_FFFF	bde[10]
0xFFC8_0000	0xFFCF_FFFF	bde[9]
0xFFC0_0000	0xFFC7_FFFF	bde[8]
0xFFB8_0000	0xFFBF_FFFF	
0xFFB0_0000	0xFFB7_FFFF	bde[14]
0xFFA8_0000	0xFFAF_FFFF	bde[13]
0xFFA0_0000	0xFFA7_FFFF	bde[12]
0xFF98_0000	0xFF9F_FFFF	bde[11]
0xFF90_0000	0xFF97_FFFF	bde[10]
0xFF88_0000	0xFF8F_FFFF	bde[9]
0xFF80_0000	0xFF87_FFFF	bde[8]
0xFF70_0000	0xFF7F_FFFF	bde[3]
0xFF60_0000	0xFF6F_FFFF	bde[2]
0xFF50_0000	0xFF5F_FFFF	bde[1]
0xFF40_0000	0xFF4F_FFFF	bde[0]
0xFF30_0000	0xFF3F_FFFF	bde[3]

Base	Limit	Enable
0xFF20_0000	0xFF2F_FFFF	bde[2]
0xFF10_0000	0xFF1F_FFFF	bde[1]
0xFF00_0000	0xFF0F_FFFF	bde[0]

2.1.5 High DRAM (0x1_0000_0000 to (TOUUD - 1))

The range from 4 GiB (1_0000_0000h) to (TOUUD - 1) is mapped to DRAM. When there is no DRAM above 4 GiB, TOUUD may be programmed to a value below 4 GiB. In that case this range is effectively disabled.

Table 2-30. High DRAM

Name	Mapping
Range	0x1_0000_0000 to (TOUUD - 1)
From IDI	DRAM
From IOSF	DRAM
Security	IMR ranges are SAI protected.

2.1.5.1 Protected Memory Range (PMR-H: Programmable)

VT-d defines a high (greater than 4 GiB) protected memory range. This range is re-locatable. This range must be protected by IMRs to ensure only the IA core has access to this range before VT-d translation is enabled.

There is one range per VT-d engine. So the SoC has two PMR-H ranges.

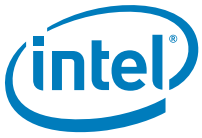
In addition to PMR-H (above 4 GiB) there is a PMR-L below 4 GiB with the same access restrictions.

Table 2-31. PMR-H

Name	PMR-H
Range	0.0.0.DefVTdBAR.PMRHBASE to 0.0.0DefVTdBAR.PMRHLIMIT and 0.0.0.GfxVTdBAR.PMRHBASE to 0.0.0GfxVTdBAR.PMRHLIMIT
From IDI	DRAM
From IOSF	DRAM
Security	GT has a copy of GfxVTd PMR. It will make sure that only VT-d walks are allowed to touch PMR and hence get onto IDI. Other tnx that hit PMR are killed before they get onto IDI. Display will add GfxVTd PMR. It will make sure that only VTd walks are allowed to go to PMR range and all other tnx will be killed before they get onto IOSF primary. DefVTd PMR will be implemented in Bunit. https://hsdes-stable.intel.com/home/default.html#article?id=101147810

2.1.6 High MMIO Address Range (TOUUD to 0x7F_FFFF_FFFF)

The range from TOUUD to 512 GiB (7F_FFFF_FFFFh) is used for devices in MMIO space. There are no legacy fixed or programmable MMIO address ranges in High MMIO space.



Root complex integrated PCI devices have memory space BARs that can be configured to claim memory within this region. Root Ports (PCIe or Mobile Express) have Base and limit range registers that can be configured to claim memory within this region.

Table 2-32. High MMIO Address Range

Name	High MMIO
Range	0.0.0.MCHBAR.TOUUD to 0x7F_FFFF_FFFF
From IDI	PSF1, unless a specific rule supersedes this rule.
From IOSF	PSF1, unless a specific rule supersedes this rule.
Security	No restrictions.

2.1.6.1 Other Ranges in High MMIO Address Ranges

Many of the programmable ranges defined in the Low MMIO Address Range can be configured to be in either Low or High MMIO Address space. The following list of ranges in Low MMIO space may be configured into High MMIO space:

- MCHBAR
- Default VTd BAR
- Graphics VTd BAR
- GTTMMADR
- GTMADR
- IBAR

2.2 System DRAM Address Space

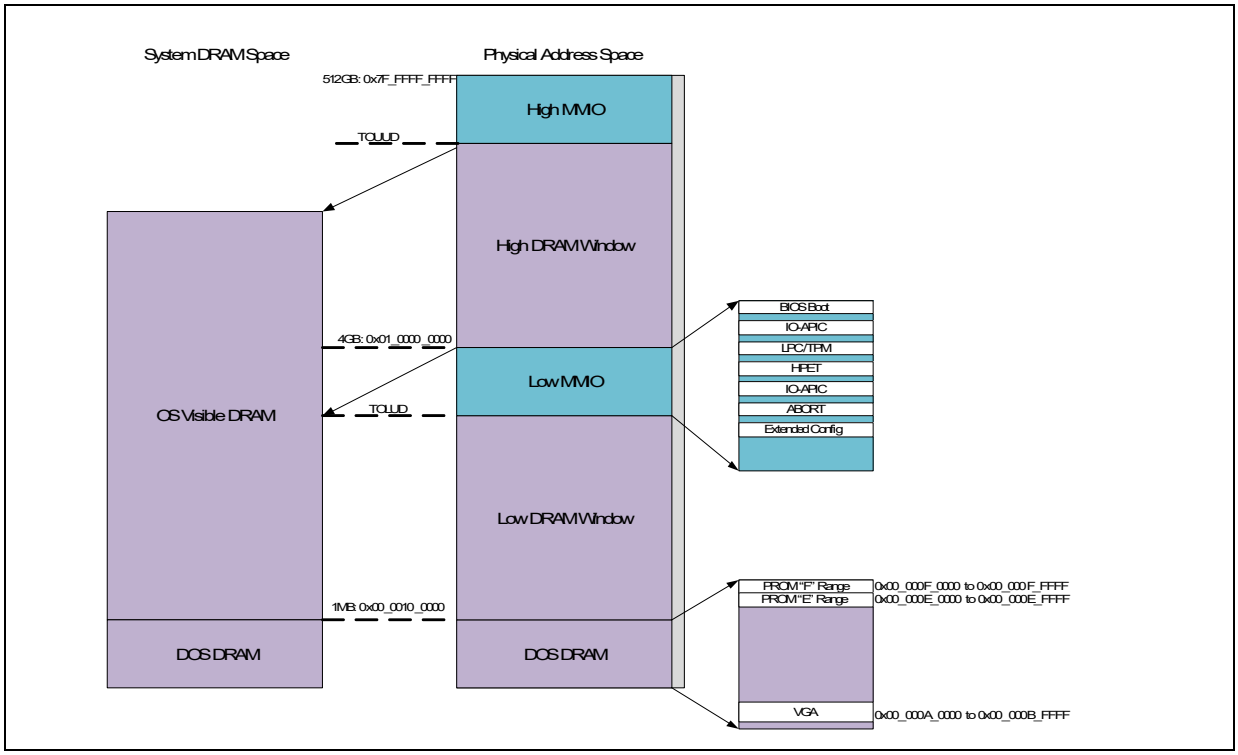
This is the range of addresses presented to the memory controller after all security checks and reclaiming has been done. The memory controller is aware of the total amount of populated DRAM and addresses above this range are considered invalid – writes will be dropped and reads will return all '1's.

In truth, memory controllers have options to swizzle which System DRAM Address Space address bits map to banks, rows, columns to increase performance. For purposes of this discussion, this mapping is assumed to 1-to-1.

2.2.1 Physical to System DRAM Address Mapping

Inside the system agent the Physical Address is converted to a System DRAM Address. This is done to "reclaim" all addressable DRAM that would otherwise be lost because the addresses conflict with the Low MMIO range.

Figure 2-2. Physical to System DRAM Address Map



2.2.2 Case 1: 2 GiB DRAM. Minimum 1 GiB PCI MMIO

BUNIT.TOLUD needs to be no greater than 3 GiB to make room for 1 GiB of Low MMIO between TOLUD and 4 GiB.

TOLUD could be set to 3 GiB, but any Physical Address Space request from 2 GiB to 3 GiB will exceed available DRAM and this range will need to be marked as unavailable by the IAFW to the OS ("bad"). Instead, it is better to leave the 2 GiB to 3 GiB Physical Address Space range available for MMIO devices. Setting TOLUD to 2 GiB makes all 2 GiB of DRAM available and provides 2 GiB of Low MMIO space.

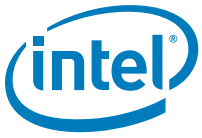
Because available DRAM is less than 4 GiB, BUNIT.TOUUD should be set to 4 GiB, allowing all of the 4 GiB to 64 GiB address space to be used for 64 b PCI MMIO.

2.2.3 Case 2: 8 GiB DRAM. Minimum 1 GiB PCI MMIO

BUNIT.TOLUD needs to be no greater than 3 GiB to make room for 1 GiB of Low MMIO between TOLUD and 4 GiB.

Setting TOLUD to 3 GiB gives the required range for Low MMIO and makes the maximum amount of Physical Address Range below 4 GiB available to access DRAM.

To make use of the remaining DRAM Address Space (3 GiB to 8 GiB), the Physical Address Space range 4 GiB to 9 GiB will automatically be mapped downwards by 1 GiB (subtract 4 GiB and add TOLUD) to 3 GiB to 8 GiB in DRAM Address Space before the request make it to the memory controller. This mapping happens for all DRAM request from CPUs or devices.



TOUUD would be set to 9 GiB and the full remaining Physical Address Space range from 9 GiB to 512 GiB is available for HIGH MMIO.

2.3 System Management Mode (SMM)

System Management Mode uses main memory for System Management RAM (SMM RAM). System Management RAM space provides a memory area that is available for the SMI handlers and code and data storage. This memory resource is normally hidden from the system OS so that the processor has immediate access to this memory space upon entry to SMM.

2.3.1 IAFW Programming Restrictions

If any of the following conditions are violated the results of SMM accesses are unpredictable and may cause the system to hang:

- The upper bound of the SMM region is controlled by BGSM. The lower bound is controlled by TSEGMB.
- IAFW should program the upper and lower bounds with the upper > lower and ensuring that the address space must not overlap address space assigned to system DRAM, or to any MMIO range. This is an IAFW responsibility.
- The SMM region must not be reported to the OS as available DRAM. This is an IAFW responsibility.
- Any address translated through the GMADR TLB must not target the SMM Range.
- IAFW should initially leave the SMM region open to allow writing of SMM code in DRAM.
- Must setup the SMMR register in each CPU to prevent cache based attacks.
- The System Management Mode Range Register (SMRR) is an enhancement to the IA-32 Intel architecture that constrains SMM cache-ability controls to SMM code.
- After the microcode update has been loaded and during the SMM relocation phase of the POST, IAFW must detect if the processor supports SMRR by examining the SMRR_CAP bit (IA32_MTRR_CAP[11]). If the SMRR_CAP bit is set (‘1’) the processor supports the SMRR feature. If the SMRR_CAP bit is clear (‘0’) the processor does not support the SMRR feature. If the SMRR is supported, it must be enabled by setting bit 3 in the IA32_FEATURE_CONTROL MSR[3] (MSR 3Ah) together with the lock bit(bit 0) of the same MSR. In addition, It must set the SMRR_PHYS_BASE and SMRR_PHYS_MASK to match the BUNIT.BSMMRRL/ BUNIT.BSMMRRH defined region.
- South Cluster devices are **never** allowed to access SMM space. ABIMR must be used for this.

2.3.2 SoC Internal Enforcement of SMM Protection

Notes:

1. SoC will automatically filter CPU request from threads that are not in SMM mode that hit the SMM range. Writes will be dropped and reads will return all ‘1’s.
2. Access to the SMM area of physical address space from agents other than the CPU should be prevented. It is the responsibility of IAFW to use a SMM policy registers for this functionality.

2.3.2.1 CPU WB Transaction to an Enabled SMM Address Space

CPU Writeback transactions to enabled SMM Address Space must be written to the associated SMM DRAM even though BUNIT.BSMMRRL/BUNIT.BSMMRRH *[ALLOW_NON_SMM_WRITES_TO_SMM_SPACE_SMMWRITESOPEN]* = 0 and the transaction is not performed in SMM mode. This ensures SMM space cache coherency when cache able extended SMM space is used. It is the responsibility of IAFW to ensure that the SMM physical address range is not exposed to the operating system or used for any other function.

IAFW must also program the SMRR register in the CPU(s) to prevent a cache based security risk.

2.4 I/O Space

The SoC implements a 64 KiB + 3 B I/O address space. The I/O Space is accessed by the CPU using the IN/OUT instructions. This address space is separate from both the Host Memory Address Space described in Section 2.1, "Host Memory Address Space" and the PCI config space described in Section 2.1, "Host Memory Address Space". These requests never map to system DRAM. These requests are always NP and the CPU waits for a completion before proceeding to the next instruction.

The CPU micro-code is responsible for ensuring that I/O transactions issued on IDI do not cross a 4 B boundary. When an instruction would results in an un-aligned I/O transaction micro-code will issue two I/O transactions. When an instruction targets the upper three bytes of the 64 KiB I/O space (FFFDh-FFFFh) and the transaction is split, the second half of the transaction will access some or all of the "+ 3" bytes of I/O space (1_0000h to 1_00002h). For example a 4 B read to FFFEh results in a 2 B transaction to FFFEh, and a 2 B transaction to 1_0000h.

Notes:

1. There are no actual resources located at 1_0000 to 1_0003.
2. Funny I/O is treated as a separate address space (see Section 2.6, "Funny I/O Space"). Eight byte Funny I/O transactions are allowed but micro-code will ensure they are always naturally aligned.

Some root complex integrated PCI devices have I/O space BARs that can be configured to claim memory within this region. Root Ports (PCIe or Mobile Express) have Base and limit range registers that can be configured to claim I/O addresses within this region. IAFW and the OS ensure that the PCI BARs are not programmed to overlap with any of the legacy address ranges.

2.4.1 Fixed I/O Ranges: Decode and Routing

These Fixed address ranges are either positively decoded in the System Agent or subtractively routed to the Primary to Sideband Bridge (P2SB).

The following table defines the Fixed I/O address ranges that are positively decoded in the system agent. If any of these ranges are not enabled, a transaction to that range will subtractively decode to the P2SB.

The System Agent must shadow a copy of several LPC registers (IOE and IOD). Only one of LPC registers will be enabled at a time and they always have the same device and function number (specifically device 31, function 0).

The B-Unit implements the GCS register.

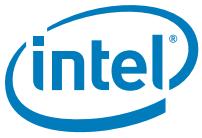


Table 2-33. Fixed I/O Address Map Positive Decode

I/O Address	IOSF Primary Target	Register control
080h	LPC or PCIe	GCS.RPR = 1
084h–086h	LPC or PCIe	GCS.RPR = 1
088h	LPC or PCIe	GCS.RPR = 1
08Ch–08Eh	LPC or PCIe	GCS.RPR = 1
200h–207h	LPC	IOE.LGE = 1
208h–20Fh	LPC	IOE.HGE = 1
220h–227h	LPC	((IOE.CAE & IOD.CA) = 3'b010) OR ((IOE.CBE & IOD.CB) = 03'b10)
228h–22Fh	LPC	((IOE.CAE & IOD.CA) = 3'b011) OR ((IOE.CBE & IOD.CB) = 3'b011)
238h–23Fh	LPC	(9IOE.CAE & IOD.CA) = 3'b100) OR (IOE.CBE & IOD.CB = 3'b100)
278h–27Fh	LPC	(IOE.PPE & IOD.LPT) = 2'b01
2E8h–2EFh	LPC	((IOE.CAE & IOD.CA) = 3'b101) OR ((IOE.CBE & IOD.CB) = 3'b101)
2F8h–2FFh	LPC	((IOE.CAE & IOD.CA) = 3'b001) OR ((IOE.CBE & IOD.CB) = 3'b001)
338h–33Fh	LPC	((IOE.CAE & IOD.CA) = 3'b110) OR ((IOE.CBE & IOD.CB) = 3'b110)
370h–375h	LPC	(IOE.FDE & IOD.FDD) = 1
377h	LPC	(IOE.FDE & IOD.FDD) = 1
378h–37Fh	LPC	(IOE.PPE & IOD.LPT) = 2'b00
3BCh–3BEh	LPC	(IOE.PPE & IOD.LPT) = 2'b10
3E8h–3EFh	LPC	((IOE.CAE & IOD.CA) = 3'b111) OR ((IOE.CBE & IOD.CB) = 3'b111)
3F0h–3F5h	LPC	(IOE.FDE & IOD.FDD) = 0
3F7h–3F7h	LPC	(IOE.FDE & IOD.FDD) = 0
3F8h–3FFh	LPC	((IOE.CAE & IOD.CA) = 3'b000) OR ((IOE.CBE & IOD.CB) = 3'b000)
4D0h–4D1h	LPC	N/A
678h–67Fh	LPC	(IOE.PPE & IOD.LPT) = 2'b01
778h–77Fh	LPC	(IOE.PPE & IOD.LPT) = 2'b00
7BCh–7BEh	LPC	(IOE.PPE & IOD.LPT) = 2'b10

The following table defines the Fixed I/O address ranges that are subtractively routed to the P2SB. Transactions that reach the P2SB are either terminated or forwarded on IOSF SB to the final destination. A hard strap informs the P2SB if LPC is enabled.

Table 2-34. Fixed I/O Address Map Subtractive Decode (Sheet 1 of 3)

CF9h	P2SB	ITSS (CPU I/F)

2.4.2 Variable I/O Ranges: Decode and Routing

Several PCI functions have I/O BARs (See Table 2-39, Funny I/O Address Ranges and Routing). The PCIe root ports have I/O Base and Limit ranges. Address decode for the standard PCI bars and bridge Base/Limit registers occurs in the IOSF fabric, except for VC0a agents on PSF0.

The Following table lists all of the non-standard legacy variable I/O address ranges along with the agent they target. These ranges are source decoded in the System Agent.

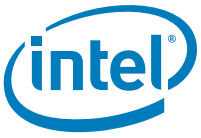

Table 2-35. Legacy Variable I/O Address Map

Range Name	Size (Bytes)	Target	Enable	Bar
LPC Generic 1	4 to 256	LPC	LGIR1[0]	LGIR1
LPC Generic 2	4 to 256	LPC	LGIR2[0]	LGIR2
LPC Generic 3	4 to 256	LPC	LGIR3[0]	LGIR3
LPC Generic 4	4 to 256	LPC	LGIR4[0]	LGIR4

2.4.2.1 Integrated Graphics Device (IGD)

Note: the IGD BARs are not restricted to Low MMIO space and could be programmed in High MMIO space.

Note: The Integrated graphics device has two Host Memory Space BARs. These are standard PCI BARs.

- Address decode to the IGD I/O BARs are valid if the Integrated Graphics device is enabled and system software has enabled the I/O Access to the device:
- IGDEnabled:
  (0.0.0.PCI.DEVEN.D2F0EN = 1)
  AND (0.2.0.PCI.PMCSR.PSRSTAT = 2'b00)
  AND (0.2.0.PCI.PCICMD2.IOE = 1)

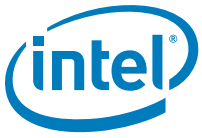
Security	No Restrictions.

2.5 PCI Config Space

PCI Config space is used to access both PCI devices inside the SoC and PCI/PCIe devices outside the SoC connected to the PCIe hierarchy. This space is only accessible from the CPU. Software has two mechanisms for accessing this space: (1) standard CF8/CFC "I/O" ports; (2) PCI Enhanced Configuration. The CPU traps CF8/CFC accesses in uCode and converts them to Funny I/O transactions. PCI Enhanced Configuration accesses appear within the Extended Configuration range as defined by the PCIEXBAR register. The system agent converts both of these types of transactions into IOSF transactions that target the PCI config space.

All SoC internal devices are on PCI bus #0. The list of all integrated PCI functions is in Section 2.8, "PCI Devices". For more information on the PCI configuration space refer to the PCI 3.0 specification and the PCIe 3.0 specification.



2.5.1 Configuration Mechanisms

The CPU is the originator of configuration cycles. The configuration cycles will be translated to PCI Config cycles before being sent on PSF fabric to configure different PCI devices or a transaction on IOSF-SB fabric to update the register.

Note: All configuration registers are expected to be mapped on IOSF-SB fabric.

2.5.1.1 Standard PCI Configuration Mechanism

The following is the mechanism for software to generate configuration cycles using a Address/Data pair in I/O space: CF8h (CONFIG_ADDRESS) and CFCh (CONFIG_DATA).

A 4 B (DW) I/O write cycle places a value into CONFIG_ADDRESS that specifies the PCI bus, the Device on that bus, the Function within the Device, and a offset to the configuration register of the Function being accessed. CONFIG_ADDRESS[31] must be '1' to enable a configuration cycle. CONFIG_DATA then becomes a window into the four bytes of configuration space specified by the contents of CONFIG_ADDRESS. Any read or write to CONFIG_DATA will result in a Funny I/O transaction that is converted by the system agent into a PCI configuration transaction.

Note: This mechanism is limited to accessing the first 256 B of configuration space.

The format of the address is as follows:

Table 2-37. PCI Config PORT CF8 Mapping

Field	I/O CF8h CONFIG_ADDRESS Bits	IDI Funny I/O bit location	IOSF CMD Header Bits
Bus Number	23:16	27:20	Byte 8 [7:0]
Device Number	15:11	19:15	Byte 9 [7:3]
Function Number	10:08	14:12	Byte 9 [2:0]
Register Number	07:02	07:02	Byte 11 [7:2]

Bit 31 of offset CF8h must be set for a configuration cycle to be generated.

2.5.1.2 PCI Express Enhanced Configuration Mechanism

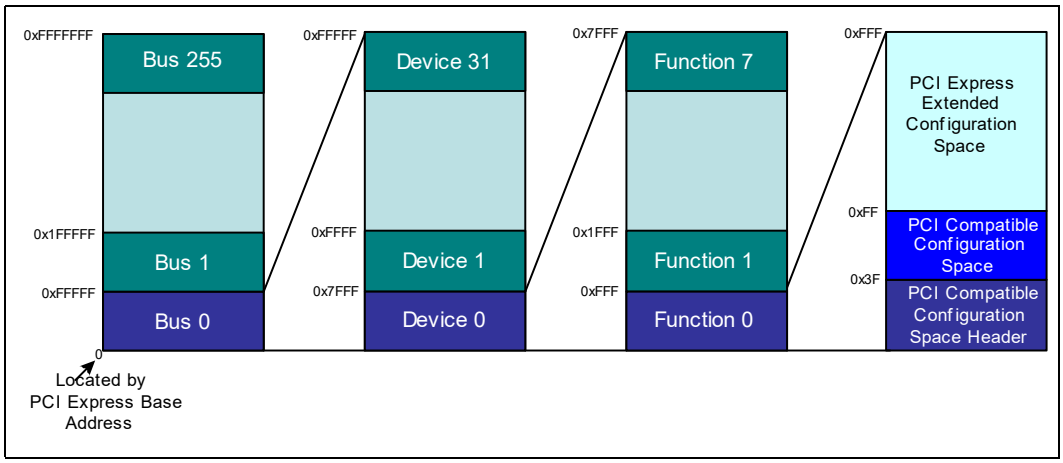
PCI Express extends the configuration space to 4096 B per device/function as compared to 256 B allowed by PCI Specification Revision 3.0. PCI Express configuration space is divided into a PCI 3.0 compatible region, which consists of the first 256 B of a logical device's configuration space and a PCI Express extended region which consists of the remaining configuration space.

The PCI-compatible region can be accessed using either the Standard PCI Configuration Mechanism or using the PCI Express Enhanced Configuration Mechanism described in this section. The extended configuration registers may only be accessed using the PCI Express Enhanced Configuration Mechanism. To maintain compatibility with PCI configuration addressing mechanisms, system software must access the extended configuration space using 32 b data operations (32 b aligned) only. These 32 b operations include byte enables allowing only appropriate bytes within the DWORD to be accessed. Locked transactions to the PCI Express memory mapped configuration address space are not supported. All changes made using either access mechanism are equivalent.

The PCI Express Enhanced Configuration Mechanism utilizes a flat memory-mapped address space to access device configuration registers. This address space is reported by the system firmware to the operating system.

The PCI Express Configuration Transaction Header includes an additional 4 b (ExtendedRegisterAddress[3:0]) between the Function Number and Register Address fields to provide indexing into the 4 KiB of configuration space allocated to each potential device. For PCI Compatible Configuration Requests, the Extended Register Address field must be all '0's.

Figure 2-3. Memory Map to PCI Express Device Configuration Space



Just the same as with PCI devices, each device is selected based on decoded address information that is provided as a part of the address portion of Configuration Request packets. A PCI Express device will decode all address information fields (bus, device, function and extended address numbers) to provide access to the correct register.

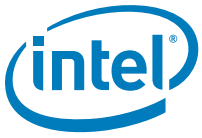
A flat 256 MiB Host Memory Address Space window into Enhanced Configuration Space is defined using the BUNIT.PCIEXBAR. This registers contains a 12 b base address which is compared against bits 39:28 of the incoming memory address. If these 12 b match the cycle is turned into a configuration cycle with the following fields:

Table 2-38. PCI Config Memory Bar Mapping

Field	Host Memory Space address	IDI Memory Cycle Bit location	IOSF CMD Header Bits
Bus Number [7:0]	27:20	27:20	Byte 8 [7:0]
Device Number [4:0]	19:15	19:15	Byte 9 [7:3]
Function Number [2:0]	14:12	14:12	Byte 9 [2:0]
Register Number [9:0]	11:2	11:2	Reg[9:6] ⇒ Byte 10 [3:0] Reg[5:0] ⇒ Byte 11 [7:2]

To access this space (steps 1, 2, and 3 are done only once by IAFW),

1. Use the PCI compatible configuration mechanism to enable the PCI Express enhanced configuration mechanism by writing '1' to bit 0 of BUNIT.PCIEXBAR registers.



2. Use the PCI compatible configuration mechanism to write an appropriate PCI Express base address into BUNIT.PCIEXBAR registers
3. Calculate the host address of the register you wish to set using

host address=(PCI Express base
+ (1 MiB× bus number)
+ (32 KiB× device number)
+ (4 KiB× function number)
+ (1 B× offset within the function))

4. Use a memory write or memory read cycle to the calculated host address to write or read that register.

2.5.1.3 Type 0/Type 1 Configuration

If the Bus Number is zero, the SoC will generate a Type 0 Configuration Cycle on IOSF. If the Bus Number is non-zero, the SoC will generate a Type 1 Configuration Cycle on IOSF.

2.5.2 ACPI Mode

Some devices/functions are not intended to be enumerated/configurable by the OS—they consume memory space, but this is not under the control of the OS. This may be for security reasons, if there is no driver for the function, or if the function is specifically for IAFW. For normal PCI functions, the PSF implements a PCI Configuration Object, which is the set of PCI Config registers that it shadows so that it can perform fabric decode and routing of transactions. For ACPI functions, the PSF implements either a Hybrid or Fixed ACPI Configuration Object. A summary is given below.

2.5.2.1 Hybrid ACPI Configuration Object

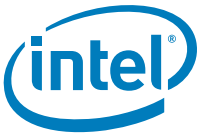
Each Hybrid ACPI configuration object has a config header disable bit associated with it. When this bit is set the PCI configuration object becomes a hybrid ACPI configuration object. The PSF fabric stops routing PCI configuration cycles to the associated function, and stops updating the shadow registers of the configuration object. The hybrid ACPI shadow registers will be compared to for Fabric decode. The configuration object remains accessible and update able via IOSF SB.

To use a device as an ACPI device, IAFW would first configure the device and then set the cfgDis bit. IAFW then informs the OS via the ACPI tables about the system resources (e.g. memory range) that have been assigned to the function.

Functions that are switchable between host and CSE root spaces use hybrid ACPI objects to allow their configuration space to be hidden while set to CSE root space, for security.

2.5.2.2 Fixed ACPI Configuration Object

A Fixed (or Native) ACPI configuration object has the same structure as a PCI configuration object, except almost all the values are set as compile-time constants. The funDis, barDis, and ROMbarDis bits are the only control fields implemented, to disable the function or BARs. The BAR and other PCI configuration settings are immutable.



Native ACPI objects are used for security (no configuration cycles accepted) and for completion routing-by-ID without BARs (also known as a ghost BDF).

2.5.2.3 IOSF2OCP Bridge ACPI Mode

The IOSF2OCP Bridge allows the PCI functions that it implements to be put into an ACPI mode. In this mode of operation, PCI config accesses to the function return a UR completion. A control bit in the private configuration space (PCICFGCTRL[{1 to 32}].PCI_CFG_DIS) disables PCI configuration accesses in the Bridge. The values programmed in the PCI Configuration registers are still valid. The Bridge uses these registers (for example BAR, MSE, D3, and BME) to determine how to handle memory accesses.

An additional BAR1 register is present in the PCI configuration space of the Bridge, for each function, specifically to provide access to the PCI Config registers when the function is in ACPI mode. Memory accesses to BAR1 access the PCI configuration space of the corresponding function; that is BAR1 is an alias to the PCI configuration space. The address decode for BAR1 ignores the MSE and D3 device states in the PCI configuration space.

Note: MMIO transaction are posted and PCI configuration accesses are non-posted. A read must always be performed following BAR1 access to ensure the Bridge observes the BAR1 write access. Only 4 B (1 DW) BAR1 downstream accesses are supported. BAR1 memory accesses, which fall outside the standard PCI configuration registers, are treated as accesses to reserved registers.

Refer to the latest version of the IOSF2OCP Bridge EAD for further details.

2.6 Funny I/O Space

Both uCode and the IGD can issue transactions on IDI targeting the Funny I/O space. Any I/O transaction with an address beyond 64 KiB + 3 is a Funny I/O transaction. There are three targets for Funny I/O transactions in the SoC: the IGD, the C-unit, and the SoC cores.

The IGD uses Funny I/O to communicate internally between the GT logic on IDI and the Display logic on IOSF. In addition there is a 32 KiB window within the GT Funny I/O range that aliases to MCHBAR providing read only access for GT to MCHBAR registers. (Read only access is enforced by SAI checks in the B-Unit).

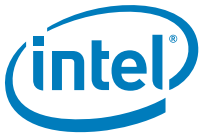
The SoC cores use Funny I/O to access PCI configuration registers (see Section 2.5, "PCI Config Space" for more details on funny I/O access to PCI config space.) In addition there is a set of uncore Configuration Registers (CRs) that are accessed by funny I/O. Uncore CRs can be accessed by uCode. In addition some of the CRs are exposed to software as MSRs.

The SoC cores can send LT doorbell transactions to other cores using Funny I/O. These Funny I/O transactions route between cores on IDI through the system agent.

2.6.1 RAVDMs

GT to CSE VDM flow is as follows:

1. GT issues Funny I/O transaction
2. B-Unit routes to A-Unit



3. A-Unit converts to RAVDM and sends to PSF1 for decode
4. PSF1 routes by ID to CSE
5. VDM "Target ID" should use the HECI1 B/D/F

GT will target the PAVP VDM range of the GTTMMADR. GT will only send posted RAVDM writes with RSP = 0 for the PAVP flow. GT RAVDMs that are writes are forwarded to CSE. Reads to the PAVP region get routed normally to display.

There are no display → CSE RAVDMs.

2.6.2 Funny IO Address Ranges

Table 2-39, Funny I/O Address Ranges and Routing below provides the address ranges and how they are routed in the system.

Table 2-39. Funny I/O Address Ranges and Routing

Range	Usage	Routing
0x2000_0000 to 0x2013_FFFF	GT Funny I/O	Route to Display: NOTE writes to 0x2012_8000 to 0x2012_FFFFh are routed to display as RAVDMs.
0x2014_0000 to 0x2014_7FFF	GT Funny I/O: MCH BAR alias (Read only)	Route to C-unit
0x2014_8000 to 0x201F_FFFF	GT Funny I/O	Route to Display
0x4000_0000 to 0x40FF_FFFF	CR access	Route to C-unit
0x8000_0000 to 0x8FFF_FFFF	PCI Config Space access	Convert to IOSF CFG transaction in SA and route by B/D/F
0xFED0_0000 to 0xFEDF_FFFF	LT Doorbells	IDI to SA to IDI—doesn't travel to A-Unit

2.7 IOSF-SB Private CR Space

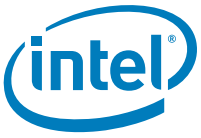
IOSF-SB message space is used to access registers mapped on IOSF-SB. These registers include uncore CRs, and chipset specific registers. The Private CR space is accessed on IOSF SB using the CRRd and CRWr opcodes. Each Destination ID can have up to 48 b of Byte addressable private register space.

An uncore CR is a configuration register that is accessible either by uCode or by IA code through the MSR read/write instruction. Uncore CRs are accessed through Funny I/O and mapped onto IOSF SB in the C-unit.

Chipset specific registers are accessed through a memory BAR in the P2S Bridge function. Many I/O controllers and most of the Analog PHYs contain Chipset specific registers for IAFW configuration. Historically these were mapped behind the SoC "RCBA" or Root Complex Base Address register.

Access to IOSF-SB by the Host or System Agent is possible over PSF via the Primary to Sideband Bridge (P2SB). P2SB will forward properly formatted register access requests as CRRd and CRWr requests via IOSF-SB. The P2SB also provides a mask that can be used to restrict access to certain endpoints.

P2SB offers two access methods for Primary to Sideband message generation:



- Sideband register access via MMIO (SBREG_BAR interface); limited to 16-bit addressing
- Sideband Message Interface (required for 48 b addressing beyond 64 KiB)

PSF CR space can be accessed using the simpler MMIO BAR interface. A single MRd64/MWr64 to the P2SB BAR causes a CRRd/Wr message to be sent via IOSF-SB.

Table 2-40. P2SB MMIO Register Interface

Addr[63:24]	Addr[23:16]	Addr[15:2]	Addr[1:0]
BAR	Target Port ID	Register offset	2'b00

As seen in Table 2-40, P2SB MMIO Register Interface, the memory address contains the BAR, destination port ID, and register offset. Using MMIO, all Sideband messages sent are non-posted and will back pressure on PSF. Writes are pipelined; whereas reads are serialized.

The Funny I/O access mechanism and the MMIO access mechanism both provide paths to the same registers on IOSF SB. However, Uncore CRs and MSRs must be protected from access by un-privileged code. SAI enforcement at the target is used for this.

2.8 PCI Devices

The PCI Configuration Matrix tables (linked) provide the Device and Function number assignment for all internal devices. In addition it specifies the number and size of the BARs for each Function. Address decoding for devices 0 (function 0 only), 2, and 3 are performed by B-Unit. All other device functions are address decoded by PSF.

Note: Functions that are implemented in an IOSF2OCP Bridge have a 4 KiB 64 b BAR1 that aliases to PCI Config space for the corresponding function. This is to provide access to the PCI Config registers when the function is in ACPI mode. Refer to the latest version of the IOSF2OCP Bridge EAD for details.

2.9 System Memory Protection

The SoC security mechanism is designed to provide access control for data stored in DRAM. Security checks happen in the Host Memory Address Space, but only for request on the way to DRAM rather than devices/MMIO.

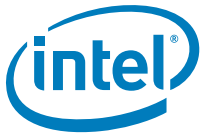
It is important for both security and coherency checking that there are no aliasing cases in either Host Memory Address Space or System DRAM Address Space for request targeting DRAM. This means that SoC must not allow accesses to two different addresses to retrieve data from the same location in DRAM.

To ensure no aliasing, certain rules must be followed.

2.9.1 PMR-L and PMR-H

Bunit will implement PMR protection for the default VTd engine.

Display (and GT) will implement PMR protection for the Gfx VTd engine:



- GT has a copy of GfxVTd PMR. It will make sure that only VT-d walks are allowed to touch PMR and hence get onto IDI. Other transactions that hit PMR are killed before they get onto IDI.
- Display will add GfxVTd PMR. It will make sure that only VTd walks are allowed to go to PMR range and all other transactions will be killed before they get onto IOSF primary.

Software is required to program PMR_def and PMR_gfx as the same but they may be different during the initial setup period.

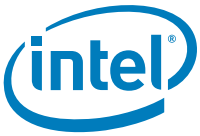
2.9.2 B-Unit Isolated Memory Regions (IMRs)

Isolated memory regions provide a mechanism to add SAI checks to certain regions of memory.

2.9.3 Summary of SoC Lock Bits

The preferred mechanism of locking registers is to use SAI policy registers. However there are many IP which do have lock bits in the SoC. The recommendation is to not add any new lock bits, but instead use SAI policy registers.

§ §



3 CSE Root Space

3.1 CSE Memory Address Space

The SoC implements a 64 b CSE Memory Address space. Internal to the CSE the minute IA subsystem uses a 32 b physical address. At the CSE Gasket a set of programmable Address Translation Tables (ATT) allow the CSE minute IA and internal DMA engines to access the full 64 b CSE Memory space of the SoC. This section describes the address space and routing outside of the CSE.

Some portion of the CSE Memory Address Space references System DRAM. IMR regions are used to divide the DRAM between the Host Memory Space and the CSE Memory Space.

VT-d does not apply in the CSE Memory Address space.

CSE Memory Address Space Decode and Routing

Transactions that originate inside the CSE are positively decoded against several possible ranges in the IOSF fabric. The downstream subtractive decode path from the CSE leads to System DRAM.

Transactions that originate outside of the CSE in the CSE root space are positively decoded against several possible ranges in the IOSF fabric. The upstream subtractive decode path from agents outside the CSE leads to the CSE. Transactions from devices outside the CSE that access System DRAM in the CSE Memory Address Space are considered Peer to Peer transactions and must be positively decoded.

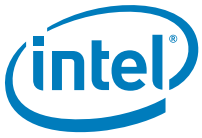
3.1.1 SoC System Agent Decode and Routing

Any transaction in the CSE root space that arrives at the A-Unit and does not positively decode to a Peer target will be forwarded to the B-Unit. Within the B-Unit the Address is checked against the IMRs and stolen memory ranges (TSEG SMM and Graphics Stolen Memory). If the IMRs allow access the transaction is converted to a System DRAM Address Space and sent to DRAM. Otherwise the transaction is aborted.

IMRs in the system agent are applied to both Host Memory address space and CSE Memory Address space. Depending on how the IMRs are programmed the Host Memory Space and the CSE Memory Space may be completely non-overlapping, or there may be IMR regions that create an alias where both Host Memory Space and CSE Memory Space reference the same System DRAM Address.

3.1.2 Abort Handling

The term abort is used in this document to handle a few different error handling mechanisms.



3.1.2.1 B-Unit Abort Handling

Non-posted Transactions that are aborted in the B-Unit will have a completion returned to the originator with bogus data. Posted transactions that are aborted in the B-Unit are dropped without altering the contents of system memory. Depending on the reason for the abort, the B-Unit will follow different error logging behaviors.

3.1.2.2 IOSF Abort Handling

Transactions routed to IOSF will either positively decode or be routed to the B-Unit. There are no cases where the IOSF fabric will abort a CSE memory space transaction.

The IOSF fabric will perform error handling for CSE space configuration cycles see Section 2.5, "PCI Config Space".

3.1.3 Fixed Positive Decode Ranges

The following table defines the fixed address ranges in the CSE Memory Address Space. The IOSF fabric is configured to route these ranges to the correct destination.

IOSF target	Range	Notes
PMC (Shared SRAM)	0x8000_0000_FF06_C000 to 0x8000_0000_FF06_FFFF	Writes and reads to this range.
LPSS (secure I/O)	0x8000_0000_FF00_6000 to 0x8000_0000_FF00_6FFF	Writes and reads to this range.
LPSS (secure I/O)	0x8000_0000_FF00_7000 to 0x8000_0000_FF00_7FFF	Writes and reads to this range.

3.1.4 Programmable Positive Decode Ranges

3.1.4.1 Dedicated PCI Functions

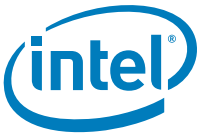
A PCI function that is always present in the CSE root space is a dedicated function. There are two dedicated functions in the SoC: Audio and the SPI controller. The CSE Programs the BARs of the dedicated function using PCI configuration cycles.

3.1.4.2 Switchable PCI Functions

Several of the PCI functions in the SoC are configurable to be in either the Host Root Space or the CSE Root Space. These functions are never in both spaces at the same time. These functions include the USB-Device controller, the PMC, the 15 functions in the LPSS, and the four functions in the SCS.

When the device is switched into the CSE Root Space, the CSE programs the BARs of the device to set the address range the device will respond to in the CSE Memory Address Space.

Switchable functions will have the same Device and Function number in both CSE Root Space and the Host Root Space. See Section 2.8, "PCI Devices" for the Device and Function number assignments.



3.1.4.3 DRAM as Peer Address Ranges

To enable routing of transactions from outside the CSE to System DRAM the IOSF fabric implements a hybrid ACPI configuration object. This is a set of registers inside the IOSF fabric that match the definition of a standard PCI type0 header. They are programmed over IOSF SB by the CSE. The BARs must be programmed by the system to route transactions to the IMR regions that are accessed in the CSE root space by peer agents.

To simplify IMR region sizing in the fabric, two large 256 MiB sized BARs are created in one hybrid ACPI object associated with ISH in PSF3. The actual IMRs will be assigned by CSE within the 256 MiB BAR region (or 512 MiB if combined). Upstream requests to the IMRs will be within the region covered by the BARs.

The following is the list of peer agents that require access to System DRAM in the CSE root space. The decode mode, either address (italicized to differentiate) or source, is listed for requests and completions. Address decoding is provided by the IOSF fabric and indicated by italics, whereas source decoding is provided by either B-Unit or the IP.

- I-Unit — Requests: source decode, Completions: source decode
- Audio — Requests: source decode, *Completions: address decode*
- ISH — *Requests: address decode, Completions: address decode*
- PMC — *Requests: address decode, Completions: address decode*

The IMR completions are routed back downstream to the requester by ID (BDF). A hybrid ACPI object in the IOSF fabric is associated with Audio, PMC, and ISH to route completions. Note that the ISH hybrid ACPI object serves dual purpose by providing the IMR region BARs and the ISH BDF for ISH IMR completions.

3.2 System DRAM Address Space

The physical CSE Memory Address is converted to a System DRAM address in the exact same way as a Host Memory Address. See Section 2.2, "System DRAM Address Space".

3.3 I/O Space

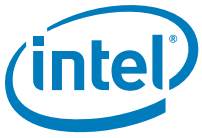
There are no resources mapped into I/O Space in the CSE root space outside of the CSE.

3.4 PCI Config Space

The CSE only accesses root complex integrated functions. By convention devices 0 to 8 will be inside the CSE itself, and devices 9 to 31 are available for use outside of the CSE. All CSE functions are on PCI bus #0.

It is possible for the CSE subsystem to generate type1 configuration transactions onto the IOSF fabric. There is no use case for this in the SoC, but it could occur. These will subtractively decode to the A-Unit and should be properly aborted.

It is possible for the CSE subsystem to generate Type 0 configuration transactions onto the IOSF fabric that will not positively decode. There is no use case for this in the SoC, bit it could occur. These will subtractively decode to the A-Unit and should be properly aborted.



3.5 IOSF-SB Private CR Space

The CSE can access IOSF-SB Private CR space from an SB ATT window in the Gasket. The IOSF-SB Private CR space is the same in CSE root space and Host root space. SAI protections are used where necessary to restrict access.

3.6 PCI Devices

The following PCI Devices are always available in the CSE root space.

Please note that some unnecessary device address resources exist in the PSF configuration because removal was not possible with schedule constraints. Specifically, PSF SPI defines an extra 16 MiB BAR for Huffman decompression, which will not be used and doesn't affect the address map.

PCI Configuration Matrix:

Table 3-1. PCI Configuration Matrix (Sheet 1 of 2)

Logical Function	PSF Agent	Type	DID	Device	Function
SoC Base device ID			5A80		
Host Bridge	C-unit	PCI	0x5AF0	0	0
DPTF (Camarillo)	C-unit	PCI	0x5A8C	0	1

eMMC	SCS	PCI	0x5ACC	28	0
LPC	LPC	PCI	0x5AE8	31	0
SMBUS	SMBUS	PCI	0x5AD4	31	1

For the switchable PCI devices see Section 2.8, "PCI Devices" for device/function assignments and BAR information. The following PCI devices are switchable: USB-Device, I2C0 to I2C7, UART0 to UART2, SPI0 to SPI2, SD Card, eMMC.

§ §

4 Register Access Methods

There are five common register access methods:

- I/O-Space Register Access Methods

1. Fixed I/O Register Access (both Regular I/O and Funny I/O accesses)
2. Variable I/O (I/O-Referenced) Register Access
3. PCI Configuration Register Access (Indirect—via Memory or I/O Registers)

- Memory-Space (Memory Mapped I/O, MMIO) Register Access Methods

4. Fixed Memory-Mapped Register Access
5. Variable Memory (Memory-Referenced) Register Access

For details on the address ranges supported by these register access methods, see the Address Map chapter.

Note: MCHBAR MMIO space has been adopted to replace the Message Bus Register Access functionality provided in previous devices. This change has been made to improve convergence between client and SoC devices as well as to resolve outstanding issues relating to interrupts, security, and VT-d support.

4.1 I/O-Space Register Access Methods

4.1.1 Fixed I/O Register Access

Fixed I/O registers are accessed by specifying their address in a PORT IN or PORT OUT transaction from the CPU core. This allows direct manipulation of the registers. Fixed I/O registers are unmovable register in I/O space. There are two categories of Fixed I/O registers:

Regular I/O registers—registers whose addresses fit within 16 b (0x0000 to 0xFFFF)

Funny I/O registers—registers whose addresses are above 2^16 + 3 (0x10004 and up)

Regular I/O registers are visible to all agents capable of making I/O accesses; Funny I/O registers are limited to SoC IA core uCode and the GEN9 Display (IGD) for internal communications within the SoC.

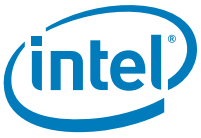
Table 4-1. Fixed I/O Register Access Method Example (P80 Register)

Type: I/O Register (Size: 32 b)	P80: 80h

Note: Funny I/O register accesses may be 64 b.

4.1.2 Variable I/O (I/O-Referenced) Register Access

Variable I/O (I/O-referenced) registers use programmable base address registers (BARs) to select the base I/O address for a range of I/O addresses. The I/O BARs act as pointers to blocks of actual I/O registers; other than the variable starting address for Variable I/O registers, accessing these registers is the same as for Fixed I/O registers.



To access an I/O-referenced register for a specific I/O base address, start with that base address and add the register's offset. Example pseudo code for an I/O-referenced register read is as follows:

```
Register_Snapshot= IOREAD([IO_BAR] + Register_Offset)
```

Base-address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other base-address register types may include fixed memory registers, fixed I/O registers or message-bus registers.

Table 4-2. Referenced I/O Register Access Method Example (HSTS Register)

Type: I/O Register (Size: 8 b)	HSTS: [_IOBAR] + 0h _IOBAR Type: PCI Configuration Register (Size: 32 b) _IOBAR Reference: [B:0, D:31, F:3] + 20h

4.1.3 PCI Configuration Register Access

Access to PCI configuration space registers is performed through one of two different configuration access methods (CAMs):

- I/O-indexed—PCI CAM
- Memory-mapped—PCI Enhanced CAM (ECAM)

Each PCI function has a standard PCI header consisting of 256 B for the I/O-access scheme (CAM), or 4096 B for the enhanced memory-access method (ECAM). Invalid read accesses return binary strings with all bits set to '1'.

Table 4-3. PCI Register Access Method Example (VID Register)

Type: PCI Configuration Register (Size: 16 b)	VID: [B:0, D:31, F:3] + 0h

4.1.3.1 PCI Configuration Access—CAM: I/O Indexed Scheme

Accesses to configuration space using the I/O method relies on two 32 b I/O registers:

- CONFIG_ADDRESS—I/O Port CF8h
- CONFIG_DATA—I/O Port CFCh

These two registers are both 32 b registers in I/O space. Using this indirect access mode, software uses CONFIG_ADDRESS (CF8h) as an index register, indicating which configuration-space register to access, and CONFIG_DATA (CFCh) acts as a window to the register pointed to in CONFIG_ADDRESS. Accesses to CONFIG_ADDRESS (CF8h) are internally captured. Upon a read or write access to CONFIG_DATA (CFCh), configuration cycles will be generated to the PCI function specified by the address captured in CONFIG_ADDRESS. The format of the address is shown in Table 4-1, Fixed I/O Register Access Method Example (P80 Register).

Table 4-4. PCI CONFIG_ADDRESS Register (I/O PORT CF8h) Mapping

Field	CONFIG_ADDRESS Bits
Enable PCI Configuration Space Mapping	31
Reserved	30:24
Bus Number	23:16
Device Number	15:11

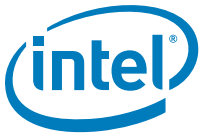


Table 4-4. PCI CONFIG_ADDRESS Register (I/O PORT CF8h) Mapping

Field	CONFIG_ADDRESS Bits
Function Number	10:08
Register/Offset Number	07:02
Note: Bit 31 of CONFIG_ADDRESS must be set for a configuration cycle to be generated.	

Pseudo code for a PCI register read is as follows:

```
Register_Snapshot= MEMREAD([Mem_BAR] + Register_Offset)

MyCfgAddr[23:16]= bus

MyCfgAddr[15:11]= device

MyCfgAddr[10:8]= funct

MyCfgAddr[7:2]= dWordMask(offset)

MyCfgAddr[31]= 1

IOWRITE(0xCF8, MyCfgAddr)

Register_Snapshot= IOREAD(0xCFC)
```

4.1.3.2 PCI Configuration Access—ECAM: Memory Mapped Scheme

A flat, 256 MiB memory space may also be allocated to perform configuration transactions. This is enabled through the BUNIT.BECREG message bus register (Port: 3h, Register: 27h) found in the SoC. BUNIT.BECREG allows remapping this 256 MiB region anywhere in physical memory space. Memory accesses within the programmed MMIO range result in configuration cycles to the appropriate PCI devices specified by the memory address as shown in Table 4-4, PCI CONFIG_ADDRESS Register (I/O PORT CF8h) Mapping.

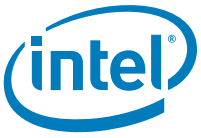
ECAM Memory Address Field	ECAM Memory Address Bits
Use from BAR: BUNIT.BECREG[31:28]	31:28
Bus Number	27:20
Device Number	19:15
Function Number	14:12
Register Number	11:02

ECAM Memory Address Field	ECAM Memory Address Bits
Use from BAR: BUNIT.BECREG[31:28]	31:28
Bus Number	27:20
Device Number	19:15
Function Number	14:12
Register Number	11:02

Note: ECAM accesses are only possible when BUNIT.BECREG.ECENABLE (bit 0) is set.

Pseudo code for an enhanced PCI configuration register read is as follows:

```
MyCfgAddr[27:20]= bus
```



```
MyCfgAddr[19:15]= device

MyCfgAddr[14:12]= funct

MyCfgAddr[11:2]= dw_offset

MyCfgAddr[31:28]= BECREG[31:28]

Register_Snapshot= MEMREAD(MyCfgAddr)
```

4.2 Memory-Space Register Access Methods

4.2.1 Fixed Memory-Mapped Register Access

Fixed Memory-Mapped I/O (MMIO) registers are accessed by specifying their 32 b/39 b address in a memory transaction from the CPU core. This allows direct manipulation of the registers. Fixed MMIO registers are unmovable registers in memory space.

Table 4-5. Fixed Memory-Mapped Register Access Method Example (IDX Register)

Type: Memory-Mapped I/O Register (Size: 32 b)	IDX: FEC00000h

4.2.2 Variable Memory (Memory-Referenced) Register Access

The SoC uses programmable base address registers (BARs) to set a range of physical address (memory) locations that it will use to decode memory reads and writes from the CPU to directly access a register. These BARs act as pointers to blocks of actual memory-mapped I/O (MMIO) registers. To access a memory-referenced register for a specific base address, start with that base address and add the register's offset. Example pseudo code for a read is shown below:

```
Register_Snapshot= MEMREAD([Mem_BAR] + Register_Offset)
```

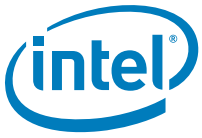
Base-address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other common base address register types include fixed memory registers and I/O registers that point to MMIO register blocks.

Table 4-6. Memory-Mapped Register Access Method Example (_MBAR Register)

Type: Memory-Mapped I/O Register (Size: 8 b)	_MBAR Type: PCI Configuration Register (Size: 32 b) _MBAR Reference: [B:0, D:31, F:3] + 10h

4.3 Register Field Access Types

Access Type	Comments
RO	**Read-Only**
RO/C	Read-Only Clear on Read, loaded by HW
RO/Strap	Read-Only Strap
RO/V	**Read-Only Variable**
RO/V/P	**Read-Only Variable Sticky**



Access Type	Comments
RW	**Read-Write**
RW/L	**Read-Write Lock**
RW/1C	**Read-Write 1 to Clear (set by hardware, cleared by FW)**
RW/1C/HC	Read-Write 1 to Clear with Hardware Clear (set by hardware, cleared by FW or HW)
RW/1C/HC/L	Read-Write 1 to Clear with Hardware clear Lock
RW/1C/L	Read-Write 1 to Clear Lock
RW/1C/P	**Read-Write 1 to Clear Sticky (set by hardware, cleared by FW)**
RW/1C/P/L	Read-Write 1 to Clear Sticky Lock
RW/1S	**Read-Write 1 to Set, cannot be cleared**
RW/1S/HC	Read-Write 1 to Set with Hardware clear (set by FW, cleared by HW)
RW/1S/HC/L	Read-Write 1 to Set with Hardware Clear, Lock
RW/1S/1C/HC	Read-Write 1 to Set, write 1 to clear with hardware clear
RW/1S/1C/HC/L	Read-Write 1 to Set, write 1 to clear with hardware clear, Lock
RW/HC	Read-Write with Hardware Clear
RW/O	**Read-Write Once**
RW/O/L	Read-Write Once Lock
RW/O/P	Read-Write Once Sticky
RW/P	**Read-Write Sticky**
RW/P/L	Read-Write Sticky Lock
RW/P/Strap	Read-Write Sticky Strap
RW/Strap	Read-Write Strap
RW/V	**Read-Write Variable**
RW/V/L	**Read-Write Variable Lock**
WO	**Write-Only**
WO/L	Write-Only Lock

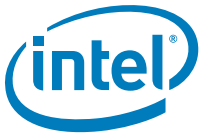
Table 4-7. Access Type Explanations

Base Access Type	Description
RO	Read Only: Writes to this register do not affect the register value. Reads return either a constant or variable device state.
RW	Read Write: Writes to this register setting alter the register value with the value written. Reads return the value of the register.
WO	Write Only: Writes to this register alters the register value. Original—Reads always return 0; revised—RTL will read reset, Saola mask read value, later Saola may change to check

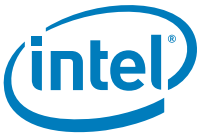
Table 4-8. Attributes/Modifiers are Applied to Base Access Types to Describe HW Interaction or Other Details

Attribute	Applicable Base Access Type	Description
/C	RO	Clear on Read: A read to the register will clear on a read to the register. Implies that HW modifies the register value.
/V	RO, RW	Variable: The read status is variable (not constant), and if the register is writable, reads do not return the write value, but return values that are dependant on other device or component state or other registers.
/P	RO, RW	PWROK: Reset only by loss of power (!PWROK). Also referred to as Sticky. The actual PWROK signal that is used as a reset depends on the power well the register is implemented in.
/L	RW, WO	Lock: Prior to the Lock bit being set (in a separate register), writes to the register load the register with the value written. Reads return the value of the register. This register is not writable once the lock bit is set. Reads to a locked register return the contents of the register. The Lock Bit itself typically has a /L attribute modifier and in some (rare) cases the Lock Bit could also have a /P modifier.
/1C	RW	Read Write 1 to Clear: Register that is set to '1' by hardware, and cleared to '0' by software writing a '1' to the register. Software writes of 0 have no effect.
/1S	RW	Read Write 1 to Set: Register that is set to '1' by software writing a '1' to the register. Software writes to 0 have no effect.
/HC	RW	Hardware Clear: Register that is cleared to '0' by hardware.
/O	RW	Write Once: This register may be written to any value once. After that, the register is Read Only.

Base Access	Attribute	HW Access	SW Access	Other
Type				
RO		none	readable, constant value	
RO	/C	loadable	readable, cleared on a read	
RO	/V	loadable	readable	
RO	/V/P	loadable	readable	reset by PWROK
RW		none	readable	
			writeable	
RW	/1C	settable	readable writeable (1 to clear, 0 has no effect)	intended to be single-bit field
RW	/1C/HC	settable clearable	readable writeable (1 to clear, 0 has no effect)	intended to be single-bit field
RW	/1C/HC/L	settable clearable	readable writeable when not locked (1 to clear, 0 has no effect)	intended to be single-bit field
RW	/1C/L	settable	readable writeable when not locked (1 to clear, 0 has no effect)	intended to be single-bit field



Base Access	Attribute	HW Access	SW Access	Other
RW	/1C/P	settable	readable writeable (1 to clear, 0 has no effect)	intended to be single-bit field reset by PWROK
RW	/1C/P/L	settable	readable writeable when not locked (1 to clear, 0 has no effect)	intended to be single-bit field reset by PWROK
RW	/1S	none	readable writeable (1 to set, 0 has no effect)	intended to be single-bit field
RW	/1S/1C/HC	settable clearable	readable writeable (1 to toggle, 0 has no effect)	intended to be single-bit field
RW	/1S/1C/HC/L	settable clearable	readable writeable when not locked (1 to toggle, 0 has no effect)	intended to be single-bit field
RW	/1S/HC	clearable	readable writeable (1 to set, 0 has no effect)	intended to be single-bit field
RW	/1S/HC/L	clearable	readable writeable when not locked (1 to set, 0 has no effect)	intended to be single-bit field
RW	/L	none	readable writeable when not locked	
RW	/O	none	readable writeable once (any value)	
RW	/O/L	none	readable writeable once when not locked (any value)	
RW	/O/P	none	readable writeable once when not locked (any value)	reset by PWROK
RW	/P	none	readable writeable	reset by PWROK
RW	/V	loadable	readable writeable	
RW	/V/L	loadable	readable writeable when not locked	For /V/L, Saola will have to behave the same as /V and will not lock since we cannot predicting the value
WO		none	reads return 0	



Base Access	Attribute	HW Access	SW Access	Other
			writeable	
WO	/L	none	reads return 0 writeable when not locked	

4.4 Alternate Access Mode

Although not a specific I/O register access mode, the ITSS implements a special Alternate Access mode to enable saving write-only (WO) registers during the state-save process. In this mode, subsequent reads to a fixed I/O register returns all of the ITSS WO-register values in sequence during state save; these values can then be written back to the appropriate registers during state restore.

5 MCHBAR

5.1 Registers Summary

Table 5-1. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
6000h	6007h	Security Control Policy (C_CR_SECURITY_CP_0_0_0_MCHBAR)—Offset 6000h	0h
6008h	600Fh	Security Read Access Control Policy (C_CR_SECURITY_RAC_0_0_0_MCHBAR)—Offset 6008h	C0061210202h
6010h	6017h	Security Write Access Control Policy (C_CR_SECURITY_WAC_0_0_0_MCHBAR)—Offset 6010h	C0061210202h
6018h	601Fh	BIOSWR Control Policy (C_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 6018h	C0061010202h
6020h	6027h	BIOSWR Read Access Control (C_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 6020h	80000C0063210217h
6028h	602Fh	BIOSWR Write Access Control (C_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 6028h	C00610C0212h
6030h	6037h	P_U_CODEWR_ALLRD Control Policy (C_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 6030h	40001000202h
6038h	603Fh	P_U_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 6038h	FFFFFFFFFFFFFFFFh
6040h	6047h	P_U_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 6040h	40001000202h
6050h	6057h	BIOS/PMC WR Control Policy (C_CR_BIOS_PMC_WR_CP_0_0_0_MCHBAR)—Offset 6050h	C0061210202h
6058h	605Fh	BIOS/PMC WR Read Access Control (C_CR_BIOS_PMC_WR_RAC_0_0_0_MCHBAR)—Offset 6058h	80000C0063210217h
6060h	6067h	BIOS/PMC WR Write Access Control (C_CR_BIOS_PMC_WR_WAC_0_0_0_MCHBAR)—Offset 6060h	C00612C0212h
6070h	6077h	P_U_PMC_CODEWR_ALLRD Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 6070h	40001200202h
6078h	607Fh	P_U_PMC_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 6078h	FFFFFFFFFFFFFFFFh
6080h	6087h	P_U_PMC_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 6080h	40001200202h
6C80h	6C87h	Default VTd Base Address Register (DEFVTDBAR_0_0_0_MCHBAR_C)—Offset 6C80h	0h
6C88h	6C8Fh	Graphics VTd Base Address Register (GFXVTDBAR_0_0_0_MCHBAR_C)—Offset 6C88h	0h
6B60h		Noncached Region Control (B_CR_BNOCACHECTL_0_0_0_MCHBAR)—Offset 6B60h	0h

5.1.1 Security Control Policy (C_CR_SECURITY_CP_0_0_0_MCHBAR)—Offset 6000h

Control policy register for the Security Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

5.1.2 Security Read Access Control Policy (C_CR_SECURITY_RAC_0_0_0_MCHBAR)—Offset 6008h

Read access control policy register for the Security Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061210202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210202h RO	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

5.1.3 Security Write Access Control Policy (C_CR_SECURITY_WAC_0_0_0_MCHBAR)—Offset 6010h

Write access control policy register for the Security Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061210202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210202h RO	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

5.1.4 BIOSWR Control Policy (C_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 6018h

Control policy register for the BIOS Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

5.1.5 BIOSWR Read Access Control (C_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 6020h

Read access control policy register for the BIOS Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 80000C0063210217h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063210217h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

5.1.6 BIOSWR Write Access Control (C_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 6028h

Write access control policy register for the BIOS Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C00610C0212h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C00610C0212h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

5.1.7 P_U_CODEWR_ALLRD Control Policy (C_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 6030h

Control policy register for the P-Code/U-Code Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

5.1.8 P_U_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 6038h

Read access control policy register for the P-Code/U-Code Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RO	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

5.1.9 P_U_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 6040h

Write access control policy register for the P-Code/U-Code Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000 202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

5.1.10 BIOS/PMC WR Control Policy (C_CR_BIOS_PMC_WR_CP_0_0_0_MCHBAR)—Offset 6050h

Control policy register for the BIOS/PMC Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061210202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210 202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

5.1.11 BIOS/PMC WR Read Access Control (C_CR_BIOS_PMC_WR_RAC_0_0_0_MCHBAR)—Offset 6058h

Read access control policy register for the BIOS/PMC Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 80000C0063210217h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063210217h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

5.1.12 BIOS/PMC WR Write Access Control (C_CR_BIOS_PMC_WR_WAC_0_0_0_MCHBAR)—Offset 6060h

Write access control policy register for the BIOS/PMC Write Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C00612C0212h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C00612C0212h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

5.1.13 P_U_PMC_CODEWR_ALLRD Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 6070h

Control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

5.1.14 P_U_PMC_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 6078h

Read access control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

5.1.15 P_U_PMC_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 6080h

Write access control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001200202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200202h RW	**Security Attribute of Initiator Permission Enable (sai):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

5.1.16 Default VTd Base Address Register (DEFVTDBAR_0_0_0_MCHBAR_C)—Offset 6C80h

This is the base address for the Default VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset the DEFVTd configuration space is disabled and must be enabled by writing a 1'b1 to DEFVTBAREN. BIOS programs this register after which the register cannot be altered. BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0h RO	**Reserved (RESERVED_1):** Reserved.
39	0h RO	**Default VTd Base Address Bit 40 (DEFVTDBAR_40_BIT):** Reserved for future growth to 40bit addressing in uServer. Will always be 1'b0 in the SoC.
38:12	0h RW	**Default VTd Base Address Register (DEFVTDBAR):** If DEFVTDBAR is enabled this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space. BIOS will program this register, resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the default VTd IOMMU register set. If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12], the request targets the Default VTd BAR.
11:2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	0h RW	**DEFVTDBAR Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: Locks the contents of the register, including itself.
0	0h RW/L	**Default VTd Base Address Range Enable (DEFVTDBAREN):** 0: DEFVTDBAR is disabled and does not claim any memory 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 1'b0 if VTd capability is disabled.

5.1.17 Graphics VTd Base Address Register (GFXVTDBAR_0_0_0_MCHBAR_C)—Offset 6C88h

This is the base address for the Graphics VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset the GFXVT configuration space is disabled and must be enabled by writing a 1 to GFXVTBAREN. BIOS programs this register, after which the register cannot be altered. BIOS must write GFXVTDBAR, immediately follow it up with read of DEVEN_0_0_0_PCI, and then write (with value from read operation) to DEVEN_0_0_0_PCI, to ensure that all copies of GFXVTDBAR in the system are updated.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:12	0h RW	**Graphics VT Base Address Register (GFXVTBAR):** This field corresponds to bits 39 to 12 of the base address GFXVT configuration space. BIOS will program this register, resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFXVT register set. All the Bits in this register are locked in LT mode.
11:2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	0h RW	**GFXVTDBAR Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: Locks the contents of the register, including itself.
0	0h RW/L	**Graphics VT Base Address Range Enable (GFXVTBAREN):** 0: GFXVTBAR is disabled and does not claim any memory. 1: GFXVTBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

5.1.18 Noncached Region Control (B_CR_BNOCACHECTL_0_0_0_MCHBAR)—Offset 6B60h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED_0 (Reserved):** Reserved.
0:0	0h RW	**ENABLE_NO_SNOOP (Enable No Snoop)**: When set, B-Unit compares bits 35:20 incoming addresses to Upper and Lower NoSnoop Bounds to see if the transaction should be prevented from issuing a processor snoop operation.

5.2 Registers Summary

Table 5-2. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1000h	1003h	DRAM Rank Population 0 (D_CR_DRP0)—Offset 1000h	10000000h

Table 5-2. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1008h	100Bh	DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1008h	210702CBh
100Ch	100Fh	DRAM Timing Register 1A (D_CR_DTR1A)—Offset 100Ch	30481218h
1010h	1013h	DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1010h	8C080C30h
1014h	1017h	DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1014h	3002EA28h
1018h	101Bh	DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1018h	30209149h
101Ch	101Fh	DRAM Timing Register 5A (D_CR_DTR5A)—Offset 101Ch	304200C2h
1020h	1023h	DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1020h	20100000h
1024h	1027h	DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1024h	D060C06h
1028h	102Bh	DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1028h	CC50A18h
102Ch	102Fh	D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 102Ch	0h
1030h	1033h	D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1030h	0h
1034h	1037h	D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1034h	10000028h
1038h	103Bh	DRAM Refresh Control (D_CR_DRFC)—Offset 1038h	1750h
103Ch	103Fh	D-Unit Scheduler (D_CR_DSCH)—Offset 103Ch	3901C08h
1040h	1043h	DRAM Calibration Control (D_CR_DCAL)—Offset 1040h	1057h
1044h	1047h	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 104Ch	20000h
104Ch	104Fh	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 104Ch	0h
1050h	1053h	Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1050h	6C000008h
1054h	1057h	TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1054h	0h
1058h	105Bh	D-Unit Control Operations (D_CR_DCO)—Offset 1058h	0h
10A4h	10A7h	Data Scrambler (D_CR_SCRAMCTRL)—Offset 10A4h	0h
10ACh	10AFh	Error Injection Address Register (D_CR_ERR_INJ)—Offset 10ACh	0h
10B0h	10B3h	Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 10B0h	0h
10B4h	10B7h	Error Log Register (D_CR_ERR_ECC_LOG)—Offset 10B4h	0h
10BCh	10BFh	D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 10BCh	0h
1124h	1127h	Major Mode Control (D_CR_MMC)—Offset 1124h	2B01E518h
1128h	112Bh	Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1128h	1F207C8h
112Ch	112Fh	Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 112Ch	1F207C8h
1130h	1133h	Access Class Initial Priority (D_CR_ACCIP)—Offset 1130h	17C2h
1134h	1137h	Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1134h	1F52940h
1138h	113Bh	Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1138h	14000000h
113Ch	113Fh	Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 113Ch	0h
1140h	1143h	Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1140h	1F29400h
1144h	1147h	Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1144h	1F5294Ah
1148h	114Bh	Deadline Threshold (D_CR_DL_THRS)—Offset 1148h	6h

Table 5-2. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
114Ch	114Fh	Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 114Ch	1800h
1154h	1157h	DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1154h	0h
1180h	1183h	DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1180h	0h
1184h	1187h	MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1184h	0h

5.2.1 DRAM Rank Population 0 (D_CR_DRP0)—Offset 1000h

Rank configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: DDR3L. • 001: LPDDR3. • 010: LPDDR4. • 011: Reserved. • 100: Reserved. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC (DDR3L).
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM. • 01: BGA. • 10: BGA mirrored (LPDDR3 Only). • 11: UDIMM (DDR3L Only).
18:16	0h RO	**Reserved (RSVD18_16):** Reserved.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** See Address Mapping section for full description. • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** See Address Mapping section for full description. • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved.
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved.
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit, full cacheline read and writes go through a single D-Unit. • 1: PMI Dual Data Mode is enabled, only half cacheline read/ writes go through a single D-Unit.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

5.2.2 DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1008h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 210702CBh

Bit Range	Default & Access	Field Name (ID): Description
31:25	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/LPDDR3: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. tCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.

Bit Range	Default & Access	Field Name (ID): Description
24:21	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/ tZQCS, tXSDLL) before allowing traffic to DRAM (in 64 x DRAM Clocks). LPDDR3/LPDDR4: tXSDLL = 0. DDR3L: tXSDLL = tDLLK = 512 Clocks = 8 x 64 DRAM Clocks. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
20:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3 and minimum of 8 in LPDDR4. Note: Derating adds 1.875ns to this timing.

5.2.3 DRAM Timing Register 1A (D_CR_DTR1A)—Offset 100Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30481218h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L: tZQCL/tZQoper: Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL: ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L and LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.Not used in DDR3L/LPDDR3/.

5.2.4 DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1010h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8C080C30h

Bit Range	Default & Access	Field Name (ID): Description
31:23	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
22:21	0h RO	**Reserved (RSVD22_21):** Reserved.
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved.
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

5.2.5 DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1014h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3002EA28h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • DDR3L Equation: = tRTP.
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L only. tCMD must be set to 1N for LPDDR3/LPDDR4.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). Note: Masked Write operation in LPDDR4 is always BL16. D-Unit applies this timing for same rank as well as same bank.

5.2.6 DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1018h

Specifies DRAM timings parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30209149h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 + tWPST - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L Equation: tWRDR = CWL + tDQSSmax + BL/2 + tWPST - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tRWDR = RL + tDQSCKmax + BL/2 + tRPST - (WL + tDQSSmin - tWPRE). • LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - 2). • DDR3L Equation: tRWDR = CL + tDQSCKmax + BL/2 + tRPST - (CWL + tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. • DDR3L Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3/4 Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE. • DDR3L Equation: tRRDR = BL/2 + tRPST + tDQSCKmax - tDQSCKmin + tRPRE + 1.

5.2.7 DRAM Timing Register 5A (D_CR_DTR5A)—Offset 101Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

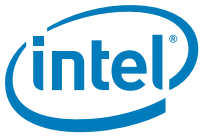
Default: 304200C2h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWPST + tWTR.
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L Equation: tRWSR = CL + tDQSCKmax + BL/2 + tRPST - (CWL +tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

5.2.8 DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1020h

Specifies DRAM timing parameters.

Access Method



Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For /LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Maintenance Operation Delay (MNTDLY):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc, panic refresh is an exception to this delay.) needs to be performed, D-Unit waits this amount of time before performing the maintenance operation to allow for some high priority requests to be issued (in 4x SPID clocks).
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the quiet time before issuing MRR/MRW command. (in DRAM clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

5.2.9 DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1024h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D060C06h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + tRPST.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved.
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

5.2.10 DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1028h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CC50A18h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).

Bit Range	Default & Access	Field Name (ID): Description
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

5.2.11 D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 102Ch

Specifies the parameters to control DRAM ODT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices

Bit Range	Default & Access	Field Name (ID): Description
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved.
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L Only) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = DOCRx.WRODTSTOP (subtract 1 if DOCRx.WRODTSTART = 1 in 2N mode).
13	0h RO	**Reserved (RSVD13):** Reserved.
12:9	0h RW	**Read command to ODT assertion delay (DDR3L Only) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L Equation: RDODTSTART = CL CWL (add 1 if DOCRx.WRODTSTART = 0 in 2N mode). The max value for this CR is 0xE
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP >= 6
4	0h RO	**Reserved (RSVD4):** Reserved.
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L Equation: WRODTSTART = 0 Note: DDR3 spec requires ODT to be asserted high when the DRAM Write command is issued. In DDR3L 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion). The max value for this CR is 0xE

5.2.12 D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1030h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved.
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved.
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

5.2.13 D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1034h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. 0 - Enable Repeaters clock gating, 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. 0 - Enable IOSF-SB EP clock gating, 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved.
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

5.2.14 DRAM Refresh Control (D_CR_DRFC)—Offset 1038h

Specifies the parameters to control scheduling of refresh commands.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1750h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD31_22):** Reserved.
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (RSVD19_18):** Reserved.
17:16	0h RO	**Reserved (RSVD17_16):** Reserved.
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Disable tREFI counter and stop issuing refresh commands. • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved.
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

5.2.15 D-Unit Scheduler (D_CR_DSCH)—Offset 103Ch

Specifies parameters to control scheduling of commands to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3901C08h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data. • 01: Always write read valid one SPID clock before data. • 10: Write read valid up to 2 SPID clocks before data. • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were recieved. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty.
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4. • LPDDR4: = MWr tCCD = MWr BL/2 = 8.

5.2.16 DRAM Calibration Control (D_CR_DCAL)—Offset 1040h

Specifies parameters to control ZQ Calibration.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1057h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit, in LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved.
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

5.2.17 VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 104Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

5.2.18 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1050h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6C000008h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved.
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit polls the DRAM mode register MR4 to determine required refresh rate (in 4x tREFI units).
7:5	0h RO	**Reserved (RSVD7_5):** Reserved.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of TQOFFSET.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last MR4 read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables MR4 read on Self Refresh Exit. If disabled, D-Unit will not read MR4 value on Self-Refresh exit.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read MR4 value periodically. Note: Will be enabled only if refreshes are enabled.

5.2.19 TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1054h

Specifies temperature offset and refresh rate adjustments requested by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:16	0h RW	**MR Value (MR_VALUE):** MR2 Shadow Register (DDR3L Only): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry.
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved.
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** Reserved

5.2.20 D-Unit Control Operations (D_CR_DCO)—Offset 1058h

Specifies D-Unit initialization and control operation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/ GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved.
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit needs to be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.2.21 Data Scrambler (D_CR_SCRAMCTRL)—Offset 10A4h

Specifies parameters to control data scrambling in D-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved.
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycle. • 10: Clock Gate every 3 cycle. • 11: Clock Gate every 4 cycle.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved.
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

5.2.22 Error Injection Address Register (D_CR_ERR_INJ)—Offset 10ACh

Contains the target address for ECC error injection.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.2.23 Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 10B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** If enabled, the error injection is continuously armed for ERR_INJ.ADDR 32B write address matching until it is cleared. • 00: No error injection. • 01: Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on QW0 of the 32B data. • 10: Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on QW0 of the 32B data. • 11: Reserved.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

5.2.24 Error Log Register (D_CR_ERR_ECC_LOG)—Offset 10B4h

Detected ECC errors are captured in this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Clear (CLEAR):** Setting this bit to one clears all fields in this register, including itself.

Bit Range	Default & Access	Field Name (ID): Description
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

5.2.25 D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 10BCh

Contains the values read from D-Unit fuses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: reserved. • [7:7]: fus_dun_ddr3l_dis. • [15:8]: reserved.

5.2.26 Major Mode Control (D_CR_MMC)—Offset 1124h

Specifies parameters to control read/write major mode operation and transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2B01E518h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved.
17:12	1Eh RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.

Bit Range	Default & Access	Field Name (ID): Description
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

5.2.27 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1128h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

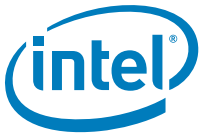
5.2.28 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 112Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h



Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

5.2.29 Access Class Initial Priority (D_CR_ACCIP)—Offset 1130h

Each field of this register defines the initial priority of one access class.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 17C2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved.
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

5.2.30 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1134h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F52940h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.2.31 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1138h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.2.32 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 113Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.2.33 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1140h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F29400h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.2.34 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1144h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F5294Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.2.35 Deadline Threshold (D_CR_DL_THRS)—Offset 1148h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved.
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

5.2.36 Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 114Ch

This register controls blocking rules enforced in RMM and WMM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1800h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved.
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved.
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

5.2.37 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1154h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved.
3	0h RW/V	**SUSPENDP (SUSPENDP):** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/V	**SUSPEND (SUSPEND):** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/V	**WAKE (WAKE):** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

5.2.38 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1180h

LPDDR4 DQS Retraining control register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

5.2.39 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1184h

Controls the data bits swizzling crossbar for MR4.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved.
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

5.3 Registers Summary

Table 5-3. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1200h	1203h	DRAM Rank Population 0 (D_CR_DRP0)—Offset 1200h	10000000h
1208h	120Bh	DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1208h	210702CBh
120Ch	120Fh	DRAM Timing Register 1A (D_CR_DTR1A)—Offset 120Ch	30481218h
1210h	1213h	DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1210h	8C080C30h
1214h	1217h	DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1214h	3002EA28h
1218h	121Bh	DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1218h	30209149h
121Ch	121Fh	DRAM Timing Register 5A (D_CR_DTR5A)—Offset 121Ch	304200C2h
1220h	1223h	DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1220h	20100000h
1224h	1227h	DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1224h	D060C06h
1228h	122Bh	DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1228h	CC50A18h
122Ch	122Fh	D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 122Ch	0h
1230h	1233h	D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1230h	0h
1234h	1237h	D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1234h	10000028h
1238h	123Bh	DRAM Refresh Control (D_CR_DRFC)—Offset 1238h	1750h
123Ch	123Fh	D-Unit Scheduler (D_CR_DSCH)—Offset 123Ch	3901C08h
1240h	1243h	DRAM Calibration Control (D_CR_DCAL)—Offset 1240h	1057h
1244h	1247h	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 124Ch	20000h
124Ch	124Fh	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 124Ch	0h
1250h	1253h	Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1250h	6C000008h
1254h	1257h	TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1254h	0h
1258h	125Bh	D-Unit Control Operations (D_CR_DCO)—Offset 1258h	0h
12A4h	12A7h	Data Scrambler (D_CR_SCRAMCTRL)—Offset 12A4h	0h
12ACh	12AFh	Error Injection Address Register (D_CR_ERR_INJ)—Offset 12ACh	0h
12B0h	12B3h	Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 12B0h	0h
12B4h	12B7h	Error Log Register (D_CR_ERR_ECC_LOG)—Offset 12B4h	0h
12BCh	12BFh	D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 12BCh	0h
1324h	1327h	Major Mode Control (D_CR_MMC)—Offset 1324h	2B01E518h
1328h	132Bh	Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1328h	1F207C8h

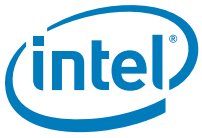


Table 5-3. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
132Ch	132Fh	Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 132Ch	1F207C8h
1330h	1333h	Access Class Initial Priority (D_CR_ACCIP)—Offset 1330h	17C2h
1334h	1337h	Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1334h	1F52940h
1338h	133Bh	Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1338h	14000000h
133Ch	133Fh	Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 133Ch	0h
1340h	1343h	Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1340h	1F29400h
1344h	1347h	Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1344h	1F5294Ah
1348h	134Bh	Deadline Threshold (D_CR_DL_THRS)—Offset 1348h	6h
134Ch	134Fh	Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 134Ch	1800h
1354h	1357h	DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1354h	0h
1380h	1383h	DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1380h	0h
1384h	1387h	MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1384h	0h

5.3.1 DRAM Rank Population 0 (D_CR_DRP0)—Offset 1200h

Rank configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: DDR3L. • 001: LPDDR3. • 010: LPDDR4. • 011: Reserved. • 100: Reserved. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC (DDR3L).
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM. • 01: BGA. • 10: BGA mirrored (LPDDR3 Only). • 11: UDIMM (DDR3L Only).
18:16	0h RO	**Reserved (RSVD18_16):** Reserved.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** See Address Mapping section for full description. • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** See Address Mapping section for full description. • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved.
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit, full cacheline read and writes go through a single D-Unit. • 1: PMI Dual Data Mode is enabled, only half cacheline read/ writes go through a single D-Unit.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

5.3.2 DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1208h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 210702CBh

Bit Range	Default & Access	Field Name (ID): Description
31:25	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/LPDDR3/: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. tCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
24:21	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/ tZQCS, tXSDLL) before allowing traffic to DRAM (in 64 x DRAM Clocks). LPDDR3/LPDDR4: tXSDLL = 0. DDR3L: tXSDLL = tDLLK = 512 Clocks = 8 x 64 DRAM Clocks. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
20:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3 and minimum of 8 in LPDDR4. Note: Derating adds 1.875ns to this timing.

5.3.3 DRAM Timing Register 1A (D_CR_DTR1A)—Offset 120Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30481218h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L: tZQCL/tZQoper: Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL: ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L and LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.Not used in DDR3L/LPDDR3/.

5.3.4 DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1210h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8C080C30h

Bit Range	Default & Access	Field Name (ID): Description
31:23	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
22:21	0h RO	**Reserved (RSVD22_21):** Reserved.
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).

Bit Range	Default & Access	Field Name (ID): Description
16	0h RO	**Reserved (RSVD16):** Reserved.
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

5.3.5 DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1214h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3002EA28h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • DDR3L Equation: = tRTP.
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L only. tCMD must be set to 1N for LPDDR3/LPDDR4.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).

Bit Range	Default & Access	Field Name (ID): Description
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). Note: Masked Write operation in LPDDR4 is always BL16. D-Unit applies this timing for same rank as well as same bank.

5.3.6 DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1218h

Specifies DRAM timings parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30209149h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 + tWPST - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L Equation: tWRDR = CWL + tDQSSmax + BL/2 + tWPST - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tRWDR = RL + tDQSCKmax + BL/2 + tRPST - (WL + tDQSSmin - tWPRE). • LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - 2). • DDR3L Equation: tRWDR = CL + tDQSCKmax + BL/2 + tRPST - (CWL + tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

Bit Range	Default & Access	Field Name (ID): Description
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. • DDR3L Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3/4 Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE. • DDR3L Equation: tRRDR = BL/2 + tRPST + tDQSCKmax - tDQSCKmin + tRPRE + 1.

5.3.7 DRAM Timing Register 5A (D_CR_DTR5A)—Offset 121Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 304200C2h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.

Bit Range	Default & Access	Field Name (ID): Description
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWPST + tWTR.
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L Equation: tRWSR = CL + tDQSCKmax + BL/2 + tRPST - (CWL +tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

5.3.8 DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1220h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Maintenance Operation Delay (MNTDLY):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc, panic refresh is an exception to this delay.) needs to be performed, D-Unit waits this amount of time before performing the maintenance operation to allow for some high priority requests to be issued (in 4x SPID clocks).

Bit Range	Default & Access	Field Name (ID): Description
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the quiet time before issuing MRR/MRW command. (in DRAM clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

5.3.9 DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1224h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D060C06h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + tRPST.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RO	**Reserved (RSVD8_7):** Reserved.
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

5.3.10 DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1228h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CC50A18h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

5.3.11 D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 122Ch

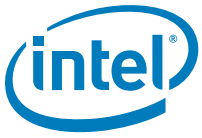
Specifies the parameters to control DRAM ODT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved.
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L Only) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = DOCRx.WRODTSTOP (subtract 1 if DOCRx.WRODTSTART = 1 in 2N mode).
13	0h RO	**Reserved (RSVD13):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
12:9	0h RW	**Read command to ODT assertion delay (DDR3L Only) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L Equation: RDODTSTART = CL CWL (add 1 if DOCRx.WRODTSTART = 0 in 2N mode). The max value for this CR is 0xE
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP >= 6
4	0h RO	**Reserved (RSVD4):** Reserved.
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L Equation: WRODTSTART = 0 Note: DDR3 spec requires ODT to be asserted high when the DRAM Write command is issued. In DDR3L 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion). The max value for this CR is 0xE

5.3.12 D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1230h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved.
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

5.3.13 D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1234h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. 0 - Enable Repeaters clock gating, 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. 0 - Enable IOSF-SB EP clock gating, 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved.
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

5.3.14 DRAM Refresh Control (D_CR_DRFC)—Offset 1238h

Specifies the parameters to control scheduling of refresh commands.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1750h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD31_22):** Reserved.
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved.
17:16	0h RO	**Reserved (RSVD17_16):** Reserved.
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Disable tREFI counter and stop issuing refresh commands. • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.

Bit Range	Default & Access	Field Name (ID): Description
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved.
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

5.3.15 D-Unit Scheduler (D_CR_DSCH)—Offset 123Ch

Specifies parameters to control scheduling of commands to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3901C08h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data. • 01: Always write read valid one SPID clock before data. • 10: Write read valid up to 2 SPID clocks before data. • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.

Bit Range	Default & Access	Field Name (ID): Description
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were recieved. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty.
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** Reserved.
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4. • LPDDR4: = MWr tCCD = MWr BL/2 = 8.

5.3.16 DRAM Calibration Control (D_CR_DCAL)—Offset 1240h

Specifies parameters to control ZQ Calibration.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1057h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved.
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit, in LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved.
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

5.3.17 VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 124Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved.
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

5.3.18 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1250h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6C000008h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved.
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit polls the DRAM mode register MR4 to determine required refresh rate (in 4x tREFI units).

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD7_5):** Reserved.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of TQOFFSET.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last MR4 read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables MR4 read on Self Refresh Exit. If disabled, D-Unit will not read MR4 value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read MR4 value periodically. Note: Will be enabled only if refreshes are enabled.

5.3.19 TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1254h

Specifies temperature offset and refresh rate adjustments requested by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:16	0h RW	**MR Value (MR_VALUE):** MR2 Shadow Register (DDR3L Only): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry.
15:11	0h RO	**Reserved (RSVD15_11):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved.
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** Reserved

5.3.20 D-Unit Control Operations (D_CR_DCO)—Offset 1258h

Specifies D-Unit initialization and control operation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/ GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved.
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit needs to be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.3.21 Data Scrambler (D_CR_SCRAMCTRL)—Offset 12A4h

Specifies parameters to control data scrambling in D-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved.
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycle. • 10: Clock Gate every 3 cycle. • 11: Clock Gate every 4 cycle.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved.
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

5.3.22 Error Injection Address Register (D_CR_ERR_INJ)—Offset 12ACh

Contains the target address for ECC error injection.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.3.23 Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 12B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** If enabled, the error injection is continuously armed for ERR_INJ.ADDR 32B write address matching until it is cleared. • 00: No error injection. • 01: Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on QW0 of the 32B data. • 10: Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on QW0 of the 32B data. • 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

5.3.24 Error Log Register (D_CR_ERR_ECC_LOG)—Offset 12B4h

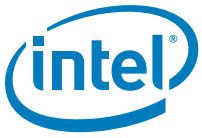
Detected ECC errors are captured in this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Clear (CLEAR):** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.



Bit Range	Default & Access	Field Name (ID): Description
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

5.3.25 D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 12BCh

Contains the values read from D-Unit fuses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved.
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: reserved. • [7:7]: fus_dun_ddr3l_dis. • [15:8]: reserved.

5.3.26 Major Mode Control (D_CR_MMC)—Offset 1324h

Specifies parameters to control read/write major mode operation and transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2B01E518h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved.
17:12	1Eh RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

5.3.27 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1328h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

5.3.28 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 132Ch

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

5.3.29 Access Class Initial Priority (D_CR_ACCIP)—Offset 1330h

Each field of this register defines the initial priority of one access class.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 17C2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved.
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

5.3.30 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1334h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F52940h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.3.31 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1338h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.3.32 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 133Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.3.33 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1340h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F29400h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.3.34 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1344h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F5294Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.3.35 Deadline Threshold (D_CR_DL_THRS)—Offset 1348h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved.
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

5.3.36 Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 134Ch

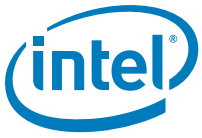
This register controls blocking rules enforced in RMM and WMM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1800h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved.
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved.
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.



Bit Range	Default & Access	Field Name (ID): Description
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

5.3.37 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1354h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved.
3	0h RW/V	**SUSPENDP (SUSPENDP):** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND (SUSPEND):** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/V	**WAKE (WAKE):** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

5.3.38 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1380h

LPDDR4 DQS Retraining control register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

5.3.39 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1384h

Controls the data bits swizzling crossbar for MR4.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved.
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

5.4 Registers Summary

Table 5-4. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1400h	1403h	DRAM Rank Population 0 (D_CR_DRP0)—Offset 1400h	10000000h
1408h	140Bh	DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1408h	210702CBh
140Ch	140Fh	DRAM Timing Register 1A (D_CR_DTR1A)—Offset 140Ch	30481218h
1410h	1413h	DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1410h	8C080C30h
1414h	1417h	DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1414h	3002EA28h
1418h	141Bh	DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1418h	30209149h
141Ch	141Fh	DRAM Timing Register 5A (D_CR_DTR5A)—Offset 141Ch	304200C2h
1420h	1423h	DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1420h	20100000h
1424h	1427h	DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1424h	D060C06h
1428h	142Bh	DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1428h	CC50A18h
142Ch	142Fh	D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 142Ch	0h
1430h	1433h	D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1430h	0h
1434h	1437h	D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1434h	10000028h
1438h	143Bh	DRAM Refresh Control (D_CR_DRFC)—Offset 1438h	1750h
143Ch	143Fh	D-Unit Scheduler (D_CR_DSCH)—Offset 143Ch	3901C08h
1440h	1443h	DRAM Calibration Control (D_CR_DCAL)—Offset 1440h	1057h
1444h	1447h	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 144Ch	20000h

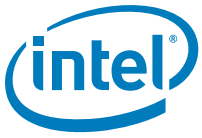


Table 5-4. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
144Ch	144Fh	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 144Ch	0h
1450h	1453h	Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1450h	6C000008h
1454h	1457h	TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1454h	0h
1458h	145Bh	D-Unit Control Operations (D_CR_DCO)—Offset 1458h	0h
14A4h	14A7h	Data Scrambler (D_CR_SCRAMCTRL)—Offset 14A4h	0h
14ACh	14AFh	Error Injection Address Register (D_CR_ERR_INJ)—Offset 14ACh	0h
14B0h	14B3h	Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 14B0h	0h
14B4h	14B7h	Error Log Register (D_CR_ERR_ECC_LOG)—Offset 14B4h	0h
14BCh	14BFh	D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 14BCh	0h
1524h	1527h	Major Mode Control (D_CR_MMC)—Offset 1524h	2B01E518h
1528h	152Bh	Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1528h	1F207C8h
152Ch	152Fh	Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 152Ch	1F207C8h
1530h	1533h	Access Class Initial Priority (D_CR_ACCIP)—Offset 1530h	17C2h
1534h	1537h	Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1534h	1F52940h
1538h	153Bh	Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1538h	14000000h
153Ch	153Fh	Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 153Ch	0h
1540h	1543h	Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1540h	1F29400h
1544h	1547h	Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1544h	1F5294Ah
1548h	154Bh	Deadline Threshold (D_CR_DL_THRS)—Offset 1548h	6h
154Ch	154Fh	Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 154Ch	1800h
1554h	1557h	DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1554h	0h
1580h	1583h	DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1580h	0h
1584h	1587h	MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1584h	0h

5.4.1 DRAM Rank Population 0 (D_CR_DRP0)—Offset 1400h

Rank configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: DDR3L. • 001: LPDDR3. • 010: LPDDR4. • 011: Reserved. • 100: Reserved. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC (DDR3L).
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM. • 01: BGA. • 10: BGA mirrored (LPDDR3 Only). • 11: UDIMM (DDR3L Only).
18:16	0h RO	**Reserved (RSVD18_16):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Bank Address Hashing Enable (BAHEN):** See Address Mapping section for full description. • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** See Address Mapping section for full description. • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved.
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved.
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit, full cacheline read and writes go through a single D-Unit. • 1: PMI Dual Data Mode is enabled, only half cacheline read/ writes go through a single D-Unit.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

5.4.2 DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1408h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 210702CBh

Bit Range	Default & Access	Field Name (ID): Description
31:25	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/LPDDR3: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. tCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
24:21	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 64 x DRAM Clocks). LPDDR3/LPDDR4: tXSDLL = 0. DDR3L: tXSDLL = tDLLK = 512 Clocks = 8 x 64 DRAM Clocks. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
20:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3 and minimum of 8 in LPDDR4. Note: Derating adds 1.875ns to this timing.

5.4.3 DRAM Timing Register 1A (D_CR_DTR1A)—Offset 140Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30481218h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L: tZQCL/tZQoper: Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL: ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L and LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.Not used in DDR3L/LPDDR3.

5.4.4 DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1410h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8C080C30h

Bit Range	Default & Access	Field Name (ID): Description
31:23	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)

Bit Range	Default & Access	Field Name (ID): Description
22:21	0h RO	**Reserved (RSVD22_21):** Reserved.
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved.
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

5.4.5 DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1414h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3002EA28h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • DDR3L Equation: = tRTP.
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L only. tCMD must be set to 1N for LPDDR3/LPDDR4.

Bit Range	Default & Access	Field Name (ID): Description
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). Note: Masked Write operation in LPDDR4 is always BL16. D-Unit applies this timing for same rank as well as same bank.

5.4.6 DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1418h

Specifies DRAM timings parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30209149h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 + tWPST - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L Equation: tWRDR = CWL + tDQSSmax + BL/2 + tWPST - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tRWDR = RL + tDQSCKmax + BL/2 + tRPST - (WL + tDQSSmin - tWPRE). • LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - 2). • DDR3L Equation: tRWDR = CL + tDQSCKmax + BL/2 + tRPST - (CWL + tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

Bit Range	Default & Access	Field Name (ID): Description
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. • DDR3L Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3/4 Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE. • DDR3L Equation: tRRDR = BL/2 + tRPST + tDQSCKmax - tDQSCKmin + tRPRE + 1.

5.4.7 DRAM Timing Register 5A (D_CR_DTR5A)—Offset 141Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 304200C2h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.

Bit Range	Default & Access	Field Name (ID): Description
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWPST + tWTR.
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L Equation: tRWSR = CL + tDQSCKmax + BL/2 + tRPST - (CWL +tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

5.4.8 DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1420h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Maintenance Operation Delay (MNTDLY):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc, panic refresh is an exception to this delay.) needs to be performed, D-Unit waits this amount of time before performing the maintenance operation to allow for some high priority requests to be issued (in 4x SPID clocks).

Bit Range	Default & Access	Field Name (ID): Description
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the quiet time before issuing MRR/MRW command. (in DRAM clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

5.4.9 DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1424h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D060C06h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + tRPST.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RO	**Reserved (RSVD8_7):** Reserved.
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

5.4.10 DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1428h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CC50A18h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

5.4.11 D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 142Ch

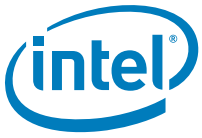
Specifies the parameters to control DRAM ODT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved.
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L Only) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = DOCRx.WRODTSTOP (subtract 1 if DOCRx.WRODTSTART = 1 in 2N mode).
13	0h RO	**Reserved (RSVD13):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
12:9	0h RW	**Read command to ODT assertion delay (DDR3L Only) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L Equation: RDODTSTART = CL CWL (add 1 if DOCRx.WRODTSTART = 0 in 2N mode). The max value for this CR is 0xE
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP >= 6
4	0h RO	**Reserved (RSVD4):** Reserved.
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L Equation: WRODTSTART = 0 Note: DDR3 spec requires ODT to be asserted high when the DRAM Write command is issued. In DDR3L 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion). The max value for this CR is 0xE

5.4.12 D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1430h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved.
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

5.4.13 D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1434h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. 0 - Enable Repeaters clock gating, 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. 0 - Enable IOSF-SB EP clock gating, 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved.
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

5.4.14 DRAM Refresh Control (D_CR_DRFC)—Offset 1438h

Specifies the parameters to control scheduling of refresh commands.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1750h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD31_22):** Reserved.
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved.
17:16	0h RO	**Reserved (RSVD17_16):** Reserved.
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Disable tREFI counter and stop issuing refresh commands. • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.

Bit Range	Default & Access	Field Name (ID): Description
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved.
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

5.4.15 D-Unit Scheduler (D_CR_DSCH)—Offset 143Ch

Specifies parameters to control scheduling of commands to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3901C08h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data. • 01: Always write read valid one SPID clock before data. • 10: Write read valid up to 2 SPID clocks before data. • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.

Bit Range	Default & Access	Field Name (ID): Description
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty.
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** Reserved.
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4. • LPDDR4: = MWr tCCD = MWr BL/2 = 8.

5.4.16 DRAM Calibration Control (D_CR_DCAL)—Offset 1440h

Specifies parameters to control ZQ Calibration.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1057h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved.
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit, in LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved.
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

5.4.17 VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 144Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved.
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

5.4.18 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1450h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6C000008h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved.
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit polls the DRAM mode register MR4 to determine required refresh rate (in 4x tREFI units).

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD7_5):** Reserved.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of TQOFFSET.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last MR4 read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables MR4 read on Self Refresh Exit. If disabled, D-Unit will not read MR4 value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read MR4 value periodically. Note: Will be enabled only if refreshes are enabled.

5.4.19 TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1454h

Specifies temperature offset and refresh rate adjustments requested by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:16	0h RW	**MR Value (MR_VALUE):** MR2 Shadow Register (DDR3L Only): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry.
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD7_3):** Reserved.
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** Reserved.

5.4.20 D-Unit Control Operations (D_CR_DCO)—Offset 1458h

Specifies D-Unit initialization and control operation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/ GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved.
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit needs to be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.4.21 Data Scrambler (D_CR_SCRAMCTRL)—Offset 14A4h

Specifies parameters to control data scrambling in D-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved.
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycle. • 10: Clock Gate every 3 cycle. • 11: Clock Gate every 4 cycle.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved.
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

5.4.22 Error Injection Address Register (D_CR_ERR_INJ)—Offset 14ACh

Contains the target address for ECC error injection.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.4.23 Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 14B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** If enabled, the error injection is continuously armed for ERR_INJ.ADDR 32B write address matching until it is cleared. • 00: No error injection. • 01: Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on QW0 of the 32B data. • 10: Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on QW0 of the 32B data. • 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

5.4.24 Error Log Register (D_CR_ERR_ECC_LOG)—Offset 14B4h

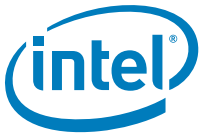
Detected ECC errors are captured in this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Clear (CLEAR):** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.



Bit Range	Default & Access	Field Name (ID): Description
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

5.4.25 D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 14BCh

Contains the values read from D-Unit fuses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved.
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: reserved. • [7:7]: fus_dun_ddr3l_dis. • [15:8]: reserved.

5.4.26 Major Mode Control (D_CR_MMC)—Offset 1524h

Specifies parameters to control read/write major mode operation and transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2B01E518h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved.
17:12	1Eh RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

5.4.27 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1528h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

5.4.28 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 152Ch

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

5.4.29 Access Class Initial Priority (D_CR_ACCIP)—Offset 1530h

Each field of this register defines the initial priority of one access class.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 17C2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved.
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

5.4.30 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1534h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F52940h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.4.31 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1538h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.4.32 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 153Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.4.33 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1540h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F29400h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.4.34 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1544h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F5294Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.4.35 Deadline Threshold (D_CR_DL_THRS)—Offset 1548h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved.
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

5.4.36 Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 154Ch

This register controls blocking rules enforced in RMM and WMM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1800h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved.
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved.
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.

Bit Range	Default & Access	Field Name (ID): Description
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

5.4.37 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1554h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved.
3	0h RW/V	**SUSPENDP (SUSPENDP):** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND (SUSPEND):** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/V	**WAKE (WAKE):** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

5.4.38 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1580h

LPDDR4 DQS Retraining control register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

5.4.39 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1584h

Controls the data bits swizzling crossbar for MR4.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved.
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

5.5 Registers Summary

Table 5-5. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1600h	1603h	DRAM Rank Population 0 (D_CR_DRP0)—Offset 1600h	10000000h
1608h	160Bh	DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1608h	210702CBh
160Ch	160Fh	DRAM Timing Register 1A (D_CR_DTR1A)—Offset 160Ch	30481218h
1610h	1613h	DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1610h	8C080C30h
1614h	1617h	DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1614h	3002EA28h
1618h	161Bh	DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1618h	30209149h
161Ch	161Fh	DRAM Timing Register 5A (D_CR_DTR5A)—Offset 161Ch	304200C2h
1620h	1623h	DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1620h	20100000h
1624h	1627h	DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1624h	D060C06h
1628h	162Bh	DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1628h	CC50A18h
162Ch	162Fh	D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 162Ch	0h
1630h	1633h	D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1630h	0h
1634h	1637h	D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1634h	10000028h
1638h	163Bh	DRAM Refresh Control (D_CR_DRFC)—Offset 1638h	1750h
163Ch	163Fh	D-Unit Scheduler (D_CR_DSCH)—Offset 163Ch	3901C08h
1640h	1643h	DRAM Calibration Control (D_CR_DCAL)—Offset 1640h	1057h
1644h	1647h	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 164Ch	20000h

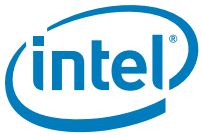


Table 5-5. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
164Ch	164Fh	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 164Ch	0h
1650h	1653h	Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1650h	6C000008h
1654h	1657h	TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1654h	0h
1658h	165Bh	D-Unit Control Operations (D_CR_DCO)—Offset 1658h	0h
16A4h	16A7h	Data Scrambler (D_CR_SCRAMCTRL)—Offset 16A4h	0h
16ACh	16AFh	Error Injection Address Register (D_CR_ERR_INJ)—Offset 16ACh	0h
16B0h	16B3h	Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 16B0h	0h
16B4h	16B7h	Error Log Register (D_CR_ERR_ECC_LOG)—Offset 16B4h	0h
16BCh	16BFh	D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 16BCh	0h
1724h	1727h	Major Mode Control (D_CR_MMC)—Offset 1724h	2B01E518h
1728h	172Bh	Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1728h	1F207C8h
172Ch	172Fh	Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 172Ch	1F207C8h
1730h	1733h	Access Class Initial Priority (D_CR_ACCIP)—Offset 1730h	17C2h
1734h	1737h	Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1734h	1F52940h
1738h	173Bh	Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1738h	14000000h
173Ch	173Fh	Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 173Ch	0h
1740h	1743h	Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1740h	1F29400h
1744h	1747h	Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1744h	1F5294Ah
1748h	174Bh	Deadline Threshold (D_CR_DL_THRS)—Offset 1748h	6h
174Ch	174Fh	Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 174Ch	1800h
1754h	1757h	DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1754h	0h
1780h	1783h	DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1780h	0h
1784h	1787h	MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1784h	0h

5.5.1 DRAM Rank Population 0 (D_CR_DRP0)—Offset 1600h

Rank configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: DDR3L. • 001: LPDDR3. • 010: LPDDR4. • 011: Reserved. • 100: Reserved. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC (DDR3L).
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM. • 01: BGA. • 10: BGA mirrored (LPDDR3 Only). • 11: UDIMM (DDR3L Only).
18:16	0h RO	**Reserved (RSVD18_16):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Bank Address Hashing Enable (BAHEN):** See Address Mapping section for full description. • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** See Address Mapping section for full description. • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved.
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved.
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit, full cacheline read and writes go through a single D-Unit. • 1: PMI Dual Data Mode is enabled, only half cacheline read/ writes go through a single D-Unit.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

5.5.2 DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1608h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 210702CBh

Bit Range	Default & Access	Field Name (ID): Description
31:25	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/LPDDR3: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. tCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
24:21	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 64 x DRAM Clocks). LPDDR3/LPDDR4: tXSDLL = 0. DDR3L: tXSDLL = tDLLK = 512 Clocks = 8 x 64 DRAM Clocks. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
20:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3 and minimum of 8 in LPDDR4. Note: Derating adds 1.875ns to this timing.

5.5.3 DRAM Timing Register 1A (D_CR_DTR1A)—Offset 160Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30481218h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L: tZQCL/tZQoper: Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL: ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L and LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.Not used in DDR3L/LPDDR3.

5.5.4 DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1610h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8C080C30h

Bit Range	Default & Access	Field Name (ID): Description
31:23	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)

Bit Range	Default & Access	Field Name (ID): Description
22:21	0h RO	**Reserved (RSVD22_21):** Reserved.
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved.
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

5.5.5 DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1614h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3002EA28h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • DDR3L Equation: = tRTP.
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L only. tCMD must be set to 1N for LPDDR3/LPDDR4.

Bit Range	Default & Access	Field Name (ID): Description
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). Note: Masked Write operation in LPDDR4 is always BL16. D-Unit applies this timing for same rank as well as same bank.

5.5.6 DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1618h

Specifies DRAM timings parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30209149h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 + tWPST - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L Equation: tWRDR = CWL + tDQSSmax + BL/2 + tWPST - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tRWDR = RL + tDQSCKmax + BL/2 + tRPST - (WL + tDQSSmin - tWPRE). • LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - 2). • DDR3L Equation: tRWDR = CL + tDQSCKmax + BL/2 + tRPST - (CWL + tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

Bit Range	Default & Access	Field Name (ID): Description
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. • DDR3L Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3/4 Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE. • DDR3L Equation: tRRDR = BL/2 + tRPST + tDQSCKmax - tDQSCKmin + tRPRE + 1.

5.5.7 DRAM Timing Register 5A (D_CR_DTR5A)—Offset 161Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 304200C2h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.

Bit Range	Default & Access	Field Name (ID): Description
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWPST + tWTR.
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L Equation: tRWSR = CL + tDQSCKmax + BL/2 + tRPST - (CWL +tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

5.5.8 DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1620h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Maintenance Operation Delay (MNTDLY):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc, panic refresh is an exception to this delay.) needs to be performed, D-Unit waits this amount of time before performing the maintenance operation to allow for some high priority requests to be issued (in 4x SPID clocks).

Bit Range	Default & Access	Field Name (ID): Description
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the quiet time before issuing MRR/MRW command. (in DRAM clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

5.5.9 DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1624h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D060C06h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + tRPST.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RO	**Reserved (RSVD8_7):** Reserved.
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

5.5.10 DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1628h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CC50A18h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

5.5.11 D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 162Ch

Specifies the parameters to control DRAM ODT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved.
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L Only) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = DOCRx.WRODTSTOP (subtract 1 if DOCRx.WRODTSTART = 1 in 2N mode).
13	0h RO	**Reserved (RSVD13):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
12:9	0h RW	**Read command to ODT assertion delay (DDR3L Only) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L Equation: RDODTSTART = CL CWL (add 1 if DOCRx.WRODTSTART = 0 in 2N mode). The max value for this CR is 0xE
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP >= 6
4	0h RO	**Reserved (RSVD4):** Reserved.
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L Equation: WRODTSTART = 0 Note: DDR3 spec requires ODT to be asserted high when the DRAM Write command is issued. In DDR3L 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion). The max value for this CR is 0xE

5.5.12 D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1630h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved.
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

5.5.13 D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1634h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. 0 - Enable Repeaters clock gating, 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. 0 - Enable IOSF-SB EP clock gating, 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved.
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

5.5.14 DRAM Refresh Control (D_CR_DRFC)—Offset 1638h

Specifies the parameters to control scheduling of refresh commands.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1750h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD31_22):** Reserved.
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved.
17:16	0h RO	**Reserved (RSVD17_16):** Reserved.
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Disable tREFI counter and stop issuing refresh commands. • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.

Bit Range	Default & Access	Field Name (ID): Description
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved.
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

5.5.15 D-Unit Scheduler (D_CR_DSCH)—Offset 163Ch

Specifies parameters to control scheduling of commands to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3901C08h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data. • 01: Always write read valid one SPID clock before data. • 10: Write read valid up to 2 SPID clocks before data. • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.

Bit Range	Default & Access	Field Name (ID): Description
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were recieved. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty.
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** Reserved.
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4. • LPDDR4: = MWr tCCD = MWr BL/2 = 8.

5.5.16 DRAM Calibration Control (D_CR_DCAL)—Offset 1640h

Specifies parameters to control ZQ Calibration.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1057h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved.
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit, in LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved.
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

5.5.17 VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 164Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved.
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

5.5.18 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1650h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6C000008h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved.
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit polls the DRAM mode register MR4 to determine required refresh rate (in 4x tREFI units).

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD7_5):** Reserved.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of TQOFFSET.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last MR4 read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables MR4 read on Self Refresh Exit. If disabled, D-Unit will not read MR4 value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read MR4 value periodically. Note: Will be enabled only if refreshes are enabled.

5.5.19 TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1654h

Specifies temperature offset and refresh rate adjustments requested by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:16	0h RW	**MR Value (MR_VALUE):** MR2 Shadow Register (DDR3L Only): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry.
15:11	0h RO	**Reserved (RSVD15_11):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved.
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** Reserved.

5.5.20 D-Unit Control Operations (D_CR_DCO)—Offset 1658h

Specifies D-Unit initialization and control operation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/ GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved.
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit needs to be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.5.21 Data Scrambler (D_CR_SCRAMCTRL)—Offset 16A4h

Specifies parameters to control data scrambling in D-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved.
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycle. • 10: Clock Gate every 3 cycle. • 11: Clock Gate every 4 cycle.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved.
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

5.5.22 Error Injection Address Register (D_CR_ERR_INJ)—Offset 16ACh

Contains the target address for ECC error injection.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.5.23 Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 16B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** If enabled, the error injection is continuously armed for ERR_INJ.ADDR 32B write address matching until it is cleared. • 00: No error injection. • 01: Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on QW0 of the 32B data. • 10: Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on QW0 of the 32B data. • 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

5.5.24 Error Log Register (D_CR_ERR_ECC_LOG)—Offset 16B4h

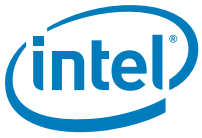
Detected ECC errors are captured in this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Clear (CLEAR):** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.



Bit Range	Default & Access	Field Name (ID): Description
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

5.5.25 D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 16BCh

Contains the values read from D-Unit fuses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved.
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: reserved. • [7:7]: fus_dun_ddr3l_dis. • [15:8]: reserved.

5.5.26 Major Mode Control (D_CR_MMC)—Offset 1724h

Specifies parameters to control read/write major mode operation and transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2B01E518h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved.
17:12	1Eh RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

5.5.27 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1728h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

5.5.28 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 172Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

5.5.29 Access Class Initial Priority (D_CR_ACCIP)—Offset 1730h

Each field of this register defines the initial priority of one access class.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 17C2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved.
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

5.5.30 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1734h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F52940h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.5.31 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1738h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.5.32 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 173Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.5.33 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1740h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F29400h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.5.34 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1744h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F5294Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.5.35 Deadline Threshold (D_CR_DL_THRS)—Offset 1748h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved.
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

5.5.36 Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 174Ch

This register controls blocking rules enforced in RMM and WMM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1800h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved.
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved.
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.

Bit Range	Default & Access	Field Name (ID): Description
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

5.5.37 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1754h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved.
3	0h RW/V	**SUSPENDP (SUSPENDP):** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND (SUSPEND):** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/V	**WAKE (WAKE):** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

5.5.38 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1780h

LPDDR4 DQS Retraining control register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

5.5.39 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1784h

Controls the data bits swizzling crossbar for MR4.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved.
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

5.6 Registers Summary

Table 5-6. Summary of memss_regs Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1A00h	1A03h	DRAM Rank Population 0 (D_CR_DRP0)—Offset 1A00h	10000000h
1A08h	1A0Bh	DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1A08h	210702CBh
1A0Ch	1A0Fh	DRAM Timing Register 1A (D_CR_DTR1A)—Offset 1A0Ch	30481218h
1A10h	1A13h	DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1A10h	8C080C30h
1A14h	1A17h	DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1A14h	3002EA28h
1A18h	1A1Bh	DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1A18h	30209149h
1A1Ch	1A1Fh	DRAM Timing Register 5A (D_CR_DTR5A)—Offset 1A1Ch	304200C2h
1A20h	1A23h	DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1A20h	20100000h
1A24h	1A27h	DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1A24h	D060C06h
1A28h	1A2Bh	DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1A28h	CC50A18h
1A2Ch	1A2Fh	D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 1A2Ch	0h
1A30h	1A33h	D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1A30h	0h
1A34h	1A37h	D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1A34h	10000028h
1A38h	1A3Bh	DRAM Refresh Control (D_CR_DRFC)—Offset 1A38h	1750h
1A3Ch	1A3Fh	D-Unit Scheduler (D_CR_DSCH)—Offset 1A3Ch	3901C08h
1A40h	1A43h	DRAM Calibration Control (D_CR_DCAL)—Offset 1A40h	1057h
1A44h	1A47h	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 1A4Ch	20000h

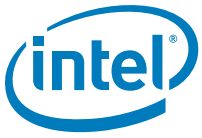


Table 5-6. Summary of memss_regs Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1A4Ch	1A4Fh	VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 1A4Ch	0h
1A50h	1A53h	Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1A50h	6C000008h
1A54h	1A57h	TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1A54h	0h
1A58h	1A5Bh	D-Unit Control Operations (D_CR_DCO)—Offset 1A58h	0h
1AA4h	1AA7h	Data Scrambler (D_CR_SCRAMCTRL)—Offset 1AA4h	0h
1AACh	1AAFh	Error Injection Address Register (D_CR_ERR_INJ)—Offset 1AACh	0h
1AB0h	1AB3h	Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 1AB0h	0h
1AB4h	1AB7h	Error Log Register (D_CR_ERR_ECC_LOG)—Offset 1AB4h	0h
1ABCh	1ABFh	D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 1ABCh	0h
1B24h	1B27h	Major Mode Control (D_CR_MMC)—Offset 1B24h	2B01E518h
1B28h	1B2Bh	Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1B28h	1F207C8h
1B2Ch	1B2Fh	Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 1B2Ch	1F207C8h
1B30h	1B33h	Access Class Initial Priority (D_CR_ACCIP)—Offset 1B30h	17C2h
1B34h	1B37h	Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1B34h	1F52940h
1B38h	1B3Bh	Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1B38h	14000000h
1B3Ch	1B3Fh	Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 1B3Ch	0h
1B40h	1B43h	Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1B40h	1F29400h
1B44h	1B47h	Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1B44h	1F5294Ah
1B48h	1B4Bh	Deadline Threshold (D_CR_DL_THRS)—Offset 1B48h	6h
1B4Ch	1B4Fh	Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 1B4Ch	1800h
1B54h	1B57h	DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1B54h	0h
1B80h	1B83h	DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1B80h	0h
1B84h	1B87h	MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1B84h	0h

5.6.1 DRAM Rank Population 0 (D_CR_DRP0)—Offset 1A00h

Rank configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: DDR3L. • 001: LPDDR3. • 010: LPDDR4. • 011: Reserved. • 100: Reserved. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC (DDR3L).
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM. • 01: BGA. • 10: BGA mirrored (LPDDR3 Only). • 11: UDIMM (DDR3L Only).
18:16	0h RO	**Reserved (RSVD18_16):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Bank Address Hashing Enable (BAHEN):** See Address Mapping section for full description. • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** See Address Mapping section for full description. • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved.
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved.
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit, full cacheline read and writes go through a single D-Unit. • 1: PMI Dual Data Mode is enabled, only half cacheline read/ writes go through a single D-Unit.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

5.6.2 DRAM Timing Register 0A (D_CR_DTR0A)—Offset 1A08h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 210702CBh

Bit Range	Default & Access	Field Name (ID): Description
31:25	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/LPDDR3: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. tCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
24:21	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 64 x DRAM Clocks). LPDDR3/LPDDR4: tXSDLL = 0. DDR3L: tXSDLL = tDLLK = 512 Clocks = 8 x 64 DRAM Clocks. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
20:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3 and minimum of 8 in LPDDR4. Note: Derating adds 1.875ns to this timing.

5.6.3 DRAM Timing Register 1A (D_CR_DTR1A)—Offset 1A0Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30481218h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L: tZQCL/tZQoper: Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL: ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L and LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.Not used in DDR3L/LPDDR3.

5.6.4 DRAM Timing Register 2A (D_CR_DTR2A)—Offset 1A10h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8C080C30h

Bit Range	Default & Access	Field Name (ID): Description
31:23	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)

Bit Range	Default & Access	Field Name (ID): Description
22:21	0h RO	**Reserved (RSVD22_21):** Reserved.
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved.
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

5.6.5 DRAM Timing Register 3A (D_CR_DTR3A)—Offset 1A14h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3002EA28h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • DDR3L Equation: = tRTP.
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L only. tCMD must be set to 1N for LPDDR3/LPDDR4.

Bit Range	Default & Access	Field Name (ID): Description
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). Note: Masked Write operation in LPDDR4 is always BL16. D-Unit applies this timing for same rank as well as same bank.

5.6.6 DRAM Timing Register 4A (D_CR_DTR4A)—Offset 1A18h

Specifies DRAM timings parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30209149h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 + tWPST - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L Equation: tWRDR = CWL + tDQSSmax + BL/2 + tWPST - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tRWDR = RL + tDQSCKmax + BL/2 + tRPST - (WL + tDQSSmin - tWPRE). • LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - 2). • DDR3L Equation: tRWDR = CL + tDQSCKmax + BL/2 + tRPST - (CWL + tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

Bit Range	Default & Access	Field Name (ID): Description
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. • DDR3L Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3/4 Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE. • DDR3L Equation: tRRDR = BL/2 + tRPST + tDQSCKmax - tDQSCKmin + tRPRE + 1.

5.6.7 DRAM Timing Register 5A (D_CR_DTR5A)—Offset 1A1Ch

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 304200C2h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.

Bit Range	Default & Access	Field Name (ID): Description
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). LPDDR3/LPDDR4/DDR3L Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWPST + tWTR.
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L Equation: tRWSR = CL + tDQSCKmax + BL/2 + tRPST - (CWL +tDQSSmin - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L using ODT, this latency may need to be increased by one clock.

5.6.8 DRAM Timing Register 6A (D_CR_DTR6A)—Offset 1A20h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Maintenance Operation Delay (MNTDLY):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc, panic refresh is an exception to this delay.) needs to be performed, D-Unit waits this amount of time before performing the maintenance operation to allow for some high priority requests to be issued (in 4x SPID clocks).

Bit Range	Default & Access	Field Name (ID): Description
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the quiet time before issuing MRR/MRW command. (in DRAM clocks). Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

5.6.9 DRAM Timing Register 7A (D_CR_DTR7A)—Offset 1A24h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D060C06h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + tRPST.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RO	**Reserved (RSVD8_7):** Reserved.
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

5.6.10 DRAM Timing Register 8A (D_CR_DTR8A)—Offset 1A28h

Specifies DRAM timing parameters.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CC50A18h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

5.6.11 D-Unit ODT Control Register A (D_CR_DOCRA)—Offset 1A2Ch

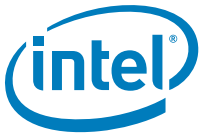
Specifies the parameters to control DRAM ODT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved.
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L Only) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = DOCRx.WRODTSTOP (subtract 1 if DOCRx.WRODTSTART = 1 in 2N mode).
13	0h RO	**Reserved (RSVD13):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
12:9	0h RW	**Read command to ODT assertion delay (DDR3L Only) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L Equation: RDODTSTART = CL CWL (add 1 if DOCRx.WRODTSTART = 0 in 2N mode). The max value for this CR is 0xE
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP >= 6
4	0h RO	**Reserved (RSVD4):** Reserved.
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L Equation: WRODTSTART = 0 Note: DDR3 spec requires ODT to be asserted high when the DRAM Write command is issued. In DDR3L 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion). The max value for this CR is 0xE

5.6.12 D-Unit Power Management Control 0 (D_CR_DPMC0)—Offset 1A30h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved.
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

5.6.13 D-Unit Power Management Control 1 (D_CR_DPMC1)—Offset 1A34h

Specifies the parameters to control D-Unit power management features.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000028h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. 0 - Enable Repeaters clock gating, 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. 0 - Enable IOSF-SB EP clock gating, 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved.
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

5.6.14 DRAM Refresh Control (D_CR_DRFC)—Offset 1A38h

Specifies the parameters to control scheduling of refresh commands.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1750h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD31_22):** Reserved.
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved.
17:16	0h RO	**Reserved (RSVD17_16):** Reserved.
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Disable tREFI counter and stop issuing refresh commands. • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.

Bit Range	Default & Access	Field Name (ID): Description
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved.
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

5.6.15 D-Unit Scheduler (D_CR_DSCH)—Offset 1A3Ch

Specifies parameters to control scheduling of commands to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3901C08h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data. • 01: Always write read valid one SPID clock before data. • 10: Write read valid up to 2 SPID clocks before data. • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.

Bit Range	Default & Access	Field Name (ID): Description
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were recieved. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty.
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** Reserved.
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4. • LPDDR4: = MWr tCCD = MWr BL/2 = 8.

5.6.16 DRAM Calibration Control (D_CR_DCAL)—Offset 1A40h

Specifies parameters to control ZQ Calibration.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1057h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved.
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit, in LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved.
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

5.6.17 VNN Scaling Timer Control (D_CR_VNNTIMER)—Offset 1A4Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved.
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

5.6.18 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL)—Offset 1A50h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6C000008h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last DRAM Mode Register Read to MR4 MRR issued. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved.
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit polls the DRAM mode register MR4 to determine required refresh rate (in 4x tREFI units).

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD7_5):** Reserved.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of TQOFFSET.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last MR4 read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables MR4 read on Self Refresh Exit. If disabled, D-Unit will not read MR4 value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read MR4 value periodically. Note: Will be enabled only if refreshes are enabled.

5.6.19 TQ Temperature Offset Control (D_CR_TQOFFSET)—Offset 1A54h

Specifies temperature offset and refresh rate adjustments requested by software.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:16	0h RW	**MR Value (MR_VALUE):** MR2 Shadow Register (DDR3L Only): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry.
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD7_3):** Reserved.
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** Reserved.

5.6.20 D-Unit Control Operations (D_CR_DCO)—Offset 1A58h

Specifies D-Unit initialization and control operation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/ GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved.
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit needs to be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.6.21 Data Scrambler (D_CR_SCRAMCTRL)—Offset 1AA4h

Specifies parameters to control data scrambling in D-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved.
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycle. • 10: Clock Gate every 3 cycle. • 11: Clock Gate every 4 cycle.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved.
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

5.6.22 Error Injection Address Register (D_CR_ERR_INJ)—Offset 1AACh

Contains the target address for ECC error injection.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved.

5.6.23 Error Injection Control Register (D_CR_ERR_INJ_CTL)—Offset 1AB0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** If enabled, the error injection is continuously armed for ERR_INJ.ADDR 32B write address matching until it is cleared. • 00: No error injection. • 01: Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on QW0 of the 32B data. • 10: Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on QW0 of the 32B data. • 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

5.6.24 Error Log Register (D_CR_ERR_ECC_LOG)—Offset 1AB4h

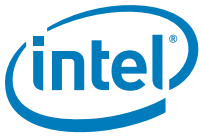
Detected ECC errors are captured in this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Clear (CLEAR):** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.



Bit Range	Default & Access	Field Name (ID): Description
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

5.6.25 D-Unit Fuse Status (D_CR_DFUSESTAT)—Offset 1ABCh

Contains the values read from D-Unit fuses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved.
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: reserved. • [7:7]: fus_dun_ddr3l_dis. • [15:8]: reserved.

5.6.26 Major Mode Control (D_CR_MMC)—Offset 1B24h

Specifies parameters to control read/write major mode operation and transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2B01E518h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved.
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved.
17:12	1Eh RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

5.6.27 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB)—Offset 1B28h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

5.6.28 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD)—Offset 1B2Ch

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F207C8h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved.
25:20	1Fh RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved.
11:6	1Fh RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

5.6.29 Access Class Initial Priority (D_CR_ACCIP)—Offset 1B30h

Each field of this register defines the initial priority of one access class.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 17C2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved.
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

5.6.30 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0)—Offset 1B34h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F52940h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.6.31 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1)—Offset 1B38h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.6.32 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2)—Offset 1B3Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.6.33 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3)—Offset 1B40h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F29400h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.6.34 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4)—Offset 1B44h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F5294Ah

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved.
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

5.6.35 Deadline Threshold (D_CR_DL_THRS)—Offset 1B48h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved.
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

5.6.36 Major Mode Blocking Rules Control (D_CR_MM_BLK)—Offset 1B4Ch

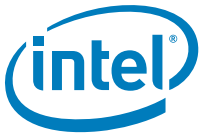
This register controls blocking rules enforced in RMM and WMM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1800h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved.
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved.
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.



Bit Range	Default & Access	Field Name (ID): Description
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved.
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

5.6.37 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD)—Offset 1B54h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved.
3	0h RW/V	**SUSPENDP (SUSPENDP):** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND (SUSPEND):** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved.
0	0h RW/V	**WAKE (WAKE):** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Clear Mask (CLEAR_MASK):** Mask ANDed with pseudo-random data. Resets to all 1s. Setting bit n to 0 in this register will force every nth bit in the data to be set to 0

5.6.38 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL)—Offset 1B80h

LPDDR4 DQS Retraining control register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved.
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

5.6.39 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE)—Offset 1B84h

Controls the data bits swizzling crossbar for MR4.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved.
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved.
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved.
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved.
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

5.7 Registers Summary

Table 5-7. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7000h	7003h	Thermal Device Mailbox Data0 (P_CR_THERMAL_MAILBOX_DATA0_0_0_0_MCHBAR)—Offset 7000h	0h
7004h	7007h	Thermal Device Mailbox Data1 (P_CR_THERMAL_MAILBOX_DATA1_0_0_0_MCHBAR)—Offset 7004h	0h
7008h	700Bh	Thermal Device Mailbox Interface (P_CR_THERMAL_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7008h	0h
700Ch	700Fh	Thermal Device IRQ and Lock Configuration (P_CR_THERMAL_DEVICE_IRQ_0_0_0_MCHBAR)—Offset 700Ch	0h
7010h	7013h	Package Thermal Interrupt Control (P_CR_PKG_THERM_INTERRUPT_0_0_0_MCHBAR)—Offset 7010h	0h
7014h	7017h	ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR (P_CR_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR)—Offset 7014h	0h
701Ch	701Fh	Package Thermal Status (P_CR_PKG_THERM_STATUS_0_0_0_MCHBAR)—Offset 701Ch	0h

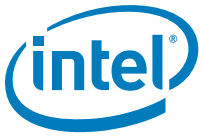


Table 5-7. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7024h	7027h	LPDDR DRAM Thermal (MR4) Status of Channel 01 (P_CR_MEM_MR4_TEMPERATURE_DEV1_0_0_0_MCHBAR)—Offset 7024h	0h
7028h	702Bh	LPDDR DRAM Thermal (MR4) Status of Channel 10 (P_CR_MEM_MR4_TEMPERATURE_DEV2_0_0_0_MCHBAR)—Offset 7028h	0h
702Ch	702Fh	Machine Check Error Source Log (P_CR_MCA_ERROR_SRC_0_0_0_MCHBAR)—Offset 702Ch	0h
7030h	7033h	DDR Thermal Throttling Control (P_CR_DDR_THERM_THRT_CTRL_0_0_0_MCHBAR)—Offset 7030h	0h
7034h	7037h	DDR Thermal Interrupt Control (P_CR_DDR_THERM_INTERRUPT_0_0_0_MCHBAR)—Offset 7034h	0h
7038h	703Bh	DDR Thermal Status (P_CR_DDR_THERM_STATUS_0_0_0_MCHBAR)—Offset 7038h	0h
7048h	704Bh	Dram Energy Counter (P_CR_DDR_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7048h	0h
704Ch	704Fh	DDR RAPL Performance Status (P_CR_DDR_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 704Ch	58F0h
7050h	7053h	Package RAPL Performance Status (P_CR_PACKAGE_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 7050h	0h
7054h	7057h	IA Core Performance / Power Priority Control (P_CR_PRIMARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7054h	0h
7058h	705Bh	Graphics Performance / Power Priority Control (P_CR_SECONDARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7058h	10h
705Ch	705Fh	IA Energy Counter (P_CR_PRIMARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 705Ch	0h
7060h	7063h	Graphics Energy Counter (P_CR_SECONDARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7060h	0h
7068h	706Bh	PACKAGE_POWER_SKU_UNIT (P_CR_PACKAGE_POWER_SKU_UNIT_0_0_0_MCHBAR)—Offset 7068h	330A0E08h
706Ch	706Fh	SOC Energy Counter (P_CR_PACKAGE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 706Ch	0h
7070h	7073h	GT_PERF_STATUS (P_CR_GT_PERF_STATUS_0_0_0_MCHBAR)—Offset 7070h	0h
7074h	7077h	Temperature Reference and Control (P_CR_TEMPERATURE_TARGET_0_0_0_MCHBAR)—Offset 7074h	5A0000h
7078h	707Bh	BIOS Reset Completion (P_CR_BIOS_RESET_CPL_0_0_0_MCHBAR)—Offset 7078h	0h
7080h	7083h	BIOS_MAILBOX_DATA (P_CR_BIOS_MAILBOX_DATA_0_0_0_MCHBAR)—Offset 7080h	0h
7084h	7087h	BIOS_MAILBOX_INTERFACE (P_CR_BIOS_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7084h	0h

Table 5-7. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7088h	708Bh	CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7088h	0h
708Ch	708Fh	GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 708Ch	0h

70A0h	70A7h	Package Power SKU and RAPL Power Control Capabilities (P_CR_PACKAGE_POWER_SKU_0_0_0_MCHBAR)—Offset 70A0h	12024000600118h
70A8h	70AFh	Package RAPL Power Limit (P_CR_PACKAGE_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 70A8h	0h
70B0h	70B3h	IA_PERF_LIMIT_REASONS (P_CR_IA_PERF_LIMIT_REASONS_0_0_0_MCHBAR)—Offset 70B0h	0h
70C0h	70C3h	IA Core C0 Residency Counter (P_CR_TELEM_IA_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C0h	0h
70C4h	70C7h	Graphics C0 Residency Counter (P_CR_TELEM_GT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C4h	0h
70C8h	70CBh	I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C8h	0h
70CCh	70CFh	TELEM_IA_FREQ_ACCUMULATOR (P_CR_TELEM_IA_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70CCh	0h
70D0h	70D3h	Graphics C0 Residency Counter (P_CR_TELEM_GT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70D0h	0h
70D4h	70D7h	I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70D4h	0h
70E8h	70EFh	Memory Active Residency (P_CR_TELEM_FAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E8h	0h
70F4h	70F7h	Package Temperatures (P_CR_PACKAGE_TEMPERATURES_0_0_0_MCHBAR)—Offset 70F4h	0h
7104h	7107h	Package Thermal Limit Control (P_CR_THERMAL_LIMIT_CONTROL_0_0_0_MCHBAR)—Offset 7104h	0h
7108h	710Bh	Memory Subsystem Frequency Capabilities (P_CR_MEMSS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7108h	0h
7114h	7117h	Memory Controller (MC) BIOS Reset Request and Status (P_CR_MC_BIOS_REQ_0_0_0_MCHBAR)—Offset 7114h	0h
7118h	711Bh	MEMSS_FREQUENCY_CAPABILITIES1 (P_CR_MEMSS_FREQUENCY_CAPABILITIES1_0_0_0_MCHBAR)—Offset 7118h	0h

Table 5-7. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7160h	7163h	PP1_C0_CORE_CLOCK_0_0_0_MCHBAR (P_CR_PP1_C0_CORE_CLOCK_0_0_0_MCHBAR)—Offset 7160h	0h
7164h	7167h	Core Exists Vector (P_CR_CORE_EXISTS_VECTOR_0_0_0_MCHBAR)—Offset 7164h	0h
7168h	716Bh	Software Core Disable Mask (P_CR_CORE_DISABLE_MASK_0_0_0_MCHBAR)—Offset 7168h	0h
71F0h	71F7h	PL3 and PL4 Control (P_CR_PL3_CONTROL_0_0_0_MCHBAR)—Offset 71F0h	0h
7244h	7247h	Graphics Superqueue Active Clocks (P_CR_PP1_ANY_THREAD_ACTIVITY_0_0_0_MCHBAR)—Offset 7244h	0h
7248h	724Bh	LPDDR DRAM Thermal (MR4) Status of Channel 00 (P_CR_MEM_MR4_TEMPERATURE_DEV3_0_0_0_MCHBAR)—Offset 7248h	0h
724Ch	724Fh	LPDDR DRAM Thermal (MR4) Status of Channel 11 (P_CR_MEM_MR4_TEMPERATURE_DEV4_0_0_0_MCHBAR)—Offset 724Ch	0h

5.7.1 Thermal Device Mailbox Data0 (P_CR_THERMAL_MAILBOX_DATA0_0_0_0_MCHBAR)—Offset 7000h

This register represents the lower 32b of the thermal mailbox data. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA[31:0] (DATA):** This field contains the low 32 bits of data associated with specific commands.

5.7.2 Thermal Device Mailbox Data1 (P_CR_THERMAL_MAILBOX_DATA1_0_0_0_MCHBAR)—Offset 7004h

This register represents the upper 32b of the thermal mailbox data. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA[63:32] (DATA):** This field contains the low 32 bits of data associated with specific commands.

5.7.3 Thermal Device Mailbox Interface (P_CR_THERMAL_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7008h

This register implements the control and response of the Thermal Device Mailbox. Software may use this mailbox to configure and query various parameters into SOC thermal / power control. This particular register is responsible for initiating requests to the thermal device and reading responses. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Run/Busy (RUN_BUSY):** The run/busy control is used for managing the semaphore on the mailbox interface. Typical usage involves the following flow: • Software waits for the interface run/busy bit to clear. • Software writes the mailbox data registers as appropriate for this command. • Software writes a command encoding and sets the run/busy bit in the interface register. • Software waits for the interface run/busy bit to clear to indicate the command has been handled. • Software queries the completion code in the command field of the interface register to ensure it passed (0b indicates pass) Bit encoding for the run/busy: • 0 = The thermal mailbox is idle or the last request has been completed. Software may initiate new requests. • 1 = The thermal mailbox is busy. The thermal device is still handling a request. Writes to thermal mailbox are not allowed at this time.
30:29	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:8	0h RW/V	**Additional Parameters (ADDR_CNTL):** This field is used as an additional modifier to the command encoding for incoming mailbox requests. In thermal device mailbox responses, this field is always zero. The applicability of this additional parameter field is handled on a case by case basis for the services supplied by this mailbox
7:0	0h RW/V	**Command / Completion Code (COMMAND):** For incoming requests (where run/busy=1), this field represents the command opcode. For responses (where run/busy=0), this field represents the response completion code. A completion code of 0b indicates passing, all other completion codes indicate failure.

5.7.4 Thermal Device IRQ and Lock Configuration (P_CR_THERMAL_DEVICE_IRQ_0_0_0_MCHBAR)—Offset 700Ch

IRQ vector number for thermal/power device that is sent to the IOAPIC and Lock field for INTR_LAT_0_0_1_PCI.INTRPIN

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**LOCK (LOCK):** Used to lock P_CR_INTR_LAT_0_0_1_PCI.INTPIN. BIOS should set this lock bit before passing control to the OS
30:8	0h RO	**RESERVED (RESERVED):** Reserved
7:0	0h RW	**IRQ (IRQ):** IRQ vector number for the thermal / power device. This field controls the event vector issues to the IOAPIC. It must be configured by BIOS for INTA support.

5.7.5 Package Thermal Interrupt Control (P_CR_PKG_THERM_INTERRUPT_0_0_0_MCHBAR)—Offset 7010h

This register is used to manage processor thermal interrupts, including management of filtering on the virtual thermal sensor control signal. These features are designed to allow software to implement smooth control of thermally significant events for platform thermal management. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**Time Window (TIME_WINDOW):** Virtual Temperature thermal filter RC time constant. Virtual temperature readings are run through an RC filter before they are fed into status and interrupt generation. This filtering allows software smooth control of thermal responses to thermally significant events. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
23:16	0h RW	**Thermal Threshold 2 Temperature (THRESHOLD2_TEMP):** Thermal interrupt threshold temperature in degrees Celsius. Described in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). E.g., a reading of 0x28 == 40'C. This threshold is managed relative to the filtered temperature.
15:8	0h RW	**Thermal Threshold 1 Temperature (THRESHOLD1_TEMP):** Thermal interrupt threshold temperature in degrees Celsius. Described in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). E.g., a reading of 0x28 == 40'C. This threshold is managed relative to the filtered temperature.
7:3	0h RO	Reserved.
2	0h RW	**Critical Thermal Event Interrupt Enable (CRITICAL_THERMAL_INT_ENABLE):** Enable thermal interrupt generation when the processor has detected a critical thermal event that requires immediate servicing. This event is intended to be an alert indicating thermal control failure and is an early warning of thermal runaway.
1	0h RW	**THRESHOLD2_INT_ENABLE (THRESHOLD2_INT_ENABLE):** When set, enables the generation of a thermal interrupt whenever the Thermal Threshold 2 Temperature is crossed. Interrupts are generated when the threshold is crossed in either direction. Interrupt destination is programmed in the TMBAR configuration space.
0	0h RW	**Threshold 1 Interrupt Enable (THRESHOLD1_INT_ENABLE):** When set, enables the generation of a thermal interrupt whenever the Thermal Threshold 1 Temperature is crossed. Interrupts are generated when the threshold is crossed in either direction. Interrupt destination is programmed in the TMBAR configuration space.

5.7.6 ISPDRIVER_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR (P_CR_PROCESSING_SYSTEM_FREQ_CAPABILITIES_0_0_0_MCHBAR)—Offset 7014h

PUNIT_MMIO: Image Processing System Frequency Capabilities
This register describes the frequency capabilities of the image processing system. Units are 25MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved ratio for the image processing system. Units are 25MHz multiplied by the ratio. This value is updated dynamically whenever the processing system frequency changes.
23:16	0h RO/V	**MAX_RATIO (MAX_RATIO):** Maximum ratio for the image processing system. Units are 25MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_RATIO (EFFICIENT_RATIO):** Firmware-calculated efficient ratio for the image processing system. Units are 25MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_RATIO (MIN_RATIO):** Minimum ratio for the image processing system. Units are 25MHz multiplied by the ratio.

5.7.7 Package Thermal Status (P_CR_PKG_THERM_STATUS_0_0_0_MCHBAR)—Offset 701Ch

This register is used to monitor the status of the package level virtual thermal sensor and details on the source of package level thermal events. The package level virtual thermal sensor is a filtered version of the maximum temperature observed at any domain within the package. That temperature is applied to the Package Thermal Interrupt configuration for event delivery to software for run-time thermal management. When an event is observed, this register describe the source(s) of that event.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RO/V	**Temperature (TEMPERATURE):** Virtual maximum SOC temperature in degrees Celsius. Calculated as a maximum of all on-die thermal sensor readings and filtered according to the time constant described in the PKG_THERM_INTERRUPT register. Data format is signed, 2's complement with the LSB representing 1'C resolution (S8.7.0).
15:6	0h RO	Reserved.
5	0h RW/0C/V	**Critical Thermal Event Log (CRITICAL_THERMAL_EVENT_LOG):** Sticky log bit indicating that the processor has operated out of its thermal specification since the last time software cleared this bit. Set by hardware on a 0 to 1 transition of Critical Thermal Event Status.
4	0h RO/V	**Critical Thermal Event Status (CRITICAL_THERMAL_EVENT_STATUS):** Status bit indicating that the processor is operating outside of its thermal specification. It is intended as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RW/0C/V	**Thermal Threshold 2 Log (THRESHOLD2_LOG):** Sticky log bit that indicates temperature has crossed the software programmable thermal threshold2 in either falling or rising directions.
2	0h RO/V	**Thermal Threshold 2 Status (THRESHOLD2_STATUS):** Indicates that the current filtered temperature (bits 23:16 of this register) is greater than or equal to the Threshold2 defined in the PKG_THERM_INTERRUPT configuration register.
1	0h RW/0C/V	**Thermal Threshold 1 Log (THRESHOLD1_LOG):** Sticky log bit that indicates temperature has crossed the software programmable thermal threshold1 in either falling or rising directions.
0	0h RO/V	**Thermal Threshold 1 Status (THRESHOLD1_STATUS):** Indicates that the current filtered temperature (bits 23:16 of this register) is greater than or equal to the Threshold1 defined in the PKG_THERM_INTERRUPT configuration register.

5.7.8 LPDDR DRAM Thermal (MR4) Status of Channel 01 (P_CR_MEM_MR4_TEMPERATURE_DEV1_0_0_0_MCHBAR)—Offset 7024h

LPDDR DRAM Thermal (MR4) Status of Channel 01, when there are multiple DRAMs in a rank, the maximum MR4 is reported

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 01 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 01 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

5.7.9 LPDDR DRAM Thermal (MR4) Status of Channel 10 (P_CR_MEM_MR4_TEMPERATURE_DEV2_0_0_0_MCHBAR)—Offset 7028h

LPDDR DRAM Thermal (MR4) Status of Channel 10, when there are multiple DRAMs in a rank, the maximum MR4 is reported

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 10 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 10 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

5.7.10 Machine Check Error Source Log (P_CR_MCA_ERROR_SRC_0_0_0_MCHBAR)—Offset 702Ch

This register logs error source information i.e IERR or MCERR information for Pcode. The error fields are cleared by HW or BIOS. This register is also shadowed in the I/O space.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CATERR (CATERR):** Asserted by HW on IERR or MCERR assertion.
30	0h RW/V	**IERR (IERR):** Asserted by HW on IERR assertion.
29	0h RW/V	**MCERR (MCERR):** Asserted by HW on MCERR assertion.
28:8	0h RO	Reserved.
7:0	0h RW	**RESERVED (RESERVED):** Undefined - reserved for future use.

5.7.11 DDR Thermal Throttling Control (P_CR_DDR_THERM_THRT_CTRL_0_0_0_MCHBAR)—Offset 7030h

This register is used to configure thermal throttling policies for memory.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**RESERVED_1 (RESERVED_1):** RESERVED
25	0h RW/V	**DDR3L Refresh Rate (DDR3L_REFRESH_RATE):** This field is to allow platform software to request refresh rate for DDR3L
24	0h RW/V	**DDR3L Throttle Enable (THROTTLE_LEVEL_ENABLE):** When set and DRAM_Type is DDR3L, SOC throttles memory traffic to level specified in THRT_LVL NOTE: This field is ignored if DRAM_Type is not DDR3L

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW/V	**DDR3L Throttle Level (THROTTLE_LEVEL):** Throttle level in %BW, in units of 1%. Default = 0%. Input of 100 or higher is clipped to 100%, NOTE: this field is ignored if DRAM_type is not DDR3L
15:10	0h RO	**RESERVED_0 (RESERVED_0):** RESERVED
9	0h RW/V	**Memory Thermal Throttle Enable (MEM_THRT_ENABLE):** When set, memory traffic is throttled if memory MR4 value >= THERM_THRT_THRESHOLD, respectively. Thermal throttling is achieved by applying memory bandwidth clips in the memory subsystem.
8	0h RW/V	**Memory Thermal Throttling Configuration (MEM_THRT_CFG):** Configure memory throttling behavior. Policies are defined as follows: • 0 = Thermal throttling policy uses instantaneous MR4 status for THERM_THRT_THRESHOLD • 1 = Thermal throttling policy uses time filtered MR4 status for THERM_THRT_THRESHOLD. Filtering time constant is configured in the DDR_THERM_INTERRUPT register.
7	0h RW/V	**Reserved (NM_THERM_THRT_ENABLE):** Reserved
6:4	0h RW/V	**Reserved (NM_THERM_THRT_THRESHOLD):** Reserved
3	0h RW/V	**LPDDR Memory Thermal Throttling Enable (FM_THERM_THRT_ENABLE):** When set, throttling is activated if LPDDR memory MR4 value is greater than or equal to THERM_THRT_THRESHOLD. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this bit should be set to enable LPDDR throttling to keep DRAM within its Tcasemax spec.
2:0	0h RW/V	**LPDDR Memory Thermal Throttling Threshold (FM_THERM_THRT_THRESHOLD):** Configurable threshold of LPDDR memory MR4 value greater than or equal to which thermal throttling is activated. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this field should be configured to avoid DRAM to exceed its Tcasemax spec. • Memory MR4 >= Threshold = Enable thermal throttling • Memory MR4 < Threshold = Disable thermal throttling

5.7.12 DDR Thermal Interrupt Control (P_CR_DDR_THERM_INTERRUPT_0_0_0_MCHBAR)—Offset 7034h

This register is used to manage DDR thermal interrupts, including management of filtering on the virtual DRAM thermal sensor control signal. These features are designed to allow software to implement smooth control of thermally significant events for platform thermal management.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**Time Window (TIME_WINDOW):** Virtual Temperature thermal filter RC time constant. Virtual temperature readings are run through an RC filter before they are fed into status and interrupt generation. This filtering allows software smooth control of thermal responses to thermally significant events. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
23:16	0h RO	Reserved.
15	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD2_INT_ENABLE):** Reserved
14:12	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD2):** Reserved
11	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD1_INT_ENABLE):** Reserved
10:8	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD1):** Reserved
7	0h RW	**Memory MR4 Threshold 2 Interrupt Enable (FAR_MEM_MR4_THRESHOLD2_INT_ENABLE):** Enable thermal interrupt generation whenever the virtual maximum memory MR4 has crossed THRESHOLD2. Interrupts are triggered when the filtered MR4 temperature crosses in both rising and falling directions.
6:4	0h RW	**Memory MR4 Threshold 2 (FAR_MEM_MR4_THRESHOLD2):** Configurable memory threshold2 value for memory thermal interrupt generation
3	0h RW	**Memory MR4 Threshold 1 Interrupt Enable (FAR_MEM_MR4_THRESHOLD1_INT_ENABLE):** Enable thermal interrupt generation whenever the virtual maximum memory MR4 has crossed THRESHOLD1. Interrupts are triggered when the filtered MR4 temperature crosses in both rising and falling directions.
2:0	0h RW	**Memory MR4 Threshold 1 (FAR_MEM_MR4_THRESHOLD1):** Configurable memory threshold1 value for memory thermal interrupt generation

5.7.13 DDR Thermal Status (P_CR_DDR_THERM_STATUS_0_0_0_MCHBAR)—Offset 7038h

Status register for monitoring DDR thermal status. Data reported here is aggregated by memory type, and values reported represent the maximum MR4 readings observed in those respective domains. Temperatures are additionally filtered by the MR4 thermal filtering time constant described in the DDR Thermal Interrupt configuration register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21:19	0h RO/V	**Reserved (NEAR_MEM_MR4):** Reserved
18:16	0h RO/V	**LPDDR Memory MR4 (FAR_MEM_MR4):** Virtual maximum memory MR4 reading. Calculated as a maximum of all LPDDR memory MR4 readings and filtered according to the time constant described in DDR_THERM_INTERRUPT register.
15:8	0h RO	Reserved.
7	0h RW/0C/V	**Reserved (NEAR_MEM_MR4_THRESHOLD2_LOG):** Reserved
6	0h RO/V	**Reserved (NEAR_MEM_MR4_THRESHOLD2_STATUS):** Reserved
5	0h RW/0C/V	**Reserved (NEAR_MEM_MR4_THRESHOLD1_LOG):** Reserved
4	0h RO/V	**Reserved (NEAR_MEM_MR4_THRESHOLD1_STATUS):** Reserved
3	0h RW/0C/V	**Memory MR4 Threshold2 Log (FAR_MEM_MR4_THRESHOLD2_LOG):** Indicates that the virtual maximum memory MR4 has crossed THRESHOLD2 since the last time this register was cleared. The bit is set when the threshold is crossed in either direction. Software may clear this bit.
2	0h RO/V	**Memory MR4 Threshold2 Status (FAR_MEM_MR4_THRESHOLD2_STATUS):** Status bit is set when the virtual maximum memory MR4 reading is greater than or equal to THRESHOLD2. It is cleared when temperature is less than THRESHOLD2

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/0C/V	**Memory MR4 Threshold1 Log (FAR_MEM_MR4_THRESHOLD1_LOG):** Indicates that the virtual maximum memory MR4 has crossed THRESHOLD1 since the last time this register was cleared. The bit is set when the threshold is crossed in either direction. Software may clear this bit.
0	0h RO/V	**Memory MR4 Threshold1 Status (FAR_MEM_MR4_THRESHOLD1_STATUS):** Status bit is set when the virtual maximum memory MR4 reading is greater than or equal to THRESHOLD1. It is cleared when temperature is less than THRESHOLD1

5.7.14 Dram Energy Counter (P_CR_DDR_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7048h

Reports total energy consumed in DRAM. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by DDR RAPL or OLTM control algorithms if the product supports those features.
To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**JOULES (JOULES):** Total Joules of energy consumed by all DIMMs. Units are proportional to Joules and are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT.

5.7.15 DDR RAPL Performance Status (P_CR_DDR_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 704Ch

Memory RAPL performance throttling counter. This counter accumulates time that any channel in the memory controller is bandwidth throttled due to memory RAPL constraints. This counter counts total time (in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units) that any channel is throttled. If

two channels are throttled, this counter increments at a 2x rate, so that for 1ms in wall clock time the counter counts 2ms. This counter does not include throttling as a result of thermal management or MEMHOT. This register is updated at approximately 1ms intervals. This counter is normalized to 'seconds' and is not subject to variation of actual DRAM clock speeds. This register is read only for software via MMIO MSR and PECI/PCS. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 58F0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	58F0h RW	**DDR Bandwidth Throttle Duration (DURATION):** Bandwidth throttle duration counter due to Memory RAPL. Sum across all channels in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units. This data can serve as a proxy for the potential performance impacts of RAPL on memory accesses.

5.7.16 Package RAPL Performance Status (P_CR_PACKAGE_RAPL_PERF_STATUS_0_0_0_MCHBAR) —Offset 7050h

Counts time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT. If software uses the TURBO_ACTIVATION_RATIO or PECI ACPI P-NOTIFY, the turbo activation ratios described by those features will may elevate the effective OS request (as calculated by this counter) to max turbo. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Performance Throttle Duration (COUNTS):** Time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT

5.7.17 IA Core Performance / Power Priority Control (P_CR_PRIMARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7054h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
4:0	0h RW	**IA Core Priority Level (PRIPTP):** Performance priority Level for the IA Core (primary) power plane. A higher number implies a higher priority.

5.7.18 Graphics Performance / Power Priority Control (P_CR_SECONDARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7058h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
4:0	10h RW	**Graphics Priority Level (SECPTP):** Performance priority Level for the Graphics (secondary) power plane. A higher number implies a higher priority.

5.7.19 IA Energy Counter (P_CR_PRIMARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 705Ch

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.
To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**IA Energy Counter (DATA):** Contains an accumulated value of the energy consumed in the primary power plane. To find the energy consumed in a given time window, software should subtract the two energy readings. Software will have to take care of counter wrapping around when it overflows. Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT

5.7.20 Graphics Energy Counter (P_CR_SECONDARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7060h

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.
To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

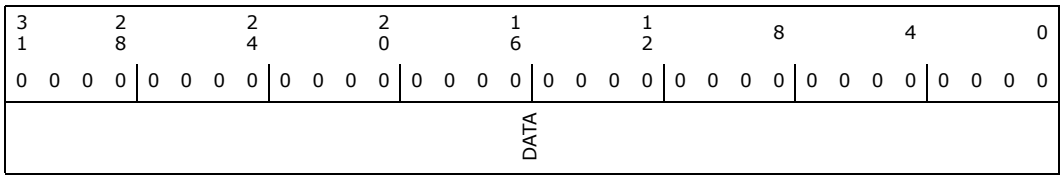
Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**SOC Energy Counter (DATA):** Contains accumulated energy consumed by the entire CPU. This counter will wrap around and keep counting when the counter overflows. Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT

5.7.23 GT_PERF_STATUS (P_CR_GT_PERF_STATUS_0_0_0_MCHBAR)—Offset 7070h

Contains the voltage and ratio status for GT. This register is mapped to GT_PERF_STATUS_0_0_0_MCHBAR.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	Reserved.
25:17	0h RO/V	**RP_STATE_RATIO_SLICE (RP_STATE_RATIO_SLICE):** Ratio of the current RP-state, in 16.6Mhz 1xclks. When the graphics engine is in RC6, this field is zeroed out.
16:8	0h RO/V	**RP_STATE_RATIO_UNSLICE (RP_STATE_RATIO_UNSLICE):** Ratio of the current RP-state, in 16.6Mhz 1xclks. When the graphics engine is in RC6, this field is zeroed out.
7:0	0h RO/V	**RP_STATE_VOLTAGE (RP_STATE_VOLTAGE):** RP-State Voltage GT Target Voltage in U1.7 Volts

5.7.24 Temperature Reference and Control (P_CR_TEMPERATURE_TARGET_0_0_0_MCHBAR)—Offset 7074h

This register contains information about the fan speed control target temperature as well as details on the reference temperature for IA core DTS relative temperature reading. **MSR_Name**: TEMPERATURE_TARGET **MSR_Addr**: 0x1A2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 5A0000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
30:24	0h RW	**Thermal Monitor Activation Offset Control (TJ_MAX_TCC_OFFSET):** This field allows platform software to configure the temperature at which thermal monitor engages to be lower than the manufacturing configured maximum constraint. This field is programmed in 1'C units. E.g., if the default silicon configured maximum temperature is 100'C and this field is configured to 10, then the silicon will engage thermal throttling algorithms at 90'C

Bit Range	Default & Access	Field Name (ID): Description
23:16	5Ah RO/V	**Reference Temperature (REF_TEMP):** Tjmax a.k.a. Thermal Monitor activation temperature or Prochot Temperature. This is the maximum junction temperature at which thermal throttling aka thermal monitor is activated. This temperature is the maximum temperature at which the silicon is capable of operating at. All IA core digital thermal sensor readings are reported as a relative negative offset from this reference temperature, such that a read on of zero implies the cores are running at this temperature.
15:8	0h RO/V	**Fan Temperature Target Offset (FAN_TEMP_TARGET_OFFSET):** Fan Temperature Target Offset a.k.a. TControl indicates the relative offset from the the Thermal Monitor Trip Temperature at which fans should be engaged.
7:0	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved

5.7.25 BIOS Reset Completion (P_CR_BIOS_RESET_CPL_0_0_0_MCHBAR)—Offset 7078h

This register is used as a means for BIOS to communicate staging to the Punit / Pcode. The exact definition and utility of each bit may differ across products. The general philosophy is that when BIOS is done with stage0, it writes the RST_CPL0 bit and then waits for the PCODE_INIT_DONE0 bit to be set before proceeding to the next step.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RESERVED0 (RESERVED0):** reserved
15	0h RO/V	**Stage7 Pcode Reset Complete (PCODE_INIT_DONE7):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
14	0h RO/V	**Stage6 Pcode Reset Complete (PCODE_INIT_DONE6):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO/V	**Stage5 Pcode Reset Complete (PCODE_INIT_DONE5):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
12	0h RO/V	**Stage4 Pcode Reset Complete (PCODE_INIT_DONE4):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
11	0h RO/V	**Stage3 Pcode Reset Complete (PCODE_INIT_DONE3):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
10	0h RO/V	**Stage2 Pcode Reset Complete (PCODE_INIT_DONE2):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
9	0h RO/V	**Stage1 Pcode Reset Complete (PCODE_INIT_DONE1):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
8	0h RO/V	**Stage0 Pcode Reset Complete (PCODE_INIT_DONE):** Pcode has completed its actions in response to Stage0 BIOS Reset complete. Between BIOS Stage0 complete and pcode Stage0 complete, pcode will apply all power savings configurations to PCS and will set up C_STATE_LATENCY control MSR settings for IRTL management.
7	0h RW	**Stage7 BIOS Reset Complete (RST_CPL7):** reset complete
6	0h RW	**Stage6 BIOS Reset Complete (RST_CPL6):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
5	0h RW	**Stage5 BIOS Reset Complete (RST_CPL5):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
4	0h RW	**Stage4 BIOS Reset Complete (RST_CPL4):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Stage3 BIOS Reset Complete (RST_CPL3):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
2	0h RW	**Stage2 BIOS Reset Complete (RST_CPL2):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
1	0h RW	**Stage1 BIOS Reset Complete (RST_CPL1):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
0	0h RW	**Stage0 BIOS Reset Complete (RST_CPL):** Set by BIOS to indicate that all power management configurations as part of reset are complete. This must include Punit patch load done as well as all relevant Punit power management register and mailbox configurations done. Once this bit is set, Punit will allow normal power management to start. Before setting this bit, P-states and C-states support is disabled. BIOS should wait before receiving the Pcode Stage0 reset complete before proceeding with any further steps.

5.7.26 BIOS_MAILBOX_DATA (P_CR_BIOS_MAILBOX_DATA_0_0_0_MCHBAR)—Offset 7080h

Data register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

5.7.27 BIOS_MAILBOX_INTERFACE (P_CR_BIOS_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7084h

Control and Status register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** SW may write to the two mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode. After setting this bit SW will poll this bit until it is cleared. PCODE will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:29	0h RO	Reserved.
28:8	0h RW/V	**ADDRESS (ADDRESS):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

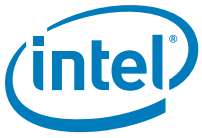
5.7.28 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7088h

PUNIT_MMIO: Core Frequency Capabilities
This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.

5.7.29 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 708Ch

PUNIT_MMIO: Graphics Engine Frequency Capabilities
This register describes the frequency capabilities of the integrated graphics engine. Units are 50MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.

5.7.30 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7090h

PUNIT_MMIO: System Agent Frequency Capabilities
This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio.
Last resolved ratio is updated upon changes to the System Agent frequency.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

5.7.31 Memory Frequency Status (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7094h

This register reports out the LPDDR memory frequency. The actual capabilities of the SOC with respect to LPDDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Last Resolved Memory Frequency (LAST_RESOLVED_RATIO):** This field reports out the LPDDR memory frequency in integer multiple of 133.33MHz. This register reflects what BIOS has programmed as the default LPDDR frequency in products that do not support run-time memory frequency control. For products supporting run-time memory frequency control, this field describes the last resolved frequency.
23:16	0h RO/V	**RESERVED_2 (RESERVED_2):** Reserved
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved
7:0	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved

5.7.32 Package Power SKU and RAPL Power Control Capabilities (P_CR_PACKAGE_POWER_SKU_0_0_0_MCHBAR)—Offset 70A0h

This register describes the the power SKU of the part and limits on time window and power limit configuration allowed in the RAPL PL1 and PL2 configuration registers.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 12024000600118h

Bit Range	Default & Access	Field Name (ID): Description
63:55	0h RO	**RESERVED_3 (RESERVED_3):** Reserved
54:48	12h RW	**RAPL Maximum Allowed Time Window (PKG_MAX_WIN):** The maximal time window allowed to be programmed for RAPL PL1 and PL2 controls for the SKU. Higher values will be clamped to this value. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
47	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
46:32	240h RW	**RAPL Maximum Power Limit (PKG_MAX_PWR):** The maximal package power setting allowed for the SKU. Higher values will be clamped to this value. The maximum setting is typical not guaranteed. The default value for this field is determined by fuses. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
30:16	60h RW	**Package Minimum Power (PKG_MIN_PWR):** The minimal package power setting allowed for the SKU. Lower values may not be achievable by run-time RAPL PL1 and PL2 control algorithms.
15	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
14:0	118h RW	**PKG_TDP (PKG_TDP):** The TDP package power setting allowed for the SKU. The TDP setting is typical not guaranteed. The default value for this field is determined by fuses. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].

5.7.33 Package RAPL Power Limit (P_CR_PACKAGE_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 70A8h

Package RAPL Power Limit allows a software agent to define power limitation for the package domain. Power limitation is defined in terms of average power usage (Watts) over a time window specified. Two power limits and associated time windows can be specified. These power limits are commonly referred to as PL1 (long time window) and PL2 (short time window). Each power limit provides independent clamping control that would permit the processor cores to go below OS-requested state to meet the power limits. A lock mechanism allow the software agent to enforce power limit settings. Once the lock bit is set, the power limit settings are static and un-modifiable until next RESET.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**Package RAPL Lock (PKG_PWR_LIM_LOCK):** When set all settings in this register are locked and are treated as Read Only. This lock control is persistent until the next reset. This bit will typically set by BIOS during boot time or resume from Sx.
62:56	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
55:49	0h RW/L	**Power Limit 2 (PL2) Time Window (PKG_PWR_LIM_2_TIME):** Time window for Power Limit 1 (PL2). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
48	0h RW/L	**Power Limit 2 (PL2) Clamp (PKG_CLMP_LIM_2):** Clamp mode control for PL2. • 0 = PL2 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL2 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
47	0h RW/L	**Power Limit 2 (PL2) Enable (PKG_PWR_LIM_2_EN):** Enable for Power Limit 2 (PL2). Setting this bit activates the power limit and time window defined for PL2.
46:32	0h RW/L	**Power Limit 2 (PL2) (PKG_PWR_LIM_2):** Sets the average power usage limit of the package domain corresponding to the PL2 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL2 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.
31:24	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
23:17	0h RW/L	**Power Limit 1 (PL1) Time Window (PKG_PWR_LIM_1_TIME):** Time window for Power Limit 1 (PL1). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/L	**Power Limit 1 (PL1) Clamp (PKG_CLMP_LIM_1):** Clamp mode control for PL1. • 0 = PL1 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL1 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
15	0h RW/L	**Power Limit 1 (PL1) Enable (PKG_PWR_LIM_1_EN):** Enable for Power Limit 1 (PL1). Setting this bit activates the power limit and time window defined for PL1.
14:0	0h RW/L	**Power Limit 1 (PL1) (PKG_PWR_LIM_1):** Sets the average power usage limit of the package domain corresponding to the PL1 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL1 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.

5.7.34 IA_PERF_LIMIT_REASONS (P_CR_IA_PERF_LIMIT_REASONS_0_0_0_MCHBAR)—Offset 70B0h

This register reports reasons for performance limitations on the IA cores. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**QOS_LOG (QOS_LOG):** Logged indication that frequency was clamped below the software-defined quality-of-service floor. This bit is set by firmware, and is clearable by software.
30	0h RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG (MAX_EFFICIENCY_FREQ_LOG):** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency. This bit is set by firmware, and is clearable by software.
29	0h RW/0C/V	**MCT_LOG (MCT_LOG):** Logged indication that frequency was clamped due to ratio change transition attenuation. This bit is set by firmware, and is clearable by software.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/0C/V	**EDP_LOG (EDP_LOG):** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint. This bit is set by firmware, and is clearable by software.
27	0h RW/0C/V	**MULTI_CORE_TURBO_LOG (MULTI_CORE_TURBO_LOG):** Logged indication that frequency was clamped due to effective multi-core turbo constraints. This bit is set by firmware, and is clearable by software.
26	0h RW/0C/V	**VR_THERMALERT_LOG (VR_THERMALERT_LOG):** Logged indication that frequency was clamped due to a voltage regulator thermal excursion. This bit is set by firmware, and is clearable by software.
25	0h RW/0C/V	**IA_UTILIZATION_LOG (IA_UTILIZATION_LOG):** Logged indication that frequency was clamped due to the autonomous utilization-based P-state control algorithm. This bit is set by firmware, and is clearable by software.
24	0h RW/0C/V	**DEV3_LOG (DEV3_LOG):** Logged indication that frequency was clamped due to a Device 3 driver override. This bit is set by firmware, and is clearable by software.
23	0h RW/0C/V	**DEV2_LOG (DEV2_LOG):** Logged indication that frequency was clamped due to a Device 2 driver override. This bit is set by firmware, and is clearable by software.
22	0h RW/0C/V	**SPARE6_LOG (SPARE6_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
21	0h RW/0C/V	**SPARE5_LOG (SPARE5_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
20	0h RW/0C/V	**SPARE4_LOG (SPARE4_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
19	0h RW/0C/V	**PL2_LOG (PL2_LOG):** Logged indication that frequency was clamped due to a package-level PL2 excursion. This bit is set by firmware, and is clearable by software.
18	0h RW/0C/V	**PL1_LOG (PL1_LOG):** Logged indication that frequency was clamped due to a package-level PL1 excursion. This bit is set by firmware, and is clearable by software.
17	0h RW/0C/V	**THERMAL_LOG (THERMAL_LOG):** Logged indication that frequency was clamped due to a thermal excursion. This bit is set by firmware, and is clearable by software.
16	0h RW/0C/V	**PROCHOT_LOG (PROCHOT_LOG):** Logged indication that frequency was clamped due to PROCHOT assertion. This bit is set by firmware, and is clearable by software.
15	0h RO/V	**QOS_STATUS (QOS_STATUS):** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	0h RO/V	**MAX_EFFICIENCY_FREQ_STATUS (MAX_EFFICIENCY_FREQ_STATUS):** Frequency is limited below the maximum efficiency frequency.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO/V	**MCT_STATUS (MCT_STATUS):** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit).
12	0h RO/V	**EDP_STATUS (EDP_STATUS):** Frequency is limited due to a package-level EDP constraint.
11	0h RO/V	**MULTI_CORE_TURBO_STATUS (MULTI_CORE_TURBO_STATUS):** Frequency is limited due to effective multi-core turbo constraints.
10	0h RO/V	**VR_THERMALERT_STATUS (VR_THERMALERT_STATUS):** Frequency is limited due to a VR thermal excursion.
9	0h RO/V	**IA_UTILIZATION_STATUS (IA_UTILIZATION_STATUS):** Frequency is limited due to autonomous utilization-based P-state control.
8	0h RO/V	**DEV3_STATUS (DEV3_STATUS):** Frequency is limited due to Dev3 driver override.
7	0h RO/V	**DEV2_STATUS (DEV2_STATUS):** Frequency is limited due to Dev2 driver override.
6	0h RO/V	**SPARE6_STATUS (SPARE6_STATUS):** Spare status bit.
5	0h RO/V	**SPARE5_STATUS (SPARE5_STATUS):** Spare status bit.
4	0h RO/V	**SPARE4_STATUS (SPARE4_STATUS):** Spare status bit.
3	0h RO/V	**PL2_STATUS (PL2_STATUS):** Frequency is limited due to a package-level PL2 excursion.
2	0h RO/V	**PL1_STATUS (PL1_STATUS):** Frequency is limited due to a package-level PL1 excursion.
1	0h RO/V	**THERMAL_STATUS (THERMAL_STATUS):** Frequency is limited due to thermal excursion.
0	0h RO/V	**PROCHOT_STATUS (PROCHOT_STATUS):** Frequency is limited due to external PROCHOT assertion.

5.7.35 IA Core C0 Residency Counter (P_CR_TELEM_IA_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C0h

This counter measures time that any core is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the IA Frequency Accumulator to calculate the average active clock ratio multiplier on the IA domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that any core is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

5.7.36 Graphics C0 Residency Counter (P_CR_TELEM_GT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C4h

This counter measures time that graphics is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the Graphics Frequency Accumulator to calculate the average active clock ratio multiplier on the GT domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that graphics is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

5.7.37 I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_C0_RESIDENCY_0_0_0_MCHBAR)—Offset 70C8h

This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the I-unit Frequency Accumulator to calculate the average active clock ratio multiplier on the I-unit domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

5.7.38 TELEM_IA_FREQ_ACCUMULATOR (P_CR_TELEM_IA_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70CCh

Frequency accumulation data counted at ART >> 4

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Residency data

5.7.39 Graphics C0 Residency Counter (P_CR_TELEM_GT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70D0h

This counter integrates the current clock ratio multiplier for the Graphics domain at the same rate as the corresponding C0 residency counter. Its primary utility is in assessing the average active frequency of the domain **Average Active Frequency = Frequency Accumulator / C0 Residency**

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Clock Ratio Multiplier Accumulator (DATA):** This counter integrates the current clock ratio of the domain at the same rate as the corresponding C0 residency counter

5.7.40 I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_FREQ_ACCUMULATOR_0_0_0_MCHBAR)—Offset 70D4h

This counter integrates the current clock ratio multiplier for the I-unit processing system domain at the same rate as the corresponding C0 residency counter. Its primary utility is in assessing the average active frequency of the domain
Average Active Frequency = Frequency Accumulator / C0 Residency

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Clock Ratio Multiplier Accumulator (DATA):** This counter integrates the current clock ratio of the domain at the same rate as the corresponding C0 residency counter

5.7.41 Memory Active Residency (P_CR_TELEM_FAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E8h

This counter measures the total time spent with memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO/V	**DATA (DATA):** This counter measures the total time spent with memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

5.7.42 Package Temperatures (P_CR_PACKAGE_TEMPERATURES_0_0_0_MCHBAR)—Offset 70F4h

Read-only register used for monitoring thermal status from all domains in the package.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**System Agent Temperature (SA_Temperature):** System agent domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
23:16	0h RO/V	**I-unit Temperature (ISP_Temperature):** Camera domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
15:8	0h RO/V	**Graphics Temperature (GT_Temperature):** Graphics domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
7:0	0h RO/V	**IA Core Temperature (IA_Temperature):** Virtual max temperature of all IA cores in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered

5.7.43 Package Thermal Limit Control (P_CR_THERMAL_LIMIT_CONTROL_0_0_0_MCHBAR)—Offset 7104h

This register is used for run-time control of the package level virtual thermal sensor. This interrupt and threshold is most commonly utilized by drivers wishing to control maximum silicon temperature in order to manage local or system level thermals due to various physical constraints. This temperature configuration applies only to in-die thermal sensors and not to any DRAM related thermal control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RW	**Enable (ENABLE):** When set, it enables run-time thermal limit control to the THERMAL_LIMIT_TEMP described in this register.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Package Thermal Limit Temperature (THERMAL_LIMIT_TEMP):** Maximum SOC temperature allowed. Described in a signed, 2's complement format with the least significant bit representing 1'C resolution (S8.7.0). If the setting is higher than the processor's factory configured maximum temperature as described in the TEMPERATURE_TARGET MSR, this field is ignored. This field may be updated at any time.

5.7.44 Memory Subsystem Frequency Capabilities (P_CR_MEMSS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7108h

Describes the maximum frequency capabilities of DDR supported on this particular SOC. If the maximum supported frequency reports a zero, it indicates that the respective DRAM technology is not supported on this product.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Reserved (NUM_NM_CH):** Reserved
29:24	0h RW	**Reserved (WIO_FREQ):** Reserved
23:18	0h RW	**LPDDR4 Max Frequency (LP4_FREQ_HIGH):** This field indicates maximum LPDDR4 frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates LPDDR4 is not supported.
17:12	0h RW	**LPDDR4 Max Frequency at Min Voltage (LP4_FREQ_LOW):** This field indicates maximum LPDDR4 frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as 'Max' frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR4 is not supported.
11:6	0h RW	**LPDDR3 Max Frequency (LP3_FREQ_HIGH):** This field indicates maximum LPDDR3 frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates LPDDR3 is not supported.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**LPDDR3 Max Frequency at Min Voltage (LP3_FREQ_LOW):** This field indicates maximum LPDDR3 frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as 'Max' frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR3 is not supported.

5.7.45 Memory Controller (MC) BIOS Reset Request and Status (P_CR_MC_BIOS_REQ_0_0_0_MCHBAR)—Offset 7114h

This register is used as the primary interface between BIOS and P-unit with respect to the Memory sub-system reset flow. This register provides both details about the current memory configuration as well as memory power-up sequencing controls. The typical memory subsystem reset and configuration flow is as follows. Each bullet describes the strict sequential ordering of the flow.

- BIOS reads MEMSS_FREQUENCY_CAPABILITIES to discover silicon capabilities.
- BIOS detects LPDDR DRAM frequency and the number of LPDDR channels that have DRAM devices attached. These results are then configured into the LPDDR channel active and frequency configuration fields.
- BIOS discovers if DRAM is currently in self-refresh, and if so, it configures Request Type (REQ_TYPE) to 100b to indicate this state. The SOC then uses this information as a way to ensure proper self-refresh exit flows as part of power-up sequencing.
- Once the lower 16 bits of the MC_BIOS_REQ register are configured based on platform discovery, BIOS sets Run/Busy to initiate firmware to start the memory subsystem reset sequence.
- P-unit firmware executes the initial configuration of PHY settings, and when complete it clears Run/Busy bit
- BIOS executes DDR PHY static configuration flow and initializes PHY PLL, and ensures that both steps are complete
- BIOS sets MC_BIOS_REQ.PHY_CONFIG_COMPLETE and MC_BIOS_REQ.RUN_BUSY to start the next phase
- P-unit firmware initiates the power-up sequence for D-units and Wide I/O collateral logic.
- P-unit firmware sets MC_BIOS_REQ.DUNIT_RESET_COMPLETE and clears the Run/Busy when it is done.
- BIOS observes Run/Busy deassertion and continues with MRC flow to initialize, train, configure memory subsystem settings.
- BIOS sets MC_BIOS_REQ.CPGC_MODE_COMPLETE and MC_BIOS_REQ.RUN_BUSY to start the next phase
- P-unit firmware configures D-unit, PHY to support normal operation of memory subsystem, and when completed, clears the Run/Busy bit
- BIOS waits for MC_BIOS_REQ.RUN_BUSY to clear, and then complete remaining configuration of Dunit and MLMC.
- BIOS executes memory configuration validation and lock sequence with the CSE.
- BIOS sets MC_BIOS_REQ.MEM_INIT_DONE and MC_BIOS_REQ.RUN_BUSY to indicate to Punit that all memory configuration is complete and memory configuration is locked.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Run/Busy (RUN_BUSY):** This bit indicates that the BIOS request is pending for P-unit firmware processing. BIOS sets this bit together with command details defined in the lower bits of this register. Firmware may only clear this bit after the BIOS request has been observed and completed. • 0 = The MC BIOS reset mailbox is idle or the last request has been completed. Software may initiate new requests. • 1 = The MC BIOS reset mailbox is busy. It is still handling a request. Writes to the mailbox are not allowed at this time.
30:27	0h RW	**RESERVED_2 (RESERVED_2):** reserved
26:24	0h RW	**DRAM_TYPE (DRAM_TYPE):** BIOS programs DRAM type filed: • 001b = LPDDR3 • 010b = LPDDR4 • 100b = DDR3L • else = reserved
23:20	0h RW	**RESERVED_1 (RESERVED_1):** reserved
19	0h RW	**Memory Init Done (MEM_INIT_DONE):** BIOS programs this bit after memory subsystem is fully configured, including security locking configuration completed
18	0h RW	**CPGC Mode Complete (CPGC_MODE_COMPLETE):** BIOS programs this bit after the memory train/init flow is complete. This initiates P-unit firmware execution of memory and D-unit clock configuration settings for normal operation
17	0h RW	**D-unit Reset Complete (DUNIT_RESET_COMPLETE):** Punit programs this bit after memory subsystem IPs are powered and corresponding reset flows are complete. At this point, those blocks are ready for executing the memory training flow, including intialization to support CPGC mode. BIOS can talk to Dunit after this.
16	0h RW	**Memory PHY Configuration Complete (PHY_CONFIG_COMPLETE):** BIOS programs this bit indicating PHY initial configuration is complete and all DDR PHY PLLs are locked. Upon observation of this flag, P-unit firmware will initiate the power-up sequence of memory subsystem related IPs

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**DDR Channel 11 Active (FM_CH3_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
14	0h RW	**DDR Channel 00 Active (FM_CH2_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
13	0h RW	**DDR Channel 10 Active (FM_CH1_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
12	0h RW	**DDR Channel 01 Active (FM_CH0_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
11	0h RW	**RESERVED_2 (WIO_ONLY):** Reserved
10	0h RW	**RESERVED_0 (RESERVED_0):** reserved
9	0h RW	**RESERVED_3 (REQ_TYPE_SPECIAL):** reserved
8:6	0h RW	**Request Type (REQ_TYPE):** This field is used to configure reset hints to the P-unit firmware. Encodings include: • 1xxb = Memory is in self-refresh, manual self-refresh exit is required • 0xxb = Memory is not in self-refresh or DRAM contents do not need to be preserved.
5:0	0h RW	**DDR Frequency Configuration (REQ_DATA):** BIOS programs this field to request DDR frequency in integer multiple of 133.33MHz. BIOS reads MEMSS_FREQUENCY_CAPABILITIES register(s) to discover maximum SOC supported capabilities. And BIOS is expected to request only legal DDR frequencies that are equal or lower than the maximum SOC supported capabilities.

5.7.46 MEMSS_FREQUENCY_CAPABILITIES1 (P_CR_MEMSS_FREQUENCY_CAPABILITIES1_0_0_0_MCHBAR)—Offset 7118h

Describes the maximum frequency capabilities of DDR supported and DDR configuration on this particular SOC. If the maximum supported frequency reports a zero, it indicates that the respective DRAM technology is not supported on this product.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RW	**RESERVED_2 (RESERVED_2):** reserved
24	0h RW	**DDR_CONFIG_LIMITATION (DDR_CONFIG_LIMITATION):** Describe the DDR configuration limitation of this particular SOC: • 0 = no DDR configuration limitation • 1 = DDR configuration is limited to1ch x 64-bit DDR3L, or 2ch x32 LPDDR3 or LPDDR4
23:12	0h RW	**RESERVED_1 (RESERVED_1):** reserved
11:6	0h RW	**DDR3L Max Frequency (DDR3L_FREQ_HIGH):** This field indicates maximum DDR3L frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates DDR3L is not supported.
5:0	0h RW	**DDR3L Max Frequency at Min Voltage (DDR3L_FREQ_LOW):** This field indicates maximum DDR3L frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as 'Max' frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR4 is not supported.

5.7.47 PP1_C0_CORE_CLOCK_0_0_0_MCHBAR (P_CR_PP1_C0_CORE_CLOCK_0_0_0_MCHBAR)—Offset 7160h

GT RC0 residency counter. Holds the accumulated number of CS clks that GT has been in RC0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated cycles GT has been in RC0.

5.7.48 Core Exists Vector (P_CR_CORE_EXISTS_VECTOR_0_0_0_MCHBAR)—Offset 7164h

Indication of the physical presence of IA cores in this silicon. IA core modules are defined as containing pairs of cores and an associated L2 cache. Module existence can therefore be inferred by OR'ing pairs of COREx_EXISTS in this register. This register does not reflect the impact of any software-based core disabling. It always reflects the capabilities of the silicon.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**CORE3_EXISTS (CORE3_EXISTS):** Indication of core physical presence
2	0h RW	**CORE2_EXISTS (CORE2_EXISTS):** Indication of core physical presence
1	0h RW	**CORE1_EXISTS (CORE1_EXISTS):** Indication of core physical presence
0	0h RW	**CORE0_EXISTS (CORE0_EXISTS):** Indication of core physical presence

5.7.49 Software Core Disable Mask (P_CR_CORE_DISABLE_MASK_0_0_0_MCHBAR)—Offset 7168h

Software may disable cores using this interface. The bit definition of this register exactly matches that defined in the CORE_EXISTS_VECTOR register. Punit firmware will apply the mask programmed into this register against the CORE_EXISTS_VECTOR to establish the resolved cores and modules to power up after a cold reset. The flow is as follows:

- Cold boot
- BIOS reads CORE_EXISTS_VECTOR to establish which modules and cores are present
- BIOS writes 1b to the corresponding core that it wishes to **disable**.
- BIOS may disable entire modules by writing 1b to a pair of cores.

- The results of the configuration are maintained in the sustain power well.
- BIOS initiates a cold reset flow at the platform. In a cold reset, the sustain power well maintains power most other rails are power cycled.
- On cold reset exit, Punit firmware inspects the core configuration and launches only the cores requested by BIOS. To software, it will appear as if these cores do not exist.

Software may discover the resolved core exists vector: resolved_core_exists_vector = (!CORE_DISABLE_MASK) & CORE_EXISTS_VECTOR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**CORE3_DISABLE_MASK (CORE3_DISABLE_MASK):** core3 disable mask
2	0h RW	**CORE2_DISABLE_MASK (CORE2_DISABLE_MASK):** core2 disable mask
1	0h RW	**CORE1_DISABLE_MASK (CORE1_DISABLE_MASK):** core1 disable mask
0	0h RW	**CORE0_DISABLE_MASK (CORE0_DISABLE_MASK):** core0 disable mask

5.7.50 PL3 and PL4 Control (P_CR_PL3_CONTROL_0_0_0_MCHBAR)—Offset 71F0h

Control Power Limit 3 (PL3) and Power Limit 4 (PL4) using this register. This limit control is physically different from the same control in the IA core MSR space.

- PL3 is designed to clamp peak sustained power to levels supported by the battery or input power supply and as such manage lifetime degradation of that power delivery element. With PL3, peak power excursions above the limit are allowed so long as they do not exceed the configured duty cycle constraint in this register.
- PL4 is designed to clamp peak instantaneous power to levels below the max supported by the battery or input power supply. These clamps are implemented a priori and the SOC is guaranteed to constrain itself below the PL4 limit always.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**Lock (LOCK):** Write a 1b to lock this register until next reset. Once locked, no further updates may be written to any bits in the register.
62:48	0h RO	Reserved.
47	0h RW/L	**PL4 Enable (PL4_ENABLE):** • 0 = disabled • 1 = enabled
46:32	0h RW/L	**PL4 Max Power (PMAX):** Power Limit 'PL4' or Pmax power limit in the units as described PACAKGE_POWER_SKU_UNIT MSR. The SOC guarantees it will never exceed this power limit even for very short time windows.
31	0h RO	Reserved.
30:24	0h RW/L	**PL3 Duty Cycle (DUTY_CYCLE):** Power limit excursion duty cycle control for PL3, describing what percentage of time it is allowed for the SOC to exceed the programmed PL3 power limit. 0% implies excursions are not supported ever and 100% implies excursions are always allowed (effectively disabling the feature). Units are in percentage(%). E.g., to allow for 20% excursion time and 80% PL3 power limit clamp time, program a value of 14h. Values greater than 100 (64h) are clipped to 100%.
23:17	0h RW/L	**PL3 Time Window (TIME_WINDOW):** Duration over which duty cycle control will be maintained. The bits of this field describe parameters for a mathematical equation for time window configuration. This time window is strictly adhered to, if the window described is 40ms, then silicon guarantees no excursions to the programmed duty cycle within a rolling 40ms window. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
16	0h RO	Reserved.
15	0h RW/L	**PL3 Enable (PL3_ENABLE):** • 0 = disabled • 1 = enabled
14:0	0h RW/L	**PL3 Power Limit (POWER_LIMIT):** Power Limit 3 (PL3) or PAppMax power level. Any SOC power measurement observed above this level is considered as an excursion against the PL3 power limit and duty cycle / time window budget. Units of this power limit are defined by PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.

5.7.51 Graphics Superqueue Active Clocks (P_CR_PP1_ANY_THREAD_ACTIVITY_0_0_0_MCHBAR)—Offset 7244h

Graphics Superqueue active residency counter. Counts at the crystal clock frequency divided by 16.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Superqueue Active Residency (SUPERQUEUE_ACTIVE_RESIDENCY):** Graphics Superqueue active residency counter. Counts in crystal reference clocks divided by 16.

5.7.52 LPDDR DRAM Thermal (MR4) Status of Channel 00 (P_CR_MEM_MR4_TEMPERATURE_DEV3_0_0_0_MCHBAR)—Offset 7248h

LPDDR DRAM Thermal (MR4) Status of Channel 00, when there are multiple DRAMs in a rank, the maximum MR4 is reported

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 00 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 00 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

5.7.53 LPDDR DRAM Thermal (MR4) Status of Channel 11 (P_CR_MEM_MR4_TEMPERATURE_DEV4_0_0_0_MCHBAR)—Offset 724Ch

LPDDR DRAM Thermal (MR4) Status of Channel 11, when there are multiple DRAMs in a rank, the maximum MR4 is reported

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 11 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 11 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

5.8 Registers Summary

Table 5-8. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value

7:6	0h RO	Reserved.
5:0	1h RW	**VC0A Posted Grant Count (VC0A_P):** VC0A posted to T-Unit MSIs.

5.8.2 Upstream A2B Arbiter Channel 0 Grant Count (A_CR_UPARB_GCNT_A2B_0_MCHBAR)—Offset 6404h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 0 Target Arbiter Grant Count (CHID0_TGT):** Target arbiter grant count for the channel ID 0 class arbiter.
23:22	0h RO	Reserved.
21:16	1h RW	**Channel ID 0 Non-posted IOMMU Grant Count (CHID0_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 0.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 0 Non-posted Grant Count (CHID0_NP):** Grant count for non-posted transactions on channel ID 0.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 0 P Grant Count (CHID0_P):** Grant count for posted transactions on channel ID 0.

5.8.3 Upstream A2B Arbiter Channel 1 Grant Count (A_CR_UPARB_GCNT_A2B_1_MCHBAR)—Offset 6408h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 1 Target Arbiter Grant Count (CHID1_TGT):** Target arbiter grant count for the channel ID 1 class arbiter.
23:22	0h RO	Reserved.
21:16	1h RW	**Channel ID 1 Non-posted IOMMU Grant Count (CHID1_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 1.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 1 Non-posted Grant Count (CHID1_NP):** Grant count for non-posted transactions on channel ID 1.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 1 P Grant Count (CHID1_P):** Grant count for posted transactions on channel ID 1.

5.8.4 Upstream A2B Arbiter Channel 2 Grant Count (A_CR_UPARB_GCNT_A2B_2_MCHBAR)—Offset 640Ch

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 2 Target Arbiter Grant Count (CHID2_TGT):** Target arbiter grant count for the channel ID 2 class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 2 Non-posted IOMMU Grant Count (CHID2_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 2.

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 2 Non-posted Grant Count (CHID2_NP):** Grant count for non-posted transactions on channel ID 2.
7:6	0h RO	Reserved.
5:0	0h RO	**Channel ID 2 P Grant Count (CHID2_P):** Grant count for posted transactions on channel ID 2.

5.8.5 Upstream A2B Arbiter Channel 3 Grant Count (A_CR_UPARB_GCNT_A2B_3_MCHBAR)—Offset 6410h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 3 Target Arbiter Grant Count (CHID3_TGT):** Target arbiter grant count for the channel ID 3 class arbiter.
23:22	0h RO	Reserved.
21:16	1h RW	**Channel ID 3 Non-posted IOMMU Grant Count (CHID3_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 3.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 3 Non-posted Grant Count (CHID3_NP):** Grant count for non-posted transactions on channel ID 3.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 3 P Grant Count (CHID3_P):** Grant count for posted transactions on channel ID 3.

5.8.6 Upstream A2B Arbiter Channel 4 Grant Count (A_CR_UPARB_GCNT_A2B_4_MCHBAR)—Offset 6414h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 4 Target Arbiter Grant Count (CHID4_TGT):** Target arbiter grant count for the channel ID 4 class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 4 Non-posted IOMMU Grant Count (CHID4_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 4.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 4 Non-posted Grant Count (CHID4_NP):** Grant count for non-posted transactions on channel ID 4.
7:6	0h RO	Reserved.
5:0	0h RO	**Channel ID 4 P Grant Count (CHID4_P):** Grant count for posted transactions on channel ID 4.

5.8.7 Upstream A2B Arbiter Channel 5 Grant Count (A_CR_UPARB_GCNT_A2B_5_MCHBAR)—Offset 6418h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 5 Target Arbiter Grant Count (CHID5_TGT):** Target arbiter grant count for the channel ID 5 class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 5 Non-posted IOMMU Grant Count (CHID5_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 5.

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 5 Non-posted Grant Count (CHID5_NP):** Grant count for non-posted transactions on channel ID 5.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 5 P Grant Count (CHID5_P):** Grant count for posted transactions on channel ID 5.

5.8.8 Upstream A2B Arbiter Channel 6 Grant Count (A_CR_UPARB_GCNT_A2B_6_MCHBAR)—Offset 641Ch

Upstream Class/Target arbiter grant count for A-Unit to B-Unit transactions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 6 Target Arbiter Grant Count (CHID6_TGT):** Target arbiter grant count for the channel ID 6 class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 6 Non-posted IOMMU Grant Count (CHID6_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 6.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 6 Non-posted Grant Count (CHID6_NP):** Grant count for non-posted transactions on channel ID 6.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 6 P Grant Count (CHID6_P):** Grant count for posted transactions on channel ID 6.

5.8.9 Upstream A2B Arbiter Channel 7 Grant Count (A_CR_UPARB_GCNT_A2B_7_MCHBAR)—Offset 6420h

Upstream Class/Target arbiter grant count for A-Unit to B-Unit transactions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 7 Target Arbiter Grant Count (CHID7_TGT):** Target arbiter grant count for the channel ID 7 class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 7 Non-posted IOMMU Grant Count (CHID7_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 7.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 7 Non-posted Grant Count (CHID7_NP):** Grant count for non-posted transactions on channel ID 7.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 7 P Grant Count (CHID7_P):** Grant count for posted transactions on channel ID 7.

5.8.10 Upstream A2T Arbiter Channel 0 Grant Count (A_CR_UPARB_GCNT_A2T_0_MCHBAR)—Offset 6424h

Upstream Class/Target arbiter grant count for A-Unit to T-Unit transactions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 0 Target Arbiter Grant Count (CHID0_TGT):** Target arbiter grant count for the channel ID 0 a2t class arbiter.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 0 Non-posted IOMMU Grant Count (CHID0_MMU_NP):** Grant count for IOMMU non-posted transactions on channel ID 0.

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 0 Non-posted Grant Count (CHID0_NP):** Grant count for non-posted transactions on channel ID 0.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 0 P Grant Count (CHID0_P):** Grant count for posted transactions on channel ID 0.

5.8.11 Upstream P2P Arbiter Channel 0 Grant Count (A_CR_UPARB_GCNT_P2P_0_MCHBAR)—Offset 6428h

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RO	**Channel ID 0 Target Arbiter Grant Count (CHID0_TGT):** Target arbiter grant count for the channel ID 0 p2p class arbiter.
23:22	0h RO	Reserved.
21:16	1h RO	**Channel ID 0 C Grant Count (CHID0_C):** Grant count for completions on channel ID 0.
15:14	0h RO	Reserved.
13:8	1h RO	**Channel ID 0 Non-posted Grant Count (CHID0_N):** Grant count for non-posted transactions on channel ID 0.
7:6	0h RO	Reserved.
5:0	1h RO	**Channel ID 0 P Grant Count (CHID0_P):** Grant count for posted transactions on channel ID 0.

5.8.12 Upstream P2P Arbiter Channel 1 Grant Count (A_CR_UPARB_GCNT_P2P_1_MCHBAR)—Offset 642Ch

Upstream Class/Target arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RO	**Channel ID 1 Target Arbiter Grant Count (CHID1_TGT):** Target arbiter grant count for the channel ID 1 p2p class arbiter.
23:22	0h RO	Reserved.
21:16	1h RO	**Channel ID 1 C Grant Count (CHID1_C):** Grant count for completions on channel ID 1.
15:14	0h RO	Reserved.
13:8	1h RO	**Channel ID 1 Non-posted Grant Count (CHID1_N):** Grant count for non-posted transactions on channel ID 1.
7:6	0h RO	Reserved.
5:0	1h RO	**Channel ID 1 P Grant Count (CHID1_P):** Grant count for posted transactions on channel ID 1

5.8.13 Upstream Private Credit Return Grant Count Posted 0 (A_CR_CRDARB_PRIV_GCNT_DEV_P_0_MCHBAR)—Offset 6430h

PSF credit return device arb grant count posted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 3 P Grant Count (CHID3):** Grant count for posted transactions on channel ID 3.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 2 P Grant Count (CHID2):** Grant count for posted transactions on channel ID 2.
15:14	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13:8	1h RW	**Channel ID 1 P Grant Count (CHID1):** Grant count for posted transactions on channel ID 1.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 0 P Grant Count (CHID0):** Grant count for posted transactions on channel ID 0.

5.8.14 Upstream Private Credit Return Grant Count Posted 1 (A_CR_CRDARB_PRIV_GCNT_DEV_P_1_MCHBAR)—Offset 6434h

PSF credit return device arb grant count posted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 7 P Grant Count (CHID7):** Grant count for posted transactions on channel ID 7.
23:22	0h RO	Reserved.
21:16	1h RW	**Channel ID 6 P Grant Count (CHID6):** Grant count for posted transactions on channel ID 6.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 5 P Grant Count (CHID5):** Grant count for posted transactions on channel ID 5.
7:6	0h RO	Reserved.
5:0	0h RO	**Channel ID 4 P Grant Count (CHID4):** Grant count for posted transactions on channel ID 4.

5.8.15 Upstream Private Credit Return Grant Count Non-posted 0 (A_CR_CRDARB_PRIV_GCNT_DEV_N_0_MCHBAR)—Offset 6438h

PSF credit return device arb grant count non-posted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 3 Non-posted Grant Count (CHID3):** Grant count for non-posted transactions on channel ID 3.
23:22	0h RO	Reserved.
21:16	1h RW	**Channel ID 2 Non-posted Grant Count (CHID2):** Grant count for non-posted transactions on channel ID 2.
15:14	0h RO	Reserved.
13:8	1h RW	**Channel ID 1 Non-posted Grant Count (CHID1):** Grant count for non-posted transactions on channel ID 1.
7:6	0h RO	Reserved.
5:0	1h RW	**Channel ID 0 Non-posted Grant Count (CHID0):** Grant count for non-posted transactions on channel ID 0.

5.8.16 Upstream Private Credit Return Grant Count Posted 1 (A_CR_CRDARB_PRIV_GCNT_DEV_N_1_MCHBAR)—Offset 643Ch

PSF credit return device arb grant count non-posted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1040104h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	1h RW	**Channel ID 7 Non-posted Grant Count (CHID7):** Grant count for non-posted transactions on channel ID 7.
23:22	0h RO	Reserved.
21:16	4h RW	**Channel ID 6 Non-posted Grant Count (CHID6):** Grant count for non-posted transactions on channel ID 6.
15:14	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13:8	1h RW	**Channel ID 5 Non-posted Grant Count (CHID5):** Grant count for non-posted transactions on channel ID 5.
7:6	0h RO	Reserved.
5:0	4h RW	**Channel ID 4 Non-posted Grant Count (CHID4):** Grant count for non-posted transactions on channel ID 4.

5.8.17 Upstream Private Credit Return Grant Count Completion (A_CR_CRDARB_PRIV_GCNT_DEV_C_0_MCHBAR)—Offset 6440h

PSF credit return device arb grant count completion.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 101h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	0h RO	**Channel ID 3 C Grant Count (CHID3):** Grant count for completions on channel ID 3.
23:22	0h RO	Reserved.
21:16	0h RO	**Channel ID 2 C Grant Count (CHID2):** Grant count for completions on channel ID 2.
15:14	0h RO	Reserved.

5.8.25 Gazelle Queue Limit Channel 0-3 (A_CR_GZLQ_LIMIT_CH0_3_MCHBAR)—Offset 6460h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**Channel ID 3 (CHID3):** Gazelle queue limit for Upstream NP on channel ID 3.
23:16	FFh RW	**Channel ID 2 (CHID2):** Gazelle queue limit for Upstream NP on channel ID 2.
15:8	FFh RW	**Channel ID 1 (CHID1):** Gazelle queue limit for Upstream NP on channel ID 1.
7:0	FFh RW	**Channel ID 0 (CHID0):** Gazelle queue limit for Upstream NP on channel ID 0.

5.8.26 Gazelle Queue Limit Channels 4-7 (A_CR_GZLQ_LIMIT_CH4_7_MCHBAR)—Offset 6464h

Gazelle queue limit for channel ID 4 to 7.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**Channel ID 7 (CHID7):** Gazelle queue limit for Upstream NP on channel ID 7.
23:16	FFh RW	**Channel ID 6 (CHID6):** Gazelle queue limit for Upstream NP on channel ID 6.
15:8	FFh RW	**Channel ID 5 (CHID5):** Gazelle queue limit for Upstream NP on channel ID 5.
7:0	FFh RW	**Channel ID 4 (CHID4):** Gazelle queue limit for Upstream NP on channel ID 4.

5.8.27 IOMMU Arbiter Grant Count VC0a Register (A_CR_IOMMUARB_GCNT_VC0a_0_0_0_MCHBAR)—Offset 6468h

IOMMU arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10101h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21:16	1h RW	**Class Count (CLASS_CNT):** IOMMU arbiter class grant count.
15:14	0h RO	Reserved.
13:8	1h RW	**Device Non-posted (DEV_NP):** IOMMU arbiter device grant count for NP.
7:6	0h RO	Reserved.
5:0	1h RW	**Device Posted (DEV_P):** IOMMU arbiter device grant count for p.

5.8.28 IOMMU Arbiter Grant Count VC0b Register (A_CR_IOMMUARB_GCNT_VC0b_0_0_0_MCHBAR)—Offset 646Ch

IOMMU arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10101h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21:16	1h RW	**Class Count (CLASS_CNT):** IOMMU arbiter class grant count.
15:14	0h RO	Reserved.
13:8	1h RW	**Device Non-posted (DEV_NP):** IOMMU arbiter device grant count for NP.
7:6	0h RO	Reserved.
5:0	1h RW	**Device Posted (DEV_P):** IOMMU arbiter device grant count for p.

5.8.29 IOMMU Arbiter Grant Count VC1b Register (A_CR_IOMMUARB_GCNT_VC1b_0_0_0_MCHBAR)—Offset 6470h

IOMMU arbiter grant count.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10101h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21:16	1h RW	**Class Count (CLASS_CNT):** IOMMU arbiter class grant count.
15:14	0h RO	Reserved.
13:8	1h RW	**Device Non-posted (DEV_NP):** IOMMU arbiter device grant count for NP.
7:6	0h RO	Reserved.
5:0	1h RW	**Device Posted (DEV_P):** IOMMU arbiter device grant count for p.

5.8.30 Gazelle Queue Reserved Entries Channels 0-3 (A_CR_GZLQ_RSVD_CH0_3_MCHBAR)—Offset 6474h

Gazelle queue limit for channel ID 0 to 3.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040101h

Bit Range	Default & Access	Field Name (ID): Description
31:24	4h RW	**Channel ID 3 (CHID3):** Gazelle queue limit for Upstream NP on channel ID 3.
23:16	4h RW	**Channel ID 2 (CHID2):** Gazelle queue limit for Upstream NP on channel ID 2.
15:8	1h RW	**Channel ID 1 (CHID1):** Gazelle queue limit for Upstream NP on Channel ID 1.
7:0	1h RW	**Channel ID 0 (CHID0):** Gazelle queue limit for Upstream NP on Channel ID 0.

5.8.31 Gazelle Queue Reserved Entries Channels 4-7 (A_CR_GZLQ_RSVD_CH4_7_MCHBAR)—Offset 6478h

GazelleQ limit for CHID 0 to 3

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010101h

Bit Range	Default & Access	Field Name (ID): Description
31:24	1h RW	**Channel ID 7 (CHID7):** Gazelle queue limit for Upstream NP on channel ID 7.
23:16	1h RW	**Channel ID 6 (CHID6):** Gazellequeue limit for Upstream NP on channel ID 6.
15:8	1h RW	**Channel ID 5 (CHID5):** Gazelle queue limit for Upstream NP on channel ID 5.
7:0	1h RW	**Channel ID 4 (CHID4):** Gazelle queue limit for Upstream NP on channel ID 4.

5.8.32 Spare BIOS (A_CR_SPARE_BIOS_MCHBAR)—Offset 647Ch

Spare CR in MCHBAR.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SPARE RW Bits (SPARE_RW):** Spare RW 32 bits in BIOSWR policy group.

5.8.33 Upcmd Credit Maximum Channel 0 (A_CR_UPCMD_CRDTMAX_CH0_0_0_0_MCHBAR)—Offset 6490h

Upcmd Credit Max for PSF0 on Ch0 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040Ch

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	4h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	Ch RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.34 Upcmd Credit Maximum Channel 1 (A_CR_UPCMD_CRDTMAX_CH1_0_0_0_MCHBAR)—Offset 6494h

Upcmd Credit Max for PSF0 on Ch1 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40404h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	4h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	4h RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.35 Upcmd Credit Maximum Channel 2 (A_CR_UPCMD_CRDTMAX_CH2_0_0_0_MCHBAR)—Offset 6498h

Upcmd Credit Max for PSF0 on Ch2 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7F00h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	7Fh RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	0h RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.36 Upcmd Credit Maximum Channel 3 (A_CR_UPCMD_CRDTMAX_CH3_0_0_0_MCHBAR)—Offset 649Ch

Upcmd Credit Max for PSF0 on Ch3 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	7Fh RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	7Fh RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.37 Upcmd Credit Maximum Channel 4 (A_CR_UPCMD_CRDTMAX_CH4_0_0_0_MCHBAR)—Offset 64A0h

Upcmd Credit Max for PSF0 on Ch4 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	0h RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.38 Upcmd Credit Maximum Channel 5 (A_CR_UPCMD_CRDTMAX_CH5_0_0_0_MCHBAR)—Offset 64A4h

Upcmd Credit Max for PSF0 on Ch5 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 404h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	4h RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.39 Upcmd Credit Maximum Channel 6 (A_CR_UPCMD_CRDTMAX_CH6_0_0_0_MCHBAR)—Offset 64A8h

Upcmd Credit Max for PSF0 on Ch6 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 404h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	4h RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.40 Upcmd Credit Maximum Channel 7 (A_CR_UPCMD_CRDTMAX_CH7_0_0_0_MCHBAR)—Offset 64ACh

Upcmd Credit Max for PSF0 on Ch7 : Maximum number of credits exposed to PSF0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40Ch

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.
15	0h RO	Reserved.
14:8	4h RW	**Non-Posted Max (NP_MAX):** Max non-posted credits sent to PSF0 for Chid.
7	0h RO	Reserved.
6:0	Ch RW	**Posted Max (P_MAX):** Max posted credits sent to PSF0 for Chid.

5.8.41 MOT OUT Base Register (A_CR_MOT_OUT_BASE_0_0_0_MCHBAR)—Offset 64C0h

This register contains the value of the start address of the MOT debug data region. The smallest reserved region for MOT debug data (if enabled) is 16MB. MOT region must be power-of-two sized and naturally

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR enable (IMR_EN):** IMR Enable: Enables access checking for the MOT region. Note: this does not enable MOT itself merely enables access control checks for transactions that attempt to access the MOT buffer.
30	0h RO	**Trace Enable (TR_EN):** Asset Classification (AC)[0]: Trace Enable: Enables snooping of transactions to the IMR region by tracing agents such as MOT. Reserved and set to 0 for the MOT region, since otherwise this would enable recursive
29	0h RO	Reserved.
28:14	0h RW	**MOT_OUT_BASE address (MOT_OUT_BASE):** Specifies bits 38:24 of the start address of the MOT memory region. Region size must be a strict poweroftwo at least 16MB and naturally aligned to the size. These bits are compared with the result of the MOT_OUT_MASK[28:14] applied to bits 38:24 of the incoming address to determine if an access falls within the MOT region.
13:0	0h RO	Reserved.

5.8.42 MOT OUT Mask Register (A_CR_MOT_OUT_MASK_0_0_0_MCHBAR)—Offset 64C4h

This register specifies the size of the MOT region. If a request address [39:24] AND-ed with MOT_OUT_MASK[15:0] matches the MOT_OUT_BASE[15:0], then the request falls within the MOT_OUT region

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Asset Classification AC[2]: GT Implicit WB Enable: Enables implicit writebacks to protected region from GT caching agent. When set to 1 enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0 inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Asset Classification AC[1]: IA Implicit WB Enable: Enables implicit writebacks to protected region from IA caching agent. When set to 1 enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0 inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	Reserved.
28:14	0h RW	**MOT OUT Mask (MOT_OUT_MASK):** Specifies the size of the MOT region. If Request Address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[28:14] then the request falls within the MOT_OUT region
13:0	0h RO	Reserved.

5.8.43 A-Unit BIOSWR Control Policy (A_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 64C8h

This register controls the access policy to the A-Unit BIOS_RAC BIOS_AC BIOS_CP.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40061010202h RW	**BIOS Control Policy (BIOSWR_CP):** Bit vector used to determine which agents are allowed access to the A-Unit BIOSWR Registers based on the value from the agents 6 bit SAI field. This register is selfreferential the access policy provided applies to access to the control register itself.

5.8.44 A-Unit BIOSWR Ready Access Control (A_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 64D0h

This register configures the Read Access Policy for the A-Unit BIOS policy configuration registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit BIOS policy group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 80000C0063010217h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063010217h RW	**BIOS Read Access Control (BIOSWR_RAC):** Bit vector used to determine which agents are allowed Rd access to the A-Unit BIOSWR Register based on the value from the agents 6 bit SAI field.

5.8.45 BIOSWR Write Access Control (A_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 64D8h

This register configures the Write Access Policy for the A-Unit BIOSWR registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit BIOS policy group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061000212h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061000212h RW	**BIOS Write Access Control (BIOSWR_WAC):** Bit vector used to determine which agents are allowed Wr access to the A-Unit BIOSWR registers based on the value from the agents 6 bit SAI field.

5.8.46 AUnit Pcode/Ucode Write, All Read Control Policy Register (A_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 64E0h

AUnit Pcode/Ucode Write, All Read Control Policy: This register controls the access policy to the Aunit P_U_CODEWR_ALLRD_RAC P_U_CODEWR_ALLRD_WAC

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**P_U_CODEWR_ALLRD Control Policy (P_U_CODEWR_ALLRD_CP):** Bit vector used to determine which agents are allowed access to the Aunit P_U_CODEWR_ALLRD based on the value from the agents 6 bit SAI field. This register is selfreferential the access policy provided applies to access to the control register itself.

5.8.47 AUnit Pcode/Ucode Write, All Read Read Access Control Policy Register (A_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 64E8h

AUnit Pcode/Ucode Write, All Read Read Access Control Policy: This register controls the read access policy to the Aunit P_U_CODEWR_ALLRD

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**P_U_CODEWR_ALLRD Read Access Control (P_U_CODEWR_ALLRD_RAC):** Bit vector used to determine which agents are allowed Rd access to the Aunit P_U_CODEWR_ALLRD based on the value from the agents 6 bit SAI field.

5.8.48 AUnit Pcode/Ucode Write, All Read Write Access Control Policy Register (A_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 64F0h

AUnit Pcode/Ucode Write, All Read Write Access Control Policy: This register controls the write access policy to the Aunit P_U_CODEWR_ALLRD

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**P_U_CODEWR_ALLRD Write Access Control (P_U_CODEWR_ALLRD_WAC):** Bit vector used to determine which agents are allowed Wr access to the Aunit P_U_CODEWR_ALLRD based on the value from the agents 6 bit SAI field.

5.8.49 CHAP Select 1 (A_CR_CHAP_SLCT1_MCHBAR)—Offset 6500h

Chap event select register 1.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RW	**Channel ID Y Count Upstream txn (CHID_Y_CNT_UPTXN):** Count upstream txn on all VCs where CHID_Y[i]=1.
15:8	0h RO	Reserved.
7:0	0h RW	**Channel ID X Count Upstream txn (CHID_X_CNT_UPTXN):** Count upstream txn on all VCs where CHID_X[i]=1.

5.8.50 CHAP Select 2 (A_CR_CHAP_SLCT2_MCHBAR)—Offset 6504h

Chap event select register 2.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RW	**Channel ID Y Count Downstream txn (CHID_Y_CNT_DNTXN):** Count downstream txn on all VCs where CHID_Y[i]=1.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7:0	0h RW	**Channel ID X Count Downstream txn (CHID_X_CNT_DNTXN):** Count downstream txn on all VCs where CHID_X[i]=1.

5.8.51 CHAP Select 3 (A_CR_CHAP_SLCT3_MCHBAR)—Offset 6508h

Chap event select register 3.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:2	1h RW	**Q Occupancy Y (Q_OCCUPANCY_Y):** Count occupancy/residency of certain Q in A-Unit • 00: UpCmd • 01: UpData • 10: GzlQ • 11: DnCmd/Data
1:0	0h RW	**Q Occupancy X (Q_OCCUPANCY_X):** Count occupancy/residency of certain Q in A-Unit • 00: UpCmd • 01: UpData • 10: GzlQ • 11: DnCmd/Data

5.8.52 A_IMRGLOBAL_BM Control Policy (A_CR_IMRGLOBAL_BM_CP_0_0_0_MCHBAR)—Offset 6510h

This register controls the access policy to the A-Unit IMRGLOBAL_BM_RAC IMRGLOBAL_BM_AC IMRGLOBAL_BM_CP.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMRGLOBAL_BM Control Policy (IMRGLOBAL_BM_CP):** Bit vector used to determine which agents are allowed access to the A-Unit IMRGLOBAL_BM Registers based on the value from the agents 6 bit SAI field. This register is selfreferential the access policy provided applies to access to the control register itself.

5.8.53 A_IMRGLOBAL_BM Read Access Control (A_CR_IMRGLOBAL_BM_RAC_0_0_0_MCHBAR)—Offset 6518h

This register configures the Read Access Policy for the A-Unit IMRGLOBAL_BM policy configuration registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit IMRGLOBAL_BM policy group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F0FFFF0FFFF0FFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	F0FFFF0FFFF0FFFFh RO	**IMRGLOBAL_BM Read Access Control (IMRGLOBAL_BM_RAC):** Bit vector used to determine which agents are allowed Rd access to the A-Unit IMRGLOBAL_BM Register based on the value from the agents 6 bit SAI field.

5.8.54 A_IMRGLOBAL_BM Write Access Control (A_CR_IMRGLOBAL_BM_WAC_0_0_0_MCHBAR)—Offset 6520h

This register configures the Write Access Policy for the A-Unit IMRGLOBAL_BM registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit IMRGLOBAL_BM policy group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010 202h RW	**IMRGLOBAL_BM Write Access Control (IMRGLOBAL_BM_WAC):** Bit vector used to determine which agents are allowed Wr access to the A-Unit IMRGLOBAL_BM registers based on the value from the agents 6 bit SAI field.

5.8.55 Uncorrectable Error Status Register (A_CR_UNCERRSTS_0_0_0_MCHBAR)—Offset 6588h

Errors that have been seen in aunit. The error is only logged if the respective bit in UNCERRMSK is 0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

1	0h RW/1C	**bad sai posted (bad_sai_posted):** An incorrect/illegal sai was received with an upstream posted transaction.
0	0h RW/1C	**illegal posted opcode (illegal_posted_opcode):** Illegal/ Unsupported posted opcode received from iosf.

5.8.56 Uncorrectable Error Mask Register (A_CR_UNCERRMSK_0_0_0_MCHBAR)—Offset 658Ch

Masks whether a reported error is logged and signaled to the IEH. 1- do not log/signal. 0 - log/signal.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**reserved (undefined31):** reserved for future use
30	1h RO	**reserved (undefined30):** reserved for future use
29	1h RO	**reserved (undefined29):** reserved for future use
28	1h RO	**reserved (undefined28):** reserved for future use
27	1h RO	**reserved (undefined27):** reserved for future use
26	1h RO	**reserved (undefined26):** reserved for future use
25	1h RO	**reserved (undefined25):** reserved for future use
24	1h RO	**reserved (undefined24):** reserved for future use
23	1h RO	**reserved (undefined23):** reserved for future use
22	1h RO	**reserved (undefined22):** reserved for future use
21	1h RO	**reserved (undefined21):** reserved for future use
20	1h RO	**reserved (undefined20):** reserved for future use
19	1h RO	**reserved (undefined19):** reserved for future use
18	1h RO	**reserved (undefined18):** reserved for future use
17	1h RO	**reserved (undefined17):** reserved for future use
16	1h RO	**reserved (undefined16):** reserved for future use
15	1h RO	**reserved (undefined15):** reserved for future use
14	1h RO	**reserved (undefined14):** reserved for future use
13	1h RO	**reserved (undefined13):** reserved for future use
12	1h RO	**reserved (undefined12):** reserved for future use
11	1h RO	**reserved (undefined11):** reserved for future use

Bit Range	Default & Access	Field Name (ID): Description
10	1h RW	**msi rsvd set (msi_rsvd_set):** An MSI was received with reserved bits set
9	1h RW	**gpa overflow (gpa_overflow):** A transaction was received with a guest physical address that was too large
8	1h RW	**illegal msi (illegal_msi):** A malformed/illegal MSI was received in the upstream direction
7	1h RW	**at translated illegal device (at_translated_illegal_device):** A device that is not support to set the AT bit set it to an illegal value
6	1h RO	**reserved (undefined5):** reserved for future use
5	1h RW	**bad sai cmpl (bad_sai_cmpl):** An incorrect/illegal sai was received with an upstream completion transaction.
4	1h RW	**received lk cmpl (received_lk_cmpl):** Received a CmplLck completion from iosf.
3	1h RW	**bad sai nonposted (bad_sai_nonposted):** An incorrect/illegal sai was received with an upstream non-posted transaction.
2	1h RW	**illegal nonposted opcode (illegal_nonposted_opcode):** Illegal/Unsupported non-posted opcode received from iosf.
1	1h RW	**bad sai posted (bad_sai_posted):** An incorrect/illegal sai was received with an upstream posted transaction.
0	1h RW	**illegal posted opcode (illegal_posted_opcode):** Illegal/ Unsupported posted opcode received from iosf.

5.8.57 Slice and Channel Hash (A_CR_SLICE_CHANNEL_HASH_0_0_0_MCHBAR)—Offset 65C0h

A-Unit slice and channel hash function.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 3C00000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**Lock (LOCK):** Intended usage is for BIOS to set the LOCK when it updates the CR. A-Unit implements only storage for this bit. No hardware exists to implement hardware locking.
62:52	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
51:38	0h RW	**Channel Hash Mask (CH_HASH_MASK):** When both PMI channels in a slice are enabled, this field specifies the Channel Hash Mask to be applied on Addr[19:6] postremap DRAM address of the request to compute which PMI channel a request must be routed to. Relevant only when HVM mode is disabled and only for requests that do not fall under the MOT region. B-Unit will override the programmed value to include the Channel Selector bit See SLICEHASH.INTERLEAVE_MODE field. Note that HVM mode and MOT regions have special hash requirements and hence they do not use the CH_HASH_MASK.
37:36	3h RW	**Channel Enabled for Slice 1 (SYM_SLICE1_CHANNEL_ENABLED):** Specifies which channel is enabled for Slice 1, This is for those cases where Channel 0 or 1 could be disabled for Slice 1 If both bits are set then channel select will be based on the Channel Select logic
35:34	3h RW	**Channel Enabled for Slice 0 (SYM_SLICE0_CHANNEL_ENABLED):** Specifies which channel is enabled for Slice 0, This is for those cases where Channel 0 or 1 could be disabled for Slice 0 If both bits are set then channel select will be based on the Channel Select logic
33	0h RO	Reserved.
32	0h RW	**Channel 1 Disabled (CH_1_DISABLED):** Channel 1 in both slices are disabled no memory address mapped to ch 1. All requests sent to channel 0.
31	0h RW	**Enable PMI Dual Data Mode (ENABLE_PMI_DUAL_DATA_MODE):** When set to 1, Single Command Interface and Dual Data Interface for Reads and Writes
30:20	0h RO	Reserved.
19:6	0h RW	**Slice Hash Mask (SLICE_HASH_MASK):** When both slices are enabled this field specifies the Slice Hash Mask to be applied on Addr[19:6] physical address of the request to compute which slice a request must be routed to. Relevant only when HVM mode is disabled and only for physical addresses that do not fall under the Asymmetric Memory Region and the MOT region. B-Unit will override the programmed value to include the Slice Selector bit See INTERLEAVE_MODE field. Note that HVM mode nonaddress IDI requests asymmetric memory region and MOT regions have special hash requirements and hence they do not use the SLICE_HASH_MASK.
5	0h RO	Reserved.
4	0h RW	**Slice 0 Mem Disabled (SLICE_0_MEM_DISABLED):** Slice 0 is disabled for memory accesses; no memory address mapped to Slice 0 and all memory requests sent to Slice 1.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**Interleave Mode (INTERLEAVE_MODE):** Default interleave mode that specifies how the Slice Selector and Channel Selector bits are to be determined. Relevant only when HVM mode is disabled and only for system memory addresses that do not fall under the MOT region or the Asymmetric memory region in the System Address Map. Legal encodings are 0x0 0x1 and 0x2. An encoding of 0x3 is treated as if it was 0x2. When both slices and all four PMI channels are enabled: • 0h: Default Slice Selector is Addr[10] and Default Channel Selector is Addr[11] • 1h: Default Slice Selector is Addr[11] and Default Channel Selector is Addr[12] • 2h: Default Slice Selector is Addr[12] and Default Channel Selector is Addr[13] When both slices are enabled but only one channel in each slice enabled: • 0h: Default Slice Selector is Addr[10] • 1h: Default Slice Selector is Addr[11] • 2h: Default Slice Selector is Addr[12] When only SLICE0 is enabled and both channels on that slice are enabled: • 0h: Default Channel Selector is Addr[10] • 1h: Default Channel Selector is Addr[11] • 2h: Default Channel Selector is Addr[12] When SLICE0 and only one channel in that slice is enabled this field is not relevant. B-Unit overrides the setting of the SLICE_HASH_MASK to always include the Slice Selector bit. Similarly, B-Unit overrides the setting of the CH_HASH_MASK to always include the Channel Selector bit.
1	0h RW	**HVM Mode (HVM_MODE):** • 0: HVM mode is disabled. • 1: HVM mode is enabled. When HVM mode is enabled, Slice Hash and Channel Hash is done as follows: Both slices and all four PMI channels enabled: • Slice Hash is Request Physical Addr[29] • Channel Hash is PostRemap Addr[30] Both slices enabled but only one PMI channel in each slice enabled: • Slice Hash is Request Physical Addr[29] Only one SLICE0 enabled but both PMI channels in SLICE0 enabled: • Channel Hash is PostRemap Addr[29] When HVM_MODE is enabled TOLUD must be set at 2GB.
0	0h RW	**Slice 1 Disabled (SLICE_1_DISABLED):** Slice 1 is disabled; no memory address mapped to Slice 1. All request sent to Slice 0.

5.8.58 Mirror Range Register (A_CR_MIRROR_RANGE_0_0_0_MCHBAR)—Offset 65C8h

Mirror Range: This register defines base and limit of the 8M aligned region in memory that captures the mirror writes. Since b[22:0] are assumed to be 0's the smallest size of the region is 8M

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:48	0h RO	Reserved.
47:32	0h RW	**Mirror Limit Address (MIRROR_LIMIT):** Mirror Limit: specifies b38:b23 of HPA indicating the end of mirror packet buffer region
31:16	0h RO	Reserved.
15:0	0h RW	**Mirror_Base Address (MIRROR_BASE):** Mirror Base: specifies b38:b23 of HPA indicating the start of mirror packet buffer region

5.8.59 ASYM MEM REGION 0 CONFIGURATION WITH NO INTERLEAVING (A_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR)—Offset 65D0h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 0, With No Interleaving (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM Region Slice 0 (SLICE0_ASYM_CHANNEL_SELECT):** Specifies which Channel in ASYM Slice 0 request is sent
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_LIMIT):** Specifies bits [38:31] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:4	0h RW	**Base Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	Reserved.

5.8.60 ASYM MEM REGION 1 CONFIGURATION WITH NO INTERLEAVING (A_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR)—Offset 65D4h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 1, With No Interleaving (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM SLICE 1 (SLICE1_ASYM_CHANNEL_SELECT):** Specifies Channel for ASYM Region Slice 1
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_LIMIT):** Specifies bits [38:31] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	Reserved.
14:4	0h RW	**Limit Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	Reserved.

5.8.61 Two-Way Asymmetric Memory Region Configuration (A_CR_ASYM_2WAY_MEM_REGION_0_0_0_MCHBAR)—Offset 65D8h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Two-Way Asymmetric Memory Configuration (ASYM_2WAY_INTERLEAVE_ENABLE):** Setting this bit to 0 disables Interleave Asymmetric memory region 1, setting it to 1 enables the region.
30:28	0h RO	Reserved.
27:17	0h RW	**Limit Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_LIMIT):** Specifies bits [38:28] of the highest address of Interleave Asymmetric Region, all the lower bits of the region's highest address are equal to 1.
16:15	0h RO	Reserved.
14:4	0h RW	**Base Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_BASE):** Specifies bits [38:28] of the base address of Interleave Asymmetric Region; all the lower bits of the region's base address are equal to 0.
3:2	0h RO	Reserved.
1:0	0h RW	**Two-Way Asymmetric Interleave Mode (ASYM_2WAY_INTLV_MODE):** Going with 2 bits here. 2'b00 : Asymmetric memory Split between Channel 0 of Slice 0 and Slice 1 2'b01 : Asymmetric memory split between Channel 1 of Slice 0 and Slice 1 2'b10 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 0 2'b11 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 1

5.9 Registers Summary

Table 5-9. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value

5.9.1 B-Unit Miscellaneous Configuration (B_CR_BMISC_0_0_0_MCHBAR)—Offset 6800h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RESERVED_0):** Reserved.
3	0h RW	**Send Boot Vector to DRAM (SEND_BOOT_VECTOR_TO_DRAM):** When set,IA accesses to 0xFFFF_0000 to 0XFFFF_FFFF will be sent to memory, regardless of the Host IO Boundary setting in TOLUD.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW	**ABSeginDRAM Legacy Video Area (ABSEGINDRAM):** When this bit is set, reads and writes targeting A or Bsegments are routed to DRAM. Asegment corresponds to the memory range 0xA_0000 to 0xA_FFFF. Bsegment corresponds to the memory ranges 0xB_0000 to 0xB_7FFF and 0xB_8000 to 0xB_FFFF.
1	1h RW	**Read FSeg from DRAM (READ_FSEG_FROM_DRAM):** When this bit is set, reads targeting Fsegment are routed to DRAM. Fsegment corresponds to the memory range 0xF_0000 to 0xF_FFFF.
0	1h RW	**Read ESeg from DRAM (READ_ESEG_FROM_DRAM):** When this bit is set, reads targeting Esegment are routed to DRAM. Esegment corresponds to the memory range 0xE_0000 to 0xE_FFFF.

5.9.2 Security Control Policy (B_CR_SECURITY_CP_0_0_0_MCHBAR)—Offset 6808h

This register controls the access policy to the B-Unit SEC Read Access Control Policy SECURITY_RAC, Write Access Control policy registers SECURITY_WAC, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO	**Security Control Policy (SEC_SAI_POL):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.

5.9.3 Security Group Read Access Policy (B_CR_SECURITY_RAC_0_0_0_MCHBAR)—Offset 6810h

This register configures the Read Access Policy for the B-Unit Security Group registers. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RO	**Security SAI Read Access Policy (SEC_SAI_POL):** Bit vector used to determine which agents are allowed read access to the B-Unit Security Group Configuration registers based on each agent's 6bit encoded SAI value.

5.9.4 Security Group Write Access Policy (B_CR_SECURITY_WAC_0_0_0_MCHBAR)—Offset 6818h

This register configures the Write Access Policy for the B-Unit Security Group registers. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RO	**Security SAI Write Access Policy (SEC_SAI_POL):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.

5.9.5 Slice 0 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE0)—Offset 6868h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases.

5.9.6 Slice 1 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE1)—Offset 686Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases.

5.9.7 IMR0 Base (B_CR_BIMR0BASE_0_0_0_MCHBAR)—Offset 6870h

This register, along with IMR0MASK, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR0 Base (IMR0_BASE):** Specifies bits 38:10 of the start address of IMR0 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR0MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR0 defined region.

5.9.8 IMR0 Mask (B_CR_BIMR0MASK_0_0_0_MCHBAR)—Offset 6874h

This register, along with IMR0BASE, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR0 Mask (IMR0_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR0BASE[28:0] value. A match indicates that the incoming address falls within the IMR0 region.

5.9.9 IMR0 Control Policy (B_CR_BIMR0CP_0_0_0_MCHBAR)—Offset 6878h

This register controls the access policy to the Read Access Policy BIMR0RAC, Write Access Policy BIMR0WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR0 Control Policy (IMR0_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.

5.9.10 IMR0 Read Access Policy (B_CR_BIMR0RAC_0_0_0_MCHBAR)—Offset 6880h

This register, along with IMR0BASE, IMR0MASK and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR0. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR0 Read Access Policy 63 (IMR0_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR0 Read Access Policy 62 (IMR0_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR0 Read Access Policy 61 (IMR0_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR0 Read Access Policy 60 (IMR0_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR0 Read Access Policy 59 (IMR0_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR0 Read Access Policy 58 (IMR0_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR0 Read Access Policy 57 (IMR0_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR0 Read Access Policy 56 (IMR0_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR0 Read Access Policy 55 (IMR0_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR0 Read Access Policy 54 (IMR0_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR0 Read Access Policy 53 (IMR0_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR0 Read Access Policy 52 (IMR0_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR0 Read Access Policy 51 (IMR0_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR0 Read Access Policy 50 (IMR0_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR0 Read Access Policy 49 (IMR0_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR0 Read Access Policy 48 (IMR0_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR0 Read Access Policy 47 (IMR0_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR0 Read Access Policy 46 (IMR0_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR0 Read Access Policy 45 (IMR0_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR0 Read Access Policy 44 (IMR0_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR0 Read Access Policy 43 (IMR0_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
42	0h RW	**IMR0 Read Access Policy 42 (IMR0_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR0 Read Access Policy 41 (IMR0_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR0 Read Access Policy 40 (IMR0_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR0 Read Access Policy 39 (IMR0_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR0 Read Access Policy 38 (IMR0_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR0 Read Access Policy 37 (IMR0_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR0 Read Access Policy 36 (IMR0_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR0 Read Access Policy 35 (IMR0_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR0 Read Access Policy 34 (IMR0_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR0 Read Access Policy 33 (IMR0_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR0 Read Access Policy 32 (IMR0_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR0 Read Access Policy 31 (IMR0_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR0 Read Access Policy 30 (IMR0_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR0 Read Access Policy 29 (IMR0_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR0 Read Access Policy 28 (IMR0_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**IMR0 Read Access Policy 27 (IMR0_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR0 Read Access Policy 26 (IMR0_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR0 Read Access Policy 25 (IMR0_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR0 Read Access Policy 24 (IMR0_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR0 Read Access Policy 23 (IMR0_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR0 Read Access Policy 22 (IMR0_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR0 Read Access Policy 21 (IMR0_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR0 Read Access Policy 20 (IMR0_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR0 Read Access Policy 19 (IMR0_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR0 Read Access Policy 18 (IMR0_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR0 Read Access Policy 17 (IMR0_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR0 Read Access Policy 16 (IMR0_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR0 Read Access Policy 15 (IMR0_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR0 Read Access Policy 14 (IMR0_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR0 Read Access Policy 13 (IMR0_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR0 Read Access Policy 12 (IMR0_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR0 Read Access Policy 11 (IMR0_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR0 Read Access Policy 10 (IMR0_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR0 Read Access Policy 9 (IMR0_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR0 Read Access Policy 8 (IMR0_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR0 Read Access Policy 7 (IMR0_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR0 Read Access Policy 6 (IMR0_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR0 Read Access Policy 5 (IMR0_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR0 Read Access Policy 4 (IMR0_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR0 Read Access Policy 3 (IMR0_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR0 Read Access Policy 2 (IMR0_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR0 Read Access Policy 1 (IMR0_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR0 Read Access Policy 0 (IMR0_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

5.9.11 IMR0 Write Access Policy (B_CR_BIMR0WAC_0_0_0_MCHBAR)—Offset 6888h

This register, along with IMR0BASE, IMR0MASK and IMR0RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR0. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR0 Write Access Policy 63 (IMR0_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR0 Write Access Policy 62 (IMR0_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR0 Write Access Policy 61 (IMR0_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR0 Write Access Policy 60 (IMR0_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR0 Write Access Policy 59 (IMR0_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR0 Write Access Policy 58 (IMR0_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR0 Write Access Policy 57 (IMR0_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR0 Write Access Policy 56 (IMR0_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR0 Write Access Policy 55 (IMR0_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR0 Write Access Policy 54 (IMR0_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR0 Write Access Policy 53 (IMR0_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR0 Write Access Policy 52 (IMR0_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR0 Write Access Policy 51 (IMR0_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR0 Write Access Policy 50 (IMR0_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR0 Write Access Policy 49 (IMR0_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR0 Write Access Policy 48 (IMR0_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR0 Write Access Policy 47 (IMR0_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR0 Write Access Policy 46 (IMR0_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR0 Write Access Policy 45 (IMR0_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR0 Write Access Policy 44 (IMR0_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR0 Write Access Policy 43 (IMR0_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR0 Write Access Policy 42 (IMR0_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR0 Write Access Policy 41 (IMR0_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR0 Write Access Policy 40 (IMR0_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR0 Write Access Policy 39 (IMR0_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR0 Write Access Policy 38 (IMR0_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR0 Write Access Policy 37 (IMR0_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR0 Write Access Policy 36 (IMR0_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR0 Write Access Policy 35 (IMR0_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR0 Write Access Policy 34 (IMR0_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR0 Write Access Policy 33 (IMR0_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR0 Write Access Policy 32 (IMR0_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR0 Write Access Policy 31 (IMR0_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR0 Write Access Policy 30 (IMR0_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR0 Write Access Policy 29 (IMR0_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR0 Write Access Policy 28 (IMR0_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.

5.9.12 IMR1 Base (B_CR_BIMR1BASE_0_0_0_MCHBAR)—Offset 6890h

This register, along with IMR1MASK, IMR1RAC and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Trace Enable (TR_EN):** Asset Classification AC[0]: Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 1 IMR1 Base (IMR1_BASE):** Specifies bits 38:10 of the start address of IMR1 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR1MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR1 defined region.

5.9.13 IMR1 Mask (B_CR_BIMR1MASK_0_0_0_MCHBAR)—Offset 6894h

This register, along with IMR1BASE, IMR1RAC and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Asset Classification AC[2]: Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 1 IMR1 Mask (IMR1_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR1BASE[28:0] value. A match indicates that the incoming address falls within the IMR1 region.

5.9.14 IMR1 Control Policy (B_CR_BIMR1CP_0_0_0_MCHBAR)—Offset 6898h

This register controls the access policy to the Read Access Policy BIMR1RAC, the Write Access Policy BIMR1WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR1 Control Policy (IMR1_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers, based on the value from each agent's 6bit SAI field.

5.9.15 IMR1 Read Access Policy (B_CR_BIMR1RAC_0_0_0_MCHBAR)—Offset 68A0h

This register, along with IMR1BASE, IMR1MASK and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR1 Read Access Policy 63 (IMR1_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR1 Read Access Policy 62 (IMR1_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR1 Read Access Policy 61 (IMR1_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR1 Read Access Policy 60 (IMR1_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR1 Read Access Policy 59 (IMR1_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR1 Read Access Policy 58 (IMR1_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR1 Read Access Policy 57 (IMR1_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR1 Read Access Policy 56 (IMR1_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR1 Read Access Policy 55 (IMR1_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR1 Read Access Policy 54 (IMR1_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR1 Read Access Policy 53 (IMR1_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR1 Read Access Policy 52 (IMR1_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR1 Read Access Policy 51 (IMR1_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR1 Read Access Policy 50 (IMR1_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR1 Read Access Policy 49 (IMR1_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR1 Read Access Policy 48 (IMR1_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR1 Read Access Policy 47 (IMR1_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR1 Read Access Policy 46 (IMR1_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR1 Read Access Policy 45 (IMR1_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR1 Read Access Policy 44 (IMR1_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR1 Read Access Policy 43 (IMR1_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR1 Read Access Policy 42 (IMR1_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

28	0h RW	**IMR1 Read Access Policy 28 (IMR1_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR1 Read Access Policy 27 (IMR1_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR1 Read Access Policy 26 (IMR1_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR1 Read Access Policy 25 (IMR1_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR1 Read Access Policy 24 (IMR1_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR1 Read Access Policy 23 (IMR1_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR1 Read Access Policy 22 (IMR1_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR1 Read Access Policy 21 (IMR1_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR1 Read Access Policy 20 (IMR1_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR1 Read Access Policy 19 (IMR1_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR1 Read Access Policy 18 (IMR1_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR1 Read Access Policy 17 (IMR1_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR1 Read Access Policy 16 (IMR1_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR1 Read Access Policy 15 (IMR1_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR1 Read Access Policy 14 (IMR1_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR1 Read Access Policy 13 (IMR1_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR1 Read Access Policy 12 (IMR1_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR1 Read Access Policy 11 (IMR1_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR1 Read Access Policy 10 (IMR1_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR1 Read Access Policy 9 (IMR1_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR1 Read Access Policy 8 (IMR1_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR1 Read Access Policy 7 (IMR1_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR1 Read Access Policy 6 (IMR1_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR1 Read Access Policy 5 (IMR1_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR1 Read Access Policy 4 (IMR1_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR1 Read Access Policy 3 (IMR1_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR1 Read Access Policy 2 (IMR1_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR1 Read Access Policy 1 (IMR1_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR1 Read Access Policy 0 (IMR1_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

5.9.16 IMR1 Write Access Policy (B_CR_BIMR1WAC_0_0_0_MCHBAR)—Offset 68A8h

This register, along with IMR1BASE, IMR1MASK and IMR1RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

21	0h RW	**IMR1 Write Access Policy 21 (IMR1_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR1 Write Access Policy 20 (IMR1_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR1 Write Access Policy 19 (IMR1_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR1 Write Access Policy 18 (IMR1_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR1 Write Access Policy 17 (IMR1_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR1 Write Access Policy 16 (IMR1_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR1 Write Access Policy 15 (IMR1_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR1 Write Access Policy 14 (IMR1_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**IMR1 Write Access Policy 13 (IMR1_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR1 Write Access Policy 12 (IMR1_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR1 Write Access Policy 11 (IMR1_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR1 Write Access Policy 10 (IMR1_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR1 Write Access Policy 9 (IMR1_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR1 Write Access Policy 8 (IMR1_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR1 Write Access Policy 7 (IMR1_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR1 Write Access Policy 6 (IMR1_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR1 Write Access Policy 5 (IMR1_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR1 Write Access Policy 4 (IMR1_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR1 Write Access Policy 3 (IMR1_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR1 Write Access Policy 2 (IMR1_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR1 Write Access Policy 1 (IMR1_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR1 Write Access Policy 0 (IMR1_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.

5.9.17 Base 0 IMR2 Base (B_CR_BIMR2BASE_0_0_0_MCHBAR)—Offset 68B0h

This register, along with IMR2MASK, IMR2RAC and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR2 Base (IMR2_BASE):** Specifies bits 38:10 of the start address of IMR2 region. IMR region size must be a strict power of two, at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR2MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR2 defined region.

5.9.18 IMR2 Mask (B_CR_BIMR2MASK_0_0_0_MCHBAR)—Offset 68B4h

This register, along with IMR2BASE, IMR2RAC, and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR2 Mask (IMR2_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR2BASE[28:0] value. A match indicates that the incoming address falls within the IMR2 region.

5.9.19 IMR2 Control Policy (B_CR_BIMR2CP_0_0_0_MCHBAR)—Offset 68B8h

This register controls the access policy to the Read Access Policy BIMR2RAC, Write Access Policy BIMR2WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR2 Control Policy (IMR2_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers, based on the value from each agent's 6bit SAI field.

5.9.20 IMR2 Read Access Policy (B_CR_BIMR2RAC_0_0_0_MCHBAR)—Offset 68C0h

This register, along with IMR2BASE, IMR2MASK and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR2. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR2 Read Access Policy 63 (IMR2_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR2 Read Access Policy 62 (IMR2_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR2 Read Access Policy 61 (IMR2_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR2 Read Access Policy 60 (IMR2_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR2 Read Access Policy 59 (IMR2_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR2 Read Access Policy 58 (IMR2_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR2 Read Access Policy 57 (IMR2_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR2 Read Access Policy 56 (IMR2_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR2 Read Access Policy 55 (IMR2_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR2 Read Access Policy 54 (IMR2_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR2 Read Access Policy 53 (IMR2_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR2 Read Access Policy 52 (IMR2_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR2 Read Access Policy 51 (IMR2_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR2 Read Access Policy 50 (IMR2_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR2 Read Access Policy 49 (IMR2_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR2 Read Access Policy 48 (IMR2_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR2 Read Access Policy 47 (IMR2_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR2 Read Access Policy 46 (IMR2_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR2 Read Access Policy 45 (IMR2_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR2 Read Access Policy 44 (IMR2_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR2 Read Access Policy 43 (IMR2_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR2 Read Access Policy 42 (IMR2_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR2 Read Access Policy 41 (IMR2_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR2 Read Access Policy 40 (IMR2_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR2 Read Access Policy 39 (IMR2_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR2 Read Access Policy 38 (IMR2_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR2 Read Access Policy 37 (IMR2_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR2 Read Access Policy 36 (IMR2_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR2 Read Access Policy 35 (IMR2_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR2 Read Access Policy 34 (IMR2_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR2 Read Access Policy 33 (IMR2_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR2 Read Access Policy 32 (IMR2_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR2 Read Access Policy 31 (IMR2_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR2 Read Access Policy 30 (IMR2_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR2 Read Access Policy 29 (IMR2_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR2 Read Access Policy 28 (IMR2_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR2 Read Access Policy 27 (IMR2_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR2 Read Access Policy 26 (IMR2_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR2 Read Access Policy 25 (IMR2_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR2 Read Access Policy 24 (IMR2_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR2 Read Access Policy 23 (IMR2_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR2 Read Access Policy 22 (IMR2_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR2 Read Access Policy 21 (IMR2_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR2 Read Access Policy 20 (IMR2_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR2 Read Access Policy 19 (IMR2_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR2 Read Access Policy 18 (IMR2_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR2 Read Access Policy 17 (IMR2_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR2 Read Access Policy 16 (IMR2_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR2 Read Access Policy 15 (IMR2_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR2 Read Access Policy 14 (IMR2_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR2 Read Access Policy 13 (IMR2_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR2 Read Access Policy 12 (IMR2_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR2 Read Access Policy 11 (IMR2_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR2 Read Access Policy 10 (IMR2_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR2 Read Access Policy 9 (IMR2_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR2 Read Access Policy 8 (IMR2_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR2 Read Access Policy 7 (IMR2_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR2 Read Access Policy 6 (IMR2_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR2 Read Access Policy 5 (IMR2_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR2 Read Access Policy 4 (IMR2_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR2 Read Access Policy 3 (IMR2_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR2 Read Access Policy 2 (IMR2_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR2 Read Access Policy 1 (IMR2_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR2 Read Access Policy 0 (IMR2_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

5.9.21 IMR2 Write Access Policy (B_CR_BIMR2WAC_0_0_0_MCHBAR)—Offset 68C8h

This register, along with IMR2BASE, IMR2MASK and IMR2RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR2. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR2 Write Access Policy 63 (IMR2_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR2 Write Access Policy 62 (IMR2_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR2 Write Access Policy 61 (IMR2_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR2 Write Access Policy 60 (IMR2_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR2 Write Access Policy 59 (IMR2_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR2 Write Access Policy 58 (IMR2_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR2 Write Access Policy 57 (IMR2_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR2 Write Access Policy 56 (IMR2_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR2 Write Access Policy 55 (IMR2_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR2 Write Access Policy 54 (IMR2_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR2 Write Access Policy 53 (IMR2_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR2 Write Access Policy 52 (IMR2_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR2 Write Access Policy 51 (IMR2_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR2 Write Access Policy 50 (IMR2_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR2 Write Access Policy 49 (IMR2_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR2 Write Access Policy 48 (IMR2_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR2 Write Access Policy 47 (IMR2_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR2 Write Access Policy 46 (IMR2_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR2 Write Access Policy 45 (IMR2_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR2 Write Access Policy 44 (IMR2_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR2 Write Access Policy 43 (IMR2_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR2 Write Access Policy 42 (IMR2_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR2 Write Access Policy 41 (IMR2_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR2 Write Access Policy 40 (IMR2_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR2 Write Access Policy 39 (IMR2_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR2 Write Access Policy 38 (IMR2_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR2 Write Access Policy 37 (IMR2_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR2 Write Access Policy 36 (IMR2_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR2 Write Access Policy 35 (IMR2_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR2 Write Access Policy 34 (IMR2_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR2 Write Access Policy 33 (IMR2_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR2 Write Access Policy 32 (IMR2_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR2 Write Access Policy 31 (IMR2_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR2 Write Access Policy 30 (IMR2_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR2 Write Access Policy 29 (IMR2_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR2 Write Access Policy 28 (IMR2_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR2 Write Access Policy 27 (IMR2_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR2 Write Access Policy 26 (IMR2_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR2 Write Access Policy 25 (IMR2_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR2 Write Access Policy 24 (IMR2_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR2 Write Access Policy 23 (IMR2_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR2 Write Access Policy 22 (IMR2_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR2 Write Access Policy 21 (IMR2_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR2 Write Access Policy 20 (IMR2_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR2 Write Access Policy 19 (IMR2_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR2 Write Access Policy 18 (IMR2_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR2 Write Access Policy 17 (IMR2_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR2 Write Access Policy 16 (IMR2_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR2 Write Access Policy 15 (IMR2_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR2 Write Access Policy 14 (IMR2_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR2 Write Access Policy 13 (IMR2_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR2 Write Access Policy 12 (IMR2_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR2 Write Access Policy 11 (IMR2_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR2 Write Access Policy 10 (IMR2_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR2 Write Access Policy 9 (IMR2_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR2 Write Access Policy 8 (IMR2_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR2 Write Access Policy 7 (IMR2_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR2 Write Access Policy 6 (IMR2_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR2 Write Access Policy 5 (IMR2_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR2 Write Access Policy 4 (IMR2_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR2 Write Access Policy 3 (IMR2_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR2 Write Access Policy 2 (IMR2_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR2 Write Access Policy 1 (IMR2_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR2 Write Access Policy 0 (IMR2_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

5.9.22 IMR3 Base (B_CR_BIMR3BASE_0_0_0_MCHBAR)—Offset 68D0h

This register, along with IMR3MASK, IMR3RAC and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR3 Base (IMR3_BASE):** Specifies bits 38:10 of the start address of IMR3 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR3MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR3 defined region.

5.9.23 IMR3 Mask (B_CR_BIMR3MASK_0_0_0_MCHBAR)—Offset 68D4h

This register, along with IMR3BASE, IMR3RAC and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR3 Mask (IMR3_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR3BASE[28:0] value. A match indicates that the incoming address falls within the IMR3 region.

5.9.24 IMR3 Control Policy (B_CR_BIMR3CP_0_0_0_MCHBAR)—Offset 68D8h

This register controls the access policy to the Read Access Policy BIMR3RAC, the Write Access Policy BIMR3WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR3 Control Policy (IMR3_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers, based on the value from each agent's 6bit SAI field.

5.9.25 IMR3 Read Access Policy (B_CR_BIMR3RAC_0_0_0_MCHBAR)—Offset 68E0h

This register, along with IMR3BASE, IMR3MASK and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR3. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR3 Read Access Policy 63 (IMR3_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR3 Read Access Policy 62 (IMR3_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR3 Read Access Policy 61 (IMR3_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR3 Read Access Policy 60 (IMR3_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR3 Read Access Policy 59 (IMR3_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR3 Read Access Policy 58 (IMR3_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR3 Read Access Policy 57 (IMR3_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR3 Read Access Policy 56 (IMR3_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR3 Read Access Policy 55 (IMR3_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR3 Read Access Policy 54 (IMR3_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR3 Read Access Policy 53 (IMR3_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR3 Read Access Policy 52 (IMR3_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR3 Read Access Policy 51 (IMR3_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR3 Read Access Policy 50 (IMR3_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR3 Read Access Policy 49 (IMR3_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR3 Read Access Policy 48 (IMR3_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR3 Read Access Policy 47 (IMR3_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR3 Read Access Policy 46 (IMR3_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR3 Read Access Policy 45 (IMR3_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.

15	0h RO	**IMR3 Read Access Policy 15 (IMR3_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR3 Read Access Policy 14 (IMR3_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR3 Read Access Policy 13 (IMR3_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR3 Read Access Policy 12 (IMR3_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR3 Read Access Policy 11 (IMR3_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR3 Read Access Policy 10 (IMR3_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR3 Read Access Policy 9 (IMR3_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR3 Read Access Policy 8 (IMR3_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR3 Read Access Policy 7 (IMR3_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR3 Read Access Policy 6 (IMR3_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR3 Read Access Policy 5 (IMR3_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR3 Read Access Policy 4 (IMR3_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR3 Read Access Policy 3 (IMR3_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR3 Read Access Policy 2 (IMR3_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR3 Read Access Policy 1 (IMR3_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR3 Read Access Policy 0 (IMR3_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.

5.9.26 IMR3 Write Access Policy (B_CR_BIMR3WAC_0_0_0_MCHBAR)—Offset 68E8h

This register, along with IMR3BASE, IMR3MASK and IMR3RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR3. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR3 Write Access Policy 63 (IMR3_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR3 Write Access Policy 62 (IMR3_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR3 Write Access Policy 61 (IMR3_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR3 Write Access Policy 60 (IMR3_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR3 Write Access Policy 59 (IMR3_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR3 Write Access Policy 58 (IMR3_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR3 Write Access Policy 57 (IMR3_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR3 Write Access Policy 56 (IMR3_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR3 Write Access Policy 55 (IMR3_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR3 Write Access Policy 54 (IMR3_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR3 Write Access Policy 53 (IMR3_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR3 Write Access Policy 52 (IMR3_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR3 Write Access Policy 51 (IMR3_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR3 Write Access Policy 50 (IMR3_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR3 Write Access Policy 49 (IMR3_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR3 Write Access Policy 48 (IMR3_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR3 Write Access Policy 47 (IMR3_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR3 Write Access Policy 46 (IMR3_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR3 Write Access Policy 45 (IMR3_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR3 Write Access Policy 44 (IMR3_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR3 Write Access Policy 43 (IMR3_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR3 Write Access Policy 42 (IMR3_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR3 Write Access Policy 41 (IMR3_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR3 Write Access Policy 40 (IMR3_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR3 Write Access Policy 39 (IMR3_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR3 Write Access Policy 38 (IMR3_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR3 Write Access Policy 37 (IMR3_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR3 Write Access Policy 36 (IMR3_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR3 Write Access Policy 35 (IMR3_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR3 Write Access Policy 34 (IMR3_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR3 Write Access Policy 33 (IMR3_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR3 Write Access Policy 32 (IMR3_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR3 Write Access Policy 31 (IMR3_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR3 Write Access Policy 30 (IMR3_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR3 Write Access Policy 29 (IMR3_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR3 Write Access Policy 28 (IMR3_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR3 Write Access Policy 27 (IMR3_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR3 Write Access Policy 26 (IMR3_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR3 Write Access Policy 25 (IMR3_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR3 Write Access Policy 24 (IMR3_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR3 Write Access Policy 23 (IMR3_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR3 Write Access Policy 22 (IMR3_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR3 Write Access Policy 21 (IMR3_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR3 Write Access Policy 20 (IMR3_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR3 Write Access Policy 19 (IMR3_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR3 Write Access Policy 18 (IMR3_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR3 Write Access Policy 17 (IMR3_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR3 Write Access Policy 16 (IMR3_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR3 Write Access Policy 15 (IMR3_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR3 Write Access Policy 14 (IMR3_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR3 Write Access Policy 13 (IMR3_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR3 Write Access Policy 12 (IMR3_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR3 Write Access Policy 11 (IMR3_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR3 Write Access Policy 10 (IMR3_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR3 Write Access Policy 9 (IMR3_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR3 Write Access Policy 8 (IMR3_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR3 Write Access Policy 7 (IMR3_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR3 Write Access Policy 6 (IMR3_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR3 Write Access Policy 5 (IMR3_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR3 Write Access Policy 4 (IMR3_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR3 Write Access Policy 3 (IMR3_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR3 Write Access Policy 2 (IMR3_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR3 Write Access Policy 1 (IMR3_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR3 Write Access Policy 0 (IMR3_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

5.9.27 IMR4 Base (B_CR_BIMR4BASE_0_0_0_MCHBAR)—Offset 68F0h

This register, along with IMR4MASK, IMR4RAC and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR4 Base (IMR4_BASE):** Specifies bits 38:10 of the start address of IMR4 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR4MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR4 defined region.

5.9.28 IMR4 Mask (B_CR_BIMR4MASK_0_0_0_MCHBAR)—Offset 68F4h

This register, along with IMR4BASE, IMR4RAC and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR4 Mask (IMR4_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR4BASE[28:0] value. A match indicates that the incoming address falls within the IMR4 region.

5.9.29 B-Unit IMR4 Control Policy (B_CR_BIMR4CP_0_0_0_MCHBAR)—Offset 68F8h

This register controls the access policy to the Read Access Policy BIMR4RAC, the Write Access Policy BIMR4WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**B-Unit IMR4 Control Policy (IMR4_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers, based on the value from each agent's 6bit SAI field.

5.9.30 IMR4 Read Access Policy (B_CR_BIMR4RAC_0_0_0_MCHBAR)—Offset 6900h

This register, along with IMR4BASE, IMR4MASK and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR4. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR4 Read Access Policy 63 (IMR4_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR4 Read Access Policy 62 (IMR4_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR4 Read Access Policy 61 (IMR4_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR4 Read Access Policy 60 (IMR4_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR4 Read Access Policy 59 (IMR4_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR4 Read Access Policy 58 (IMR4_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR4 Read Access Policy 57 (IMR4_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR4 Read Access Policy 56 (IMR4_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR4 Read Access Policy 55 (IMR4_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

36	0h RW	**IMR4 Read Access Policy 36 (IMR4_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR4 Read Access Policy 35 (IMR4_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR4 Read Access Policy 34 (IMR4_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR4 Read Access Policy 33 (IMR4_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR4 Read Access Policy 32 (IMR4_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR4 Read Access Policy 31 (IMR4_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR4 Read Access Policy 30 (IMR4_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR4 Read Access Policy 29 (IMR4_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR4 Read Access Policy 28 (IMR4_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR4 Read Access Policy 27 (IMR4_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR4 Read Access Policy 26 (IMR4_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR4 Read Access Policy 25 (IMR4_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR4 Read Access Policy 24 (IMR4_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR4 Read Access Policy 23 (IMR4_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR4 Read Access Policy 22 (IMR4_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR4 Read Access Policy 21 (IMR4_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR4 Read Access Policy 20 (IMR4_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR4 Read Access Policy 19 (IMR4_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR4 Read Access Policy 18 (IMR4_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR4 Read Access Policy 17 (IMR4_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR4 Read Access Policy 16 (IMR4_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR4 Read Access Policy 15 (IMR4_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR4 Read Access Policy 14 (IMR4_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR4 Read Access Policy 13 (IMR4_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR4 Read Access Policy 12 (IMR4_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR4 Read Access Policy 11 (IMR4_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR4 Read Access Policy 10 (IMR4_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR4 Read Access Policy 9 (IMR4_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR4 Read Access Policy 8 (IMR4_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR4 Read Access Policy 7 (IMR4_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR4 Read Access Policy 6 (IMR4_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR4 Read Access Policy 5 (IMR4_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR4 Read Access Policy 4 (IMR4_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR4 Read Access Policy 3 (IMR4_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR4 Read Access Policy 2 (IMR4_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR4 Read Access Policy 1 (IMR4_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR4 Read Access Policy 0 (IMR4_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

5.9.31 IMR4 Write Access Policy (B_CR_BIMR4WAC_0_0_0_MCHBAR)—Offset 6908h

This register, along with IMR4BASE, IMR4MASK and IMR4RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR4. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

0	0h RW	**IMR4_WRITE_POL_0 (IMR4_WRITE_POL_0):** B-Unit IMR4 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.

5.9.32 IMR5 Base (B_CR_BIMR5BASE_0_0_0_MCHBAR)—Offset 6910h

This register, along with IMR5MASK, IMR5RAC and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:0	0h RW	**Base 0 IMR5 Base (IMR5_BASE):** Specifies bits 38:10 of the start address of IMR5 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR5MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR5 defined region.

5.9.33 IMR5 Mask (B_CR_BIMR5MASK_0_0_0_MCHBAR)—Offset 6914h

This register, along with IMR5BASE, IMR5RAC and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR5 Mask (IMR5_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR5BASE[28:0] value. A match indicates that the incoming address falls within the IMR5 region.

5.9.34 IMR5 Control Policy (B_CR_BIMR5CP_0_0_0_MCHBAR)—Offset 6918h

This register controls the access policy to the Read Access Policy BIMR5RAC, the Write Access Policy BIMR5WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR5 Control Policy (IMR5_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers, based on the value from each agent's 6bit SAI field.

5.9.35 IMR5 Read Access Policy (B_CR_BIMR5RAC_0_0_0_MCHBAR)—Offset 6920h

This register, along with IMR5BASE, IMR5MASK and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR5. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR5 Read Access Policy 63 (IMR5_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR5 Read Access Policy 62 (IMR5_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR5 Read Access Policy 61 (IMR5_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RO	**IMR5 Read Access Policy 60 (IMR5_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR5 Read Access Policy 59 (IMR5_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR5 Read Access Policy 58 (IMR5_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR5 Read Access Policy 57 (IMR5_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR5 Read Access Policy 56 (IMR5_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR5 Read Access Policy 55 (IMR5_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR5 Read Access Policy 54 (IMR5_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR5 Read Access Policy 53 (IMR5_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR5 Read Access Policy 52 (IMR5_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR5 Read Access Policy 51 (IMR5_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR5 Read Access Policy 50 (IMR5_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR5 Read Access Policy 49 (IMR5_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR5 Read Access Policy 48 (IMR5_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR5 Read Access Policy 47 (IMR5_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR5 Read Access Policy 46 (IMR5_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0h RO	**IMR5 Read Access Policy 45 (IMR5_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR5 region, based on each agent's 6bit encoded SAI value.

56	0h RW	**IMR5 Write Access Policy 56 (IMR5_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
55	0h RW	**IMR5 Write Access Policy 55 (IMR5_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR5 Write Access Policy 54 (IMR5_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR5 Write Access Policy 53 (IMR5_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR5 Write Access Policy 52 (IMR5_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR5 Write Access Policy 51 (IMR5_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR5 Write Access Policy 50 (IMR5_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR5 Write Access Policy 49 (IMR5_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR5 Write Access Policy 48 (IMR5_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR5 Write Access Policy 47 (IMR5_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR5 Write Access Policy 46 (IMR5_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR5 Write Access Policy 45 (IMR5_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR5 Write Access Policy 44 (IMR5_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR5 Write Access Policy 43 (IMR5_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR5 Write Access Policy 42 (IMR5_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR5 Write Access Policy 41 (IMR5_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
40	0h RW	**IMR5 Write Access Policy 40 (IMR5_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR5 Write Access Policy 39 (IMR5_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR5 Write Access Policy 38 (IMR5_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR5 Write Access Policy 37 (IMR5_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR5 Write Access Policy 36 (IMR5_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR5 Write Access Policy 35 (IMR5_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR5 Write Access Policy 34 (IMR5_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR5 Write Access Policy 33 (IMR5_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR5 Write Access Policy 32 (IMR5_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR5 Write Access Policy 31 (IMR5_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR5 Write Access Policy 30 (IMR5_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR5 Write Access Policy 29 (IMR5_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR5 Write Access Policy 28 (IMR5_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR5 Write Access Policy 27 (IMR5_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR5 Write Access Policy 26 (IMR5_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR5 Write Access Policy 25 (IMR5_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR5 Write Access Policy 24 (IMR5_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR5 Write Access Policy 23 (IMR5_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR5 Write Access Policy 22 (IMR5_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR5 Write Access Policy 21 (IMR5_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR5 Write Access Policy 20 (IMR5_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR5 Write Access Policy 19 (IMR5_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR5 Write Access Policy 18 (IMR5_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR5 Write Access Policy 17 (IMR5_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR5 Write Access Policy 16 (IMR5_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR5 Write Access Policy 15 (IMR5_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR5 Write Access Policy 14 (IMR5_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR5 Write Access Policy 13 (IMR5_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR5 Write Access Policy 12 (IMR5_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR5 Write Access Policy 11 (IMR5_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**IMR5 Write Access Policy 10 (IMR5_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR5 Write Access Policy 9 (IMR5_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR5 Write Access Policy 8 (IMR5_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR5 Write Access Policy 7 (IMR5_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR5 Write Access Policy 6 (IMR5_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR5 Write Access Policy 5 (IMR5_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR5 Write Access Policy 4 (IMR5_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR5 Write Access Policy 3 (IMR5_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR5 Write Access Policy 2 (IMR5_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR5 Write Access Policy 1 (IMR5_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR5 Write Access Policy 0 (IMR5_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

5.9.37 IMR6 Base (B_CR_BIMR6BASE_0_0_0_MCHBAR)—Offset 6930h

This register, along with IMR6MASK, IMR6RAC and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR6 Base (IMR6_BASE):** Specifies bits 38:10 of the start address of IMR6 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR6MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR6 defined region.

5.9.38 IMR6 Mask (B_CR_BIMR6MASK_0_0_0_MCHBAR)—Offset 6934h

This register, along with IMR6BASE, IMR6RAC and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR6 Mask (IMR6_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR6BASE[28:0] value. A match indicates that the incoming address falls within the IMR6 region.

5.9.39 IMR6 Control Policy (B_CR_BIMR6CP_0_0_0_MCHBAR)—Offset 6938h

This register controls the access policy to the Read Access Policy BIMR6RAC, the Write Access Policy BIMR6WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR6 Control Policy (IMR6_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC, BIMR6CP registers, based on the value from each agent's 6bit SAI field.

5.9.40 IMR6 Read Access Policy (B_CR_BIMR6RAC_0_0_0_MCHBAR)—Offset 6940h

This register, along with IMR6BASE, IMR6MASK and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR6 Read Access Policy 63 (IMR6_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR6 Read Access Policy 62 (IMR6_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR6 Read Access Policy 61 (IMR6_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR6 Read Access Policy 60 (IMR6_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR6 Read Access Policy 59 (IMR6_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR6 Read Access Policy 58 (IMR6_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR6 Read Access Policy 57 (IMR6_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR6 Read Access Policy 56 (IMR6_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR6 Read Access Policy 55 (IMR6_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR6 Read Access Policy 54 (IMR6_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR6 Read Access Policy 53 (IMR6_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR6 Read Access Policy 52 (IMR6_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR6 Read Access Policy 51 (IMR6_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR6 Read Access Policy 50 (IMR6_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
49	0h RW	**IMR6 Read Access Policy 49 (IMR6_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR6 Read Access Policy 48 (IMR6_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR6 Read Access Policy 47 (IMR6_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR6 Read Access Policy 46 (IMR6_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR6 Read Access Policy 45 (IMR6_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR6 Read Access Policy 44 (IMR6_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR6 Read Access Policy 43 (IMR6_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR6 Read Access Policy 42 (IMR6_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR6 Read Access Policy 41 (IMR6_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR6 Read Access Policy 40 (IMR6_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR6 Read Access Policy 39 (IMR6_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR6 Read Access Policy 38 (IMR6_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR6 Read Access Policy 37 (IMR6_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR6 Read Access Policy 36 (IMR6_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR6 Read Access Policy 35 (IMR6_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
34	0h RW	**IMR6 Read Access Policy 34 (IMR6_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR6 Read Access Policy 33 (IMR6_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR6 Read Access Policy 32 (IMR6_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR6 Read Access Policy 31 (IMR6_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR6 Read Access Policy 30 (IMR6_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR6 Read Access Policy 29 (IMR6_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR6 Read Access Policy 28 (IMR6_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR6 Read Access Policy 27 (IMR6_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR6 Read Access Policy 26 (IMR6_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR6 Read Access Policy 25 (IMR6_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR6 Read Access Policy 24 (IMR6_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR6 Read Access Policy 23 (IMR6_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR6 Read Access Policy 22 (IMR6_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR6 Read Access Policy 21 (IMR6_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR6 Read Access Policy 20 (IMR6_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**IMR6 Read Access Policy 19 (IMR6_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR6 Read Access Policy 18 (IMR6_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR6 Read Access Policy 17 (IMR6_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR6 Read Access Policy 16 (IMR6_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR6 Read Access Policy 15 (IMR6_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR6 Read Access Policy 14 (IMR6_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR6 Read Access Policy 13 (IMR6_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR6 Read Access Policy 12 (IMR6_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR6 Read Access Policy 11 (IMR6_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR6 Read Access Policy 10 (IMR6_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR6 Read Access Policy 9 (IMR6_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR6 Read Access Policy 8 (IMR6_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR6 Read Access Policy 7 (IMR6_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR6 Read Access Policy 6 (IMR6_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR6 Read Access Policy 5 (IMR6_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**IMR6 Read Access Policy 4 (IMR6_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR6 Read Access Policy 3 (IMR6_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR6 Read Access Policy 2 (IMR6_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR6 Read Access Policy 1 (IMR6_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR6 Read Access Policy 0 (IMR6_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

5.9.41 IMR6 Write Access Policy (B_CR_BIMR6WAC_0_0_0_MCHBAR)—Offset 6948h

This register, along with IMR6BASE, IMR6MASK and IMR6RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR6 Write Access Policy 63 (IMR6_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR6 Write Access Policy 62 (IMR6_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR6 Write Access Policy 61 (IMR6_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR6 Write Access Policy 60 (IMR6_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
59	0h RO	**IMR6 Write Access Policy 59 (IMR6_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR6 Write Access Policy 58 (IMR6_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR6 Write Access Policy 57 (IMR6_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR6 Write Access Policy 56 (IMR6_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR6 Write Access Policy 55 (IMR6_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR6 Write Access Policy 54 (IMR6_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR6 Write Access Policy 53 (IMR6_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR6 Write Access Policy 52 (IMR6_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR6 Write Access Policy 51 (IMR6_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR6 Write Access Policy 50 (IMR6_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR6 Write Access Policy 49 (IMR6_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR6 Write Access Policy 48 (IMR6_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR6 Write Access Policy 47 (IMR6_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR6 Write Access Policy 46 (IMR6_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR6 Write Access Policy 45 (IMR6_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR6 Write Access Policy 44 (IMR6_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR6 Write Access Policy 43 (IMR6_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR6 Write Access Policy 42 (IMR6_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR6 Write Access Policy 41 (IMR6_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR6 Write Access Policy 40 (IMR6_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR6 Write Access Policy 39 (IMR6_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR6 Write Access Policy 38 (IMR6_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR6 Write Access Policy 37 (IMR6_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR6 Write Access Policy 36 (IMR6_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR6 Write Access Policy 35 (IMR6_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR6 Write Access Policy 34 (IMR6_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR6 Write Access Policy 33 (IMR6_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR6 Write Access Policy 32 (IMR6_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR6 Write Access Policy 31 (IMR6_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR6 Write Access Policy 30 (IMR6_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**IMR6 Write Access Policy 29 (IMR6_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR6 Write Access Policy 28 (IMR6_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR6 Write Access Policy 27 (IMR6_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR6 Write Access Policy 26 (IMR6_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR6 Write Access Policy 25 (IMR6_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR6 Write Access Policy 24 (IMR6_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR6 Write Access Policy 23 (IMR6_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR6 Write Access Policy 22 (IMR6_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR6 Write Access Policy 21 (IMR6_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR6 Write Access Policy 20 (IMR6_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR6 Write Access Policy 19 (IMR6_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR6 Write Access Policy 18 (IMR6_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR6 Write Access Policy 17 (IMR6_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR6 Write Access Policy 16 (IMR6_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR6 Write Access Policy 15 (IMR6_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO	**IMR6 Write Access Policy 14 (IMR6_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR6 Write Access Policy 13 (IMR6_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR6 Write Access Policy 12 (IMR6_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR6 Write Access Policy 11 (IMR6_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR6 Write Access Policy 10 (IMR6_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR6 Write Access Policy 9 (IMR6_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR6 Write Access Policy 8 (IMR6_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR6 Write Access Policy 7 (IMR6_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR6 Write Access Policy 6 (IMR6_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR6 Write Access Policy 5 (IMR6_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR6 Write Access Policy 4 (IMR6_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR6 Write Access Policy 3 (IMR6_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR6 Write Access Policy 2 (IMR6_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR6 Write Access Policy 1 (IMR6_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR6 Write Access Policy 0 (IMR6_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

5.9.42 IMR7 Base (B_CR_BIMR7BASE_0_0_0_MCHBAR)—Offset 6950h

This register, along with IMR7MASK, IMR7RAC and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR7 Base (IMR7_BASE):** Specifies bits 38:10 of the start address of IMR7 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR7MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR7 defined region.

5.9.43 IMR7 Mask (B_CR_BIMR7MASK_0_0_0_MCHBAR)—Offset 6954h

This register, along with IMR7BASE, IMR7RAC and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR7 Mask (IMR7_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR7BASE[28:0] value. A match indicates that the incoming address falls within the IMR7 region.

5.9.44 IMR7 Control Policy (B_CR_BIMR7CP_0_0_0_MCHBAR)—Offset 6958h

This register controls the access policy to the Read Access Policy BIMR7RAC, the Write Access Policy BIMR7WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR7 Control Policy (IMR7_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers, based on the value from each agent's 6bit SAI field.

5.9.45 IMR7 Read Access Policy (B_CR_BIMR7RAC_0_0_0_MCHBAR)—Offset 6960h

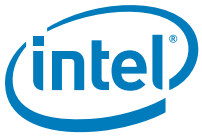
This register, along with IMR7BASE, IMR7MASK and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR7. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR7 Read Access Policy 63 (IMR7_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR7 Read Access Policy 62 (IMR7_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR7 Read Access Policy 61 (IMR7_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR7 Read Access Policy 60 (IMR7_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR7 Read Access Policy 59 (IMR7_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR7 Read Access Policy 58 (IMR7_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR7 Read Access Policy 57 (IMR7_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR7 Read Access Policy 56 (IMR7_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR7 Read Access Policy 55 (IMR7_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR7 Read Access Policy 54 (IMR7_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.



Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR7 Read Access Policy 53 (IMR7_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR7 Read Access Policy 52 (IMR7_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR7 Read Access Policy 51 (IMR7_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR7 Read Access Policy 50 (IMR7_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR7 Read Access Policy 49 (IMR7_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR7 Read Access Policy 48 (IMR7_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR7 Read Access Policy 47 (IMR7_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR7 Read Access Policy 46 (IMR7_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR7 Read Access Policy 45 (IMR7_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

14	0h RO	**IMR7 Read Access Policy 14 (IMR7_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR7 Read Access Policy 13 (IMR7_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR7 Read Access Policy 12 (IMR7_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR7 Read Access Policy 11 (IMR7_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR7 Read Access Policy 10 (IMR7_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR7 Read Access Policy 9 (IMR7_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR7 Read Access Policy 8 (IMR7_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR7 Read Access Policy 7 (IMR7_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR7 Read Access Policy 6 (IMR7_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR7 Read Access Policy 5 (IMR7_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR7 Read Access Policy 4 (IMR7_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR7 Read Access Policy 3 (IMR7_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR7 Read Access Policy 2 (IMR7_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR7 Read Access Policy 1 (IMR7_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR7 Read Access Policy 0 (IMR7_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

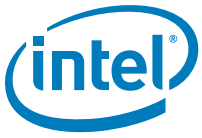
5.9.46 IMR7 Write Access Policy (B_CR_BIMR7WAC_0_0_0_MCHBAR)—Offset 6968h

This register, along with IMR7BASE, IMR7MASK and IMR7RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR7. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR7 Write Access Policy 63 (IMR7_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR7 Write Access Policy 62 (IMR7_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR7 Write Access Policy 61 (IMR7_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR7 Write Access Policy 60 (IMR7_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR7 Write Access Policy 59 (IMR7_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR7 Write Access Policy 58 (IMR7_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR7 Write Access Policy 57 (IMR7_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR7 Write Access Policy 56 (IMR7_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR7 Write Access Policy 55 (IMR7_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR7 Write Access Policy 54 (IMR7_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR7 Write Access Policy 53 (IMR7_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR7 Write Access Policy 52 (IMR7_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR7 Write Access Policy 51 (IMR7_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR7 Write Access Policy 50 (IMR7_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR7 Write Access Policy 49 (IMR7_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR7 Write Access Policy 48 (IMR7_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR7 Write Access Policy 47 (IMR7_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR7 Write Access Policy 46 (IMR7_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR7 Write Access Policy 45 (IMR7_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR7 Write Access Policy 44 (IMR7_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR7 Write Access Policy 43 (IMR7_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR7 Write Access Policy 42 (IMR7_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR7 Write Access Policy 41 (IMR7_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR7 Write Access Policy 40 (IMR7_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR7 Write Access Policy 39 (IMR7_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR7 Write Access Policy 38 (IMR7_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR7 Write Access Policy 37 (IMR7_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR7 Write Access Policy 36 (IMR7_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR7 Write Access Policy 35 (IMR7_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR7 Write Access Policy 34 (IMR7_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR7 Write Access Policy 33 (IMR7_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR7 Write Access Policy 32 (IMR7_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR7 Write Access Policy 31 (IMR7_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR7 Write Access Policy 30 (IMR7_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR7 Write Access Policy 29 (IMR7_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR7 Write Access Policy 28 (IMR7_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR7 Write Access Policy 27 (IMR7_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR7 Write Access Policy 26 (IMR7_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR7 Write Access Policy 25 (IMR7_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR7 Write Access Policy 24 (IMR7_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR7 Write Access Policy 23 (IMR7_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR7 Write Access Policy 22 (IMR7_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR7 Write Access Policy 21 (IMR7_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR7 Write Access Policy 20 (IMR7_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR7 Write Access Policy 19 (IMR7_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR7 Write Access Policy 18 (IMR7_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR7 Write Access Policy 17 (IMR7_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR7 Write Access Policy 16 (IMR7_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR7 Write Access Policy 15 (IMR7_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR7 Write Access Policy 14 (IMR7_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR7 Write Access Policy 13 (IMR7_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR7 Write Access Policy 12 (IMR7_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR7 Write Access Policy 11 (IMR7_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR7 Write Access Policy 10 (IMR7_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR7 Write Access Policy 9 (IMR7_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR7 Write Access Policy 8 (IMR7_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR7 Write Access Policy 7 (IMR7_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR7 Write Access Policy 6 (IMR7_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR7 Write Access Policy 5 (IMR7_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR7 Write Access Policy 4 (IMR7_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR7 Write Access Policy 3 (IMR7_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR7 Write Access Policy 2 (IMR7_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR7 Write Access Policy 1 (IMR7_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR7 Write Access Policy 0 (IMR7_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

5.9.47 IMR8 Base (B_CR_BIMR8BASE_0_0_0_MCHBAR)—Offset 6970h

This register, along with IMR8MASK, IMR8RAC and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR8 Base (IMR8_BASE):** Specifies bits 38:10 of the start address of IMR8 region. IMR region size must be a strict power of two at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR8MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR8 defined region.

5.9.48 IMR8 Mask (B_CR_BIMR8MASK_0_0_0_MCHBAR)—Offset 6974h

This register, along with IMR8BASE, IMR8RAC and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR8 Mask (IMR8_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR8BASE[28:0] value. A match indicates that the incoming address falls within the IMR8 region.

5.9.49 IMR8 Control Policy (B_CR_BIMR8CP_0_0_0_MCHBAR)—Offset 6978h

This register controls the access policy to the Read Access Policy BIMR8RAC, the Write Access Policy BIMR8WAC, and, self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR8 Control Policy (IMR8_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers, based on the value from each agent's 6bit SAI field.

5.9.50 IMR8 Read Access Policy (B_CR_BIMR8RAC_0_0_0_MCHBAR)—Offset 6980h

This register, along with IMR8BASE, IMR8MASK and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR8. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

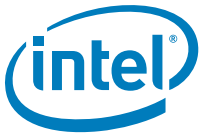
Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR8 Read Access Policy 63 (IMR8_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR8 Read Access Policy 62 (IMR8_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR8 Read Access Policy 61 (IMR8_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR8 Read Access Policy 60 (IMR8_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR8 Read Access Policy 59 (IMR8_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR8 Read Access Policy 58 (IMR8_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR8 Read Access Policy 57 (IMR8_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR8 Read Access Policy 56 (IMR8_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR8 Read Access Policy 55 (IMR8_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR8 Read Access Policy 54 (IMR8_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR8 Read Access Policy 53 (IMR8_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR8 Read Access Policy 52 (IMR8_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR8 Read Access Policy 51 (IMR8_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR8 Read Access Policy 50 (IMR8_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR8 Read Access Policy 49 (IMR8_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR8 Read Access Policy 48 (IMR8_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR8 Read Access Policy 47 (IMR8_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR8 Read Access Policy 46 (IMR8_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR8 Read Access Policy 45 (IMR8_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR8 Read Access Policy 44 (IMR8_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR8 Read Access Policy 43 (IMR8_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.



Bit Range	Default & Access	Field Name (ID): Description
42	0h RW	**IMR8 Read Access Policy 42 (IMR8_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR8 Read Access Policy 41 (IMR8_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR8 Read Access Policy 40 (IMR8_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR8 Read Access Policy 39 (IMR8_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR8 Read Access Policy 38 (IMR8_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR8 Read Access Policy 37 (IMR8_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR8 Read Access Policy 36 (IMR8_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR8 Read Access Policy 35 (IMR8_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR8 Read Access Policy 34 (IMR8_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR8 Read Access Policy 33 (IMR8_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR8 Read Access Policy 32 (IMR8_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR8 Read Access Policy 31 (IMR8_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR8 Read Access Policy 30 (IMR8_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR8 Read Access Policy 29 (IMR8_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR8 Read Access Policy 28 (IMR8_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**IMR8 Read Access Policy 27 (IMR8_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR8 Read Access Policy 26 (IMR8_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR8 Read Access Policy 25 (IMR8_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR8 Read Access Policy 24 (IMR8_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR8 Read Access Policy 23 (IMR8_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR8 Read Access Policy 22 (IMR8_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR8 Read Access Policy 21 (IMR8_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR8 Read Access Policy 20 (IMR8_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR8 Read Access Policy 19 (IMR8_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR8 Read Access Policy 18 (IMR8_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR8 Read Access Policy 17 (IMR8_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR8 Read Access Policy 16 (IMR8_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR8 Read Access Policy 15 (IMR8_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR8 Read Access Policy 14 (IMR8_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR8 Read Access Policy 13 (IMR8_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR8 Read Access Policy 12 (IMR8_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR8 Read Access Policy 11 (IMR8_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR8 Read Access Policy 10 (IMR8_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR8 Read Access Policy 9 (IMR8_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR8 Read Access Policy 8 (IMR8_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR8 Read Access Policy 7 (IMR8_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR8 Read Access Policy 6 (IMR8_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR8 Read Access Policy 5 (IMR8_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR8 Read Access Policy 4 (IMR8_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR8 Read Access Policy 3 (IMR8_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR8 Read Access Policy 2 (IMR8_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR8 Read Access Policy 1 (IMR8_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR8 Read Access Policy 0 (IMR8_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR8 region, based on each agent's 6bit encoded SAI value.

5.9.51 IMR8 Write Access Policy (B_CR_BIMR8WAC_0_0_0_MCHBAR)—Offset 6988h

This register, along with IMR8BASE, IMR8MASK and IMR8RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR8. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

32	0h RW	**IMR8 Write Access Policy 32 (IMR8_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR8 Write Access Policy 31 (IMR8_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR8 Write Access Policy 30 (IMR8_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR8 Write Access Policy 29 (IMR8_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR8 Write Access Policy 28 (IMR8_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR8 Write Access Policy 27 (IMR8_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR8 Write Access Policy 26 (IMR8_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR8 Write Access Policy 25 (IMR8_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR8 Write Access Policy 24 (IMR8_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR8 Write Access Policy 23 (IMR8_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR8 Write Access Policy 22 (IMR8_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR8 Write Access Policy 21 (IMR8_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR8 Write Access Policy 20 (IMR8_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR8 Write Access Policy 19 (IMR8_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR8 Write Access Policy 18 (IMR8_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR8 Write Access Policy 17 (IMR8_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR8 Write Access Policy 16 (IMR8_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR8 Write Access Policy 15 (IMR8_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR8 Write Access Policy 14 (IMR8_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR8 Write Access Policy 13 (IMR8_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR8 Write Access Policy 12 (IMR8_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR8 Write Access Policy 11 (IMR8_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR8 Write Access Policy 10 (IMR8_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR8 Write Access Policy 9 (IMR8_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR8 Write Access Policy 8 (IMR8_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR8 Write Access Policy 7 (IMR8_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR8 Write Access Policy 6 (IMR8_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR8 Write Access Policy 5 (IMR8_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR8 Write Access Policy 4 (IMR8_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR8 Write Access Policy 3 (IMR8_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR8 Write Access Policy 2 (IMR8_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR8 Write Access Policy 1 (IMR8_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR8 Write Access Policy 0 (IMR8_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.

5.9.52 IMR9 Base (B_CR_BIMR9BASE_0_0_0_MCHBAR)—Offset 6990h

This register, along with IMR9MASK, IMR9RAC and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 1 IMR9 Base (IMR9_BASE):** Specifies bits 38:10 of the start address of IMR9 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR9MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR9 defined region.

5.9.53 IMR9 Mask (B_CR_BIMR9MASK_0_0_0_MCHBAR)—Offset 6994h

This register, along with IMR9BASE, IMR9RAC and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 1 IMR9 Mask (IMR9_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR9BASE[28:0] value. A match indicates that the incoming address falls within the IMR9 region.

5.9.54 IMR9 Control Policy (B_CR_BIMR9CP_0_0_0_MCHBAR)—Offset 6998h

This register controls the access policy to the Read Access Policy BIMR9RAC, the Write Access Policy BIMR9WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR9 Control Policy (IMR9_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC, BIMR9CP registers based on the value from each agent's 6bit SAI field.

5.9.55 IMR9 Read Access Policy (B_CR_BIMR9RAC_0_0_0_MCHBAR)—Offset 69A0h

This register, along with IMR9BASE, IMR9MASK and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR9. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR9 Read Access Policy 63 (IMR9_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR9 Read Access Policy 62 (IMR9_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR9 Read Access Policy 61 (IMR9_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR9 Read Access Policy 60 (IMR9_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR9 Read Access Policy 59 (IMR9_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR9 Read Access Policy 58 (IMR9_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR9 Read Access Policy 57 (IMR9_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR9 Read Access Policy 56 (IMR9_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR9 Read Access Policy 55 (IMR9_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR9 Read Access Policy 54 (IMR9_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR9 Read Access Policy 53 (IMR9_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR9 Read Access Policy 52 (IMR9_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR9 Read Access Policy 51 (IMR9_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR9 Read Access Policy 50 (IMR9_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR9 Read Access Policy 49 (IMR9_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR9 Read Access Policy 48 (IMR9_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR9 Read Access Policy 47 (IMR9_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR9 Read Access Policy 46 (IMR9_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR9 Read Access Policy 45 (IMR9_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR9 Read Access Policy 44 (IMR9_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR9 Read Access Policy 43 (IMR9_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR9 Read Access Policy 42 (IMR9_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR9 Read Access Policy 41 (IMR9_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR9 Read Access Policy 40 (IMR9_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR9 Read Access Policy 39 (IMR9_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR9 Read Access Policy 38 (IMR9_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR9 Read Access Policy 37 (IMR9_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR9 Read Access Policy 36 (IMR9_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR9 Read Access Policy 35 (IMR9_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR9 Read Access Policy 34 (IMR9_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR9 Read Access Policy 33 (IMR9_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR9 Read Access Policy 32 (IMR9_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR9 Read Access Policy 31 (IMR9_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR9 Read Access Policy 30 (IMR9_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR9 Read Access Policy 29 (IMR9_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR9 Read Access Policy 28 (IMR9_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR9 Read Access Policy 27 (IMR9_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR9 Read Access Policy 26 (IMR9_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR9 Read Access Policy 25 (IMR9_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR9 Read Access Policy 24 (IMR9_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR9 Read Access Policy 23 (IMR9_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR9 Read Access Policy 22 (IMR9_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR9 Read Access Policy 21 (IMR9_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR9 Read Access Policy 20 (IMR9_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR9 Read Access Policy 19 (IMR9_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR9 Read Access Policy 18 (IMR9_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR9 Read Access Policy 17 (IMR9_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR9 Read Access Policy 16 (IMR9_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR9 Read Access Policy 15 (IMR9_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR9 Read Access Policy 14 (IMR9_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR9 Read Access Policy 13 (IMR9_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR9 Read Access Policy 12 (IMR9_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR9 Read Access Policy 11 (IMR9_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR9 Read Access Policy 10 (IMR9_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR9 Read Access Policy 9 (IMR9_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR9 Read Access Policy 8 (IMR9_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR9 Read Access Policy 7 (IMR9_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR9 Read Access Policy 6 (IMR9_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR9 Read Access Policy 5 (IMR9_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR9 Read Access Policy 4 (IMR9_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR9 Read Access Policy 3 (IMR9_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR9 Read Access Policy 2 (IMR9_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR9 Read Access Policy 1 (IMR9_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR9 Read Access Policy 0 (IMR9_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

5.9.56 IMR9 Write Access Policy (B_CR_BIMR9WAC_0_0_0_MCHBAR)—Offset 69A8h

This register, along with IMR9BASE, IMR9MASK and IMR9RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR9. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

44	0h RW	**IMR9 Write Access Policy 44 (IMR9_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
43	0h RW	**IMR9 Write Access Policy 43 (IMR9_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR9 Write Access Policy 42 (IMR9_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR9 Write Access Policy 41 (IMR9_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR9 Write Access Policy 40 (IMR9_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR9 Write Access Policy 39 (IMR9_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR9 Write Access Policy 38 (IMR9_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR9 Write Access Policy 37 (IMR9_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR9 Write Access Policy 36 (IMR9_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR9 Write Access Policy 35 (IMR9_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR9 Write Access Policy 34 (IMR9_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR9 Write Access Policy 33 (IMR9_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR9 Write Access Policy 32 (IMR9_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR9 Write Access Policy 31 (IMR9_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR9 Write Access Policy 30 (IMR9_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR9 Write Access Policy 29 (IMR9_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**IMR9 Write Access Policy 28 (IMR9_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR9 Write Access Policy 27 (IMR9_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR9 Write Access Policy 26 (IMR9_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR9 Write Access Policy 25 (IMR9_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR9 Write Access Policy 24 (IMR9_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR9 Write Access Policy 23 (IMR9_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR9 Write Access Policy 22 (IMR9_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR9 Write Access Policy 21 (IMR9_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR9 Write Access Policy 20 (IMR9_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR9 Write Access Policy 19 (IMR9_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR9 Write Access Policy 18 (IMR9_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR9 Write Access Policy 17 (IMR9_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR9 Write Access Policy 16 (IMR9_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR9 Write Access Policy 15 (IMR9_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR9 Write Access Policy 14 (IMR9_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**IMR9 Write Access Policy 13 (IMR9_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR9 Write Access Policy 12 (IMR9_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR9 Write Access Policy 11 (IMR9_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR9 Write Access Policy 10 (IMR9_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR9 Write Access Policy 9 (IMR9_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR9 Write Access Policy 8 (IMR9_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR9 Write Access Policy 7 (IMR9_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR9 Write Access Policy 6 (IMR9_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR9 Write Access Policy 5 (IMR9_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR9 Write Access Policy 4 (IMR9_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR9 Write Access Policy 3 (IMR9_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR9 Write Access Policy 2 (IMR9_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR9 Write Access Policy 1 (IMR9_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR9 Write Access Policy 0 (IMR9_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

5.9.57 IMR10 Base (B_CR_BIMR10BASE_0_0_0_MCHBAR)—Offset 69B0h

This register, along with IMR10MASK, IMR10RAC and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR10 Base (IMR10_BASE):** Specifies bits 38:10 of the start address of IMR10 region. IMR region size must be a strict power of two at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR10MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR10 defined region.

5.9.58 IMR10 Mask (B_CR_BIMR10MASK_0_0_0_MCHBAR)—Offset 69B4h

This register, along with IMR10BASE, IMR10RAC and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR10 Mask (IMR10_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR10BASE[28:0] value. A match indicates that the incoming address falls within the IMR10 region.

5.9.59 IMR10 Control Policy (B_CR_BIMR10CP_0_0_0_MCHBAR)—Offset 69B8h

This register controls the access policy to the Read Access Policy BIMR10RAC, the Write Access Policy BIMR10WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR10 Control Policy (IMR10_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP, registers based on the value from each agent's 6bit SAI field.

5.9.60 IMR10 Read Access Policy (B_CR_BIMR10RAC_0_0_0_MCHBAR)—Offset 69C0h

This register, along with IMR10BASE, IMR10MASK and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR10 Read Access Policy 63 (IMR10_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR10 Read Access Policy 62 (IMR10_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR10 Read Access Policy 61 (IMR10_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR10 Read Access Policy 60 (IMR10_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR10 Read Access Policy 59 (IMR10_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR10 Read Access Policy 58 (IMR10_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR10 Read Access Policy 57 (IMR10_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR10 Read Access Policy 56 (IMR10_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR10 Read Access Policy 55 (IMR10_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR10 Read Access Policy 54 (IMR10_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR10 Read Access Policy 53 (IMR10_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR10 Read Access Policy 52 (IMR10_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR10 Read Access Policy 51 (IMR10_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR10 Read Access Policy 50 (IMR10_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR10 Read Access Policy 49 (IMR10_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR10 Read Access Policy 48 (IMR10_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR10 Read Access Policy 47 (IMR10_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR10 Read Access Policy 46 (IMR10_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR10 Read Access Policy 45 (IMR10_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR10 Read Access Policy 44 (IMR10_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR10 Read Access Policy 43 (IMR10_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR10 Read Access Policy 42 (IMR10_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR10 Read Access Policy 41 (IMR10_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR10 Read Access Policy 40 (IMR10_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR10 Read Access Policy 39 (IMR10_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR10 Read Access Policy 38 (IMR10_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR10 Read Access Policy 37 (IMR10_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR10 Read Access Policy 36 (IMR10_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR10 Read Access Policy 35 (IMR10_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR10 Read Access Policy 34 (IMR10_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR10 Read Access Policy 33 (IMR10_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR10 Read Access Policy 32 (IMR10_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR10 Read Access Policy 31 (IMR10_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR10 Read Access Policy 30 (IMR10_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR10 Read Access Policy 29 (IMR10_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR10 Read Access Policy 28 (IMR10_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR10 Read Access Policy 27 (IMR10_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR10 Read Access Policy 26 (IMR10_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR10 Read Access Policy 25 (IMR10_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR10 Read Access Policy 24 (IMR10_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR10 Read Access Policy 23 (IMR10_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR10 Read Access Policy 22 (IMR10_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR10 Read Access Policy 21 (IMR10_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR10 Read Access Policy 20 (IMR10_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR10 Read Access Policy 19 (IMR10_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR10 Read Access Policy 18 (IMR10_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR10 Read Access Policy 17 (IMR10_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR10 Read Access Policy 16 (IMR10_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR10 Read Access Policy 15 (IMR10_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR10 Read Access Policy 14 (IMR10_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR10 Read Access Policy 13 (IMR10_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR10 Read Access Policy 12 (IMR10_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR10 Read Access Policy 11 (IMR10_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR10 Read Access Policy 10 (IMR10_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR10 Read Access Policy 9 (IMR10_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR10 Read Access Policy 8 (IMR10_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR10 Read Access Policy 7 (IMR10_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR10 Read Access Policy 6 (IMR10_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR10 Read Access Policy 5 (IMR10_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR10 Read Access Policy 4 (IMR10_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR10 Read Access Policy 3 (IMR10_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR10 Read Access Policy 2 (IMR10_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR10 Read Access Policy 1 (IMR10_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR10 Read Access Policy 0 (IMR10_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

5.9.61 IMR10 Write Access Policy (B_CR_BIMR10WAC_0_0_0_MCHBAR)—Offset 69C8h

This register along with IMR10BASE, IMR10MASK and IMR10RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR10 Write Access Policy 63 (IMR10_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR10 Write Access Policy 62 (IMR10_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR10 Write Access Policy 61 (IMR10_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR10 Write Access Policy 60 (IMR10_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR10 Write Access Policy 59 (IMR10_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR10 Write Access Policy 58 (IMR10_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR10 Write Access Policy 57 (IMR10_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR10 Write Access Policy 56 (IMR10_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR10 Write Access Policy 55 (IMR10_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR10 Write Access Policy 54 (IMR10_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR10 Write Access Policy 53 (IMR10_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR10 Write Access Policy 52 (IMR10_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR10 Write Access Policy 51 (IMR10_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR10 Write Access Policy 50 (IMR10_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR10 Write Access Policy 49 (IMR10_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR10 Write Access Policy 48 (IMR10_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR10 Write Access Policy 47 (IMR10_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR10 Write Access Policy 46 (IMR10_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR10 Write Access Policy 45 (IMR10_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR10 Write Access Policy 44 (IMR10_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR10 Write Access Policy 43 (IMR10_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR10 Write Access Policy 42 (IMR10_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR10 Write Access Policy 41 (IMR10_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR10 Write Access Policy 40 (IMR10_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR10 Write Access Policy 39 (IMR10_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR10 Write Access Policy 38 (IMR10_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR10 Write Access Policy 37 (IMR10_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR10 Write Access Policy 36 (IMR10_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR10 Write Access Policy 35 (IMR10_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR10 Write Access Policy 34 (IMR10_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR10 Write Access Policy 33 (IMR10_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR10 Write Access Policy 32 (IMR10_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR10 Write Access Policy 31 (IMR10_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR10 Write Access Policy 30 (IMR10_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR10 Write Access Policy 29 (IMR10_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR10 Write Access Policy 28 (IMR10_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR10 Write Access Policy 27 (IMR10_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR10 Write Access Policy 26 (IMR10_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR10 Write Access Policy 25 (IMR10_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR10 Write Access Policy 24 (IMR10_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR10 Write Access Policy 23 (IMR10_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR10 Write Access Policy 22 (IMR10_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR10 Write Access Policy 21 (IMR10_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR10 Write Access Policy 20 (IMR10_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR10 Write Access Policy 19 (IMR10_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR10 Write Access Policy 18 (IMR10_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR10 Write Access Policy 17 (IMR10_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR10 Write Access Policy 16 (IMR10_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR10 Write Access Policy 15 (IMR10_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR10 Write Access Policy 14 (IMR10_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR10 Write Access Policy 13 (IMR10_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR10 Write Access Policy 12 (IMR10_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR10 Write Access Policy 11 (IMR10_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR10 Write Access Policy 10 (IMR10_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR10 Write Access Policy 9 (IMR10_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR10 Write Access Policy 8 (IMR10_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR10 Write Access Policy 7 (IMR10_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR10 Write Access Policy 6 (IMR10_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR10 Write Access Policy 5 (IMR10_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR10 Write Access Policy 4 (IMR10_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR10 Write Access Policy 3 (IMR10_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR10 Write Access Policy 2 (IMR10_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR10 Write Access Policy 1 (IMR10_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR10 Write Access Policy 0 (IMR10_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

5.9.62 IMR11 Base (B_CR_BIMR11BASE_0_0_0_MCHBAR)—Offset 69D0h

This register, along with IMR11MASK, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR11 Base (IMR11_BASE):** Specifies bits 38:10 of the start address of IMR11 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR11MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR11 defined region.

5.9.63 IMR11 Mask (B_CR_BIMR11MASK_0_0_0_MCHBAR)—Offset 69D4h

This register, along with IMR11BASE, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR11 Mask (IMR11_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR11BASE[28:0] value. A match indicates that the incoming address falls within the IMR11 region.

5.9.64 IMR11 Control Policy (B_CR_BIMR11CP_0_0_0_MCHBAR)—Offset 69D8h

This register controls the access policy to the Read Access Policy BIMR11RAC, the Write Access Policy BIMR11WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR11 Control Policy (IMR11_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers, based on the value from each agent's 6bit SAI field.

5.9.65 IMR11 Read Access Policy (B_CR_BIMR11RAC_0_0_0_MCHBAR)—Offset 69E0h

This register, along with IMR11BASE, IMR11MASK and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR11 Read Access Policy 63 (IMR11_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR11 Read Access Policy 62 (IMR11_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR11 Read Access Policy 61 (IMR11_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR11 Read Access Policy 60 (IMR11_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR11 Read Access Policy 59 (IMR11_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR11 Read Access Policy 58 (IMR11_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR11 Read Access Policy 57 (IMR11_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR11 Read Access Policy 56 (IMR11_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR11 Read Access Policy 55 (IMR11_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR11 Read Access Policy 54 (IMR11_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR11 Read Access Policy 53 (IMR11_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR11 Read Access Policy 52 (IMR11_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR11 Read Access Policy 51 (IMR11_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR11 Read Access Policy 50 (IMR11_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR11 Read Access Policy 49 (IMR11_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR11 Read Access Policy 48 (IMR11_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR11 Read Access Policy 47 (IMR11_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR11 Read Access Policy 46 (IMR11_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR11 Read Access Policy 45 (IMR11_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR11 Read Access Policy 44 (IMR11_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR11 Read Access Policy 43 (IMR11_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
42	0h RW	**IMR11 Read Access Policy 42 (IMR11_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR11 Read Access Policy 41 (IMR11_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR11 Read Access Policy 40 (IMR11_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

12	0h RW	**IMR11 Read Access Policy 12 (IMR11_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR11 Read Access Policy 11 (IMR11_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR11 Read Access Policy 10 (IMR11_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR11 Read Access Policy 9 (IMR11_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR11 Read Access Policy 8 (IMR11_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR11 Read Access Policy 7 (IMR11_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR11 Read Access Policy 6 (IMR11_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR11 Read Access Policy 5 (IMR11_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR11 Read Access Policy 4 (IMR11_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR11 Read Access Policy 3 (IMR11_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR11 Read Access Policy 2 (IMR11_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR11 Read Access Policy 1 (IMR11_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR11 Read Access Policy 0 (IMR11_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

5.9.66 IMR11 Write Access Policy (B_CR_BIMR11WAC_0_0_0_MCHBAR)—Offset 69E8h

This register, along with IMR11BASE, IMR11MASK and IMR11RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR11 Write Access Policy 63 (IMR11_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR11 Write Access Policy 62 (IMR11_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR11 Write Access Policy 61 (IMR11_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR11 Write Access Policy 60 (IMR11_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR11 Write Access Policy 59 (IMR11_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR11 Write Access Policy 58 (IMR11_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR11 Write Access Policy 57 (IMR11_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR11 Write Access Policy 56 (IMR11_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR11 Write Access Policy 55 (IMR11_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR11 Write Access Policy 54 (IMR11_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR11 Write Access Policy 53 (IMR11_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR11 Write Access Policy 52 (IMR11_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR11 Write Access Policy 51 (IMR11_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR11 Write Access Policy 50 (IMR11_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR11 Write Access Policy 49 (IMR11_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR11 Write Access Policy 48 (IMR11_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR11 Write Access Policy 47 (IMR11_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR11 Write Access Policy 46 (IMR11_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR11 Write Access Policy 45 (IMR11_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR11 Write Access Policy 44 (IMR11_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR11 Write Access Policy 43 (IMR11_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR11 Write Access Policy 42 (IMR11_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR11 Write Access Policy 41 (IMR11_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR11 Write Access Policy 40 (IMR11_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR11 Write Access Policy 39 (IMR11_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR11 Write Access Policy 38 (IMR11_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR11 Write Access Policy 37 (IMR11_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR11 Write Access Policy 36 (IMR11_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR11 Write Access Policy 35 (IMR11_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR11 Write Access Policy 34 (IMR11_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR11 Write Access Policy 33 (IMR11_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR11 Write Access Policy 32 (IMR11_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR11 Write Access Policy 31 (IMR11_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR11 Write Access Policy 30 (IMR11_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR11 Write Access Policy 29 (IMR11_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR11 Write Access Policy 28 (IMR11_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR11 Write Access Policy 27 (IMR11_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR11 Write Access Policy 26 (IMR11_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR11 Write Access Policy 25 (IMR11_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR11 Write Access Policy 24 (IMR11_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR11 Write Access Policy 23 (IMR11_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR11 Write Access Policy 22 (IMR11_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR11 Write Access Policy 21 (IMR11_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR11 Write Access Policy 20 (IMR11_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR11 Write Access Policy 19 (IMR11_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR11 Write Access Policy 18 (IMR11_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR11 Write Access Policy 17 (IMR11_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR11 Write Access Policy 16 (IMR11_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR11 Write Access Policy 15 (IMR11_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR11 Write Access Policy 14 (IMR11_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR11 Write Access Policy 13 (IMR11_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR11 Write Access Policy 12 (IMR11_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR11 Write Access Policy 11 (IMR11_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR11 Write Access Policy 10 (IMR11_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR11 Write Access Policy 9 (IMR11_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR11 Write Access Policy 8 (IMR11_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR11 Write Access Policy 7 (IMR11_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR11 Write Access Policy 6 (IMR11_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR11 Write Access Policy 5 (IMR11_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR11 Write Access Policy 4 (IMR11_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR11 Write Access Policy 3 (IMR11_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR11 Write Access Policy 2 (IMR11_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR11 Write Access Policy 1 (IMR11_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR11 Write Access Policy 0 (IMR11_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

5.9.67 IMR12 Base (B_CR_BIMR12BASE_0_0_0_MCHBAR)—Offset 69F0h

This register, along with IMR12MASK, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR12 Base (IMR12_BASE):** Specifies bits 38:10 of the start address of IMR12 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR12MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR12 defined region.

5.9.68 IMR12 Mask (B_CR_BIMR12MASK_0_0_0_MCHBAR)—Offset 69F4h

This register, along with IMR12BASE, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR12 Mask (IMR12_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR12BASE[28:0] value. A match indicates that the incoming address falls within the IMR12 region.

5.9.69 IMR12 Control Policy (B_CR_BIMR12CP_0_0_0_MCHBAR)—Offset 69F8h

This register controls the access policy to the Read Access Policy BIMR12RAC, the Write Access Policy BIMR12WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR12 Control Policy (IMR12_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers, based on the value from each agent's 6bit SAI field.

5.9.70 IMR12 Read Access Policy (B_CR_BIMR12RAC_0_0_0_MCHBAR)—Offset 6A00h

This register, along with IMR12BASE, IMR12MASK and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

37	0h RO	**IMR12 Read Access Policy 37 (IMR12_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR12 Read Access Policy 36 (IMR12_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR12 Read Access Policy 35 (IMR12_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR12 Read Access Policy 34 (IMR12_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR12 Read Access Policy 33 (IMR12_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR12 Read Access Policy 32 (IMR12_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR12 Read Access Policy 31 (IMR12_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR12 Read Access Policy 30 (IMR12_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR12 Read Access Policy 29 (IMR12_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR12 Read Access Policy 28 (IMR12_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR12 Read Access Policy 27 (IMR12_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR12 Read Access Policy 26 (IMR12_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR12 Read Access Policy 25 (IMR12_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR12 Read Access Policy 24 (IMR12_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR12 Read Access Policy 23 (IMR12_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR12 Read Access Policy 22 (IMR12_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR12 Read Access Policy 21 (IMR12_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR12 Read Access Policy 20 (IMR12_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR12 Read Access Policy 19 (IMR12_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR12 Read Access Policy 18 (IMR12_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR12 Read Access Policy 17 (IMR12_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR12 Read Access Policy 16 (IMR12_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR12 Read Access Policy 15 (IMR12_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR12 Read Access Policy 14 (IMR12_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR12 Read Access Policy 13 (IMR12_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR12 Read Access Policy 12 (IMR12_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR12 Read Access Policy 11 (IMR12_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR12 Read Access Policy 10 (IMR12_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR12 Read Access Policy 9 (IMR12_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR12 Read Access Policy 8 (IMR12_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR12 Read Access Policy 7 (IMR12_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR12 Read Access Policy 6 (IMR12_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR12 Read Access Policy 5 (IMR12_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR12 Read Access Policy 4 (IMR12_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR12 Read Access Policy 3 (IMR12_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR12 Read Access Policy 2 (IMR12_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR12 Read Access Policy 1 (IMR12_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR12 Read Access Policy 0 (IMR12_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

5.9.71 IMR12 Write Access Policy (B_CR_BIMR12WAC_0_0_0_MCHBAR)—Offset 6A08h

This register, along with IMR12BASE, IMR12MASK and IMR12RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

36	0h RW	**IMR12 Write Access Policy 36 (IMR12_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR12 Write Access Policy 35 (IMR12_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR12 Write Access Policy 34 (IMR12_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR12 Write Access Policy 33 (IMR12_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR12 Write Access Policy 32 (IMR12_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR12 Write Access Policy 31 (IMR12_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR12 Write Access Policy 30 (IMR12_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR12 Write Access Policy 29 (IMR12_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**IMR12 Write Access Policy 28 (IMR12_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR12 Write Access Policy 27 (IMR12_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR12 Write Access Policy 26 (IMR12_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR12 Write Access Policy 25 (IMR12_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR12 Write Access Policy 24 (IMR12_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR12 Write Access Policy 23 (IMR12_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR12 Write Access Policy 22 (IMR12_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR12 Write Access Policy 21 (IMR12_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR12 Write Access Policy 20 (IMR12_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR12 Write Access Policy 19 (IMR12_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR12 Write Access Policy 18 (IMR12_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR12 Write Access Policy 17 (IMR12_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR12 Write Access Policy 16 (IMR12_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR12 Write Access Policy 15 (IMR12_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR12 Write Access Policy 14 (IMR12_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**IMR12 Write Access Policy 13 (IMR12_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR12 Write Access Policy 12 (IMR12_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR12 Write Access Policy 11 (IMR12_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR12 Write Access Policy 10 (IMR12_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR12 Write Access Policy 9 (IMR12_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR12 Write Access Policy 8 (IMR12_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR12 Write Access Policy 7 (IMR12_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR12 Write Access Policy 6 (IMR12_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR12 Write Access Policy 5 (IMR12_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR12 Write Access Policy 4 (IMR12_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR12 Write Access Policy 3 (IMR12_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR12 Write Access Policy 2 (IMR12_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR12 Write Access Policy 1 (IMR12_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR12 Write Access Policy 0 (IMR12_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

5.9.72 IMR13 Base (B_CR_BIMR13BASE_0_0_0_MCHBAR)—Offset 6A10h

This register, along with IMR13MASK, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR13 Base (IMR13_BASE):** Specifies bits 38:10 of the start address of IMR13 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR13MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR13 defined region.

5.9.73 IMR13 Mask (B_CR_BIMR13MASK_0_0_0_MCHBAR)—Offset 6A14h

This register, along with IMR13BASE, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR13 Mask (IMR13_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR13BASE[28:0] value. A match indicates that the incoming address falls within the IMR13 region.

5.9.74 IMR13 Control Policy (B_CR_BIMR13CP_0_0_0_MCHBAR)—Offset 6A18h

This register controls the access policy to the Read Access Policy BIMR13RAC, the Write Access Policy BIMR13WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR13 Control Policy (IMR13_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers, based on the value from each agent's 6bit SAI field.

5.9.75 IMR13 Read Access Policy (B_CR_BIMR13RAC_0_0_0_MCHBAR)—Offset 6A20h

This register, along with IMR13BASE, IMR13MASK and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR13 Read Access Policy 63 (IMR13_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR13 Read Access Policy 62 (IMR13_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR13 Read Access Policy 61 (IMR13_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR13 Read Access Policy 60 (IMR13_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR13 Read Access Policy 59 (IMR13_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR13 Read Access Policy 58 (IMR13_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR13 Read Access Policy 57 (IMR13_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR13 Read Access Policy 56 (IMR13_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR13 Read Access Policy 55 (IMR13_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR13 Read Access Policy 54 (IMR13_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR13 Read Access Policy 53 (IMR13_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR13 Read Access Policy 52 (IMR13_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR13 Read Access Policy 51 (IMR13_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR13 Read Access Policy 50 (IMR13_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR13 Read Access Policy 49 (IMR13_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR13 Read Access Policy 48 (IMR13_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR13 Read Access Policy 47 (IMR13_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR13 Read Access Policy 46 (IMR13_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR13 Read Access Policy 45 (IMR13_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR13 Read Access Policy 44 (IMR13_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR13 Read Access Policy 43 (IMR13_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR13 Read Access Policy 42 (IMR13_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR13 Read Access Policy 41 (IMR13_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR13 Read Access Policy 40 (IMR13_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR13 Read Access Policy 39 (IMR13_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR13 Read Access Policy 38 (IMR13_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR13 Read Access Policy 37 (IMR13_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR13 Read Access Policy 36 (IMR13_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR13 Read Access Policy 35 (IMR13_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR13 Read Access Policy 34 (IMR13_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR13 Read Access Policy 33 (IMR13_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR13 Read Access Policy 32 (IMR13_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR13 Read Access Policy 31 (IMR13_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR13 Read Access Policy 30 (IMR13_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR13 Read Access Policy 29 (IMR13_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR13 Read Access Policy 28 (IMR13_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR13 Read Access Policy 27 (IMR13_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR13 Read Access Policy 26 (IMR13_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR13 Read Access Policy 25 (IMR13_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR13 Read Access Policy 24 (IMR13_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR13 Read Access Policy 23 (IMR13_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR13 Read Access Policy 22 (IMR13_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR13 Read Access Policy 21 (IMR13_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR13 Read Access Policy 20 (IMR13_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR13 Read Access Policy 19 (IMR13_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR13 Read Access Policy 18 (IMR13_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR13 Read Access Policy 17 (IMR13_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR13 Read Access Policy 16 (IMR13_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR13 Read Access Policy 15 (IMR13_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR13 Read Access Policy 14 (IMR13_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR13 Read Access Policy 13 (IMR13_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR13 Read Access Policy 12 (IMR13_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR13 Read Access Policy 11 (IMR13_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR13 Read Access Policy 10 (IMR13_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR13 Read Access Policy 9 (IMR13_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR13 Read Access Policy 8 (IMR13_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR13 Read Access Policy 7 (IMR13_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR13 Read Access Policy 6 (IMR13_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR13 Read Access Policy 5 (IMR13_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR13 Read Access Policy 4 (IMR13_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR13 Read Access Policy 3 (IMR13_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR13 Read Access Policy 2 (IMR13_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR13 Read Access Policy 1 (IMR13_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR13 Read Access Policy 0 (IMR13_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

5.9.76 IMR13 Write Access Policy (B_CR_BIMR13WAC_0_0_0_MCHBAR)—Offset 6A28h

This register, along with IMR13BASE, IMR13MASK and IMR13RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR13 Write Access Policy 63 (IMR13_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR13 Write Access Policy 62 (IMR13_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR13 Write Access Policy 61 (IMR13_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR13 Write Access Policy 60 (IMR13_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR13 Write Access Policy 59 (IMR13_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR13 Write Access Policy 58 (IMR13_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR13 Write Access Policy 57 (IMR13_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR13 Write Access Policy 56 (IMR13_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR13 Write Access Policy 55 (IMR13_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR13 Write Access Policy 54 (IMR13_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR13 Write Access Policy 53 (IMR13_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

21	0h RW	**IMR13 Write Access Policy 21 (IMR13_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR13 Write Access Policy 20 (IMR13_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR13 Write Access Policy 19 (IMR13_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR13 Write Access Policy 18 (IMR13_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR13 Write Access Policy 17 (IMR13_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR13 Write Access Policy 16 (IMR13_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR13 Write Access Policy 15 (IMR13_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR13 Write Access Policy 14 (IMR13_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR13 Write Access Policy 13 (IMR13_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR13 Write Access Policy 12 (IMR13_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR13 Write Access Policy 11 (IMR13_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR13 Write Access Policy 10 (IMR13_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR13 Write Access Policy 9 (IMR13_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR13 Write Access Policy 8 (IMR13_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR13 Write Access Policy 7 (IMR13_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR13 Write Access Policy 6 (IMR13_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR13 Write Access Policy 5 (IMR13_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR13 Write Access Policy 4 (IMR13_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR13 Write Access Policy 3 (IMR13_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR13 Write Access Policy 2 (IMR13_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR13 Write Access Policy 1 (IMR13_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR13 Write Access Policy 0 (IMR13_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

5.9.77 IMR14 Base (B_CR_BIMR14BASE_0_0_0_MCHBAR)—Offset 6A30h

This register, along with IMR14MASK, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR14 Base (IMR14_BASE):** Specifies bits 38:10 of the start address of IMR14 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR14MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR14 defined region.

5.9.78 IMR14 Mask (B_CR_BIMR14MASK_0_0_0_MCHBAR)—Offset 6A34h

This register, along with IMR14BASE, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR14 Mask (IMR14_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR14BASE[28:0] value. A match indicates that the incoming address falls within the IMR14 region.

5.9.79 IMR14 Control Policy (B_CR_BIMR14CP_0_0_0_MCHBAR)—Offset 6A38h

This register controls the access policy to the Read Access Policy BIMR14RAC, the Write Access Policy BIMR14WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR14 Control Policy (IMR14_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers, based on the value from each agent's 6bit SAI field.

5.9.80 IMR14 Read Access Policy (B_CR_BIMR14RAC_0_0_0_MCHBAR)—Offset 6A40h

This register, along with IMR14BASE, IMR14MASK and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR14 Read Access Policy 63 (IMR14_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR14 Read Access Policy 62 (IMR14_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR14 Read Access Policy 61 (IMR14_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR14 Read Access Policy 60 (IMR14_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR14 Read Access Policy 59 (IMR14_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR14 Read Access Policy 58 (IMR14_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR14 Read Access Policy 57 (IMR14_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR14 Read Access Policy 56 (IMR14_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR14 Read Access Policy 55 (IMR14_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR14 Read Access Policy 54 (IMR14_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR14 Read Access Policy 53 (IMR14_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR14 Read Access Policy 52 (IMR14_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR14 Read Access Policy 51 (IMR14_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR14 Read Access Policy 50 (IMR14_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR14 Read Access Policy 49 (IMR14_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR14 Read Access Policy 48 (IMR14_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR14 Read Access Policy 47 (IMR14_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR14 Read Access Policy 46 (IMR14_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR14 Read Access Policy 45 (IMR14_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR14 Read Access Policy 44 (IMR14_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR14 Read Access Policy 43 (IMR14_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
42	0h RW	**IMR14 Read Access Policy 42 (IMR14_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR14 Read Access Policy 41 (IMR14_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR14 Read Access Policy 40 (IMR14_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR14 Read Access Policy 39 (IMR14_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR14 Read Access Policy 38 (IMR14_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR14 Read Access Policy 37 (IMR14_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR14 Read Access Policy 36 (IMR14_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR14 Read Access Policy 35 (IMR14_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR14 Read Access Policy 34 (IMR14_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR14 Read Access Policy 33 (IMR14_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR14 Read Access Policy 32 (IMR14_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR14 Read Access Policy 31 (IMR14_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR14 Read Access Policy 30 (IMR14_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR14 Read Access Policy 29 (IMR14_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR14 Read Access Policy 28 (IMR14_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**IMR14 Read Access Policy 27 (IMR14_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR14 Read Access Policy 26 (IMR14_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR14 Read Access Policy 25 (IMR14_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR14 Read Access Policy 24 (IMR14_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR14 Read Access Policy 23 (IMR14_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR14 Read Access Policy 22 (IMR14_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR14 Read Access Policy 21 (IMR14_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR14 Read Access Policy 20 (IMR14_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR14 Read Access Policy 19 (IMR14_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR14 Read Access Policy 18 (IMR14_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR14 Read Access Policy 17 (IMR14_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR14 Read Access Policy 16 (IMR14_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR14 Read Access Policy 15 (IMR14_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR14 Read Access Policy 14 (IMR14_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR14 Read Access Policy 13 (IMR14_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR14 Read Access Policy 12 (IMR14_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

7	0h RO	**IMR14 Read Access Policy 7 (IMR14_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR14 Read Access Policy 6 (IMR14_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR14 Read Access Policy 5 (IMR14_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR14 Read Access Policy 4 (IMR14_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR14 Read Access Policy 3 (IMR14_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR14 Read Access Policy 2 (IMR14_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR14 Read Access Policy 1 (IMR14_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR14 Read Access Policy 0 (IMR14_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

5.9.81 IMR14 Write Access Policy (B_CR_BIMR14WAC_0_0_0_MCHBAR)—Offset 6A48h

This register, along with IMR14BASE IMR14MASK and IMR14RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR14 Write Access Policy 63 (IMR14_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR14 Write Access Policy 62 (IMR14_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR14 Write Access Policy 61 (IMR14_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR14 Write Access Policy 60 (IMR14_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR14 Write Access Policy 59 (IMR14_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR14 Write Access Policy 58 (IMR14_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR14 Write Access Policy 57 (IMR14_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR14 Write Access Policy 56 (IMR14_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR14 Write Access Policy 55 (IMR14_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR14 Write Access Policy 54 (IMR14_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR14 Write Access Policy 53 (IMR14_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR14 Write Access Policy 52 (IMR14_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR14 Write Access Policy 51 (IMR14_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR14 Write Access Policy 50 (IMR14_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR14 Write Access Policy 49 (IMR14_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR14 Write Access Policy 48 (IMR14_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR14 Write Access Policy 47 (IMR14_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR14 Write Access Policy 46 (IMR14_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR14 Write Access Policy 45 (IMR14_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR14 Write Access Policy 44 (IMR14_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR14 Write Access Policy 43 (IMR14_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR14 Write Access Policy 42 (IMR14_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR14 Write Access Policy 41 (IMR14_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR14 Write Access Policy 40 (IMR14_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR14 Write Access Policy 39 (IMR14_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR14 Write Access Policy 38 (IMR14_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR14 Write Access Policy 37 (IMR14_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR14 Write Access Policy 36 (IMR14_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR14 Write Access Policy 35 (IMR14_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR14 Write Access Policy 34 (IMR14_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR14 Write Access Policy 33 (IMR14_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR14 Write Access Policy 32 (IMR14_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR14 Write Access Policy 31 (IMR14_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR14 Write Access Policy 30 (IMR14_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR14 Write Access Policy 29 (IMR14_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR14 Write Access Policy 28 (IMR14_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR14 Write Access Policy 27 (IMR14_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR14 Write Access Policy 26 (IMR14_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR14 Write Access Policy 25 (IMR14_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR14 Write Access Policy 24 (IMR14_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR14 Write Access Policy 23 (IMR14_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR14 Write Access Policy 22 (IMR14_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR14 Write Access Policy 21 (IMR14_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR14 Write Access Policy 20 (IMR14_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR14 Write Access Policy 19 (IMR14_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR14 Write Access Policy 18 (IMR14_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR14 Write Access Policy 17 (IMR14_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR14 Write Access Policy 16 (IMR14_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR14 Write Access Policy 15 (IMR14_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR14 Write Access Policy 14 (IMR14_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR14 Write Access Policy 13 (IMR14_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR14 Write Access Policy 12 (IMR14_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR14 Write Access Policy 11 (IMR14_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR14 Write Access Policy 10 (IMR14_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR14 Write Access Policy 9 (IMR14_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR14 Write Access Policy 8 (IMR14_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR14 Write Access Policy 7 (IMR14_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR14 Write Access Policy 6 (IMR14_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR14 Write Access Policy 5 (IMR14_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR14 Write Access Policy 4 (IMR14_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR14 Write Access Policy 3 (IMR14_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR14 Write Access Policy 2 (IMR14_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR14 Write Access Policy 1 (IMR14_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR14 Write Access Policy 0 (IMR14_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

5.9.82 IMR15 Base (B_CR_BIMR15BASE_0_0_0_MCHBAR)—Offset 6A50h

This register, along with IMR15MASK, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR15 Base (IMR15_BASE):** Specifies bits 38:10 of the start address of IMR15 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR15MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR15 defined region.

5.9.83 IMR15 Mask (B_CR_BIMR15MASK_0_0_0_MCHBAR)—Offset 6A54h

This register, along with IMR15BASE, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR15 Mask (IMR15_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR15BASE[28:0] value. A match indicates that the incoming address falls within the IMR15 region.

5.9.84 IMR15 Control Policy (B_CR_BIMR15CP_0_0_0_MCHBAR)—Offset 6A58h

This register controls the access policy to the Read Access Policy BIMR15RAC, the Write Access Policy BIMR15WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR15 Control Policy (IMR15_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers, based on the value from each agent's 6bit SAI field.

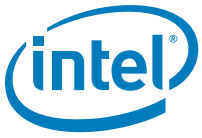
5.9.85 IMR15 Read Access Policy (B_CR_BIMR15RAC_0_0_0_MCHBAR)—Offset 6A60h

This register, along with IMR15BASE, IMR15MASK and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR15 Read Access Policy 63 (IMR15_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR15 Read Access Policy 62 (IMR15_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR15 Read Access Policy 61 (IMR15_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR15 Read Access Policy 60 (IMR15_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR15 Read Access Policy 59 (IMR15_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR15 Read Access Policy 58 (IMR15_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR15 Read Access Policy 57 (IMR15_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR15 Read Access Policy 56 (IMR15_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR15 Read Access Policy 55 (IMR15_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR15 Read Access Policy 54 (IMR15_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR15 Read Access Policy 53 (IMR15_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

21	0h RW	**IMR15 Read Access Policy 21 (IMR15_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR15 Read Access Policy 20 (IMR15_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR15 Read Access Policy 19 (IMR15_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR15 Read Access Policy 18 (IMR15_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR15 Read Access Policy 17 (IMR15_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR15 Read Access Policy 16 (IMR15_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR15 Read Access Policy 15 (IMR15_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR15 Read Access Policy 14 (IMR15_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR15 Read Access Policy 13 (IMR15_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR15 Read Access Policy 12 (IMR15_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR15 Read Access Policy 11 (IMR15_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR15 Read Access Policy 10 (IMR15_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR15 Read Access Policy 9 (IMR15_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR15 Read Access Policy 8 (IMR15_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR15 Read Access Policy 7 (IMR15_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR15 Read Access Policy 6 (IMR15_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR15 Read Access Policy 5 (IMR15_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR15 Read Access Policy 4 (IMR15_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR15 Read Access Policy 3 (IMR15_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR15 Read Access Policy 2 (IMR15_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR15 Read Access Policy 1 (IMR15_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR15 Read Access Policy 0 (IMR15_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

5.9.86 IMR15 Write Access Policy (B_CR_BIMR15WAC_0_0_0_MCHBAR)—Offset 6A68h

This register, along with IMR15BASE, IMR15MASK and IMR15RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR15 Write Access Policy 63 (IMR15_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR15 Write Access Policy 62 (IMR15_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR15 Write Access Policy 61 (IMR15_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR15 Write Access Policy 60 (IMR15_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR15 Write Access Policy 59 (IMR15_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RO	**IMR15 Write Access Policy 58 (IMR15_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR15 Write Access Policy 57 (IMR15_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR15 Write Access Policy 56 (IMR15_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR15 Write Access Policy 55 (IMR15_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR15 Write Access Policy 54 (IMR15_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR15 Write Access Policy 53 (IMR15_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR15 Write Access Policy 52 (IMR15_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR15 Write Access Policy 51 (IMR15_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR15 Write Access Policy 50 (IMR15_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR15 Write Access Policy 49 (IMR15_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR15 Write Access Policy 48 (IMR15_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR15 Write Access Policy 47 (IMR15_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR15 Write Access Policy 46 (IMR15_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR15 Write Access Policy 45 (IMR15_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR15 Write Access Policy 44 (IMR15_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
43	0h RW	**IMR15 Write Access Policy 43 (IMR15_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR15 Write Access Policy 42 (IMR15_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR15 Write Access Policy 41 (IMR15_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR15 Write Access Policy 40 (IMR15_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR15 Write Access Policy 39 (IMR15_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR15 Write Access Policy 38 (IMR15_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR15 Write Access Policy 37 (IMR15_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR15 Write Access Policy 36 (IMR15_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR15 Write Access Policy 35 (IMR15_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR15 Write Access Policy 34 (IMR15_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR15 Write Access Policy 33 (IMR15_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR15 Write Access Policy 32 (IMR15_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR15 Write Access Policy 31 (IMR15_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR15 Write Access Policy 30 (IMR15_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR15 Write Access Policy 29 (IMR15_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**IMR15 Write Access Policy 28 (IMR15_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR15 Write Access Policy 27 (IMR15_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR15 Write Access Policy 26 (IMR15_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR15 Write Access Policy 25 (IMR15_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR15 Write Access Policy 24 (IMR15_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR15 Write Access Policy 23 (IMR15_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR15 Write Access Policy 22 (IMR15_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR15 Write Access Policy 21 (IMR15_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR15 Write Access Policy 20 (IMR15_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR15 Write Access Policy 19 (IMR15_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR15 Write Access Policy 18 (IMR15_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR15 Write Access Policy 17 (IMR15_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR15 Write Access Policy 16 (IMR15_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR15 Write Access Policy 15 (IMR15_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR15 Write Access Policy 14 (IMR15_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**IMR15 Write Access Policy 13 (IMR15_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR15 Write Access Policy 12 (IMR15_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR15 Write Access Policy 11 (IMR15_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR15 Write Access Policy 10 (IMR15_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR15 Write Access Policy 9 (IMR15_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR15 Write Access Policy 8 (IMR15_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR15 Write Access Policy 7 (IMR15_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR15 Write Access Policy 6 (IMR15_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR15 Write Access Policy 5 (IMR15_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR15 Write Access Policy 4 (IMR15_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR15 Write Access Policy 3 (IMR15_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR15 Write Access Policy 2 (IMR15_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR15 Write Access Policy 1 (IMR15_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR15 Write Access Policy 0 (IMR15_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

5.9.87 IMR16 Base (B_CR_BIMR16BASE_0_0_0_MCHBAR)—Offset 6A70h

This register, along with IMR16MASK, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR16 Base (IMR16_BASE):** Specifies bits 38:10 of the start address of IMR16 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR16MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR16 defined region.

5.9.88 IMR16 Mask (B_CR_BIMR16MASK_0_0_0_MCHBAR)—Offset 6A74h

This register, along with IMR16BASE, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR16 Mask (IMR16_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR16BASE[28:0] value. A match indicates that the incoming address falls within the IMR16 region.

5.9.89 IMR16 Control Policy (B_CR_BIMR16CP_0_0_0_MCHBAR)—Offset 6A78h

This register controls the access policy to the Read Access Policy BIMR16RAC, the Write Access Policy BIMR16WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR16 Control Policy (IMR16_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers, based on the value from each agent's 6bit SAI field.

5.9.90 IMR16 Read Access Policy (B_CR_BIMR16RAC_0_0_0_MCHBAR)—Offset 6A80h

This register, along with IMR16BASE, IMR16MASK and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

56	0h RW	**IMR16 Read Access Policy 56 (IMR16_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR16 Read Access Policy 55 (IMR16_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR16 Read Access Policy 54 (IMR16_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR16 Read Access Policy 53 (IMR16_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR16 Read Access Policy 52 (IMR16_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR16 Read Access Policy 51 (IMR16_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR16 Read Access Policy 50 (IMR16_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR16 Read Access Policy 49 (IMR16_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR16 Read Access Policy 48 (IMR16_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR16 Read Access Policy 47 (IMR16_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR16 Read Access Policy 46 (IMR16_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR16 Read Access Policy 45 (IMR16_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR16 Read Access Policy 44 (IMR16_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR16 Read Access Policy 43 (IMR16_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR16 Read Access Policy 42 (IMR16_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR16 Read Access Policy 41 (IMR16_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR16 Read Access Policy 40 (IMR16_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR16 Read Access Policy 39 (IMR16_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR16 Read Access Policy 38 (IMR16_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR16 Read Access Policy 37 (IMR16_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR16 Read Access Policy 36 (IMR16_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR16 Read Access Policy 35 (IMR16_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR16 Read Access Policy 34 (IMR16_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR16 Read Access Policy 33 (IMR16_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR16 Read Access Policy 32 (IMR16_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR16 Read Access Policy 31 (IMR16_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR16 Read Access Policy 30 (IMR16_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR16 Read Access Policy 29 (IMR16_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR16 Read Access Policy 28 (IMR16_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR16 Read Access Policy 27 (IMR16_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR16 Read Access Policy 26 (IMR16_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR16 Read Access Policy 25 (IMR16_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR16 Read Access Policy 24 (IMR16_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR16 Read Access Policy 23 (IMR16_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR16 Read Access Policy 22 (IMR16_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR16 Read Access Policy 21 (IMR16_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR16 Read Access Policy 20 (IMR16_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR16 Read Access Policy 19 (IMR16_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR16 Read Access Policy 18 (IMR16_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR16 Read Access Policy 17 (IMR16_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR16 Read Access Policy 16 (IMR16_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR16 Read Access Policy 15 (IMR16_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR16 Read Access Policy 14 (IMR16_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR16 Read Access Policy 13 (IMR16_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR16 Read Access Policy 12 (IMR16_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR16 Read Access Policy 11 (IMR16_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR16 Read Access Policy 10 (IMR16_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR16 Read Access Policy 9 (IMR16_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR16 Read Access Policy 8 (IMR16_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR16 Read Access Policy 7 (IMR16_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR16 Read Access Policy 6 (IMR16_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR16 Read Access Policy 5 (IMR16_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR16 Read Access Policy 4 (IMR16_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR16 Read Access Policy 3 (IMR16_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR16 Read Access Policy 2 (IMR16_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR16 Read Access Policy 1 (IMR16_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR16 Read Access Policy 0 (IMR16_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR16 region, based on each agent's 6bit encoded SAI value.

5.9.91 IMR16 Write Access Policy (B_CR_BIMR16WAC_0_0_0_MCHBAR)—Offset 6A88h

This register, along with IMR16BASE, IMR16MASK and IMR16RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

19	0h RO	**IMR16 Write Access Policy 19 (IMR16_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR16 Write Access Policy 18 (IMR16_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR16 Write Access Policy 17 (IMR16_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR16 Write Access Policy 16 (IMR16_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR16 Write Access Policy 15 (IMR16_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR16 Write Access Policy 14 (IMR16_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR16 Write Access Policy 13 (IMR16_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR16 Write Access Policy 12 (IMR16_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR16 Write Access Policy 11 (IMR16_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR16 Write Access Policy 10 (IMR16_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR16 Write Access Policy 9 (IMR16_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR16 Write Access Policy 8 (IMR16_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR16 Write Access Policy 7 (IMR16_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR16 Write Access Policy 6 (IMR16_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR16 Write Access Policy 5 (IMR16_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR16 Write Access Policy 4 (IMR16_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR16 Write Access Policy 3 (IMR16_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR16 Write Access Policy 2 (IMR16_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR16 Write Access Policy 1 (IMR16_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR16 Write Access Policy 0 (IMR16_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

5.9.92 IMR17 Base (B_CR_BIMR17BASE_0_0_0_MCHBAR)—Offset 6A90h

This register, along with IMR17MASK, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR17BASE (IMR17_BASE):** Specifies bits 38:10 of the start address of IMR17 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR17MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR17 defined region.

5.9.93 IMR17 Mask (B_CR_BIMR17MASK_0_0_0_MCHBAR)—Offset 6A94h

This register, along with IMR17BASE, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR17 Mask (IMR17_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR17BASE[28:0] value. A match indicates that the incoming address falls within the IMR17 region.

5.9.94 IMR17 Control Policy (B_CR_BIMR17CP_0_0_0_MCHBAR)—Offset 6A98h

This register controls the access policy to the Read Access Policy BIMR17RAC, the Write Access Policy BIMR17WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR17 Control Policy (IMR17_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers, based on the value from each agent's 6bit SAI field.

5.9.95 IMR17 Read Access Policy (B_CR_BIMR17RAC_0_0_0_MCHBAR)—Offset 6AA0h

This register, along with IMR17BASE, IMR17MASK and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR17 Read Access Policy 63 (IMR17_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR17 Read Access Policy 62 (IMR17_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR17 Read Access Policy 61 (IMR17_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR17 Read Access Policy 60 (IMR17_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR17 Read Access Policy 59 (IMR17_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR17 Read Access Policy 58 (IMR17_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
57	0h RO	**IMR17 Read Access Policy 57 (IMR17_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR17 Read Access Policy 56 (IMR17_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR17 Read Access Policy 55 (IMR17_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR17 Read Access Policy 54 (IMR17_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR17 Read Access Policy 53 (IMR17_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR17 Read Access Policy 52 (IMR17_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR17 Read Access Policy 51 (IMR17_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR17 Read Access Policy 50 (IMR17_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR17 Read Access Policy 49 (IMR17_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR17 Read Access Policy 48 (IMR17_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR17 Read Access Policy 47 (IMR17_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR17 Read Access Policy 46 (IMR17_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR17 Read Access Policy 45 (IMR17_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR17 Read Access Policy 44 (IMR17_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR17 Read Access Policy 43 (IMR17_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
42	0h RW	**IMR17 Read Access Policy 42 (IMR17_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR17 Read Access Policy 41 (IMR17_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR17 Read Access Policy 40 (IMR17_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR17 Read Access Policy 39 (IMR17_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR17 Read Access Policy 38 (IMR17_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR17 Read Access Policy 37 (IMR17_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR17 Read Access Policy 36 (IMR17_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR17 Read Access Policy 35 (IMR17_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR17 Read Access Policy 34 (IMR17_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR17 Read Access Policy 33 (IMR17_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR17 Read Access Policy 32 (IMR17_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR17 Read Access Policy 31 (IMR17_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR17 Read Access Policy 30 (IMR17_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR17 Read Access Policy 29 (IMR17_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR17 Read Access Policy 28 (IMR17_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**IMR17 Read Access Policy 27 (IMR17_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR17 Read Access Policy 26 (IMR17_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR17 Read Access Policy 25 (IMR17_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR17 Read Access Policy 24 (IMR17_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR17 Read Access Policy 23 (IMR17_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR17 Read Access Policy 22 (IMR17_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR17 Read Access Policy 21 (IMR17_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR17 Read Access Policy 20 (IMR17_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR17 Read Access Policy 19 (IMR17_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR17 Read Access Policy 18 (IMR17_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR17 Read Access Policy 17 (IMR17_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR17 Read Access Policy 16 (IMR17_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR17 Read Access Policy 15 (IMR17_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR17 Read Access Policy 14 (IMR17_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR17 Read Access Policy 13 (IMR17_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR17 Read Access Policy 12 (IMR17_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR17 Read Access Policy 11 (IMR17_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR17 Read Access Policy 10 (IMR17_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR17 Read Access Policy 9 (IMR17_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR17 Read Access Policy 8 (IMR17_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR17 Read Access Policy 7 (IMR17_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR17 Read Access Policy 6 (IMR17_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR17 Read Access Policy 5 (IMR17_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR17 Read Access Policy 4 (IMR17_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR17 Read Access Policy 3 (IMR17_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR17 Read Access Policy 2 (IMR17_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR17 Read Access Policy 1 (IMR17_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR17 Read Access Policy 0 (IMR17_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

5.9.96 IMR17 Write Access Policy (B_CR_BIMR17WAC_0_0_0_MCHBAR)—Offset 6AA8h

This register, along with IMR17BASE, IMR17MASK and IMR17RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR17 Write Access Policy 63 (IMR17_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR17 Write Access Policy 62 (IMR17_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR17 Write Access Policy 61 (IMR17_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR17 Write Access Policy 60 (IMR17_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR17 Write Access Policy 59 (IMR17_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR17 Write Access Policy 58 (IMR17_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR17 Write Access Policy 57 (IMR17_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR17 Write Access Policy 56 (IMR17_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR17 Write Access Policy 55 (IMR17_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR17 Write Access Policy 54 (IMR17_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR17 Write Access Policy 53 (IMR17_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR17 Write Access Policy 52 (IMR17_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR17 Write Access Policy 51 (IMR17_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR17 Write Access Policy 50 (IMR17_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR17 Write Access Policy 49 (IMR17_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR17 Write Access Policy 48 (IMR17_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR17 Write Access Policy 47 (IMR17_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR17 Write Access Policy 46 (IMR17_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR17 Write Access Policy 45 (IMR17_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR17 Write Access Policy 44 (IMR17_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR17 Write Access Policy 43 (IMR17_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR17 Write Access Policy 42 (IMR17_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR17 Write Access Policy 41 (IMR17_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR17 Write Access Policy 40 (IMR17_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR17 Write Access Policy 39 (IMR17_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
38	0h RW	**IMR17 Write Access Policy 38 (IMR17_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR17 Write Access Policy 37 (IMR17_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR17 Write Access Policy 36 (IMR17_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR17 Write Access Policy 35 (IMR17_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR17 Write Access Policy 34 (IMR17_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR17 Write Access Policy 33 (IMR17_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR17 Write Access Policy 32 (IMR17_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR17 Write Access Policy 31 (IMR17_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR17 Write Access Policy 30 (IMR17_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR17 Write Access Policy 29 (IMR17_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR17 Write Access Policy 28 (IMR17_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR17 Write Access Policy 27 (IMR17_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR17 Write Access Policy 26 (IMR17_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR17 Write Access Policy 25 (IMR17_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR17 Write Access Policy 24 (IMR17_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**IMR17 Write Access Policy 23 (IMR17_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR17 Write Access Policy 22 (IMR17_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR17 Write Access Policy 21 (IMR17_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR17 Write Access Policy 20 (IMR17_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR17 Write Access Policy 19 (IMR17_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR17 Write Access Policy 18 (IMR17_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR17 Write Access Policy 17 (IMR17_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR17 Write Access Policy 16 (IMR17_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR17 Write Access Policy 15 (IMR17_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR17 Write Access Policy 14 (IMR17_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR17 Write Access Policy 13 (IMR17_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR17 Write Access Policy 12 (IMR17_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR17 Write Access Policy 11 (IMR17_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR17 Write Access Policy 10 (IMR17_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR17 Write Access Policy 9 (IMR17_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**IMR17 Write Access Policy 8 (IMR17_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR17 Write Access Policy 7 (IMR17_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR17 Write Access Policy 6 (IMR17_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR17 Write Access Policy 5 (IMR17_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR17 Write Access Policy 4 (IMR17_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR17 Write Access Policy 3 (IMR17_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR17 Write Access Policy 2 (IMR17_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR17 Write Access Policy 1 (IMR17_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR17 Write Access Policy 0 (IMR17_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

5.9.97 IMR18 Base (B_CR_BIMR18BASE_0_0_0_MCHBAR)—Offset 6AB0h

This register, along with IMR18MASK, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:0	0h RW	**Base 0 IMR18 Base (IMR18_BASE):** Specifies bits 38:10 of the start address of IMR18 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR18MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR18 defined region.

5.9.98 IMR18 Mask (B_CR_BIMR18MASK_0_0_0_MCHBAR)—Offset 6AB4h

This register, along with IMR18BASE, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR18 Mask (IMR18_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR18BASE[28:0] value. A match indicates that the incoming address falls within the IMR18 region.

5.9.99 IMR18 Control Policy (B_CR_BIMR18CP_0_0_0_MCHBAR)—Offset 6AB8h

This register controls the access policy to the Read Access Policy BIMR18RAC, the Write Access Policy BIMR18WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR18 Control Policy (IMR18_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers, based on the value from each agent's 6bit SAI field.

5.9.100 IMR18 Read Access Policy (B_CR_BIMR18RAC_0_0_0_MCHBAR)—Offset 6AC0h

This register, along with IMR18BASE, IMR18MASK and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR18 Read Access Policy 63 (IMR18_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR18 Read Access Policy 62 (IMR18_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR18 Read Access Policy 61 (IMR18_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR18 Read Access Policy 60 (IMR18_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR18 Read Access Policy 59 (IMR18_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR18 Read Access Policy 58 (IMR18_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR18 Read Access Policy 57 (IMR18_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR18 Read Access Policy 56 (IMR18_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR18 Read Access Policy 55 (IMR18_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR18 Read Access Policy 54 (IMR18_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR18 Read Access Policy 53 (IMR18_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR18 Read Access Policy 52 (IMR18_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR18 Read Access Policy 51 (IMR18_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR18 Read Access Policy 50 (IMR18_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR18 Read Access Policy 49 (IMR18_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR18 Read Access Policy 48 (IMR18_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR18 Read Access Policy 47 (IMR18_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR18 Read Access Policy 46 (IMR18_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR18 Read Access Policy 45 (IMR18_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR18 Read Access Policy 44 (IMR18_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR18 Read Access Policy 43 (IMR18_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR18 Read Access Policy 42 (IMR18_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR18 Read Access Policy 41 (IMR18_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR18 Read Access Policy 40 (IMR18_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR18 Read Access Policy 39 (IMR18_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR18 Read Access Policy 38 (IMR18_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR18 Read Access Policy 37 (IMR18_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR18 Read Access Policy 36 (IMR18_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR18 Read Access Policy 35 (IMR18_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR18 Read Access Policy 34 (IMR18_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
33	0h RW	**IMR18 Read Access Policy 33 (IMR18_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR18 Read Access Policy 32 (IMR18_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR18 Read Access Policy 31 (IMR18_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR18 Read Access Policy 30 (IMR18_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR18 Read Access Policy 29 (IMR18_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR18 Read Access Policy 28 (IMR18_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR18 Read Access Policy 27 (IMR18_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR18 Read Access Policy 26 (IMR18_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR18 Read Access Policy 25 (IMR18_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR18 Read Access Policy 24 (IMR18_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR18 Read Access Policy 23 (IMR18_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR18 Read Access Policy 22 (IMR18_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR18 Read Access Policy 21 (IMR18_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR18 Read Access Policy 20 (IMR18_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR18 Read Access Policy 19 (IMR18_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**IMR18 Read Access Policy 18 (IMR18_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR18 Read Access Policy 17 (IMR18_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR18 Read Access Policy 16 (IMR18_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR18 Read Access Policy 15 (IMR18_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR18 Read Access Policy 14 (IMR18_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR18 Read Access Policy 13 (IMR18_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR18 Read Access Policy 12 (IMR18_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR18 Read Access Policy 11 (IMR18_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR18 Read Access Policy 10 (IMR18_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR18 Read Access Policy 9 (IMR18_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR18 Read Access Policy 8 (IMR18_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR18 Read Access Policy 7 (IMR18_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR18 Read Access Policy 6 (IMR18_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR18 Read Access Policy 5 (IMR18_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR18 Read Access Policy 4 (IMR18_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR18 Read Access Policy 3 (IMR18_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR18 Read Access Policy 2 (IMR18_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR18 Read Access Policy 1 (IMR18_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR18 Read Access Policy 0 (IMR18_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

5.9.101 IMR18 Write Access Policy (B_CR_BIMR18WAC_0_0_0_MCHBAR)—Offset 6AC8h

This register, along with IMR18BASE, IMR18MASK and IMR18RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR18_WRITE_POL_63 (IMR18_WRITE_POL_63):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR18_WRITE_POL_62 (IMR18_WRITE_POL_62):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR18_WRITE_POL_61 (IMR18_WRITE_POL_61):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR18_WRITE_POL_60 (IMR18_WRITE_POL_60):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

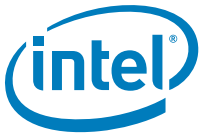
Bit Range	Default & Access	Field Name (ID): Description
59	0h RO	**IMR18_WRITE_POL_59 (IMR18_WRITE_POL_59):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR18_WRITE_POL_58 (IMR18_WRITE_POL_58):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR18_WRITE_POL_57 (IMR18_WRITE_POL_57):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR18_WRITE_POL_56 (IMR18_WRITE_POL_56):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR18_WRITE_POL_55 (IMR18_WRITE_POL_55):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR18_WRITE_POL_54 (IMR18_WRITE_POL_54):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR18_WRITE_POL_53 (IMR18_WRITE_POL_53):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR18_WRITE_POL_52 (IMR18_WRITE_POL_52):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR18_WRITE_POL_51 (IMR18_WRITE_POL_51):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR18_WRITE_POL_50 (IMR18_WRITE_POL_50):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR18_WRITE_POL_49 (IMR18_WRITE_POL_49):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**IMR18_WRITE_POL_48 (IMR18_WRITE_POL_48):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR18_WRITE_POL_47 (IMR18_WRITE_POL_47):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR18_WRITE_POL_46 (IMR18_WRITE_POL_46):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR18_WRITE_POL_45 (IMR18_WRITE_POL_45):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR18_WRITE_POL_44 (IMR18_WRITE_POL_44):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR18_WRITE_POL_43 (IMR18_WRITE_POL_43):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR18_WRITE_POL_42 (IMR18_WRITE_POL_42):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR18_WRITE_POL_41 (IMR18_WRITE_POL_41):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR18_WRITE_POL_40 (IMR18_WRITE_POL_40):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR18_WRITE_POL_39 (IMR18_WRITE_POL_39):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR18_WRITE_POL_38 (IMR18_WRITE_POL_38):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
37	0h RO	**IMR18_WRITE_POL_37 (IMR18_WRITE_POL_37):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR18_WRITE_POL_36 (IMR18_WRITE_POL_36):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR18_WRITE_POL_35 (IMR18_WRITE_POL_35):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR18_WRITE_POL_34 (IMR18_WRITE_POL_34):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR18_WRITE_POL_33 (IMR18_WRITE_POL_33):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR18_WRITE_POL_32 (IMR18_WRITE_POL_32):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR18_WRITE_POL_31 (IMR18_WRITE_POL_31):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR18_WRITE_POL_30 (IMR18_WRITE_POL_30):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR18_WRITE_POL_29 (IMR18_WRITE_POL_29):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR18_WRITE_POL_28 (IMR18_WRITE_POL_28):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR18_WRITE_POL_27 (IMR18_WRITE_POL_27):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**IMR18_WRITE_POL_26 (IMR18_WRITE_POL_26):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR18_WRITE_POL_25 (IMR18_WRITE_POL_25):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR18_WRITE_POL_24 (IMR18_WRITE_POL_24):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR18_WRITE_POL_23 (IMR18_WRITE_POL_23):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR18_WRITE_POL_22 (IMR18_WRITE_POL_22):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR18_WRITE_POL_21 (IMR18_WRITE_POL_21):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR18_WRITE_POL_20 (IMR18_WRITE_POL_20):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR18_WRITE_POL_19 (IMR18_WRITE_POL_19):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR18_WRITE_POL_18 (IMR18_WRITE_POL_18):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR18_WRITE_POL_17 (IMR18_WRITE_POL_17):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR18_WRITE_POL_16 (IMR18_WRITE_POL_16):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**IMR18_WRITE_POL_15 (IMR18_WRITE_POL_15):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR18_WRITE_POL_14 (IMR18_WRITE_POL_14):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR18_WRITE_POL_13 (IMR18_WRITE_POL_13):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR18_WRITE_POL_12 (IMR18_WRITE_POL_12):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR18_WRITE_POL_11 (IMR18_WRITE_POL_11):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR18_WRITE_POL_10 (IMR18_WRITE_POL_10):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR18_WRITE_POL_9 (IMR18_WRITE_POL_9):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR18_WRITE_POL_8 (IMR18_WRITE_POL_8):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR18_WRITE_POL_7 (IMR18_WRITE_POL_7):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR18_WRITE_POL_6 (IMR18_WRITE_POL_6):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR18_WRITE_POL_5 (IMR18_WRITE_POL_5):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**IMR18_WRITE_POL_4 (IMR18_WRITE_POL_4):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR18_WRITE_POL_3 (IMR18_WRITE_POL_3):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR18_WRITE_POL_2 (IMR18_WRITE_POL_2):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR18_WRITE_POL_1 (IMR18_WRITE_POL_1):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR18_WRITE_POL_0 (IMR18_WRITE_POL_0):** B-Unit IMR18 Write Access Policy: Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

5.9.102 IMR19 Base (B_CR_BIMR19BASE_0_0_0_MCHBAR)—Offset 6AD0h

This register, along with IMR19MASK, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:0	0h RW	**Base 0 IMR19 Base (IMR19_BASE):** Specifies bits 38:10 of the start address of IMR19 region. IMR region size must be a strict power of two, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR19MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR19 defined region.

5.9.103 IMR19 Mask (B_CR_BIMR19MASK_0_0_0_MCHBAR)—Offset 6AD4h

This register, along with IMR19BASE, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved.
28:0	0h RW	**Mask 0 IMR19 Mask (IMR19_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR19BASE[28:0] value. A match indicates that the incoming address falls within the IMR19 region.

5.9.104 IMR19 Control Policy (B_CR_BIMR19CP_0_0_0_MCHBAR)—Offset 6AD8h

This register controls the access policy to the Read Access Policy BIMR19RAC, the Write Access Policy BIMR19WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMR19 Control Policy (IMR19_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC, BIMR19CP registers, based on the value from each agent's 6bit SAI field.

5.9.105 IMR19 Read Access Policy (B_CR_BIMR19RAC_0_0_0_MCHBAR)—Offset 6AE0h

This register, along with IMR19BASE, IMR19MASK and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR19 Read Access Policy 63 (IMR19_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR19 Read Access Policy 62 (IMR19_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR19 Read Access Policy 61 (IMR19_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RO	**IMR19 Read Access Policy 60 (IMR19_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR19 Read Access Policy 59 (IMR19_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR19 Read Access Policy 58 (IMR19_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR19 Read Access Policy 57 (IMR19_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR19 Read Access Policy 56 (IMR19_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR19 Read Access Policy 55 (IMR19_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR19 Read Access Policy 54 (IMR19_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR19 Read Access Policy 53 (IMR19_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR19 Read Access Policy 52 (IMR19_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR19 Read Access Policy 51 (IMR19_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR19 Read Access Policy 50 (IMR19_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR19 Read Access Policy 49 (IMR19_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR19 Read Access Policy 48 (IMR19_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR19 Read Access Policy 47 (IMR19_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR19 Read Access Policy 46 (IMR19_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0h RO	**IMR19 Read Access Policy 45 (IMR19_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR19 Read Access Policy 44 (IMR19_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR19 Read Access Policy 43 (IMR19_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR19 Read Access Policy 42 (IMR19_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR19 Read Access Policy 41 (IMR19_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR19 Read Access Policy 40 (IMR19_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR19 Read Access Policy 39 (IMR19_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR19 Read Access Policy 38 (IMR19_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR19 Read Access Policy 37 (IMR19_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR19 Read Access Policy 36 (IMR19_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR19 Read Access Policy 35 (IMR19_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR19 Read Access Policy 34 (IMR19_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR19 Read Access Policy 33 (IMR19_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR19 Read Access Policy 32 (IMR19_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR19 Read Access Policy 31 (IMR19_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**IMR19 Read Access Policy 30 (IMR19_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR19 Read Access Policy 29 (IMR19_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR19 Read Access Policy 28 (IMR19_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR19 Read Access Policy 27 (IMR19_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR19 Read Access Policy 26 (IMR19_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR19 Read Access Policy 25 (IMR19_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR19 Read Access Policy 24 (IMR19_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR19 Read Access Policy 23 (IMR19_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR19 Read Access Policy 22 (IMR19_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR19 Read Access Policy 21 (IMR19_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR19 Read Access Policy 20 (IMR19_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR19 Read Access Policy 19 (IMR19_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR19 Read Access Policy 18 (IMR19_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR19 Read Access Policy 17 (IMR19_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR19 Read Access Policy 16 (IMR19_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**IMR19 Read Access Policy 15 (IMR19_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR19 Read Access Policy 14 (IMR19_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR19 Read Access Policy 13 (IMR19_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR19 Read Access Policy 12 (IMR19_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR19 Read Access Policy 11 (IMR19_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR19 Read Access Policy 10 (IMR19_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR19 Read Access Policy 9 (IMR19_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR19 Read Access Policy 8 (IMR19_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR19 Read Access Policy 7 (IMR19_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR19 Read Access Policy 6 (IMR19_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR19 Read Access Policy 5 (IMR19_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR19 Read Access Policy 4 (IMR19_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR19 Read Access Policy 3 (IMR19_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR19 Read Access Policy 2 (IMR19_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR19 Read Access Policy 1 (IMR19_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**IMR19 Read Access Policy 0 (IMR19_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

5.9.106 IMR19 Write Access Policy (B_CR_BIMR19WAC_0_0_0_MCHBAR)—Offset 6AE8h

This register, along with IMR19BASE, IMR19MASK and IMR19RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR19 Write Access Policy 63 (IMR19_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR19 Write Access Policy 62 (IMR19_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR19 Write Access Policy 61 (IMR19_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR19 Write Access Policy 60 (IMR19_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
59	0h RO	**IMR19 Write Access Policy 59 (IMR19_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR19 Write Access Policy 58 (IMR19_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR19 Write Access Policy 57 (IMR19_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR19 Write Access Policy 56 (IMR19_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
55	0h RW	**IMR19 Write Access Policy 55 (IMR19_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR19 Write Access Policy 54 (IMR19_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR19 Write Access Policy 53 (IMR19_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR19 Write Access Policy 52 (IMR19_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR19 Write Access Policy 51 (IMR19_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR19 Write Access Policy 50 (IMR19_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR19 Write Access Policy 49 (IMR19_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR19 Write Access Policy 48 (IMR19_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR19 Write Access Policy 47 (IMR19_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR19 Write Access Policy 46 (IMR19_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR19 Write Access Policy 45 (IMR19_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR19 Write Access Policy 44 (IMR19_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR19 Write Access Policy 43 (IMR19_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR19 Write Access Policy 42 (IMR19_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR19 Write Access Policy 41 (IMR19_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
40	0h RW	**IMR19 Write Access Policy 40 (IMR19_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR19 Write Access Policy 39 (IMR19_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR19 Write Access Policy 38 (IMR19_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR19 Write Access Policy 37 (IMR19_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR19 Write Access Policy 36 (IMR19_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR19 Write Access Policy 35 (IMR19_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR19 Write Access Policy 34 (IMR19_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR19 Write Access Policy 33 (IMR19_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR19 Write Access Policy 32 (IMR19_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR19 Write Access Policy 31 (IMR19_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR19 Write Access Policy 30 (IMR19_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR19 Write Access Policy 29 (IMR19_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR19 Write Access Policy 28 (IMR19_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR19 Write Access Policy 27 (IMR19_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR19 Write Access Policy 26 (IMR19_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR19 Write Access Policy 25 (IMR19_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR19 Write Access Policy 24 (IMR19_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR19 Write Access Policy 23 (IMR19_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR19 Write Access Policy 22 (IMR19_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR19 Write Access Policy 21 (IMR19_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR19 Write Access Policy 20 (IMR19_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR19 Write Access Policy 19 (IMR19_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR19 Write Access Policy 18 (IMR19_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR19 Write Access Policy 17 (IMR19_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR19 Write Access Policy 16 (IMR19_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR19 Write Access Policy 15 (IMR19_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR19 Write Access Policy 14 (IMR19_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR19 Write Access Policy 13 (IMR19_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR19 Write Access Policy 12 (IMR19_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR19 Write Access Policy 11 (IMR19_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**IMR19 Write Access Policy 10 (IMR19_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR19 Write Access Policy 9 (IMR19_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR19 Write Access Policy 8 (IMR19_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
7	0h RO	**IMR19 Write Access Policy 7 (IMR19_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
6	0h RO	**IMR19 Write Access Policy 6 (IMR19_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR19 Write Access Policy 5 (IMR19_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR19 Write Access Policy 4 (IMR19_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR19 Write Access Policy 3 (IMR19_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR19 Write Access Policy 2 (IMR19_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR19 Write Access Policy 1 (IMR19_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
0	0h RW	**IMR19 Write Access Policy 0 (IMR19_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

5.9.107 MOT Out Base (B_CR_MOT_OUT_BASE_0_0_0_MCHBAR)—Offset 6AF0h

This register contains the value of the start address of the MOT debug data region. The smallest reserved region for MOT debug data, if enabled, is 16MB. The MOT region must be power of two sized and naturally aligned to its size. The MOT region is evenly distributed between the slices and interleaved on a 4K granularity. When generating addresses, B-Unit MOT H/W within each slice ensures that the addresses it generates are within the region mapped to that slice.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the MOT region. Note: this does not enable MOT itself, but merely enables access control checks for transactions that attempt to access the MOT buffer.
30	0h RO	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents such as MOT. Reserved and set to 0 for the MOT region, since otherwise this would enable recursive tracing and corrupt MOT buffer.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:14	0h RW	**MOT_OUT Base (MOT_OUT_BASE):** Specifies bits 38:24 of the start address of the MOT memory region. Region size must be a strict power of two, at least 16MB, and naturally aligned to the size. These bits are compared with the result of the MOT_OUT_MASK[28:14] applied to bits 38:24 of the incoming address to determine if an access falls within the MOT region.
13:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.108 MOT Out Mask (B_CR_MOT_OUT_MASK_0_0_0_MCHBAR)—Offset 6AF4h

This register specifies the size of the MOT region. If a request address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[38:24], then the request falls within the MOT_OUT region.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_1):** Reserved.
28:14	0h RW	**MOT Out Mask (MOT_OUT_MASK):** Specifies the size of the MOT region. If Request Address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[28:14] then the request falls within the MOT_OUT region.
13:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.109 MOT Buffer Control Policy (B_CR_BMOT_BUF_CP_0_0_0_MCHBAR)—Offset 6AF8h

This register controls the access policy to BMOT_BUF_RAC, BMOT_BUF_WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010 202h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

5.9.110 MOT Buffer Read Access Policy (B_CR_BMOT_BUF_RAC_0_0_0_MCHBAR)—Offset 6B00h

This register, along with MOTBASE, MOTMASK and MOT_BUF_WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to MOT. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 60010017h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**MOT Read Access Policy 63 (MOT_BUF_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
62	0h RO	**MOT Read Access Policy 62 (MOT_BUF_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
61	0h RO	**MOT Read Access Policy 61 (MOT_BUF_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
60	0h RO	**MOT Read Access Policy 60 (MOT_BUF_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
59	0h RO	**MOT Read Access Policy 59 (MOT_BUF_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
58	0h RO	**MOT Read Access Policy 58 (MOT_BUF_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
57	0h RO	**MOT Read Access Policy 57 (MOT_BUF_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
56	0h RW	**MOT Read Access Policy 56 (MOT_BUF_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
55	0h RW	**MOT Read Access Policy 55 (MOT_BUF_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
54	0h RW	**MOT Read Access Policy 54 (MOT_BUF_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
53	0h RO	**MOT Read Access Policy 53 (MOT_BUF_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
52	0h RO	**MOT Read Access Policy 52 (MOT_BUF_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
51	0h RO	**MOT Read Access Policy 51 (MOT_BUF_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**MOT Read Access Policy 50 (MOT_BUF_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
49	0h RW	**MOT Read Access Policy 49 (MOT_BUF_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
48	0h RW	**MOT Read Access Policy 48 (MOT_BUF_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
47	0h RO	**MOT Read Access Policy 47 (MOT_BUF_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
46	0h RO	**MOT Read Access Policy 46 (MOT_BUF_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
45	0h RO	**MOT Read Access Policy 45 (MOT_BUF_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
44	0h RW	**MOT Read Access Policy 44 (MOT_BUF_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
43	0h RW	**MOT Read Access Policy 43 (MOT_BUF_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
42	0h RW	**MOT Read Access Policy 42 (MOT_BUF_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
41	0h RW	**MOT Read Access Policy 41 (MOT_BUF_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
40	0h RW	**MOT Read Access Policy 40 (MOT_BUF_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
39	0h RO	**MOT Read Access Policy 39 (MOT_BUF_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
38	0h RW	**MOT Read Access Policy 38 (MOT_BUF_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
37	0h RO	**MOT Read Access Policy 37 (MOT_BUF_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
36	0h RW	**MOT Read Access Policy 36 (MOT_BUF_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
35	0h RO	**MOT Read Access Policy 35 (MOT_BUF_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
34	0h RW	**MOT Read Access Policy 34 (MOT_BUF_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
33	0h RW	**MOT Read Access Policy 33 (MOT_BUF_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
32	0h RW	**MOT Read Access Policy 32 (MOT_BUF_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
31	0h RO	**MOT Read Access Policy 31 (MOT_BUF_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
30	1h RW	**MOT Read Access Policy 30 (MOT_BUF_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
29	1h RW	**MOT Read Access Policy 29 (MOT_BUF_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
28	0h RW	**MOT Read Access Policy 28 (MOT_BUF_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
27	0h RW	**MOT Read Access Policy 27 (MOT_BUF_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
26	0h RW	**MOT Read Access Policy 26 (MOT_BUF_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
25	0h RW	**MOT Read Access Policy 25 (MOT_BUF_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
24	0h RW	**MOT Read Access Policy 24 (MOT_BUF_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
23	0h RO	**MOT Read Access Policy 23 (MOT_BUF_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
22	0h RO	**MOT Read Access Policy 22 (MOT_BUF_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
21	0h RW	**MOT Read Access Policy 21 (MOT_BUF_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**MOT Read Access Policy 20 (MOT_BUF_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
19	0h RO	**MOT Read Access Policy 19 (MOT_BUF_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
18	0h RO	**MOT Read Access Policy 18 (MOT_BUF_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
17	0h RW	**MOT Read Access Policy 17 (MOT_BUF_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
16	1h RW	**MOT Read Access Policy 16 (MOT_BUF_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
15	0h RO	**MOT Read Access Policy 15 (MOT_BUF_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
14	0h RO	**MOT Read Access Policy 14 (MOT_BUF_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
13	0h RW	**MOT Read Access Policy 13 (MOT_BUF_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
12	0h RW	**MOT Read Access Policy 12 (MOT_BUF_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
11	0h RO	**MOT Read Access Policy 11 (MOT_BUF_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
10	0h RO	**MOT Read Access Policy 10 (MOT_BUF_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
9	0h RO	**MOT Read Access Policy 9 (MOT_BUF_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
8	0h RW	**MOT Read Access Policy 8 (MOT_BUF_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
7	0h RO	**MOT Read Access Policy 7 (MOT_BUF_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
6	0h RO	**MOT Read Access Policy 6 (MOT_BUF_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**MOT Read Access Policy 5 (MOT_BUF_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
4	1h RW	**MOT Read Access Policy 4 (MOT_BUF_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
3	0h RW	**MOT Read Access Policy 3 (MOT_BUF_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
2	1h RW	**MOT Read Access Policy 2 (MOT_BUF_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
1	1h RW	**MOT Read Access Policy 1 (MOT_BUF_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
0	1h RW	**MOT Read Access Policy 0 (MOT_BUF_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

5.9.111 MOT Buffer Write Access Policy (B_CR_BMOT_BUF_WAC_0_0_0_MCHBAR)—Offset 6B08h

This register, along with MOTBASE, MOTMASK and MOT_BUF_RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to MOT. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 60010000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**MOT Write Access Policy 63 (MOT_BUF_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
62	0h RO	**MOT Write Access Policy 62 (MOT_BUF_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
61	0h RO	**MOT Write Access Policy 61 (MOT_BUF_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
60	0h RO	**MOT Write Access Policy 60 (MOT_BUF_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
59	0h RO	**MOT Write Access Policy 59 (MOT_BUF_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
58	0h RO	**MOT Write Access Policy 58 (MOT_BUF_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
57	0h RO	**MOT Write Access Policy 57 (MOT_BUF_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
56	0h RW	**MOT Write Access Policy 56 (MOT_BUF_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
55	0h RW	**MOT Write Access Policy 55 (MOT_BUF_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
54	0h RW	**MOT Write Access Policy 54 (MOT_BUF_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
53	0h RO	**MOT Write Access Policy 53 (MOT_BUF_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
52	0h RO	**MOT Write Access Policy 52 (MOT_BUF_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
51	0h RO	**MOT Write Access Policy 51 (MOT_BUF_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**MOT Write Access Policy 50 (MOT_BUF_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

5.9.112 IMR Global BM Control Policy (B_CR_BIMRGLOBAL_BM_CP_0_0_0_MCHBAR)—Offset 6B10h

Defines the policy register that specifies who is allowed write access to BIMRGLOBAL_BM_WAC register.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**BM Control Policy (BM_CTRL_POL):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.

5.9.113 IMR Global BM Read Access Control (B_CR_BIMRGLOBAL_BM_RAC_0_0_0_MCHBAR)—Offset 6B18h

Defines the policy register that specifies who is allowed to read the BASE/MASK registers for IMR0-IMR15. This single common policy register protects reads to all base/mask registers.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**BM Read Access Policy (BM_READ_POL):** Bit vector used to determine which agents are allowed read access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

5.9.114 IMR Global BM Write Access Policy (B_CR_BIMRGLOBAL_BM_WAC_0_0_0_MCHBAR)—Offset 6B20h

Defines the policy register that specifies who is allowed to overwrite the BASE/MASK registers for IMR0-IMR15. This single common policy register protects writes to all base/mask registers.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**BM Write Access Policy (BM_WRITE_POL):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

5.9.115 Graphics Stolen Memory Control Policy (B_CR_BGSMCP_0_0_0_MCHBAR)—Offset 6B28h

This register controls the access policy to the Read Access Policy BGSMRAC, Write Access Policy BGSMWAC and self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**GSM Control Policy (GSM_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BGSMRAC, BGSMWAC and BGSMCP registers, based on the value from each agent's 6bit SAI field.

5.9.116 GSM Read Access Policy (B_CR_BGSMRAC_0_0_0_MCHBAR)—Offset 6B30h

This register configures the Read Access Policy to the memory range from BGSM to TOLUD1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 100060010100h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**SMM Read Access Policy 63 (GSM_SAI_POL_63):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
62	0h RO	**SMM Read Access Policy 62 (GSM_SAI_POL_62):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

3	0h RW	**SMM Read Access Policy 3 (GSM_SAI_POL_3):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SMM Read Access Policy 2 (GSM_SAI_POL_2):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
1	0h RW	**SMM Read Access Policy 1 (GSM_SAI_POL_1):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
0	0h RW	**SMM Read Access Policy 0 (GSM_SAI_POL_0):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

5.9.117 GSM Write Access Policy (B_CR_BGSMWAC_0_0_0_MCHBAR)—Offset 6B38h

This register configures the Write Access Policy for the memory range from BGSM to TOLUD1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 100060010100h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**GSM Write Access Policy 63 (GSM_SAI_POL_63):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
62	0h RO	**GSM Write Access Policy 62 (GSM_SAI_POL_62):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
61	0h RO	**GSM Write Access Policy 61 (GSM_SAI_POL_61):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
60	0h RO	**GSM Write Access Policy 60 (GSM_SAI_POL_60):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
59	0h RO	**GSM Write Access Policy 59 (GSM_SAI_POL_59):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
58	0h RO	**GSM Write Access Policy 58 (GSM_SAI_POL_58):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
57	0h RO	**GSM Write Access Policy 57 (GSM_SAI_POL_57):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
56	0h RW	**GSM Write Access Policy 56 (GSM_SAI_POL_56):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
55	0h RW	**GSM Write Access Policy 55 (GSM_SAI_POL_55):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
54	0h RW	**GSM Write Access Policy 54 (GSM_SAI_POL_54):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
53	0h RO	**GSM Write Access Policy 53 (GSM_SAI_POL_53):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
52	0h RO	**GSM Write Access Policy 52 (GSM_SAI_POL_52):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
51	0h RO	**GSM Write Access Policy 51 (GSM_SAI_POL_51):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
50	0h RW	**GSM Write Access Policy 50 (GSM_SAI_POL_50):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
49	0h RW	**GSM Write Access Policy 49 (GSM_SAI_POL_49):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
48	0h RW	**GSM Write Access Policy 48 (GSM_SAI_POL_48):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
47	0h RO	**GSM Write Access Policy 47 (GSM_SAI_POL_47):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
46	0h RO	**GSM Write Access Policy 46 (GSM_SAI_POL_46):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
45	0h RO	**GSM Write Access Policy 45 (GSM_SAI_POL_45):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
44	1h RW	**GSM Write Access Policy 44 (GSM_SAI_POL_44):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
43	0h RW	**GSM Write Access Policy 43 (GSM_SAI_POL_43):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
42	0h RW	**GSM Write Access Policy 42 (GSM_SAI_POL_42):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
41	0h RW	**GSM Write Access Policy 41 (GSM_SAI_POL_41):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
40	0h RW	**GSM Write Access Policy 40 (GSM_SAI_POL_40):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
39	0h RO	**GSM Write Access Policy 39 (GSM_SAI_POL_39):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
38	0h RW	**GSM Write Access Policy 38 (GSM_SAI_POL_38):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
37	0h RO	**GSM Write Access Policy 37 (GSM_SAI_POL_37):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
36	0h RW	**GSM Write Access Policy 36 (GSM_SAI_POL_36):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
35	0h RO	**GSM Write Access Policy 35 (GSM_SAI_POL_35):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
34	0h RW	**GSM Write Access Policy 34 (GSM_SAI_POL_34):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
33	0h RW	**GSM Write Access Policy 33 (GSM_SAI_POL_33):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
32	0h RW	**GSM Write Access Policy 32 (GSM_SAI_POL_32):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
31	0h RO	**GSM Write Access Policy 31 (GSM_SAI_POL_31):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
30	1h RW	**GSM Write Access Policy 30 (GSM_SAI_POL_30):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
29	1h RW	**GSM Write Access Policy 29 (GSM_SAI_POL_29):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
28	0h RW	**GSM Write Access Policy 28 (GSM_SAI_POL_28):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
27	0h RW	**GSM Write Access Policy 27 (GSM_SAI_POL_27):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**GSM Write Access Policy 26 (GSM_SAI_POL_26):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
25	0h RW	**GSM Write Access Policy 25 (GSM_SAI_POL_25):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
24	0h RW	**GSM Write Access Policy 24 (GSM_SAI_POL_24):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
23	0h RO	**GSM Write Access Policy 23 (GSM_SAI_POL_23):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
22	0h RO	**GSM Write Access Policy 22 (GSM_SAI_POL_22):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
21	0h RW	**GSM Write Access Policy 21 (GSM_SAI_POL_21):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
20	0h RO	**GSM Write Access Policy 20 (GSM_SAI_POL_20):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
19	0h RO	**GSM Write Access Policy 19 (GSM_SAI_POL_19):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
18	0h RO	**GSM Write Access Policy 18 (GSM_SAI_POL_18):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
17	0h RW	**GSM Write Access Policy 17 (GSM_SAI_POL_17):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
16	1h RW	**GSM Write Access Policy 16 (GSM_SAI_POL_16):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**GSM Write Access Policy 15 (GSM_SAI_POL_15):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
14	0h RO	**GSM Write Access Policy 14 (GSM_SAI_POL_14):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
13	0h RW	**GSM Write Access Policy 13 (GSM_SAI_POL_13):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
12	0h RW	**GSM Write Access Policy 12 (GSM_SAI_POL_12):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
11	0h RO	**GSM Write Access Policy 11 (GSM_SAI_POL_11):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
10	0h RO	**GSM Write Access Policy 10 (GSM_SAI_POL_10):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
9	0h RO	**GSM Write Access Policy 9 (GSM_SAI_POL_9):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
8	1h RW	**GSM Write Access Policy 8 (GSM_SAI_POL_8):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
7	0h RO	**GSM Write Access Policy 7 (GSM_SAI_POL_7):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
6	0h RO	**GSM Write Access Policy 6 (GSM_SAI_POL_6):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
5	0h RW	**GSM Write Access Policy 5 (GSM_SAI_POL_5):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**GSM Write Access Policy 4 (GSM_SAI_POL_4):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
3	0h RW	**GSM Write Access Policy 3 (GSM_SAI_POL_3):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
2	0h RW	**GSM Write Access Policy 2 (GSM_SAI_POL_2):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
1	0h RW	**GSM Write Access Policy 1 (GSM_SAI_POL_1):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
0	0h RW	**GSM Write Access Policy 0 (GSM_SAI_POL_0):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

5.9.118 TPM Control Policy (B_CR_TPM_CP_0_0_0_MCHBAR)—Offset 6B40h

Defines the control policy register for TPM group.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**TPM Control Policy (CTRL_POL):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

5.9.119 TPM Access Control (B_CR_TPM_AC_0_0_0_MCHBAR)—Offset 6B48h

Defines the policy register that specifies who is allowed read/write access to the TPM_SELECTOR register.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**TPM Access Policy (AC_POL):** Bit vector used to determine which agents are allowed read/write access to TPM_SELECTOR, based on each agent's 6-bit encoded SAI value.

5.9.120 BGSM Control Register (B_CR_BGSM_CTRL_0_0_0_MCHBAR)—Offset 6B50h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 19h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_0):** Reserved.
4	1h RW	**RS0 Asset Classification Bit for Graphics and Data Stolen Memory (RS0_EN):** PII transactions from RS0 that hit the Graphics and Data Stolen Memory range will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the RAC/WAC policy registers and b) GSM_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
3	1h RW	**GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
2	0h RW	**IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
1	0h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the Graphics Stolen Memory region by tracing agents.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW	**Range Check Enable (RANGE_CHECK_EN):** Enables SAI checking for the memory range from BGSM to TOLUD-1

5.9.121 SMM Control Register (B_CR_BSMR_CTRL_0_0_0_MCHBAR)—Offset 6B54h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_0):** Reserved.
4	0h RO	**RS0 Asset Classification Bit for SMM Region (RS0_EN):** No PII transaction is allowed access to SMM region. As such RS0 asset classification bit does not apply and hence provisioned as a readonly bit and set to 0.
3	0h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
2	1h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
1	1h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the SMM region by tracing agents.
0	1h RW	**Range Check Enable (RANGE_CHECK_EN):** Enables SAI checking for the SMM memory range: TSEGMB to BGSM.

5.9.122 Default VTd Control Register (B_CR_BDEFVTDPMR_CTRL_0_0_0_MCHBAR)—Offset 6B58h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1Ch

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_1):** Reserved.
4	1h RW	**RS0 Asset Classification Bit for the High and Low VTd PMRs (RS0_EN):** PII transactions from RS0 that hit VTd PMR high and low memory ranges will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the RAC/WAC policy registers and b) VTDPMR_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
3	1h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
2	1h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
1	0h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the Default VTd PHM and PLM regions by tracing agents.
0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.123 MOT Trigger Trace Control (B_CR_MOT_TRIG_TRACE_CTRL_0_0_0_MCHBAR)—Offset 6B7Ch

This register is the global MOT enable.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: E0000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Eh RW	**Flush Timer Period (FLUSH_TIMER_PERIOD):** Specifies the duration of the periodic MOT flush timer. Duration is 2^N cycles of a 19.2 MHz clock, where N is the value specified in the field.
27	0h RO	**Reserved (RESERVED_0):** Reserved.
26	0h RW/V	**Sticky Trigger 1 Match (STICKY_TRIGGER_1_MATCH):** 1 indicates Trigger 1 match. Cleared by powergood or explicit SW write.
25	0h RW/V	**Sticky Trigger 0 Match (STICKY_TRIGGER_0_MATCH):** 1 indicates Trigger 0 match. Cleared by powergood or explicit SW write.
24	0h RW/V	**Sticky Filter 1 Match (STICKY_FILTER_1_MATCH):** 1 indicates Filter 1 match. Cleared by powergood or explicit SW write.
23	0h RW/V	**Sticky Filter 0 Match (STICKY_FILTER_0_MATCH):** 1 indicates Filter 0 match. Cleared by powergood or explicit SW write.
22	0h RW/V	**MOT Storage Active (MOT_STORAGE_ACTIVE):** Current status of MOT storage to memory. Used to save/restore trigger state across power states.
21:16	0h RW	**MOT Trace Storage Stop Source (MOT_TRACE_STORAGE_STOP_SOURCE):** A bit field allowing multiple triggers to result in a trace storage stop. Storage stop is the logical OR of trigger sources selected. Note that selecting the same trigger to start and stop trace storage results in start trace storage only. • Bit position 5: External Trigger in 1 • Bit position 4: External Trigger in 0 • Bit position 3: MOT Trigger 1 • Bit position 2: MOT Trigger 0 • Bit position 1: MOT Filter 1 match • Bit position 0: MOT Filter 0 match
15:10	0h RW	**MOT Trace Storage Start Source (MOT_TRACE_STORAGE_START_SOURCE):** A bit field allowing multiple triggers to result in a trace storage start. Storage stop is the logical OR of trigger sources selected. Note that selecting the same trigger to start and stop trace storage results in start trace storage only. For bit positions, see description for MOT_TRACE_STORAGE_STOP_SOURCE field.
9	0h RW	**Enable External Trigger in 1 (ENABLE_EXTERNAL_TRIGGER_IN_1):** • 1 to enable external trigger 1 to MOT from rdu_mid • 0 to disable external trigger 1 to MOT from rdu_mid
8	0h RW	**Enable External Trigger in 0 (ENABLE_EXTERNAL_TRIGGER_IN_0):** • 1 to enable external trigger 0 to MOT from rdu_mid • 0 to disable external trigger 0 to MOT from rdu_mid

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**Trigger Out Source (TRIGGER_OUT_SOURCE):** Select source of trigger sent to rdu_mid. • 00b: Filter 0 • 01b: Filter 1 • 10b: Trigger 0 • 11b: Trigger 1
5	0h RW	**Enable External Trigger Out 0 (ENABLE_EXTERNAL_TRIGGER_OUT_0):** • 1: enable external trigger out to from MOT to rdu_mid • 0: disable external trigger out to from MOT to rdu_mid
4	0h RW	**Enable MOT Trigger 1 (ENABLE_MOT_TRIGGER_1):** • 1: enable MOT trigger 1 • 0: disable MOT trigger 1
3	0h RW	**Enable MOT Trigger 0 (ENABLE_MOT_TRIGGER_0):** • 1: enable MOT trigger 0 • 0: disable MOT trigger 0
2	0h RW	**Enable MOT Filter 1 (ENABLE_MOT_FILTER_1):** • 1: enable MOT filter 1 • 0: disable MOT filter 1
1	0h RW	**Enable MOT Filter 0 (ENABLE_MOT_FILTER_0):** • 1: enable MOT filter 0 • 0: disable MOT filter 0
0	0h RW	**Global MOT Enable (ENABLE_MOT):** • 1: enable MOT • 0: disable MOT

5.9.124 MOT Slice 0 Memory Pointer (B_CR_MOT_SLICE_0_MEM_PTR_0_0_0_MCHBAR)—Offset 6B80h

This register contains the memory address pointer used to determine where the MOT slice 0 cache lines are stored. On a write, the B-Unit logic will set itself to the value of the write Extraction of memory contents is performed as reads. On a read, the data returned should match the current value of the pointer reflecting incrementing updates from cache lines that have been stored. It also pins MOT to near or far memory.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:6	0h RW/V	**MOT Memory Pointer (MOT_MEMORY_POINTER):** The current pointer into MOT slice 0 region. Cache line granularity bits [38:6].
5:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1	1h RW	**Near or Far Memory (NEAR_OR_FAR_MEMORY):** Pin MOT slice 0 to near1 or far0 memory. This logic is implemented in the 2LM. Thus, this register bit is shadowed in its entirety in the 2LM. Unused by MOT.
0	0h RW/V	**MOT Buffer Wrap (MOT_BUFFER_WRAP):** Indication that the MOT slice 0 buffer has wrapped since the last clear of this write cleared by power good or explicit SW write.

5.9.125 MOT Slice 1 Memory Pointer (B_CR_MOT_SLICE_1_MEM_PTR_0_0_0_MCHBAR)—Offset 6B88h

This register contains the memory address pointer used to determine where the MOT slice 1 cache lines are stored. On a write, the B-Unit logic will set itself to the value of the write. Extraction of memory contents are performed as reads. On a read, the data returned should match the current value of the pointer, reflecting incrementing updates from cache lines that have been stored. It also pins MOT to near or far memory.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:6	0h RW/V	**MOT Memory Pointer (MOT_MEMORY_POINTER):** The current pointer into MOT slice 1 region. Cache line granularity bits [38:6].
5:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1	1h RW	**Near or Far Memory (NEAR_OR_FAR_MEMORY):** Pin MOT slice 1 to near1 or far0 memory. This logic is implemented in the 2LM. Thus, this register is shadowed in its entirety in the 2LM.
0	0h RW/V	**MOT Buffer Wrap (MOT_BUFFER_WRAP):** Indication that the MOT slice 1 buffer has wrapped since the last clear of this write cleared by power good or explicit SW write.

5.9.126 MOT Slice 0 Record ID (B_CR_MOT_SLICE_0_RECORD_ID_0_0_0_MCHBAR)—Offset 6B90h

This register contains the unique MOT record ID and start trace indication for slice 0. This state needs to be stored in a CR to allow it to persist across autoPG and s0ix transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED_0):** Reserved.
26	0h RW/V	**First Packet Captured (FIRST_PKT_CAPTURED):** Indicates that MOT has captured the first data packet after tracing started.
25:0	0h RW/V	**Record ID (RECORD_ID):** The current MOT unique record ID number.

5.9.127 MOT Slice 1 Record ID (B_CR_MOT_SLICE_1_RECORD_ID_0_0_0_MCHBAR)—Offset 6B94h

This register contains the unique MOT record ID and start trace indication for slice 0. This state needs to be stored in a CR to allow it to persist across autoPG and s0ix transitions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED_0):** Reserved.
26	0h RW/V	**First Packet Captured (FIRST_PKT_CAPTURED):** Indicates that MOT has captured the first data packet after tracing started.
25:0	0h RW/V	**Record ID (RECORD_ID):** The current MOT unique record ID number.

5.9.128 MOT Filter Match 0 (B_CR_MOT_FILTER_MATCH0_0_0_0_MCHBAR)—Offset 6BA0h

This register contains the value of the MOT 0 access filter Match address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	0h RW	**MOT 0 Filter Match Address (MOT_0_FILTER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.129 MOT Filter Mask (B_CR_MOT_FILTER_MASK0_0_0_0_MCHBAR)—Offset 6BA8h

This register contains the value of the MOT 0 access filter Mask address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 7FFFFFFFE0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	3FFFFFFFFh RW	**MOT 0 Filter Mask Address (MOT_0_FILTER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.130 MOT Filter Match 1 (B_CR_MOT_FILTER_MATCH1_0_0_0_MCHBAR)—Offset 6BB0h

This register contains the value of the MOT 1 access filter Match address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	0h RW	**MOT 1 Filter Match Address (MOT_1_FILTER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.131 MOT Filter Mask 1 (B_CR_MOT_FILTER_MASK1_0_0_0_MCHBAR)—Offset 6BB8h

This register contains the value of the MOT 1 access filter Mask address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 7FFFFFFFE0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	3FFFFFFFFh RW	**MOT 1 Filter Mask Address (MOT_1_FILTER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.132 MOT Filter Misc 0 (B_CR_MOT_FILTER_MISC0_0_0_0_MCHBAR)—Offset 6BC0h

This register contains the value of the MOT 0 access filter Match/Mask Agent LPID.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0)**
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: match • 0: ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Address Match Polarity (ADDR_MATCH_POLARITY):** • 1: filter inversion • 0: match criteria
0	0h RW	**Access Type Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: match writes • 0: match reads

5.9.133 MOT Filter Misc 1 (B_CR_MOT_FILTER_MISC1_0_0_0_MCHBAR)—Offset 6BC8h

This register contains the value of the MOT 1 access filter Match/Mask Agent LPID.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0)**
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: match • 0: ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Address Match Polarity (ADDR_MATCH_POLARITY):** • 1: filter inversion • 0: match criteria
0	0h RW	**Access Type Match Reads or Writes (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: match writes • 0: match reads

5.9.134 MOT Trigger Match 0 (B_CR_MOT_TRIGGER_MATCH0_0_0_0_MCHBAR)—Offset 6BD0h

This register contains the value of the MOT 0 access trigger Match address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	0h RW	**MOT 0 Trigger Match Address (MOT_0_TRIGGER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.135 MOT Trigger Mask 0 (B_CR_MOT_TRIGGER_MASK0_0_0_0_MCHBAR)—Offset 6BD8h

This register contains the value of the MOT 0 access trigger Mask address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 7FFFFFFFE0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	3FFFFFFFFh RW	**MOT 0 Trigger Mask Address (MOT_0_TRIGGER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.136 MOT Trigger Match 1 (B_CR_MOT_TRIGGER_MATCH1_0_0_0_MCHBAR)—Offset 6BE0h

This register contains the value of the MOT 1 access trigger Match address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	0h RW	**MOT1 Trigger Match Address (MOT_1_TRIGGER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.137 MOT Trigger Mask 1 (B_CR_MOT_TRIGGER_MASK1_0_0_0_MCHBAR)—Offset 6BE8h

This register contains the value of the MOT 1 access trigger Mask address.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 7FFFFFFFE0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.
38:5	3FFFFFFFFh RW	**MOT 1 Trigger Mask Address (MOT_1_TRIGGER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved.

5.9.138 MOT Trigger Misc 0 (B_CR_MOT_TRIGGER_MISC0_0_0_0_MCHBAR)—Offset 6BF0h

This register contains the value of the MOT 0 access trigger Match/Mask Agent LPID.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0)**
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: match • 0: ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Address Match Polarity (ADDR_MATCH_POLARITY):** • 1: filter inversion • 0: match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: match writes • 0: match reads

5.9.139 MOT Trigger Misc 1 (B_CR_MOT_TRIGGER_MISC1_0_0_0_MCHBAR)—Offset 6BF8h

This register contains the value of the MOT 1 access trigger Match/Mask Agent LPID.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0)**
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: match • 0: ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Address Match Polarity (ADDR_MATCH_POLARITY):** • 1: filter inversion • 0: match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: match writes • 0: match reads

5.9.140 MOT PSMI Sync (B_CR_MOT_PSMI_SYNC_0_0_0_MCHBAR)—Offset 6C00h

This register is used for PSMI sync.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	0h RW/V	**PSMI Sync 1 (PSMI_SYNC1):** Set by PSMI microcode. Once set, cleared by HW after creation of first MOT record in Slice1.
0	0h RW/V	**PSMI Sync 0 (PSMI_SYNC0):** Set by PSMI microcode. Once set, cleared by HW after creation of first MOT record in Slice0.

5.9.141 BIOSWR Control Policy (B_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 6C08h

This register specifies the control policy for the BIOSWR security policy group. It controls write access to the Read Access Policy BIOSWR_RAC, Write Access Policy BIOSWR_WAC configuration registers, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.

5.9.142 BIOSWR Read Access Policy (B_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 6C10h

This register configures the Read Access Policy for the BIOSWR security policy group. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 80000C00630D0217h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C00630D0217h RW	**Memory Range Policy (MEM_RANGE_POL):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.

5.9.143 BIOSWR Write Access Policy (B_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 6C18h

This register configures the Write Access Policy for the BIOSWR security policy group. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C00610C0212h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C00610C0212h RW	**Memory Range Policy (MEM_RANGE_POL):** Bit vector used to determine which agents are allowed write access, based on each agent's 6bit encoded SAI value.

5.9.144 TPM Selector (B_CR_TPM_SELECTOR_0_0_0_MCHBAR)—Offset 6C24h

Specifies where the TPM lives in the platform. B-Unit uses this register to source decode for requests whose addresses fall within the fixed address range for the TPM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**TPM Selector (TPM_SELECTOR):** • 0h: fTPM enabled. Target of TPM accesses is the CSE. • 1h: SPI TPM enabled. Target of TPM accesses is SPI. • 2h: LPC TPM enabled. Target of TPM accesses is LPC. • 3h: All TPMs disabled. Target of TPM accesses is the PSF Error Handler.

5.9.145 B-Unit Pcode/Ucode Write, All Read Control Policy Register (B_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 6C28h

This register controls the access policy to the Read Access Policy P_U_CODEWR_ALLRD_RAC and Write Access Policy P_U_CODEWR_ALLRD_WAC configuration registers, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

5.9.146 B-Unit Pcode/Ucode Read Access Policy (B_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 6C30h

This register configures the Read Access Policy for the B-Unit Pcode/Ucode Write, All Read registers.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

5.9.147 B-Unit Pcode/Ucode Write Access Policy (B_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 6C38h

This register configures the Write Access Policy for the B-Unit Pcode/Ucode Write, All Read policy registers. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000 202h RW	**B-Unit Pcode/Ucode Write, All Read SAI Write Access Policy (IA_SAI_POL):** Bit vector used to determine which agents are allowed write access to the B-Unit IA Core Configuration registers, based on each agent's 6bit encoded SAI value.

5.9.148 Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h

BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0h RO	**Reserved (RESERVED_0):** Reserved.
39	0h RO	**DEFVTDBAR 40 Bit (DEFVTDBAR_40_BIT):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
38:12	0h RW	**Default IOMMU VTd Config Space Base (DEFVTDBAR):** If DEFVTDBAR is enabled, this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the default VTd IOMMU register set. If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12] the request targets the Default VTd BAR.
11:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1	0h RW	**Lock Register Content (LOCK):** Locks the contents of the register including itself. Unused by the B-Unit, and does not implement the intended lock functionality. B-Unit includes this bit to support shadow copies of the register that rely on this lock bit.
0	0h RW/L	**DEFVTDBAR Enable (DEFVTDBAREN):** • 0: DEFVTDBAR is disabled and does not claim any memory • 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

5.9.149 Gfx VTd BAR (B_CR_GFXVTDBAR_0_0_0_MCHBAR)—Offset 6C88h

BIOS must write GFXVTDBAR and then immediately follow it up with read of DEVEN_0_0_0_PCI, then write (with value from read operation) to DEVEN_0_0_0_PCI to ensure that all copies of GFXVTDBAR in the system are updated.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
38:12	0h RW	**GFXVT Base Address (GFXVTBAR):** This field corresponds to bits 38 to 12 of the base address GFXVT configuration space. BIOS will program this register, resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFXVT register set. If GFXVTBAR is enabled and incoming Request Address[38:12] matches GFXVTBAR[38:12] the request targets the Gfx VTd BAR.
11:2	0h RO	**Reserved (RESERVED_1):** Reserved.
1	0h RW	**Lock Register Content (LOCK):** Locks the contents of the register, including itself. Unused by the B-Unit, and does not implement the intended lock functionality. B-Unit includes this bit to support shadow copies of the register that rely on this lock bit.
0	0h RW/L	**GFXVTBAR Enable (GFXVTBAREN):** • 0: GFXVTBAR is disabled and does not claim any memory • 1: GFXVTBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

5.9.150 B-Unit Lites Group 0 Control (B_CR_LITES0_CTL_0_0_0_MCHBAR)—Offset 6C90h

This register controls the functionality of the B-Unit Lites Group 0 mask/match functionality.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 0. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 0. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved.
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: Mask/Match hits enabled only for Slice0 • 10: Mask/match hits enabled only for Slice1 • 11: Mask/Match hits enabled for both Slices
7:4	0h RW	**DWord Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 0.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/mask, opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 0. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch, PMI datain for each PMI channel for read data, PMI dataout for each PMI channel for writes, data write from requesters to BRAM in each slice, and read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point, all match criteria for that point must be satisfied.

5.9.151 B-Unit Lites Group 0 Opcode Match Filter (B_CR_LITES0_OPCODE_MATCH_0_0_0_MCHBAR)—Offset 6C94h

This register contains the IDI and PII opcodes that will enable a Lites Group0 opcode match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points, Badmit in both slices and the U2C request interface, use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and, when clear, will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_piclet • Bit 26: C2U_Req_PRd,U2C_Req_VLW_piclet • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_piclet • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_piclet • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI

5.9.152 B-Unit Lites Group 0 Agent Match Filter (B_CR_LITES0_AGENT_MATCH_0_0_0_MCHBAR)—Offset 6C98h

This register designates which agents are enabled to trigger a Lites Group0 AgentID match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI transactions from GT for Lites Group0. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions for Lites Group0. Each bit, when set, enables a match for a transaction originating from that VC. When clear, suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions for Lites Group 0. Each bit, when set, enables a match for a transaction originating from that core. When clear, suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

5.9.153 B-Unit Lites Group 0 U2C IntData Match Filter (B_CR_LITES0_U2CINTDATA_MATCH_0_0_0_MCHBAR)—Offset 6C9Ch

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Mask for U2C Request IntData[15:0] (INTDATA_MASK):** This mask is for generating Lites Group 0 U2C request alternative view match. Only bits [7:0] of this field are used; bits [15:8] are ignored. If a mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH field is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH[7:0] field must match its corresponding u2c request IntData[15:8] bit for a match.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:8] value is compared with bits [7:0] of this field to generate a match for the U2C request address match. Bits [15:8] of this field are ignored. Note that matching based on the IntData[7:0] bits is not supported.

5.9.154 B-Unit Lites Group 0 Address Match Filter LITES0_ADDR_MATCH (B_CR_LITES0_ADDR_MATCH_0_0_0_MCHBAR)—Offset 6CA0h

This register, together with the LITES0_ADDR_MASK register, specifies the request address values that trigger a Lites Group 0 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.155 B-Unit Lites Group 0 Address Mask Filter LITES0_ADDR_MASK (B_CR_LITES0_ADDR_MASK_0_0_0_MCHBAR)—Offset 6CA8h

This register, together with the LITES0_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 0 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.156 B-Unit Lites Group 0 Data Match Filter LITES0_DATA_MATCH (B_CR_LITES0_DATA_MATCH_0_0_0_MCHBAR)—Offset 6CB0h

This register, together with LITES0_DATA_MASK, specifies the data values that will trigger a Lites Group 0 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 0 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites.

5.9.157 B-Unit Lites Group 0 Data Mask Filter LITES0_DATA_MASK (B_CR_LITES0_DATA_MASK_0_0_0_MCHBAR)—Offset 6CB4h

This register, together with LITES0_DATA_MATCH, specifies the data values that will trigger a Lites Group 0 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 0 data match/mask registers for generating a Group 0 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

5.9.158 B-Unit Lites Group 1 Control (B_CR_LITES1_CTL_0_0_0_MCHBAR)—Offset 6CC0h

This register controls the B-Unit Lites Group 1 mask/match functionality.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 1. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 1. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved.
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: mask/match hits enabled only for Slice0 • 10: mask/match hits enabled only for Slice1 • 11: mask/match hits enabled for both Slices
7:4	0h RW	**DWord Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 1.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 1.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/mask opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 1. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch, PMI datain for each PMI channel for read data, PMI dataout for each PMI channel for writes, data write from requesters to BRAM in each slice, and read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point, all match criteria for that point must be satisfied.

5.9.159 B-Unit Lites Group 1 Opcode Match Filter (B_CR_LITES1_OPCODE_MATCH_0_0_0_MCHBAR)—Offset 6CC4h

This register contains the IDI and PII opcodes that will enable a Lites Group1 opcode match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_piclet • Bit 26: C2U_Req_PRd,U2C_Req_VLW_piclet • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_piclet • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_piclet • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI

5.9.160 B-Unit Lites Group 1 Agent Match Filter (B_CR_LITES1_AGENT_MATCH_0_0_0_MCHBAR)—Offset 6CC8h

This register designates which agents are enabled to trigger a Lites Group1 AgentID match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI transactions from GT for Lites Group1. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions for Lites Group1. Each bit, when set, enables a match for a transaction originating from that VC. When clear, each bit suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions, for Lites Group 1. Each bit, when set, enables a match for a transaction originating from that core. When clear, each bit suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

5.9.161 B-Unit Lites Group 1 U2C IntData Match Filter (B_CR_LITES1_U2CINTDATA_MATCH_0_0_0_MCHBAR)—Offset 6CCCh

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** This mask is for generating Lites Group 1 U2C request alternative view match. Only bits [7:0] of this field are used; bits [15:8] are ignored. If a mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH field is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH[7:0] field must match its corresponding u2c request IntData[15:8] bit for a match.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:8] value is compared with bits [7:0] of this field to generate a match for the U2C request address match. Bits [15:8] of this field are ignored. Note that matching based on the IntData[7:0] bits is not supported.

5.9.162 B-Unit Lites Group 1 Address Match Filter LITES1_ADDR_MATCH (B_CR_LITES1_ADDR_MATCH_0_0_0_MCHBAR)—Offset 6CD0h

This register, together with the LITES1_ADDR_MASK register, specifies the request address values that trigger a Lites Group 1 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.163 B-Unit Lites Group 1 Address Mask Filter LITES1_ADDR_MASK (B_CR_LITES1_ADDR_MASK_0_0_0_MCHBAR)—Offset 6CD8h

This register, together with the LITES1_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 1 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.164 B-Unit Lites Group 1 Data Match Filter LITES1_DATA_MATCH (B_CR_LITES1_DATA_MATCH_0_0_0_MCHBAR)—Offset 6CE0h

This register, together with LITES1_DATA_MASK, specifies the data values that will trigger a Lites Group 1 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 1 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites.

5.9.165 B-Unit Lites Group 1 Data Mask Filter LITES1_DATA_MASK (B_CR_LITES1_DATA_MASK_0_0_0_MCHBAR)—Offset 6CE4h

This register, together with LITES1_DATA_MATCH, specifies the data values that will trigger a Lites Group 1 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 1 data match/mask registers for generating a Group 1 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

5.9.166 B-Unit Lites Group 2 Control (B_CR_LITES2_CTL_0_0_0_MCHBAR)—Offset 6CF0h

This register controls the functionality of the B-Unit Lites Group 2 mask/match functionality.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 2. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 2. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved.
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: Mask/Match hits enabled only for Slice0 • 10: Mask/match hits enabled only for Slice1 • 11: Mask/Match hits enabled for both Slices
7:4	0h RW	**Dword Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 2.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 2.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Alternname UC2 Request View (ALTU2CREQVIEW):** When set, address match/mask opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 2. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch PMI datain for each PMI channel read data, PMI dataout for each PMI channel write data, agent data write to BRAM in each slice, read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point all match criteria for that point must be satisfied.

5.9.167 B-Unit Lites Group 2 Opcode Match Filter (B_CR_LITES2_OPCODE_MATCH_0_0_0_MCHBAR)—Offset 6CF4h

This register contains the IDI and PII opcodes that will enable a Lites Group2 opcode match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_piclet • Bit 26: C2U_Req_PRd,U2C_Req_VLW_piclet • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_piclet • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_piclet • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI •

5.9.168 B-Unit Lites Group 2 Agent Match Filter (B_CR_LITES2_AGENT_MATCH_0_0_0_MCHBAR)—Offset 6CF8h

This register designates which agents are enabled to trigger a Lites Group2 AgentID match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI ransactions from GT for Lites Group2. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID, for PII transactions for Lites Group2. Each bit, when set, enables a match for a transaction originating from that VC. When clear, suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions for Lites Group 2. Each bit, when set, enables a match for a transaction originating from that core. When clear, suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

5.9.169 B-Unit Lites Group 2 U2C IntData Match Filter (B_CR_LITES2_U2CINTDATA_MATCH_0_0_0_MCHBAR)—Offset 6CFCh

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** This mask is for generating Lites Group 2 U2C request alternative view match. Only bits [7:0] of this field are used; bits [15:8] are ignored. If a mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH field is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH[7:0] field must match its corresponding u2c request IntData[15:8] bit for a match.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:8] value is compared with bits [7:0] of this field to generate a match for the U2C request address match. Bits [15:8] of this field are ignored. Note that matching based on the IntData[7:0] bits is not supported.

5.9.170 B-Unit Lites Group 2 Address Match Filter LITES2_ADDR_MATCH (B_CR_LITES2_ADDR_MATCH_0_0_0_MCHBAR)—Offset 6D00h

This register, together with the LITES2_ADDR_MASK register, specifies the request address values that trigger a Lites Group 2 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.171 B-Unit Lites Group 2 Address Mask Filter LITES2_ADDR_MASK (B_CR_LITES2_ADDR_MASK_0_0_0_MCHBAR)—Offset 6D08h

This register, together with the LITES2_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 2 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.172 B-Unit Lites Group 2 Data Match Filter LITES2_DATA_MATCH (B_CR_LITES2_DATA_MATCH_0_0_0_MCHBAR)—Offset 6D10h

This register, together with LITES2_DATA_MASK, specifies the data values that will trigger a Lites Group 2 data filter match. All data observation points PMI data in PMI data out read data to agent both live and nonlive and write data from agent use the same Group 2 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites

5.9.173 B-Unit Lites Group 2 Data Mask Filter LITES2_DATA_MASK (B_CR_LITES2_DATA_MASK_0_0_0_MCHBAR)—Offset 6D14h

This register, together with LITES2_DATA_MATCH, specifies the data values that will trigger a Lites Group 2 data filter match for Lites. All data observation points PMI data in PMI data out read data to agent both live and nonlive and write data from agent use the same Group 2 data match/mask registers for generating a Group 2 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

5.9.174 B-Unit Lites Group 3 Control (B_CR_LITES3_CTL_0_0_0_MCHBAR)—Offset 6D20h

This register controls the functionality of the B-Unit Lites Group 3 mask/match functionality.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 3. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 3. Each bit, when set to 1, enables length match for the PII request: • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved.
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: mask/match hits enabled only for Slice0 • 10: mask/match hits enabled only for Slice1 • 11: mask/match hits enabled for both Slices
7:4	0h RW	**Dword Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 3.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 3.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/mask, opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set inverts the polarity of the address match/mask logic i.e. reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 3. The following are the observation points that contain match filters Badmit logic within each slice after a transaction is successfully admitted into the B-Unit U2C request launch PMI datain for each PMI channel read data PMI dataout for each PMI channel write data agent data write to BRAM in each slice read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point all match criteria for that point must be satisfied.

5.9.175 B-Unit Lites Group 3 Opcode Match Filter (B_CR_LITES3_OPCODE_MATCH_0_0_0_MCHBAR)—Offset 6D24h

This register contains the IDI and PII opcodes that will enable a Lites Group3 opcode match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_piclet • Bit 26: C2U_Req_PRd,U2C_Req_VLW_piclet • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_piclet • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_piclet • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI

5.9.176 B-Unit Lites Group 3 Agent Match Filter (B_CR_LITES3_AGENT_MATCH_0_0_0_MCHBAR)—Offset 6D28h

This register designates which agents are enabled to trigger a Lites Group3 AgentID match on a transaction.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI transactions from GT for Lites Group3. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions, for Lites Group3. Each bit, when set, enables a match for a transaction originating from that VC. When clear, the bit suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions, for Lites Group 3. Each bit, when set, enables a match for a transaction originating from that core. When clear, the bit suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

5.9.177 B-Unit Lites Group 3 U2C IntData Match Filter (B_CR_LITES3_U2CINTDATA_MATCH_0_0_0_MCHBAR)—Offset 6D2Ch

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** This mask is for generating Lites Group 3 U2C request alternative view match. Only bits [7:0] of this field are used; bits [15:8] are ignored. If a mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH field is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH[7:0] field must match its corresponding u2c request IntData[15:8] bit for a match.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:8] value is compared with bits [7:0] of this field to generate a match for the U2C request address match. Bits [15:8] of this field are ignored. Note that matching based on the IntData[7:0] bits is not supported.

5.9.178 B-Unit Lites Group 3 Address Match Filter LITES3_ADDR_MATCH (B_CR_LITES3_ADDR_MATCH_0_0_0_MCHBAR)—Offset 6D30h

This register, together with the LITES3_ADDR_MASK register, specifies the request address values that trigger a Lites Group 3 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.179 B-Unit Lites Group 3 Address Mask Filter LITES3_ADDR_MASK (B_CR_LITES3_ADDR_MASK_0_0_0_MCHBAR)—Offset 6D38h

This register, together with the LITES3_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 3 address match on a transaction.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.180 B-Unit Lites Group 3 Data Match Filter LITES3_DATA_MATCH (B_CR_LITES3_DATA_MATCH_0_0_0_MCHBAR)—Offset 6D40h

This register, together with LITES3_DATA_MASK, specifies the data values that will trigger a Lites Group 3 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 3 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DATA_MATCH (DATA_MATCH):** Data value to match for Lites

5.9.181 B-Unit Lites Group 3 Data Mask Filter LITES3_DATA_MASK (B_CR_LITES3_DATA_MASK_0_0_0_MCHBAR)—Offset 6D44h

This register, together with LITES3_DATA_MATCH, specifies the data values that will trigger a Lites Group 3 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 3 data match/mask registers for generating a Group 3 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

5.9.182 B-Unit Lites and Emon Master Control LITESEMONCTL (B_CR_LITESEMON_CTL_0_0_0_MCHBAR)—Offset 6D48h

This register controls the functionality of the B-Unit Lites Debug functionality and Emon exposure to VISA.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Lites (ENABLE_LITES):** • 0: Lites logic is disabled. All Lites Views will be driven to 0s. • 1: Lites logic is enabled.
30:27	0h RW	**Emon Barb CQ Select (EMON_BARB_CQ_SELECT):** Select barb conflictQ FIFO. • 0000 to 0111: pii0 to pii7 • 1xx0: idi slice0 • 1xx1: idi slice1
26:24	0h RW	**Emon Barb Ingress Select (EMON_BARB_INGRESS_SELECT):** Select barb ingress FIFO. • 000: IDI attach point -0 -mono | per slice fifo0 • 001: IDI attach point -0 -slice fifo1 • 010: IDI attach point -1 -mono | per slice fifo1 • 011: IDI attach point -1 - slice fifo • 100: IDI attach point -2 -mono | GT slice0 • 101: IDI attach point -2 - slice fifo | GT slice1 • 110: IDI attach point -3 -mono | per slice fifo0 • 111: IDI attach point -3 - slice fifo1

Bit Range	Default & Access	Field Name (ID): Description
23:13	0h RW	**Emon VC Mask (EMON_VC_MASK):** B-Unit and T-Unit expose only the Emons corresponding to the VC(s) specified in this field (it is a mask).
12:5	0h RW	**Emon IDI Mask (EMON_IDI_MASK):** B-Unit and T-Unit expose only the Emons corresponding to the IDI agent(s) specified in this field (it is a mask). IDI agent refers to GLM modules and GT not Sunits.
4:2	0h RW	**Lites IDI Select (LITES_IDI_SELECT):** B-Unit and T-Unit expose only the views corresponding to the IDI agent specified in this field. IDI agents only refer to GT and GLM modules, not Sunits. Used only on the C2U response views.
1	0h RW	**Lites Slice Select (LITES_SLICE_SELECT):** When set to 0, B-Unit and T-Unit expose only Slice0 views. No Lites observability of any transaction routed to Slice 1. When set to 1, B-Unit and T-Unit expose only Slice1 views. No Lites observability of any transaction routed to Slice0.
0	0h RW	**Lites PMI Select (LITES_PMI_SELECT):** When set to 0, B-Unit exposes only PMI channel 0 views in either slice. No Lites observability of any transaction routed to PMI channel 1 in either slice. When set to 1, B-Unit exposes only PMI Channel 1 views in either slice.

5.9.183 B-Unit Arbiter Control BARBCTRL0 (B_CR_BARBCTRL0)—Offset 6D4Ch

Specifies the weighting for Agents 03 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiters weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.
29:24	4h RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.
5:0	4h RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

5.9.184 B-Unit Arbiter Control BARBCTRL1 (B_CR_BARBCTRL1)—Offset 6D50h

Specifies the weighting for Agents 4-7 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiter's weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.
29:24	4h RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.
5:0	4h RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

5.9.185 B-Unit Scheduler Control (B_CR_BSCHWT0)—Offset 6D54h

Specifies the weighting for Agents 0-3 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter, to allow other agents' requests to be granted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.
29:24	4h RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.
5:0	4h RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

5.9.186 B-Unit Scheduler Control (B_CR_BSCHWT1)—Offset 6D58h

Specifies the weighting for Agents 4-7 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
29:24	4h RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.
5:0	4h RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

5.9.187 B-Unit Scheduler Control (B_CR_BSCHWT2)—Offset 6D5Ch

Specifies the weighting for Agents 8-11 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.
29:24	4h RW	**Agent 11 Weight (AGENT11_WEIGHT):** Arbiter weight for Agent 11.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 10 Weight (AGENT10_WEIGHT):** Arbiter weight for Agent 10.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 9 Weight (AGENT9_WEIGHT):** Arbiter weight for Agent 9.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:0	4h RW	**Agent 8 Weight (AGENT8_WEIGHT):** Arbiter weight for Agent 8.

5.9.188 B-Unit Scheduler Control (B_CR_BSCHWT3)—Offset 6D60h

Specifies the weighting for Agents 12-15 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4040404h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved.
29:24	4h RW	**Agent 15 Weight (AGENT15_WEIGHT):** Arbiter weight for Agent 15.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved.
21:16	4h RW	**Agent 14 Weight (AGENT14_WEIGHT):** Arbiter weight for Agent 14.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved.
13:8	4h RW	**Agent 13 Weight (AGENT13_WEIGHT):** Arbiter weight for Agent 13.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved.
5:0	4h RW	**Agent 12 Weight (AGENT12_WEIGHT):** Arbiter weight for Agent 12.

5.9.189 B-Unit Flush Control (B_CR_BWFLUSH)—Offset 6D64h

Controls the policy used to determine when dirty entries must be flushed to DRAM. When the number of dirty entries is lower than a high watermark dirty_hwm the B-Unit will opportunistically flush data to DRAM after the write flush timeout value. When the number of dirty entries exceeds the high water mark, the B-Unit will initiate a highpriority flush and push dirty data to DRAM until the count is once again below the low water mark.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FF010000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**Flush Threshold (FLUSH_THRESHOLD):** All write commands are blocked at Badmit if the number of write commands in the Flush Pool exceeeds this value.
23:17	0h RO	**Reserved (RESERVED_0):** Reserved.
16	1h RO/V	**All Entries Flushed (ALL_ENTRIES_FLUSHED):** All dirty entries in the B-Unit, in both slices, have been flushed.
15:8	0h RW	**Dirty Low Water Mark (DIRTY_LWM):** Low water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.
7:0	0h RW	**Dirty High Water Mark (DIRTY_HWM):** High water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.

5.9.190 B-Unit Flush Weights (B_CR_BFLWT)—Offset 6D68h

Controls B-Unit alternate scheduling of reads and writes to DRAM.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 404h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable Flush Weights (DISABLE_FLUSH_WEIGHTS):** When set to 1, disables flush weights. Flushing of dirty entries will start when Dirty Limit is HWM, and continue until Dirty Limit is LWM. No reads will be scheduled in between.
30:14	0h RO	**Reserved (RESERVED_1):** Reserved.
13:8	4h RW	**Write Weights (WRITE_WEIGHTS):** Number of write requests sent to a PMI channel before switching to scheduling read requests, when use of flush weights is not disabled.
7:6	0h RO	**Reserved (RESERVED_0):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:0	4h RW	**Read Weights (READ_WEIGHTS):** Number of read requests sent to a PMI channel before switching to scheduling write requests, when use of flush weights is not disabled.

5.9.191 Weighted Scheduling Control of High Priority ISOC and Other Requests (B_CR_BISOCWT)—Offset 6D6Ch

Controls alternate scheduling of High Priority ISOC requests and other requests.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80003F0Fh

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Enable ISOC Requests (ENABLE_ISOC_WEIGHTS):** When set to 1, enables switching from scheduling High Priority ISOC requests to scheduling Best Effort and Low Priority ISOC requests, based on ISOC weights and NONISOC weights.
30:14	0h RO	**Reserved (RESERVED_1):** Reserved.
13:8	3Fh RW	**ISOC Request Weights (ISOC_REQUEST_WEIGHTS):** Weight for high priority isochronous requests.
7:6	0h RO	**Reserved (RESERVED_0):** Reserved.
5:0	Fh RW	**Non ISOC Request Weights (NON_ISOC_REQUEST_WEIGHTS):** Weight for non-high priority isochronous and best effort requests.

5.9.192 B-Unit Control (B_CR_BCTRL2)—Offset 6D70h

Contains basic control information used by the B-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0034h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Read Invalidate Timer (ENABLE_READ_INVALIDATE_TIMER):** When set to 1, enables the BRAM to clear the RD_DONE bit and flush dirty data when a timer expires. Used when parity is not enabled, to force the B-Unit to not indefinitely cache previously read lines, and also to cause a flush of dirty data that has been written to the BRAM entry.
30:26	0h RO	**Reserved (RESERVED_2):** Reserved.
25	0h RW	**DRAM_ECC_ENABLE (DRAM_ECC_ENABLE):** If DRAM ECC is enabled, the data error bits from the Dunit is used for indicating the derror for the corresponding transactions to the agents and forcing the poison bit when BUNIT PARITY is unsupported and Read for partial writes are enabled
24	0h RW	**MOT Disable Stall Arbiter on Error (MOT_DISABLE_STALL_ARB_ON_ERR):** If the HH widget gets an error, allow transactions to get arbitrated.
23:16	Fh RW	**BRAM Read Invalidate Time (BRAM_READ_INVALIDATE_TIME):** Timer threshold to clear rd_done bits or flush a BRAM entry, if dirty. The value specified is in multiples of 250ns. For each time interval specified, the read done status of one BRAM entry will be cleared based on a BTAG index which is then incremented to point to the next BRAM entry.
15:8	0h RW	**Casual Timer (CASUAL_TIMER):** The number of clock cycles that the B-Unit waits before starting a casual dirty flush. Casual Flush feature will not be enabled by PND2 architecture. Instead, a dirty write will be made eligible for scheduling immediately.
7:6	0h RO	**Reserved (RESERVED_1):** Reserved.
5	1h RW	**Enable 64B Write (ENABLE_64B_WRITE):** When set, B-unit will send 64B PMI Write requests for transactions requiring write access to DRAM. Must always be set to one, otherwise functional errors may occur.
4	1h RW	**Enable 64B Read (ENABLE_64B_READ):** When set, B-unit will send 64B PMI read requests for transactions requiring read access to DRAM. Must always be set to one, otherwise functional errors may occur.
3	0h RO	**Demand Scrub Enable (DEMAND_SCRUB_ENABLE):** This mode causes B-Unit to automatically issue a flush to PMI, thus writing correct data back to memory for any read request that returns with a correctable data error.
2	1h RW	**Enable Read Done for Write (ENABLE_READ_DONE_FOR_WRITE):** Enable Any writes (IWB or normal writes) to set the read_done bit in bstat, which enables return of data from the BRAM cache instead of Memory.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Miss Valid Entries (MISS_VALID_ENTRIES):** This mode causes reads to clean valid B-Unit buffer entries to look like misses instead of hits. When this bit is set -- even when all requested bytes are valid and present in the BRAM data buffer -- B-Unit will send read requests over the PMI interface to re-fetch the data from DRAM, instead of returning it from the BRAM.
0	0h RW	**Dirty Stall (DIRTY_STALL):** This mode causes reads or writes from any requester interface to dirty valid B-Unit buffer entries to stall on the appropriate requester interface until the entry has been flushed from the B-Unit.

5.9.193 Asset Classification Bits (B_CR_AC_RS0_0_0_0_MCHBAR)—Offset 6D74h

B-Unit Asset Classification AC[3] bits for IMRs and Special Protected Memory Region. Controls whether RS0 Root Space 0 transactions from PII are allowed access to IMRs and Protected Memory Region.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RESERVED_0):** Reserved.
20	1h RW	**MOT RS Asset Classification (MOT_RS0_EN):** RS Asset Classification bit for the MOT buffer. PII transactions from RS0 that hit the MOT buffer will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list, as specified in the RAC/WAC policy registers, and b) MOT_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
19:0	0h RW	**IMR RS Asset Classification (IMR_RS0_EN):** RS Asset Classification bit for IMRs 0-19. PII transactions from RS0 that hit an enabled IMR address range will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the IMRs RAC/WAC policy registers and b) IMR_AC_RS bit corresponding to the IMR is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.

5.9.194 IDI Real-Time Feature Configuration Bits (B_CR_RT_EN_0_0_0_MCHBAR)—Offset 6D78h

IDI Real-Time Feature Configuration register. Controls which IDI attachpoint support Real-Time traffic/transactions.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**IDI Agent Real-Time Traffic Mask Bits (RT_IDI_AGENT):** IDI Agent Real-Time Traffic Mask Bits. Controls which IDI Agent supports Real-Time Traffic/Transactions. Only one IDI Agent needs to be selected for real-time traffic. Currently we don't support multiple IDI agents to be enabled for real-time traffic at the same time. This field will be active only when Bit 0:RT_ENABLE is set to '1'
15:1	0h RO	Reserved.
0	0h RW	**Real-Time Enable (RT_ENABLE):** Global enable bit for Real-Time Support

5.9.195 B-Unit Control Register 3 (B_CR_BCTRL3)—Offset 6D7Ch

Specifies miscellaneous controls for the the B-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 140h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	1h RW	**Disable C2U Ingress Slice Anti-Starvation (SLICE_ANTI_STARVE_DISABLE):** When set, B-unit will always make an available request in each instantiated per-slice C2U Ingress FIFO for all IDI attach points eligible for arbitration in their respective odd/even sa2xclk clock. When clear, B-unit will mask a C2U Ingress Slice's available request from arbitration when SLICE_ANTI_STARVE_THRESHOLD consecutive requests has been granted for that IDI attach point from the other Slice Ingress FIFO. Has no effect for IDI attach points that do not have per-slice Ingress FIFOs
7:0	40h RW	**C2U Ingress Slice Anti-Starvation Threshold (SLICE_ANTI_STARVE_THRESHOLD):** Specifies the threshold for the number of consecutive requests B-admit arbiter will grant from the same Slice ingress FIFO for an IDI attachpoint, while the other Slice also has a request available

5.9.196 Asymmetric Memory Region 0 With No Interleaving Configuration (B_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR)—Offset 6E40h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions. The register has no affect is SLICE_0_MEM_DISABLED is set.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 0, With No Interleaving (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM Region Slice 0 (SLICE0_ASYM_CHANNEL_SELECT):** Specifies Channel Selected for ASYM Region Mapped To Slice 0
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_LIMIT):** Specifies bits [38:28] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:4	0h RW	**Base Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_BASE):** Specifies bits [38:28] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	Reserved.

5.9.197 Asymmetric Memory Region 1 With No Interleaving Configuration (B_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR)—Offset 6E44h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions. The register has no affect is SLICE_1_DISABLED is set.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 1, With No Interleaving. (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM SLICE 1 (SLICE1_ASYM_CHANNEL_SELECT):** Specifies Channel Selected for ASYM Region Mapped To Slice 1.
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_LIMIT):** Specifies bits [38:28] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	Reserved.
14:4	0h RW	**Base Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_BASE):** Specifies bits [38:28] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	Reserved.

5.9.198 B-Unit Machine Check Mode Low (B_CR_BMCMODE_LOW)—Offset 6E48h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	1h RW	**Machine Check Signal Mode (MC_SIGNAL_MODE):** When set to 1, B-Unit will not allow any transaction with uncorrectable error or subsequent memory transaction to propagate through to Requester. This will essentially hang CPU and CPU will end up with IERR shutdown. Issue: When set to zero B-Unit will allow transaction with an uncorrectable error to propagate and signal MC event to CPU if enabled in IA32_MC5_CTL. If enabled MC event will be taken by CPU cores at the end of instruction boundary after it detected by ROB

5.9.199 B-Unit Machine Check Mode High (B_CR_BMCMODE_HIGH)—Offset 6E4Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.9.200 Two-Way Asymmetric Memory Region Configuration (B_CR_ASYM_2WAY_MEM_REGION_0_0_0_MCHBAR)—Offset 6E50h

Specification of asymmetric memory region for the configuration with 2way Interleaved Asymmetric memory. It is only supported if all Slices and all Channels are Enabled

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Two-Way Asymmetric Memory Configuration (ASYM_2WAY_INTERLEAVE_ENABLE):** Setting this bit to 0 disables 2Way Asymmetric Interleaving; setting it to 1 enables the region.
30:28	0h RO	Reserved.
27:17	0h RW	**Limit Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_LIMIT):** Specifies bits [38:28] of the highest address of Interleave Asymmetric Region; all the lower bits of the region's highest address are equal to 1.
16:15	0h RO	Reserved.
14:4	0h RW	**Base Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_BASE):** Specifies bits [38:28] of the base address of Interleave Asymmetric Region; all the lower bits of the region's base address are equal to 0.
3:2	0h RW	**Two-Way Asymmetric Interleave Mode (ASYM_2WAY_INTLV_MODE):** Going with 2 bits here. 2'b00 : Asymmetric memory Split between Channel 0 of Slice 0 and Slice 1 2'b01 : Asymmetric memory split between Channel 1 of Slice 0 and Slice 1 2'b10 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 0 2'b11 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 1
1:0	0h RO	Reserved.

5.10 Registers Summary

Table 5-10. Summary of pcs_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7800h	7803h	Interrupt Redirection Control (INTR_REDIR_CTL_MCHBAR)—Offset 7800h	150000h
7804h	7807h	X2B_BARB_CTL1 (X2B_BARB_CTL1_MCHBAR)—Offset 7804h	0h
7808h	780Bh	Clock Gating Control (CLKGATE_CTL_MCHBAR)—Offset 7808h	0h
780Ch	780Fh	Miscellaneous Controls (MISC_CTL_MCHBAR)—Offset 780Ch	0h
7810h	7813h	Control (CTL_MCHBAR)—Offset 7810h	4B000000h
7814h	7817h	PSMI Control (PSMI_CTL_MCHBAR)—Offset 7814h	0h
7818h	781Bh	Miscellaneous T2A selector (T2A_SELECTOR_MISC_MCHBAR)—Offset 7818h	38000AA0h
781Ch	781Fh	VC Read Ordering CFG (VC_READ_ORDERING_CFG_MCHBAR)—Offset 781Ch	F9F3h
7820h	7823h	VC Write Ordering CFG (VC_WRITE_ORDERING_CFG_MCHBAR)—Offset 7820h	F9F3h

Table 5-10. Summary of pcs_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
7824h	7827h	IDI0 C2U Credit Control (IDI0_C2U_CREDIT_CTRL_MCHBAR)—Offset 7824h	6104h
7828h	782Bh	IDI1 C2U Credit Control (IDI1_C2U_CREDIT_CTRL_MCHBAR)—Offset 7828h	6104h
782Ch	782Fh	IDI2 C2U Credit Control (IDI2_C2U_CREDIT_CTRL_MCHBAR)—Offset 782Ch	A290h
7830h	7833h	IDI3 C2U Credit Control (IDI3_C2U_CREDIT_CTRL_MCHBAR)—Offset 7830h	0h
7834h	7837h	IDI4 C2U Credit Control (IDI4_C2U_CREDIT_CTRL_MCHBAR)—Offset 7834h	0h
7838h	783Bh	IDI5 C2U Credit Control (IDI5_C2U_CREDIT_CTRL_MCHBAR)—Offset 7838h	0h
783Ch	783Fh	IDI6 C2U Credit Control (IDI6_C2U_CREDIT_CTRL_MCHBAR)—Offset 783Ch	0h
7840h	7843h	IDI7 C2U Credit Control (IDI7_C2U_CREDIT_CTRL_MCHBAR)—Offset 7840h	0h
7844h	7847h	PII2 A2T Credit Control (PII2_A2T_CREDIT_CTRL_MCHBAR)—Offset 7844h	808h
7848h	784Fh	BIOSWR Control Policy (T_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 7848h	C0061010202h
7850h	7857h	BIOSWR Read Access Control (T_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 7850h	80000C00630D0217h
7858h	785Fh	BIOSWR Write Access Control (T_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 7858h	C00610C0212h
7860h	7867h	TUnit Pcode/Ucode Write, All Read Control Policy Register (T_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 7860h	40001000202h
7868h	786Fh	TUnit Pcode/Ucode Read Access Control (T_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 7868h	FFFFFFFFFFFFFFFFh
7870h	7877h	TUnit Pcode/Ucode Write Access Control (T_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 7870h	40801008602h

5.10.1 Interrupt Redirection Control (INTR_REDIR_CTL_MCHBAR)—Offset 7800h

Interrupt redirection control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 150000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved 2 (RESERVED_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**INTPRIUP Gap DIS (INTPRIUP_GAP_DIS):** When the T-unit receives the data for intpriupdate IDI transaction, if the data specifies legacy clustered mode, then the T-Unit will assume there is a gap in the logical apic id field, such that: cluster_id[3:0] == logical_id[19:16] and agent_id[3:0] == logical_id[3:0]. These two fields are stored without a gap in the T-Unit CRs. If this CR bit is a one, then T-Unit will not assume a gap in the incoming data, and will just use the lower 8 bits of logical_id for the legacy cluster case.
20	1h RW	**INTPRIUP Enable (INTPRIUP_EN):** Enable an intpriupdate IDI transaction to modify the corresponding core's enable bit, physical APIC ID, and logical APIC ID.
19	0h RW	**INTPRIUP DFR CF (INTPRIUP_DFR_CF):** Enable an intpriupdate IDI transaction to modify the destination format bit (dt/dfr), which is common to all cores, if the core's APIC enable bit is set in the transaction data.
18	1h RW	**INTPRIUP DFR Enable (INTPRIUP_DFR_EN):** Enable an intpriupdate IDI transaction to modify the destination format bit (dt/dfr), which is common to all cores.
17	0h RW	**INTPRIUP X2APIC CF (INTPRIUP_X2APIC_CF):** Enable an intpriupdate IDI transaction to modify the extended APIC mode bit, which is common to all cores, if the core's APIC enable bit is set in the transaction data.
16	1h RW	**INTPRIUP X2APIC Enable (INTPRIUP_X2APIC_EN):** Enable an intpriupdate IDI transaction to modify the extended APIC mode bit, which is common to all cores.
15:9	0h RO	**Reserved 1 (RESERVED_1):** Reserved.
8:6	0h RW	**Hash Vector (HASH_VECTOR):** Not supported. Vector-based interrupt redirection control: • 000: Select bits 7:4/5:4 for vector cluster/flat algorithm; • 001: Select bits 6:3/4:3; • 010: Select bits 4:1/2:1; • 011: Select bits 3:0/1:0; • Others: Reserved.

1:0	0h RW	**PII2 Read Data Completion Weight (PII2_READ_DATA_COMP_WEIGHT)**

5.10.3 Clock Gating Control (CLKGATE_CTL_MCHBAR)—Offset 7808h

Each bit controls a separate Clock Gating Domain. BIOS should write all bits in this register to 1.

- 0: Overrides clock gating and forces the clock gating domain to behave like a freerunning clock.
- 1: Enables Clock Gating.

The reset value for this register is controlled by an SA strap. SOCs can tie this strap to a constant, a fuse or an output from another unit. NOTE: This has to be revisited for the new PND2 T-Unit structure clock gating control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

5.10.4 Miscellaneous Controls (MISC_CTL_MCHBAR)—Offset 780Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:24	0h RO/V	**Snoop Ready Vector (SNP_RDY_VEC):** Allows Debug to dynamically read this state in the T-Unit.
23:19	0h RO	Reserved.
18:16	0h RO/V	**Snoop Required Vector (SNP_REQ_VEC):** Allows Debug to dynamically read this state in the T-Unit.
15	0h RW	**C2U Data Tracking Disabled (C2U_DATA_TRACK_DIS):** When set, this bit disables the tracking of c2u_data for IDI shutdown qualification. A stop_idi sideband request requires that T-unit drain all u2c requests, and wait for all outstanding c2u responses and c2u data to return, before responding with the u2c_done sideband message to GLM. The bug was that T-unit was not waiting on c2u_data.
14	0h RO	**IWB_FORWARDING_EN (IWB_FORWARDING_EN):** When an IWB comes into to B-unit, let it write the BRAM, even if the btag entry is locked waiting on the memory read return. Also, once written into the BRAM, let the tub2xdata logic consider the ooaq entry as ready to receive data. These two allowances will forward the IWB data to the requestor, without waiting on the memory read return.
13:12	0h RW	**Spare 2 (SPARE2):** Spare bits for hardware.
11:7	0h RW	**Spare (SPARE):** Readable and Writable Spare bits. SPARE[0] has been consumed. It is used by PCODE to bypass IDI_SHUTDOWN detection and will force IDI CSM FSM indicator to 1 for pgcb/idle detection.
6	0h RW	**GO-ACK FIFO Empty Check Disable (GO_ACK_FIFO_EMPTY_CHECK_DIS):** When set, the T-unit will NOT wait for the per-agent GO-ACK FIFO to be empty before accepting a stopidi request from the associated agent.
5	0h RW	**IDI_SHUTDOWN Bypass (IDI_SHUTDOWN_BYP):** Used by PCODE to bypass IDI_SHUTDOWN detection and will force IDI CSM FSM indicator to 1 for pgcb/idle detection.

Bit Range	Default & Access	Field Name (ID): Description
4:1	0h RW	**DPTE Count (DPTE_CNT):** This field controls the number of cycles between sending Dynamic Prefetch Throttle Update Events to each IDI Attach Point. The 4-bit value in this field is N and the Count is 2 to the Nth power. • 0: T-Unit can send a DPTE every cycle. • 1: T-Unit can send a DPTE every 2 cycles. • 2: T-Unit can send a DPTE every 4 cycles. • 3: T-Unit can send a DPTE every 8 cycles. • 4: T-Unit can send a DPTE every 16 cycles. • 15: T-Unit can send a DPTE every 32768 cycles.
0	0h RW	**DPTE Enable (DPTE_EN):** • 0: Dynamic Prefetch Throttle Events are Disabled. • 1: Dynamic Prefetch Throttle Events are Enabled.

5.10.5 Control (CTL_MCHBAR)—Offset 7810h

Control register for various T-Unit knobs.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4B000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved 1 (RESERVED_1):** Reserved.
30	1h RW	**ISOCH_BW_FIX_DIS (ISOCH_BW_FIX_DIS):** Disable A-Unit blocking snooped traffic during IA/GT P-state transitions.
29:24	Bh RW	**ISOCH Shared Reserve (ISOCH_SHARED_RESV):** The number of shared T2A cmd credits to reserve for ISOCH level traffic.
23:22	0h RO	**Reserved 0 (RESERVED_0):** Reserved R/W bits.
21	0h RW	**Use PIC_End NACK (USE_PIC_END_NACK):** Normally, when GLM asserts pm_block_req and interrupt_ready is cleared, T-Unit finishes any active interrupt and then responds back with pic_end. For VLW and LTWrites, which are broadcast interrupts, this bit allows an alternative protocol, in which T-unit sees a VLW or LTWrite active in the apic pipeline, and responds with pic_end_nack instead or pic_end. This tells GLM to not go to sleep, so that all cores will eventually be awake and T-Unit can deliver the broadcast interrupt. This bit is not meant to be used, because normally VLW and LTWrites will go into the piclet. Only use this bit if you have special knowledge.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Disable Snooping GT (DISABLE_SNOOPING_GT):** • 0: Default. Snoop GT as normal. • 1: Never snoop GT for any access from an agent.
19	0h RW	**Disable Opportunistic Slice 1 Schedule (DISABLE_OPPORTUNISTIC_SLICE1_SCHEDULE):** • 0: Default. Global B2X data selector will opportunistically schedule TSlice1 B2X selected data in the odd cycle if TSlice0 B2X selected data is not available. • 1: Global B2X data selector will always schedule TSlice1 B2X selected data only in the even cycle.
18	0h RW	**Disable IOSF High Priority Read Data Return (DISABLE_ISOC_HIGHPRI_RDDATA_RETURN):** Disables IOSF high priority read data returns and treats all read data scheduling as normal priority.
17	0h RW	**Enable NPC Collector (ENABLE_NPC_COLLECTOR):** This bit is not connected to anything.
16	0h RW	**Enable In Order APIC (ENABLE_IN_ORDER_APIC):** When 0, has no affect; When 1, forces all interrupts to bypass the piclets, and wait until all targeted cores are awake before delivering the interrupt. The APIC block will send int_wake to P-Unit for each targeted core. Note that using this bit could cause deadlock.
15	0h RW	**TG Enable High Priority Write Pulls (TG_HIGHPRI_WRITE_PULLS):** Enable High Priority Write Pulls. When 1 the X2B Data Selector will prioritize write pulls that the B-Unit has flagged as high priority over other write pulls.
14	0h RW	**TG Disable Live BRAM Bypass to PII2 (TG_LIVE_DATA_PII2):** Disable Live BRAM Bypass to PII2 Mode. When 1 all data to PII2 Agents will be returned from reading the BRAM.
13	0h RW	**TG Half Tunnel (TG_HALF_TUNNEL):** Enable IDI Half Tunneling. This should only be enabled in an Intel Debug setting on Dual Core SOCs.
12	0h RW	**TG Disable nonDRAM Snoops (TG_NDRAMSNP):** Disable nonDRAM Snoops. • 0: SA will snoop nonDRAM Memory Addresses, including Memory Mapped IO MMIO and Memory Mapped Enhanced Config Space. • 1: SA will not snoop nonDRAM Memory Addresses. This includes the standard Memory Read/Write opcodes as well as SetMonitor. There is one exception since the SA will always issue Snoop Invalidate for CLFlush opcodes even if the address is not DRAM. Note: the Monitor Logic can still be armed and triggered using a nonDRAM address.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**TG Read Data BW Mode (TG_RD_BW_MODE):** Read Data BW Mode. This Configuration Mode only affects behavior on SOCs that support two 64bit DDR3 Channels. For these SOCs this mode bit performs the following function: • 0: Enhanced Read BW mode for 2x64b DDR3 Channels. • 1: Basic Read BW mode. All other SOCs this mode bit performs the following function: • 0: Basic Read BW mode. • 1: Reserved.
10	0h RW	**TG Disable Downstream Posted Push Logic Mode (TG_DW_POST_PUSH_LOG):** Disable Downstream Posted Push Logic Mode. • 0: DRAM Read Completions to IOSF VC0 are stalled in the BRAM until all prior downstream Posted Requests from IDI are pushed into the Aunit. This ensures proper PCI Producer/ Consumer Ordering Rules. • 1: Disables the Posted Push Logic. Note this mode violates the Producer/Consumer Ordering rules.
9	0h RW	**TG Set Monitor Snoop Configuration (TG_MON_SNP_CFG):** Set Monitor Snoop Configuration. Defines the Snoop opcode that will be sent for Set Monitor requests from IDI Agents: • 0:SnpCode default • 1:SnpInv
8	0h RW	**Broadcast APIC (BCAST_APIC):** Broadcast APIC Mode. When 1 T-Unit will wake up all IDI attach points and broadcast APIC messages to all attach points not just the IDI attach points that needs to receive the APIC message. Note: The T-Unit does not change the APIC ID to the broadcast APIC ID. What is meant by Broadcast is the Interrupt message is sent to all IDI Attach Points. For directed interrupts the directed interrupt is sent to all Attach Points with the unmodified APIC ID. For redirected interrupts the T-Unit performs the standard redirection algorithm fixed roundrobin or PAIR selects 1 APIC ID to send the message but then sends the message to all IDI Attach Points.
7	0h RW	**SnpInv (SNPINV):** SnpInv only when 1 T-Unit will only send SnpInv. This disables all other Snoop types e.g. SnpCode SnpData.
6	0h RW	**UC Code Read Snoop Configuration (UC_CODE_RD_CFG):** Code Read Snoop Configuration. The SA will send the following U2C Request for Code Reads from IDI Agents. • 0: SnpCode default. • 1: SnpInv.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**PII2 Snooped Read (PII2_SNP_RD):** PII2 Snooped Read Configuration. The SA will send the following U2C Request for Snooped Reads from PII2 Agents. • 00b: Reserved. • 01b: SnpCode. • 10b: SnpData. • 11b: SnpInv default. Note: In order to use SnpCode or SnpData the B-Unit must be configured to disable the Owned Feature.
3	0h RW	**Always Snoop IDI Requests (ALWAYS_SNP_IDI):** IDI initiated requests will always be snooped even if Selfsnoop is not set and even if a Snoop Filter indicates no need to snoop.
2	0h RW	**Disable Live BRAM Bypass to IDI (DIS_LIVE_BRAM_BYP_IDI):** Disable Live BRAM Bypass to IDI Mode. When 1 all data to IDI Agents will be returned from reading the BRAM.
1	0h RW	**Outstanding Snoop (OUTSTND_SNP):** 1: Outstanding Snoop Mode. When 1, do not send any snoops if there is an outstanding Snoop from an IDI Read or Write to ECAM memory mapped Config space that has not yet received all Snoop Replies. Also, do not send any snoops if there is an outstanding Snoop from an IDI Read to MMIO that has not yet received all Snoop Replies. For all other IDI Requests, do not send any snoops if there is an outstanding Snoop that has not yet been GOed. Note: This mode does not affect the issuance of U2C Requests that are destined to the Core APICs i.e. DPTEvent IntLog IntPhy VLW LTWrite and MIscEvent. It only affects the issuance of SnpCode, SnpData, and SnpInv.
0	0h RW	**Always Snoop PII2 Requests (ALWAYS_SNP_PII2):** Always Snoop PII2 Requests Mode. Before setting this bit note the following: There is a performance optimization in the B-Unit to allow multiple Snooped Writes from PII2 Agents to the same line. The B-Unit converts all but the 1st Snoop Write to be NonSnooped. Because of this, the Snoop Everything Mode should only be enabled if 1 of the following is true: T-Unit 1 Outstanding Snoop Mode is enabled OR B-Unit has been configured to disable request combining. Even when this mode is enabled the T-Unit will never snoop Memory Requests that map to MMIO from a PII2 Agent. These requests are treated as IMR violations and also the snoop is suppressed.

5.10.6 PSMI Control (PSMI_CTL_MCHBAR)—Offset 7814h

PSMI Control register. NOTE: This register needs to be redefined for SA PSMI on the SoC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved 2 (RESERVED_2):** Reserved.
7	0h RO	**Reserved 1 (RESERVED_1):** Reserved.
6:5	0h RW	**Select IDI Attach Point (SEL_IDI_ATTACH):** Selects IDI Attach Point. i.e. Module to capture/replay. • 00b: IDI Attach Point 0 • 01b: IDI Attach Point 1 • 10b: Reserved • 11b: Reserved
4:3	0h RW	**PSMI Gear Ratio (PSMI_GEAR_RATIO):** PSMI Gear Ratio Select. • 00b: IDI transfers can occur every CZclock default • 01b: IDI transfers can occur every 2 CZclocks • 10b: IDI transfers can occur every 4 CZclocks • 11b: IDI transfers can occur every 8 CZclocks
2	0h RO	**Reserved (RESERVED_0):** Reserved.
1	0h RW	**PSMI Replay Mode (PSMI_REPLAY_MODE)**
0	0h RW	**SA Capture Mode (SA_CAPTURE_MODE):** Note: If SA Capture Mode is enabled then SSA Replay Mode and P-Unit Replay Mode are ignored.

5.10.7 Miscellaneous T2A selector (T2A_SELECTOR_MISC_MCHBAR)—Offset 7818h

This register will provide miscellaneous defeatures and controls for the T2A selector downstream block in the T-Unit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 38000AA0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	38h RW	**PII_IDLE_THRESHOLD (PII_IDLE_THRESHOLD):** Number of 1x cycles that BT-unit PII idle conditions should exist before the ISM requests idle. The restart time of PII BGFs is on the order of 150 to 210 ns. To avoid this penalty, idle should not be entered too quickly.

Bit Range	Default & Access	Field Name (ID): Description
23:13	0h RW	**Spare 1 (Spare1):** Spare register bits for read/write.
12:9	5h RW	**Maximum Downstream Nonposted Requests Issued For VC0b (MAX_DS_NP_VC0B):** Maximum number of downstream nonposted requests the T2A selector can issue for VC0b. This value should be programmed to less than or equal to the MAX_DS_NP field value but hardware will cap it at that value regardless.
8:5	5h RW	**Maximum Downstream Nonposted Requests Issued For VC0a (MAX_DS_NP_VC0A):** Maximum number of downstream nonposted requests the T2A selector can issue for VC0a. This value should be programmed to less than or equal to the MAX_DS_NP field value but hardware will cap it at that value regardless.
4:0	0h RW	**Spare 0 (Spare0):** Spare register bits for read/write.

5.10.8 VC Read Ordering CFG (VC_READ_ORDERING_CFG_MCHBAR)—Offset 781Ch

Register that indicates whether a particular B2T agent ID is configured to be inorder 1 or can be outoforder 0 for read accesses. This is will cause the access to be routed through the upstream ordering block value of 1 in the VCs bit or not value of 0 in the VCs bit. This register is not meant to be a dynamic ability to change inorder/outoforder nature and should be programmed by BIOS before devices are allowed to access memory. Note that reset value should work without a write. The IDI attaches are not upstream VCs or subject to the Upstream Ordering Block but to keep the handling generic bits will be hardwired to 0 for each IDI attach in the system.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F9F3h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved 0 (RESERVED_0):** Reserved for future VC growth.
15	1h RW	**UPSTREAM_VC15 (UPSTREAM_VC15_IN_ORDER):** Configuration bit for upstream VC15 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
14	1h RW	**UPSTREAM_VC14 (UPSTREAM_VC14_IN_ORDER):** Configuration bit for upstream VC14 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW	**UPSTREAM_VC13 (UPSTREAM_VC13_IN_ORDER):** Configuration bit for upstream VC13 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
12	1h RW	**UPSTREAM_VC12 (UPSTREAM_VC12_IN_ORDER):** Configuration bit for upstream VC12 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
11	1h RW	**UPSTREAM_VC11 (UPSTREAM_VC11_IN_ORDER):** Configuration bit for upstream VC11 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
10	0h RW	**UPSTREAM_VC1BMMU_IN_ORDER (UPSTREAM_VC1BMMU_IN_ORDER):** Configuration bit for upstream VC1Bmmus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
9	0h RW	**UPSTREAM_VC0BMMU_IN_ORDER (UPSTREAM_VC0BMMU_IN_ORDER):** Configuration bit for upstream VC0Bmmus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
8	1h RW	**UPSTREAM_VC0AMMU_IN_ORDER (UPSTREAM_VC0AMMU_IN_ORDER):** Configuration bit for upstream VC0Ammus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
7	1h RW	**Upstream VCBR In Order (UPSTREAM_VCBR_IN_ORDER):** Configuration bit for upstream VCbrs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC
6	1h RW	**Upstream VC2C In Order (UPSTREAM_VC2C_IN_ORDER):** Configuration bit for upstream VC2cs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC
5	1h RW	**Upstream VC2B In Order (UPSTREAM_VC2B_IN_ORDER):** Configuration bit for upstream VC2bs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC
4	1h RW	**Upstream VC2A In Order (UPSTREAM_VC2A_IN_ORDER):** Configuration bit for upstream VC2as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
3	0h RW	**Upstream VC1B In Order (UPSTREAM_VC1B_IN_ORDER):** Configuration bit for upstream VC1bs inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
2	0h RW	**Upstream VC1A In Order (UPSTREAM_VC1A_IN_ORDER):** Configuration bit for upstream VC1as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
1	1h RW	**Upstream VC0B In Order (UPSTREAM_VC0B_IN_ORDER):** Configuration bit for upstream VC0bs inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW	**Upstream VC0A In Order (UPSTREAM_VC0A_IN_ORDER):** Configuration bit for upstream VC0as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

5.10.9 VC Write Ordering CFG (VC_WRITE_ORDERING_CFG_MCHBAR)—Offset 7820h

Register that indicates whether a particular B2T agent ID is configured to be inorder 1 or can be outoforder 0 for write accesses. This is will cause the access to be routed through the upstream ordering block value of 1 in the VCs bit or not value of 0 in the VCs bit. This register is not meant to be a dynamic ability to change inorder/outoforder nature and should be programmed by BIOS before devices are allowed to access memory note that reset value should work without a write. The IDI attaches are not upstream VCs or subject to the Upstream Ordering Block but to keep the handling generic bits will be hardwired to 0 for each IDI attach in the system.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F9F3h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved 0 (RESERVED_0):** Reserved for future VC growth.
15	1h RW	**UPSTREAM_VC15 (UPSTREAM_VC15_IN_ORDER):** Configuration bit for upstream VC15 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
14	1h RW	**UPSTREAM_VC14 (UPSTREAM_VC14_IN_ORDER):** Configuration bit for upstream VC14 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
13	1h RW	**UPSTREAM_VC13 (UPSTREAM_VC13_IN_ORDER):** Configuration bit for upstream VC13 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
12	1h RW	**UPSTREAM_VC12 (UPSTREAM_VC12_IN_ORDER):** Configuration bit for upstream VC12 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW	**UPSTREAM_VC11 (UPSTREAM_VC11_IN_ORDER):** Configuration bit for upstream VC11 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
10	0h RW	**UPSTREAM_VC1BMMU_IN_ORDER (UPSTREAM_VC1BMMU_IN_ORDER):** Configuration bit for upstream VC1Bmmus inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
9	0h RW	**UPSTREAM_VC0BMMU_IN_ORDER (UPSTREAM_VC0BMMU_IN_ORDER):** Configuration bit for upstream VC0Bmmus inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
8	1h RW	**Upstream VC0MMU In Order (UPSTREAM_VC0AMMU_IN_ORDER):** Configuration bit for upstream VC0mmus inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
7	1h RW	**Upstream VCBR In Order (UPSTREAM_VCBR_IN_ORDER):** Configuration bit for upstream VCbrs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
6	1h RW	**Upstream VC2C In Order (UPSTREAM_VC2C_IN_ORDER):** Configuration bit for upstream VC2cs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
5	1h RW	**Upstream VC2B In Order (UPSTREAM_VC2B_IN_ORDER):** Configuration bit for upstream VC2bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
4	1h RW	**Upstream VC2A In Order (UPSTREAM_VC2A_IN_ORDER):** Configuration bit for upstream VC2as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
3	0h RW	**Upstream VC1B In Order (UPSTREAM_VC1B_IN_ORDER):** Configuration bit for upstream VC1bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Upstream VC1A In Order (UPSTREAM_VC1A_IN_ORDER):** Configuration bit for upstream VC1as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
1	1h RW	**Upstream VC0B In Order (UPSTREAM_VC0B_IN_ORDER):** Configuration bit for upstream VC0bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
0	1h RW	**Upstream VC0A In Order (UPSTREAM_VC0A_IN_ORDER):** Configuration bit for upstream VC0as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

5.10.10 IDI0 C2U Credit Control (IDI0_C2U_CREDIT_CTRL_MCHBAR)—Offset 7824h

This register will provide the number of credits that IDI C2U channels should be initialized to and other control mechanisms around IDI start/stop flows. A register will be provided per IDI attach to allow for individual IDI tuning. This register will be for the agent attached to IDI0.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6104h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved 0 (RESERVED_0):** Reserved.
17:12	6h RW	**IDI IA C2U Data Credit Initialization (IDI_IA_C2U_DATA_CREDIT_INIT):** This register is the number of credits to initialize C2U data credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress data queue size in B-Unit. This provides an ability to limit data credits at the next IDI start request change will only take place after the next IDI start request. The default value of this register should work out of reset.

Bit Range	Default & Access	Field Name (ID): Description
11:6	4h RW	**IDI IA C2U Response Credit Initialization (IDI_IA_C2U_RSP_CREDIT_INIT):** This register is the number of credits to initialize C2U response credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U response shim ingress queue size in T-Unit. This provides an ability to limit response credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.
5:0	4h RW	**IDI IA C2U Request Credit Initialization (IDI_IA_C2U_REQ_CREDIT_INIT):** This register is the number of credits to initialize C2U requests credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress queue size in Badmit. This provides an ability to limit request credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.

5.10.11 IDI1 C2U Credit Control (IDI1_C2U_CREDIT_CTRL_MCHBAR)—Offset 7828h

This register will provide the number of credits that IDI C2U channels should be initialized to and other control mechanisms around IDI start/stop flows. A register will be provided per IDI attach to allow for individual IDI tuning. This register will be for the agent attached to IDI1.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6104h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved 0 (RESERVED_0):** Reserved
17:12	6h RW	**IDI IA C2U Data Credit Initialization (IDI_IA_C2U_DATA_CREDIT_INIT):** This register is the number of credits to initialize C2U data credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress data queue size in B-Unit. This provides an ability to limit data credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.

Bit Range	Default & Access	Field Name (ID): Description
11:6	4h RW	**IDI IA C2U Response Credit Initialization (IDI_IA_C2U_RSP_CREDIT_INIT):** This bit field contains the number of credits to initialize C2U response credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U response shim ingress queue size in T-Unit. This provides an ability to limit response credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.
5:0	4h RW	**IDI IA C2U Request Credit Initialization (IDI_IA_C2U_REQ_CREDIT_INIT):** This register is the number of credits to initialize C2U requests credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress queue size in Badmit. This provides an ability to limit request credits at the next IDI start request change will only take place after next IDI start request. The default value of this register should work out of reset.

5.10.12 IDI2 C2U Credit Control (IDI2_C2U_CREDIT_CTRL_MCHBAR)—Offset 782Ch

This register will provide the number of credits that IDI C2U channels should be initialized to and other control mechanisms around IDI start / stop flows. A register will be provided per IDI attach to allow for individual IDI tuning. This register will be for the agent attached to IDI2.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A290h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved 0 (RESERVED_0):** Reserved
17:12	Ah RW	**IDI C2U Data Credit Initialization (IDI_C2U_DATA_CREDIT_INIT):** This register is the number of credits to initialize C2U data credits for the IDI attach point associated with this register. 5.10.18 PII2 A2T Credit Control (PII2_A2T_CREDIT_CTRL_MCHBAR)—Offset 7844h

This register will provide the number of credits that the T-Unit will initialize for the A2T credit initialization on PII2.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 808h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved 0 (RESERVED_0):** Reserved.
15:8	8h RW	**PII2 A2T VC0B Credit Initialization (PII2_A2T_VC0B_CREDIT_INIT):** This field is the number of credits to initialize A2T VC0b requests credits. It is not legal to program this field to a value larger than the A2T VC0b FIFO ingress queue size in the UAM block. This provides an ability to limit request credits at the PII2 credit initialization change will only take place at next credit initialization. The default value of this register should work out of reset.

Bit Range	Default & Access	Field Name (ID): Description
7:0	8h RW	**PII2 A2T VC0A Credit Initialization (PII2_A2T_VC0A_CREDIT_INIT):** This field is the number of credits to initialize A2T VC0a requests credits. It is not legal to program this field to a value larger than the A2T VC0a FIFO ingress queue size in the UAM block. This provides an ability to limit request credits at the PII2 credit initialization change will only take place at next credit initialization. The default value of this register should work out of reset.

5.10.19 BIOSWR Control Policy (T_CR_BIOSWR_CP_0_0_0_MCHBAR)—Offset 7848h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C0061010202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**Access Control Policy (ACCESS_CTRL_POL):** The Access Control Policy for this register and the T-Unit Read/write Policy Registers.

5.10.20 BIOSWR Read Access Control (T_CR_BIOSWR_RAC_0_0_0_MCHBAR)—Offset 7850h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 80000C00630D0217h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C00630D0217h RW	**Read Policy (READ_POL):** The Read Policy for the T-Unit Registers.

5.10.21 BIOSWR Write Access Control (T_CR_BIOSWR_WAC_0_0_0_MCHBAR)—Offset 7858h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: C00610C0212h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C00610C0212h RW	**Write Policy (WRITE_POL):** The Write Policy for the T-Unit Registers.

5.10.22 TUnit Pcode/Ucode Write, All Read Control Policy Register (T_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR)—Offset 7860h

TUnit Pcode/Ucode Write, All Read control policy: This register controls the access policy to the Tunit P_U_CODEWR_ALLRD_RAC P_U_CODEWR_ALLRD_WAC

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40001000202h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**ACCESS_CTRL_POL (ACCESS_CTRL_POL):** The Access Control Policy for this register and the Tunit ucode Read/write Policy Registers.

5.10.23 TUnit Pcode/Ucode Read Access Control (T_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR)—Offset 7868h

Pcode/Ucode Write, All Read Read Access Control Policy: This register controls the read access policy to the Tunit P_U_CODEWR_ALLRD

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**READ_POL (READ_POL):** The Read Policy for the Tunit ucode Registers.

5.10.24 TUnit Pcode/Ucode Write Access Control (T_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR)—Offset 7870h

Pcode/Ucode Write, All Read Write Access Control Policy: This register controls the write access policy to the Tunit P_U_CODEWR_ALLRD

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 40801008602h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40801008602h RW	**WRITE_POL (WRITE_POL):** The Write Policy for the Tunit ucode Registers.

5.11 Registers Summary

Table 5-11. Summary of cpgc_t_submap Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4800h	4803h	SAI Control Policy LSB (CPGC2_ACCESS_CONTROL_POLICY_L)—Offset 4800h	61010202h

4AC4h	4AC7h	Rank Address Swizzle (CPGC_SEQ_RANK_ADDR_SWIZZLE)—Offset 4AC4h	FEDCh
4AC8h	4ACBh	Bank Address Swizzle (CPGC_SEQ_BANK_ADDR_SWIZZLE)—Offset 4AC8h	DEB38h
4ACCh	4ACFh	Row Address Swizzle Low (CPGC_SEQ_ROW_ADDR_SWIZZLE_A)—Offset 4ACCh	A418820h
4AD0h	4AD3h	Row Address Swizzle Mid (CPGC_SEQ_ROW_ADDR_SWIZZLE_B)—Offset 4AD0h	16A4A0E6h
4AD4h	4AD7h	Row Address Swizzle High (CPGC_SEQ_ROW_ADDR_SWIZZLE_C)—Offset 4AD4h	2307B9ACh
4AD8h	4ADBh	Row Address XOR (CPGC_SEQ_ROW_ADDR_SWIZZLE_X)—Offset 4AD8h	FFFFFh
4ADCh	4ADFh	Column Address Swizzle Low (CPGC_SEQ_COL_ADDR_SWIZZLE_A)—Offset 4ADCh	65432100h
4AE0h	4AE3h	Column Address Swizzle High (CPGC_SEQ_COL_ADDR_SWIZZLE_B)—Offset 4AE0h	87h
4AE8h	4AEBh	DQ Inversion Lookup Data Low (CPGC_SEQ_ROW_ADDR_DQ_MAP0)—Offset 4AE8h	0h
4AECh	4AEFh	DQ Inversion Lookup Data High (CPGC_SEQ_ROW_ADDR_DQ_MAP1)—Offset 4AECh	0h

5.11.1 SAI Control Policy LSB (CPGC2_ACCESS_CONTROL_POLICY_L)—Offset 4800h

Lower half of the SAI Control Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 61010202h

Bit Range	Default & Access	Field Name (ID): Description
31:0	61010202h RW	**Access Control Policy LSB (Control_Policy_L):** Lower half of the SAI Control Policy Value [31:0].

5.11.2 SAI Control Policy MSB (CPGC2_ACCESS_CONTROL_POLICY_H)—Offset 4804h

Upper half of the SAI Control Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	C00h RW	**Access Control Policy MSB (Control_Policy_H):** Upper half of the SAI Control Policy Value [63:32].

5.11.3 SAI Read Policy LSB (CPGC2_ACCESS_READ_POLICY_L)—Offset 4808h

Lower half of the SAI Read Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFF3Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFF3Fh RW	**Access Read Policy LSB (Read_Policy_L):** Lower half of the SAI Read Policy Value [31:0].

5.11.4 SAI Read Policy MSB (CPGC2_ACCESS_READ_POLICY_H)—Offset 480Ch

Upper half of the SAI Read Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1371FFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	1371FFFh RW	**Access Read Policy MSB (Read_Policy_H):** Upper half of the SAI Read Policy Value [63:32].

5.11.5 SAI Write Policy LSB (CPGC2_ACCESS_WRITE_POLICY_L)—Offset 4810h

Lower half of the SAI Write Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000212h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1000212h RW	**Access Write Policy LSB (Write_Policy_L):** Lower half of the SAI Write Policy Value [31:0].

5.11.6 SAI Write Policy MSB (CPGC2_ACCESS_WRITE_POLICY_H)—Offset 4814h

Upper half of the SAI Write Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	C00h RW	**Access Write Policy MSB (Write_Policy_H):** Upper half of the SAI Write Policy Value [63:32].

5.11.7 Address Decode Repeats (CPGC2_ADDRESS_CONTROL)—Offset 4818h

If Algorithm_Address_#.Bits(6:6) is set to 1, then Address Decode is enabled.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5:0	0h RW	**Address Decode Repeats (Address_Decode_Rotate_Repeats):** Number of times the current Address_Instruction will repeat if Address_Decode_Enable is set (as N-1) (0=1 time). If for the current Address_Instruction, Address_Decode_Enable is set, then at the start of that Address_Instruction, initialize the XOR_Address_Pattern to a single 1 in the LSB of Column Address. Otherwise, it is initialized to all zero's. For (Address_Decode_Rotate_Repeat_Current = 0; Current_ Address_Decode_Rotate_Repeat_Current <= Address_Decode_Rotate_Repeat; Address_Decode_Rotate_Repeat_Current ++) Execute the entire Algorithm (Block Traversal, Algorithm_Instruction, Commands) with the following behavior: At the end of each complete Block Traversal, rotate the XOR Address Pattern 1 bit position from LSB to MSB (Column through Region_Bits_Column, Region_Bits_Row, Region_Num_Banks, and through Region_Num_Ranks). Region_Size.Num_Bank and Region_Size.Num_Rank numbers are converted to the equivalent number of adddress bits to cover their range (ceil(log2(Num+1))) and should be programmed to a power of 2 value (minus 1): 1,3,7, or 15. If only one Rank is being tested, then you should limit the amount in this register to the sum of the number of address bits without Rank bits.

5.11.8 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[0])—Offset 481Ch

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.11.9 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[1])—Offset 481Dh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.11.10 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[2])—Offset 481Eh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.11.11 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[3])—Offset 481Fh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.11.12 Data Instruction (CPGC2_DATA_INSTRUCTION[0])—Offset 4820h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.11.13 Data Instruction (CPGC2_DATA_INSTRUCTION[1])—Offset 4821h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.11.14 Data Instruction (CPGC2_DATA_INSTRUCTION[2])—Offset 4822h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.11.15 Data Instruction (CPGC2_DATA_INSTRUCTION[3])—Offset 4823h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.11.16 Data Rotation Repeats (CPGC2_DATA_CONTROL)—Offset 4824h

Number of times an enabled Data_Instruction will be repeated.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Data Rotation Repeats (Data_Select_Rotation_Repeats):** Any Data_Instruction with Data_Select_Rotation_Enable will repeat this many times. As N-1. (0=1 time)

5.11.17 Address and Data Repeats Status (CPGC2_ADDRESS_DATA_STATUS)—Offset 4828h

Current number of remaining repeats for Data and Address Repeats loops.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RO/V	**Current Remaining Data Rotation Loops (Data_Select_Rotation_Repeats_Current):** Current state of Data_Select_Rotation_Repeats loop (down count).
15:6	0h RO	Reserved.
5:0	0h RO/V	**Current Remaining Address Decode Loops (Address_Decode_Rotate_Repeats_Current):** Current state of Address_Decode_Rotate_Repeats loop (down count).

5.11.18 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[0])—Offset 482Ch

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.19 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[1])—Offset 482Dh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.20 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[2])—Offset 482Eh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.21 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[3])—Offset 482Fh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.22 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[4])—Offset 4830h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.23 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[5])—Offset 4831h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.24 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[6])—Offset 4832h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.25 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[7])—Offset 4833h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.11.26 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[0])—Offset 4834h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgement must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset tzero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. If Wait_Count_Start = 1 then the start of the Algorithm_Instruction is stalled until the Wait_Time_Current is equal to the Wait_Time. Wait_Time_Current represent the current count value from when it was last reset either by a Test starting or Wait_Count_Clear. Wait_Time_Current is a free running counter that accurately reflects the time from when it was last reset by using the following formula. Time elapsed = Wait_Timer_Current * (1/(frequency selected by Count_Value_Frequency). If Wait_Count_Clear = 1 then prior to starting the current Algorithm_Instruction, Wait_Time_Current is reset tzero. Wait_Time_Current is frozen if a Test encounters any stop condition. Wait_Time_Current is reset to zer0 when a test starts (Start_Test is asserted). Wait_Time_Current rolls over at the maximum value back tzero. Wait_Clock_Frequency(1:0) set the frequency that increment Current_Repeat_Value. The possible frequencies that can be selected are the following. Wait_Clock_Frequency = 00 = 1GHz (time = 1ns). Wait_Clock_Frequency = 01 = 1MHZ (time = 1us). Wait_Clock_Frequency = 10 = 1KHZ (time = 1ms). Wait_Clock_Frequence = 11 = DUNIT clock.
2	0h RW	**Wait Count Clear (Wait_Count_Clear):** Reset the Wait Timer at the start of this Algorithm Instruction.
1	0h RW	**Base Range Row (Base_Range_Row):** Instead of using the Base_Repeats setting, use Base_Col_Repeats setting for the size of the block for this instruction as the size of the block. This may be used for a rapid short test hitting all banks to open pages etc, or to initialize a row worth of data.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**FastY Init (FastY_Init):** FastY_Init is used to allow a background write initialization type algorithm to use FastY with Columns as the LSB address field to ensure the fastest initialization possible. ^(wD1) is a the most typical background Init function. MEMTEL uses the keyword INIT() to reference this feature. FastY_Init enables the current Algortihm_Instruction to override the current Address_Instruction[].Address_Direction and Address_Order. If set, then use the Address_Direction=000 (FastY) and Address_Order=000 (Rank, Bank, Row/Col), else use the settings defined in the current Address_Instruction.

5.11.27 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[1])—Offset 4835h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgement must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset tzero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. 3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. If Wait_Count_Start = 1 then the start of the Algorithm_Instruction is stalled until the Wait_Time_Current is equal to the Wait_Time. Wait_Time_Current represent the current count value from when it was last reset either by a Test starting or Wait_Count_Clear. Wait_Time_Current is a free running counter that accurately reflects the time from when it was last reset by using the following formula. Time elapsed = Wait_Timer_Current * (1/(frequency selected by Count_Value_Frequency). If Wait_Count_Clear = 1 then prior to starting the current Algorithm_Instruction, Wait_Time_Current is reset tzero. Wait_Time_Current is frozen if a Test encounters any stop condition. Wait_Time_Current is reset to zer0 when a test starts (Start_Test is asserted). Wait_Time_Current rolls over at the maximum value back tzero. Wait_Clock_Frequency(1:0) set the frequency that increment Current_Repeat_Value. The possible frequencies that can be selected are the following. Wait_Clock_Frequency = 00 = 1GHz (time = 1ns). Wait_Clock_Frequency = 01 = 1MHZ (time = 1us). Wait_Clock_Frequency = 10 = 1KHZ (time = 1ms). Wait_Clock_Frequence = 11 = DUNIT clock.
2	0h RW	**Wait Count Clear (Wait_Count_Clear):** Reset the Wait Timer at the start of this Algorithm Instruction.
1	0h RW	**Base Range Row (Base_Range_Row):** Instead of using the Base_Repeats setting, use Base_Col_Repeats setting for the size of the block for this instruction as the size of the block. This may be used for a rapid short test hitting all banks to open pages etc, or to initialize a row worth of data.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**FastY Init (FastY_Init):** FastY_Init is used to allow a background write initialization type algorithm to use FastY with Columns as the LSB address field to ensure the fastest initialization possible. ^(wD1) is a the most typical background Init function. MEMTEL uses the keyword INIT() to reference this feature. FastY_Init enables the current Algortihm_Instruction to override the current Address_Instruction[].Address_Direction and Address_Order. If set, then use the Address_Direction=000 (FastY) and Address_Order=000 (Rank, Bank, Row/Col), else use the settings defined in the current Address_Instruction.

5.11.32 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[6])—Offset 483Ah

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgement must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset tzero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. 5.11.34 Wait Timer Current (CPGC2_ALGORITHM_WAIT_COUNT_CURRENT)—Offset 483Ch

Current wait timer value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**Current Wait Timer (Wait_Timer_Current):** Current wait timer value. See Wait_Time description. (down count)

5.11.35 Algorithm Wait Event Control (CPGC2_ALGORITHM_WAIT_EVENT_CONTROL)—Offset 4840h

Algorithm wait event control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Select Event (Select_Event):** Select_Event is decoded in the following ways. Select_Event = 00 = Read/Write Pending CAS cue is empty Select_Event = 01 = CKE Power Down Select_Event = 10 = Refresh Select_Event = 11 = Self Refresh
29:26	0h RO	Reserved.
25:24	0h RW	**Wait Clock Frequency (Wait_Clock_Frequency):** 00 - 1GHz 01 - 1MHz 10 - 1KHz 11 - Native DUNIT clock
23:20	0h RW	**Select Event Hold Timer (Timer):** Exponential timer (timer value calculated as 2^Timer). If WaitEventStart is set in the currently executing Algorithm Instruction, this timer dynamically replaces the current Wait_Time counter following the Select_Event occurring (such as SelfRefresh or PowerDown) , to add a fixed delay for the Select_Event condition to remain before CPGC activity resumes.
19:16	0h RO	Reserved.
15:0	0h RW	**Wait Time (Wait_Time):** Number of clocks at Wait_Clock_Frequency to wait before starting current Algorithm_Instruction if Wait_Start = 1.

5.11.36 Base Repeats (CPGC2_BASE_REPEATS)—Offset 4844h

Base Address Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Repeats (Base_Repeats):** Base Address Loopcount - Typically the number of Base Addresses within the Block (Row*Col*Bank*Rank) As N-1 value. This is the number of times the current Algorithm Instruction will be executed.

5.11.37 Current Base Repeats (CPGC2_BASE_REPEATS_CURRENT)—Offset 4848h

Current Base Address Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Base Loops (Base_Repeats_Current):** Current remaining Base Address loops (down count).

5.11.38 Base Column Repeats (CPGC2_BASE_COL_REPEATS)—Offset 484Ch

Base Address Loopcount - Alternate.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Column Repeats (Base_Col_Repeats):** Alternate Base_Address_Loopcount. Often used to initialze a Row or Column worth of data. This is used when Base_Range_Row field of ALGORITHM_INSTRUCTION_CTL is activated. This is the number of times the current Algorithm Instruction will be executed.

5.11.39 Block Repeats (CPGC2_BLOCK_REPEATS)—Offset 4850h

Block Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Block Repeats (Block_Repeats):** Block Loopcount. Typically the number of Blocks to be tested to traverse the entire Tested Region. (2^region_size/2^block_size -1) As N-1 value. This is the number of times the entire list of Algorithm Instructions will be executed.

5.11.40 Current Block Repeats (CPGC2_BLOCK_REPEATS_CURRENT)—Offset 4854h

Current Block Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Block Loops (Block_Repeats_Current):** Current Block Loopcount (down count).

5.11.41 Command Instruction (CPGC2_COMMAND_INSTRUCTION[0])—Offset 4858h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.42 Command Instruction (CPGC2_COMMAND_INSTRUCTION[1])—Offset 4859h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.43 Command Instruction (CPGC2_COMMAND_INSTRUCTION[2])—Offset 485Ah

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.44 Command Instruction (CPGC2_COMMAND_INSTRUCTION[3])—Offset 485Bh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.45 Command Instruction (CPGC2_COMMAND_INSTRUCTION[4])—Offset 485Ch

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.46 Command Instruction (CPGC2_COMMAND_INSTRUCTION[5])—Offset 485Dh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.47 Command Instruction (CPGC2_COMMAND_INSTRUCTION[6])—Offset 485Eh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.48 Command Instruction (CPGC2_COMMAND_INSTRUCTION[7])—Offset 485Fh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.49 Command Instruction (CPGC2_COMMAND_INSTRUCTION[8])—Offset 4860h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.50 Command Instruction (CPGC2_COMMAND_INSTRUCTION[9])—Offset 4861h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.51 Command Instruction (CPGC2_COMMAND_INSTRUCTION[10])—Offset 4862h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.52 Command Instruction (CPGC2_COMMAND_INSTRUCTION[11])—Offset 4863h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.53 Command Instruction (CPGC2_COMMAND_INSTRUCTION[12])—Offset 4864h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.54 Command Instruction (CPGC2_COMMAND_INSTRUCTION[13])—Offset 4865h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.55 Command Instruction (CPGC2_COMMAND_INSTRUCTION[14])—Offset 4866h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.56 Command Instruction (CPGC2_COMMAND_INSTRUCTION[15])—Offset 4867h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.57 Command Instruction (CPGC2_COMMAND_INSTRUCTION[16])—Offset 4868h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.58 Command Instruction (CPGC2_COMMAND_INSTRUCTION[17])—Offset 4869h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.59 Command Instruction (CPGC2_COMMAND_INSTRUCTION[18])—Offset 486Ah

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.60 Command Instruction (CPGC2_COMMAND_INSTRUCTION[19])—Offset 486Bh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.61 Command Instruction (CPGC2_COMMAND_INSTRUCTION[20])—Offset 486Ch

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.62 Command Instruction (CPGC2_COMMAND_INSTRUCTION[21])—Offset 486Dh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.63 Command Instruction (CPGC2_COMMAND_INSTRUCTION[22])—Offset 486Eh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.64 Command Instruction (CPGC2_COMMAND_INSTRUCTION[23])—Offset 486Fh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.11.65 Hammer Repeats (CPGC2_HAMMER_REPEATS)—Offset 4870h

Hammer Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Hammer Repeats (Hammer_Repeats):** Hammer_Repeats is the number of times any command is repeated at the same address when the Hammer control bit is set in the Command_Instruction (if not an offset command).

5.11.66 Current Hammer Repeats (CPGC2_HAMMER_REPEATS_CURRENT)—Offset 4874h

Current Hammer Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Hammer Repeats (Hammer_Repeats_Current):** Current Hammer Loopcount (down count).

5.11.67 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[0])—Offset 4878h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.68 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[1])—Offset 4879h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.69 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[2])—Offset 487Ah

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.70 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[3])—Offset 487Bh

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.71 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[4])—Offset 487Ch

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.76 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[9])—Offset 4881h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.77 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[10])—Offset 4882h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.78 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[11])—Offset 4883h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.79 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[12])—Offset 4884h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.80 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[13])—Offset 4885h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.81 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[14])—Offset 4886h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.82 Offset Address Instruction (CPGC2_OFFSET_ADDRESS_INSTRUCTION[15])—Offset 4887h

Offset Address Direction Instructions. Note that these registers are grouped as two sets of 8 Offset_Address registers and their associated set of 6 Offset_Command registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][7:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Address Instruction (Last):** Last Offset_Address_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[7] and Offset_Address_Instruction[15] have this bit set implicitly.
6	0h RW	**Stripe Enable (Stripe):** Normal Offsets use Address_Order=110. This allows full traversal of the entire Block by and offset. If Stripe is active, then there is no carry between Row and Column. This will keep the offset address within the same Row, or the same Column or on the same diagonal.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX East** Increment Row and Carry Increment into Column. **(1)(10) Inv(FastX) - West** Decrement Row and Carry Decrement into Column. **(0)(11) Diagonal2 - South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(11) Inv(Diagonal2) North West** Increment Column and Decrement Row and Carry Decrement Column into Row. Offset accesses begin one 'step' in the given direction from the current Base_Address.
2	0h RW	**Periodic Data Inversion Enable (Periodic_Data_Inv_En):** Enabled periodic data inversion - based on Address_Direction (OrderX field) -normally invert every 2^Block_Size_Bits_Row/Col, modified based on Periodic_Data_Inversion_Adjustment.
1:0	0h RW	**Periodic Data Inversion Adjustment (Periodic_Data_Inv_Adj):** Reduce or increase the inversion interval by -1,0,1 based on the value in this field. 00 - no adjust 01 - interval is increased by 1 11 - interval is decreased by 1 10 - reserved

5.11.83 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[0])—Offset 4888h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.84 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[1])—Offset 4889h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.85 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[2])—Offset 488Ah

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.86 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[3])—Offset 488Bh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.87 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[4])—Offset 488Ch

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.88 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[5])—Offset 488Dh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.89 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[6])—Offset 488Eh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.90 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[7])—Offset 488Fh

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.91 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[8])—Offset 4890h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.92 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[9])—Offset 4891h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.93 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[10])—Offset 4892h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.94 Offset Command Instruction (CPGC2_OFFSET_COMMAND_INSTRUCTION[11])—Offset 4893h

Offset Command Instructions. Note that these registers are grouped as two sets of 6 Offset_Command registers and their associated set of 8 Offset_Address registers. Thus we have two Offset_Groups. Selected by Command_Instruction.Offset_Group bit. i.e. an array [1:0][5:0].

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Offset Command Instruction. (Last):** Last Offset_Command_Instruction. The offset instruction is complete after all Offset_Address, Offset_Repeats, and Offset_Commands have finished. Offset_Address_Instruction[5] and Offset_Address_Instruction[11] have this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Offset_Command_Instruction. Combine the Data_Instruction Invert_Data field, the Algorithm_Instruction Invert_Data field, Command_Instruction Invert_Data field and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RO	Reserved.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Offset command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Access Enable (Offset):** 1=Normal Offset Command/ Address, 0=Use Base Address and Offset_Command_Instruction Write bit.
1	0h RO	Reserved.
0	0h RW	**Write Command (Write):** A Write operation will be performed at the Offset (or Base if the Offset field = 0) Address.

5.11.95 Offset Repeats (CPGC2_OFFSET_REPEATS[0])—Offset 4894h

Set the loopcount for Offset (Distance from Base). Selected by Command_Instruction.Offset_Group bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Offset Repeats (Offset_Repeats):** Set the loopcount for Offset (Distance from Base). The entire list of Offset Commands are executed for each loop.

5.11.96 Offset Repeats (CPGC2_OFFSET_REPEATS[1])—Offset 4898h

Set the loopcount for Offset (Distance from Base). Selected by Command_Instruction.Offset_Group bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Offset Repeats (Offset_Repeats):** Set the loopcount for Offset (Distance from Base). The entire list of Offset Commands are executed for each loop.

5.11.97 Current Offset Repeats (CPGC2_OFFSET_REPEATS_CURRENT)—Offset 489Ch

Current Offset Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Offset Repeats (Offset_Repeats_Current):** Current Offset Loopcount (down count).

5.11.98 Region Low Row Address (CPGC2_REGION_LOW_ROW)—Offset 48A0h

Region low row address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RW	**Low Row (Low_Row):** Set the bottom Row for the physical memory being tested. This value is added to all Region Row Addresses computed.

5.11.99 Region Low Col Address (CPGC2_REGION_LOW_COL)—Offset 48A4h

Region low column address.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10:2	0h RW	**Low Column (Low_Col):** Set the lowest Column for the physical memory being tested. This value is added to all Region Column Addresses computed.
1:0	0h RO	Reserved.

5.11.100 Block Low Row Current (CPGC2_BLOCK_ORIGIN_ROW_CURRENT)—Offset 48A8h

Block low row current.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Block Origin Row (Block_Origin_Row_Current):** Current row within the testing region of memory Updated as the block traverses through the region.

5.11.101 Current Base Address Rank and Column (CPGC2_BASE_ADDRESS_COL_RANK_CURRENT)—Offset 48ACh

Current Base Address both Rank and Column.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:16	0h RO/V	**Current Rank Base Address (Base_Rank_Current):** Current Base Address Rank within the block.
15:11	0h RO	Reserved.
10:2	0h RO/V	**Current Column Base Address (Base_Col_Current):** Current Base Address Column within the block.
1:0	0h RO	Reserved.

5.11.102 Current Base Address Bank and Row (CPGC2_BASE_ADDRESS_ROW_BANK_CURRENT)—Offset 48B0h

Current Base Address both Bank and Row.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RO/V	**Current Bank Base Address (Base_Bank_Current):** Current Base Address Bank within the block.
23:18	0h RO	Reserved.
17:0	0h RO/V	**Current Row Base Address (Base_Row_Current):** Current Base Address Row within the block.

5.11.103 Current Offset Address Column (CPGC2_OFFSET_ADDRESS_COL_CURRENT)—Offset 48B4h

Current Offset Address - Column

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10:2	0h RO/V	**Current Column Offset Address (Offset_Col_Current):** Current Offset Address Column within the block. Only valid if the current Command_Instruction pointed to by Command_Instruction_Current is an Offset command.
1:0	0h RO	Reserved.

5.11.104 Current Offset Address Row (CPGC2_OFFSET_ADDRESS_ROW_CURRENT)—Offset 48B8h

Current Offset Address - Row

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Row Offset Address (Offset_Row_Current):** Current Offset Address Row within the block. Only valid if the current Command_Instruction pointed to by Command_Instruction_Current is an Offset command.

5.11.105 Address Size (CPGC2_ADDRESS_SIZE)—Offset 48BCh

Set the size of the Region and Block.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:24	0h RW	**Region Row Size (Region_Size_Bits_Row):** 2^Region_Size_Bits_Row is the number of rows in the testing region. Must be >= to Block_Size_Bits_Row.
23:20	0h RW	**Region Column Size (Region_Size_Bits_Col):** 2^Region_Size_Bits_Col is the number of columns in the testing region. It is also used as the Block_Size_Bits_Col value to set the size of the block. Minimum value is 1 if Address_Decode_Enable =1. , so this normally needs to be set to the number of Column bits of the memory.
19:16	0h RW	**Block Ranks Size (Block_Size_Num_Ranks):** Number of Ranks to test for a Block (as N-1 = top rank number). All Rank Addresses go through the Rank Address Lookup table.
15:12	0h RW	**Block Banks Size (Block_Size_Num_Banks):** Number of Banks to test for a Block (as N-1 = top bank number). All Bank Address values go through the Bank Address Lookup table.
11:9	0h RO	Reserved.
8:4	0h RW	**Block Row Size (Block_Size_Bits_Row):** 2^Block_Size_Bits_Row is the number of rows for a Block. If block traversal is used, then this must be at least 4 rows (=2). Minimum value is 1 if Address_Decode_Enable =1.
3:0	0h RW	**Block Column Size (Block_Size_Bits_Col):** Reserved for use as Block_Size_Bits_Col - Fixed as same as Region_Size_Bits_Col for the SoC. There is no column traversal of a block.

5.11.106 Base Address Control (CPGC2_BASE_ADDRESS_CONTROL)—Offset 48C0h

Control handling of Base Address - inversion and increment rates and increment amounts.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26	0h RW	**Address Inversion Rate (Address_Inversion_Rate):** Address_Inversion_Rate determines if the enabled Address Fields toggle inversion on the Command Sequence Boundary (following a Command_Instruction with the Last bit set) or every Command_Instruction. 0 Invert enabled Address fields after executing the Command_Instruction with the Last bit set. 1 Invert enabled Address fields following each Command_Instruction
25:22	0h RW	**Address Inversion Enable (Address_Inversion_Enable):** Address_Inversion_Enable enables particular Address Fields to be inverted. [25] Rank_Inversion_Enable. [24] Bank_Inversion_Enable. [23] Row_Inversion_Enable. [22] Col_Inversion_Enable.
21	0h RW	**Address Increment Rate (Address_Order0_Inc_Rate):** Address_Order0_Inc_Rate determines if the Address Order 0 Field is incremented on the Command Sequence Boundary (following a Command_Instruction with the Last bit set) or every Command_Instruction. 0 Increment Address after executing the Command_Instruction with the Last bit set. 1 Increment Address following each Command_Instruction.
20:18	0h RO/V	**Rank Increment (Fixed) (Reserved_Rank_Inc):** All Base Rank addresses are incremented (or decremented) by 2^Rank_Inc (unsigned value).
17:15	0h RO/V	**Bank Increment (Fixed) (Reserved_Bank_Inc):** All Base Bank addresses are incremented (or decremented) by 2^Bank_Inc (unsigned value).
14:11	0h RW	**Column Increment (Col_Inc):** All Base and Offset Column addresses are incremented (or decremented) by 2^Col_Inc (unsigned value).

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	Reserved.
9:6	0h RW	**Row Increment (Row_Inc):** All Base and Offset Row addresses are incremented (or decremented) by 2^Row_Inc (unsigned value).
5	0h RW	**Block Move Half Block (Block_Move_Half_Block):** if Block_Move_One_Row =1 then the Block is moved by 1 row Else if Block_Move_Half_Bock = 1 then the Block is moved by 2^(Block_Size_Bits_Row)/2 Rows Else the Block is moved by = 2^(Row_Block_Size).
4	0h RW	**Block Move One Row (Block_Move_One_Row):** See Block_Move_Half_Block for description.
3:0	0h RO	Reserved.

5.11.107 Address PRBS Control (CPGC2_ADDRESS_PRBS_CONTROL)—Offset 48C4h

Control PRBS Address generator.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	Reserved.
25	0h RW	**Address_PRBS_High Row map enable (Address_PRBS_High_Row):** The higher order bits of the PRBS Address Generator (bits 3 through Address_PRBS_Size-1) will be on the same Row bits when the PRBS Address is selected.
24	0h RW	**Address_PRBS_High Column map enable (Address_PRBS_High_Col):** The higher order bits of the PRBS Address Generator (bits 3 through Address_PRBS_Size-1) will be on the same Column bits when the PRBS Address is selected.
23:18	0h RO	Reserved.
17	0h RW	**Address_PRBS_Mid Row map enable (Address_PRBS_Mid_Row):** Bits [2:1] of the Row address will be bits [2:1] of the PRBS Address Generator when the PRBS Address is selected.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Address_PRBS_Mid Column map enable (Address_PRBS_Mid_Col):** Bits [2:1] of the Column address will be bits [2:1] of the PRBS Address Generator when the PRBS Address is selected.
15:10	0h RO	Reserved.
9	0h RW	**Address_PRBS_Low Row map enable (Address_PRBS_Low_Row):** LSB of Row address will be the LSB of the PRBS Address Generator when the PRBS Address is selected.
8	0h RW	**Address_PRBS_Low Column map enable (Address_PRBS_Low_Col):** LSB of Column address will be the LSB of the PRBS Address Generator when the PRBS Address is selected.
7	0h RW	**Address PRBS Enable (Address_PRBS_Enable):** If Address_PRBS_Enable is active, and Address_Decode_Enable is not active in the current Address_Instruction, thenn each command is enabled to use the PRBS address if the Address_Decode_or_PRBS_En bit is set.
6:4	0h RO	Reserved.
3:0	0h RW	**Address PRBS Size (Address_PRBS_Size):** Size of PRBS for address generation if Address_PRBS_Enable is active. See text for PRBS Polynomials being used for each setting.

5.11.108 Address PRBS Seed (CPGC2_ADDRESS_PRBS_SEED)—Offset 48C8h

Seed for Address PRBS generator.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RW	**Address PRBS Seed (Address_PRBS_Seed):** Seed for Address PRBS generator.

5.11.109 Current Address PRBS Status (CPGC2_ADDRESS_PRBS_CURRENT)—Offset 48CCh

Current value of Address PRBS generator.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Current Address PRBS (Address_PRBS_Current):** Current value of Address PRBS generator. Address advances as Address_Order0_Inc_Rate. The Seed is re-loaded (from Save) at each Algorithm_Instruction boundary.

5.11.110 Address PRBS Save (CPGC2_ADDRESS_PRBS_SAVE)—Offset 48D0h

Currently saved Address PRBS seed.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:0	0h RO/V	**Address PRBS Save (Address_PRBS_Save):** Saved value of Address PRBS generator. Value is saved automatically during block advance, and restored (from Seed) when Block Traversal (Repeats) is complete.

5.11.111 Command FSM Current State (CPGC2_CMD_FSM_CURRENT)—Offset 48D4h

Current state of Command FSM - used at stop-on-error to determine the current progress in the test at the time of the error.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:28	0h RO/V	**Address Instuction Pointer (Address_Instruction_Current):** Current Address_Instruction pointer.
27:26	0h RO	Reserved.
25:24	0h RO/V	**Data Instruction Pointer (Data_Instruction_Current):** Current Data_Instruction pointer.
23:18	0h RO	Reserved.
17:15	0h RO/V	**Algorithm Instruction Pointer (Algorithm_Instruction_Current):** Current Algorithm_Instruction pointer.
14:13	0h RO	Reserved.
12:8	0h RO/V	**Command Instruction Pointer (Command_Instruction_Current):** Current Command_Instruction pointer.
7	0h RO	Reserved.
6	0h RO/V	**Offset Group Select Pointer (Offset_Group_Instruction_Current):** Current Offset_Group as pointed to by the Current Command_Instruction (if an Offset instruction).
5:3	0h RO/V	**Offset Address Instruction Pointer (Offset_Address_Instruction_Current):** Current Offset_Address_Instruction pointer.
2:0	0h RO/V	**Offset Command Instruction Pointer (Offset_Command_Instruction_Current):** Current Offset_Command_Instruction pointer.

5.11.112 Algorithm Wait Timer Configuration (CPGC2_WAIT_2_START_CONFIG)—Offset 48D8h

Configure the timebase for the Algorithm Wait Timer.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Increment value (Increment_Value):** See Prescaler field for information on this field.

Bit Range	Default & Access	Field Name (ID): Description
27:26	0h RO	Reserved.
25:16	0h RW	**Clock Frequency (Clock_Freq):** When a setting of 1MHz or 1KHz is used in Wait_Clock_Frequency, this field provides a way to tell the hardware the native Memory Controller clock frequency, which is fed into the Prescaler automatically (with a 1 Increment_Value also automatically fed into the counter).
15:10	0h RO	Reserved.
9:0	0h RW	**Prescaler (Prescaler_for_Clock_Freq):** In order to make the 'standard' 1 GHz clock for the CPGC specified Wait_Clock_Frequency setting, we need to provide a pre-scaler, and Increment Value to modify the existing Wait_Timer_Current advancement. This field will divide the native Memory Controller clock by the provided value, with '1' being 'No Divide'. After that divide, the Wait_Timer_Current will advance by the 'Increment_Value' field. In this way, we are creating a clock ratio able to 'multiply' the native Memory Controller clock by 'Increment_Value/Prescaler'. For small values of Wait_Time, the error will be substantial, and it may be better to modify the programming to the '11' Native Clock setting and manually compute the required Wait_Time for the desired delay.

5.11.113 VISA Mux Selection (CPGC2_VISA_MUX_SEL)—Offset 48DCh

Selection for VISA mux controls.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:13	0h RW	**Error Group 1 (Err1_grp_Sel):** Err Group 1 Select.
12:11	0h RW	**Error Group 0 (Err0_grp_Sel):** Err Group 0 Select.
10:9	0h RW	**DPAT Group 1 (Dpat1_grp_Sel):** Dpat Group 1 Select.
8:7	0h RW	**DPAT Group 0 (Dpat0_grp_Sel):** Dpat Group 0 Select.
6:5	0h RW	**Command Group 1 (Cmd1_grp_Sel):** Cmd Group 1 Select.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW	**Command Group 0 (Cmd0_grp_Sel):** Cmd Group 0 Select.
2	0h RW	**Error-Command (Err1_or_Cmd1):** Err group 1 or Cmd group 1 select.
1	0h RW	**Command-DPAT (Cmd0_or_Dpat1):** Cmd group 0 or Dpat group 1 select.
0	0h RW	**DPAT-Error (Dpat0_or_Err0):** Dpat group 0 or Err group 0 select.

5.11.114 Loopback Squencer Configuration (CPGC_LB_SEQ_CFG)—Offset 48E0h

Loopback Sequencer Config.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Start Test Delay (START_TEST_DELAY):** Start_Test_Delay is the delay period (in byte clocks) to execute a test(i.e transition to Loopback.Pattern) after the link is in Loopback.Idle and Local_Start_Test is asserted. If Local_Start_Test is set upon the initial entry to Loopback.Idle then a test (entry to Loopback.Pattern) will immediately start after Start_Test_Delay number of byte clocks is enforced. During Start_Test_test the Valid must not be asserted (i.e Loopback.PM) and no comparison of data will be taking place. Start_Test_Delay=0 is reserved and not allowed. Start_Test_Delay=1 will result in a 1byte clock delay. Start_Test_Delay=2 will result in a 2byte clock delay.
23:21	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:16	0h RW	**Loopcount (LOOPCOUNT):** 2^(Loopcount) determines the length of a test. One Loopcount consists of Pattern_Length followed by PM_Length. Pattern_Length corresponds to the Loopback Master generating patterns and the Loopback.Slave and/or Loopback Master performing error checking occueeing (valid is assered). PM_Length corresponds to the functional power savings mode (valid is not asserted). Loopcount=0 means the test is infinite. Loopcount=1 means the test will end after two loops. Loopcount=2 means the test will end after four loops. Loopcount=3 means the test will end after eight loops.
15:8	0h RW	**PM Length (PM_LENGTH):** PM_Length(i.e Loopback.PM) forms the second half of the loopcount sequence with Pattern_Length (i.e Loopback.Pattern)forming the first half. PM_Length is used in conjection with Pattern_Length and Loopcount to go in and out of Power Savings Modes in an identical way to how the functional power saving mode behave. This includes post amble, pre-amble, etc. PM_Length duration is defined in total # of byte clocks. If PM_Length is set to 0 then no power saving modes will be entered. If the end of the test has not been reached, (Curren_Loopcount !=Loopcount) the loopcount is incremented and the sequence repeats (Pattern_Length followed by PM_Length). If the end of the test has not been reached (Current_Loopcount=Loopcount) the link transitions back to Loopback.Idle following the PM state.
7:0	0h RW	**Pattern Length (PATTERN_LENGTH):** Pattern_Length (i.e Loopback.Pattern) forms the first half of the Loopcount sequence with PM_Length (i.e Loopback.PM) forming the second half. Pattern_Length is the portion of Loopcount when patterns are generated(Loopback Master) and compared (Loopback Master and optionally the Loopback Slave). Pattern_Length suration is defined in total # of byte clocks. A zero value is illegal. The Sum of Pattern_Length and PM_Length (Duration of a Loopcount)must always be set to a value of two or more.

5.11.115 Loopback Sequencer Control (CPGC_LB_SEQ_CTL)—Offset 48E4h

Loopback sequencer control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:12	0h RW	**Initialization Mode (INITIALIZATION_MODE):** A change to Initialization_Mode occurs immediately. 00 - OFF - REUT is clock gated. 01 - LSM Mode - Enter Loopback.Idle state through the appropriate Link Layer bits as a Loopback Master or Loopback Slave. 10 - Force Master - Force entry to Loopback.Idle as a Loopback Master (Supported if Force_Loopback capability is set). 11 - Force Slave - Force entry to Loopback.Idle as Loopback Slave (Supported if Force_Loopback capability is set). Note: A user must be careful to transition both sides of the Link to Loopback.Idle if switching Initialization_Mode from Force Master or Force Slave to LSM Mode or undefined behavior can be expected. Note: Initialization Mode should not be changed while Local_Start_Test is set, or while Test_In_Progress is set.
11:7	0h RO	Reserved.
6	0h RW	**Bind Stop on Error (BIND_STOP_ON_ERROR):** Test will stop based on Global_Error (external input) and Local_Error will drive Global_Error.
5	0h RW	**Bind Clear Errors (BIND_CLEAR_ERRORS):** Local_Clear_Errors will clear all other REUT instances that have this bit set.
4	0h RW	**Bind Stop Test (BIND_STOP_TEST):** Local_Stop_Test will stop all other REUT instances that have this bit set.
3	0h RW	**Bind Start Test (BIND_START_TEST):** Local_Start_Test will start all other REUT instances that have this bit set.
2	0h RW/V	**Local Clear Errors (LOCAL_CLEAR_ERRORS):** Setting Local_Clear_Errors to 1 will immediately clear all local Error registers (i.e. CPGC_ERR_* registers). Local_Clear_Errors will immediately clear to 0 after clearing affected registers. If this bit fails to auto-clear, then there is no clock and the clear will occur at the start of the next test.
1	0h RW/V	**Local Stop Test (LOCAL_STOP_TEST):** If Local_Stop_Test is set to 1 and a Loopback test is in progress (i.e. Test_In_Progress=1) then a transition to Loopback. Idle will occur as soon as possible (i.e. Link enters Loopback.PM). Local_Stop_Test will immediately clear to 0 after stopping a Loopback test (i.e. Local_Stop_Test=0 while in Loopback.Idle).

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Local Start Test (LOCAL_START_TEST):** If Local_Start_Test is set a Sequence will immediately start, or wait until entry to Loopback state. A complete Sequence is defined by the following behavior: 1) An initial delay of Start_Test_Delay byte clocks must first occur in Loopback.PM (with Valid de-asserted). 2) Transition to Loopback.Pattern (Valid asserted) for a duration of Pattern_Length Byte clocks during which data is generated and compared by the Loopback Master and optionally compared by the Loopback Slave. 3) Increment Loopcounter. 4) Optionally Transition to Loopback.PM (with Valid deasserted), if so programmed, for a duration of PM_Length Byte clocks during which power modes are functionally enforced as what would happen normally based on the length of the PM_Length duration. 5) If Current Loopcount !=2^Loopcount then go to step 2. 6) If Current Loopcount !=2^Loopcount then the Link returns to Loopback.Idle, Local_Start_Test is cleared for the Master. Local_Start_Test is not cleared on the Loopback.Slave.

5.11.116 Loopback Loopcount Tx Status (CPGC_LB_SEQ_LOOPCOUNT_TX_STATUS)—Offset 48E8h

Indicates the current TX Loopcount value in the Sequence.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Loopcount (CURRENT_LOOPCOUNT):** Current_Loopcount indicates how many times the full Sequence has been executed in the TX path. Current_Loopcount is cleared by Local_Clear_Errors.

5.11.117 Loopback Loopcount Rx Status (CPGC_LB_SEQ_LOOPCOUNT_RX_STATUS)—Offset 48ECh

Indicates the current RX Loopcount value in the Sequence.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Loopcount (CURRENT_LOOPCOUNT):** Current_Loopcount indicates how many times the full Sequence has been executed in the RX path. Current_Loopcount is cleared by Local_Clear_Errors.

5.11.118 Pattern Length Status (CPGC_LB_SEQ_PL_RX_STATUS)—Offset 48F0h

Indicates how many Bytes are left in Loopback.Pattern.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RO/V	**Current Pattern Length (CURRENT_PATTERN_LENGTH):** Current_Pattern_Length is used in conjuntion with Stop_On_Error_Control conditons to determine where the last failure occurred within Loopback.Pattern. Current_Pattern_Length indicates how many Bytes were left in Loopback.Pattern when the error occurred. Current_Pattern_Length is cleared by Local_Clear_Errors.

5.11.119 Refresh Control (CPGC_MISC_REFRESH_CTL)—Offset 48F4h

CPGC MISC REFRESH CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Panic Refresh Only (PANIC_REFRESH_ONLY):** Reserved
30:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Start Test on RefZQ (REFZQ_EN_START_TEST_SYNC):** Reserved
7:4	0h RO	Reserved.
3:0	0h RW	**Rank Mask of Refresh (REFRESH_RANK_MASK):** Reserved

5.11.120 ZQ Control (CPGC_MISC_ZQ_CTL)—Offset 48F8h

CPGC MISC ZQ CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Always do ZQ (ALWAYS_DO_ZQ):** Reserved
30:2	0h RO	Reserved.
1:0	0h RW	**Rank Mask of ZQ (ZQ_RANK_MASK):** Reserved

5.11.121 ODT Control (CPGC_MISC_ODT_CTL)—Offset 48FCh

CPGC MISC ODT CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDR Training MPR Pattern (MPR_Train_DDR_On):** Reserved
30:18	0h RO	Reserved.
17:16	0h RW	**Rank ODT On (ODT_ON):** Reserved
15:2	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Rank ODT Override (ODT_OVERRIDE):** Reserved

5.11.122 CKE Control (CPGC_MISC_CKE_CTL)—Offset 4900h

CPGC MISC CKE CTL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**Rank CKE On (CKE_ON):** Reserved
15:9	0h RO	Reserved.
8	0h RW	**Start Test on CKE (CKE_EN_START_TEST_SYNC):** Reserved
7:2	0h RO	Reserved.
1:0	0h RW	**Rank CKE Override (CKE_OVERRIDE):** Reserved

5.11.123 Command Rate (CPGC_MISC_CMD_RATE)—Offset 4904h

CPGC CMD_RATE

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100Ah

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MRW uses 2 clocks CS (init_mrw_2n_cs):** Reserved
30:14	0h RO	Reserved.
13:12	1h RW	**CK to CKE delay (ck_to_cke_delay):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	**Reset Delay (reset_delay):** Reserved
7:4	0h RW	**Reset On Command (reset_on_command):** Reserved
3:1	5h RW	**Command Rate Limit (cmd_rate_limit):** Reserved
0	0h RW	**Enable Command Rate Limit (enable_cmd_rate_limit):** Reserved

5.11.124 External Trigger Control (CPGC_MISC_EXT_TRIGGER)—Offset 4908h

CPGC MISC EXT TRIGGER

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**Trigger Out on Test Done (TRIGGER_OUT_ON_TEST_DONE):** Reserved
2	0h RW	**Trigger Out on Error (TRIGGER_OUT_ON_ERROR):** Reserved
1	0h RW	**Trigger Out on Start (TRIGGER_OUT_GLOBAL_START):** Reserved
0	0h RW	**Trigger in to Start (TRIGGER_IN_GLOBAL_START):** Reserved

5.11.125 Sequence Control (CPGC_SEQ_CTL)—Offset 490Ch

Sequence Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RW/V	**Continue Single Step (CONTINUE_SINGLE_MODE):** When in Single_Command_Mode setting this bit will enable a new command to be issued. This bit immediately clears after being set.
8	0h RW	**Single Step/Cmd Mode (SINGLE_CMD_MODE):** Enter Single Command mode were we will issue one command from CPGC and then pause command issuing. This may be resumed by setting Continue_Single_Mode, or normal continuous operation resumed by clearing this bit.
7:3	0h RO	Reserved.
2	0h RW/V	**Clear Errors (CLEAR_ERRORS):** Setting this bit will immediately clear all error registers and error status. This bit will automatically self clear.
1	0h RW/V	**Stop Test (STOP_TEST):** Forces an exit from the tests running on this engine/channel. Note that this will also cause a test stop for all engines with GLB_STOP_BIND set. This bit will self clear.
0	0h RW/V	**Start Test (START_TEST):** Used to initiate a transition to active mode on this engine/channel (note that INIT_MODE has to be programmed first). Note that this will also cause a test start for all engines with GLB_START_BIND set. This bit will self clear.

5.11.126 Sequence Configuration A (CPGC_SEQ_CFG_A)—Offset 4910h

Sequence Configuration Low Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 200000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22	0h RW	**Request Data Size (REQUEST_DATA_SIZE):** Size of requests CPGC is issuing, 64B and 32B transactions and is encoded as follows: 0 - 32 Byte Transactions 1 - 64 Byte Transactions

Bit Range	Default & Access	Field Name (ID): Description
21	1h RW	**CPGC Control (CPGC_CONTROL):** Used to indicate the OPIO(MCDRAM) or CPGC(DDR) mode. 1 - CPGC Mode. 0 - OPIO Mode.
20:15	0h RO	Reserved.
14:12	0h RW	**Initialization Mode (INITIALIZATION_MODE):** 000 - IDLE MODE 001 - ACTIVE MODE 010 - DIRECT MODE 011 - ACTIVE MODE 100 - MRS MODE 101 - ERROR DUMP MODE (Reserved) 110 - WDB FILL MODE (Reserved) 111 - REWIND MODE (Reserved)
11	0h RW	**Bind Stop Test (GLOBAL_STOP_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test stop (both forced and due to a stop condition) for any channel engine with GLOBAL_STOP_BIND set will cause the same action to occur on all engines with GLOBAL_STOP_BIND set. This feature is usually used when synchronization between multiple engines/ channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
10	0h RW	**Bind Start Test (GLOBAL_START_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test start for any channel with GLOBAL_START_BIND set will cause the same action to occur on all engines with GLOBAL_START_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
9	0h RW	**Bind Stop-on-Error (GLOBAL_STOP_ON_ERR_BIND):** Setting this bit will bind this channel engine to all other channel engines. A test stop (due to an error condition) for any channel with GLOBAL_STOP_ON_ERR_BIND set will cause the same action to occur on all engines with GLOBAL_STOP_ON_ERR_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Bind Clera Errors (GLOBAL_CLEAR_ERR_BIND):** Setting this bit will bind this channel engine to all other channel engines. Clearing all error registers and error status for any channel with GLOBAL_CLEAR_ERR_BIND set will cause the same action to occur on all engines with GLOBAL_CLEAR_ERR_BIND set. This feature is usually used when synchronization between multiple engines/channels necessitates a global control of all supported engines. Note: this field is only available if multiple channels/engines are supported for the current implementation, otherwise it is reserved.
7	0h RO	Reserved.
6	0h RW	**Constant Write Strobe (ENABLE_CONSTANT_WRITE_STROBE):** Reserved
5:0	0h RO	Reserved.

5.11.127 Sequence Configuration B (CPGC_SEQ_CFG_B)—Offset 4914h

Sequence Config High.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW	**Start Delay (START_DELAY):** Number of clock cycles (in CPGC-S clock domain) the start of the test is delayed by after START_TEST has been asserted by the user. This is usually used to synchronize multiple SoC CPGC engines on multiple channels according to a defined phase relationship.

5.11.128 Sequence Status (CPGC_SEQ_STATUS)—Offset 4918h

Sequence Test Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Test Done (TEST_DONE):** This bit will be set when the test is complete (or has been forced to exit due to a stop condition). Bit is cleared on a reset or when user starts another test.
30	0h RO/V	**Test Busy (TEST_BUSY):** This bit will be set when once a test has started. Bit is cleared on a reset or once test is done (or has been forced to exit due a stop condition).
29	0h RO/V	**Algorithm Done (ALGO_DONE):** This bit will be set when all the algorithms are complete. It is cleared on a reset.
28	0h RO/V	**Single Step/Cmd Paused (SINGLE_MODE_PAUSED):** This bit will be set when a command has been issued and we are paused due to Single_Command_Mode. The test may be continued by either clearing Single_Command_Mode or by setting Continue_Single_Mode.
27:0	0h RO	Reserved.

5.11.129 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[0])—Offset 4920h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.130 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[1])—Offset 4924h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.131 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[2])—Offset 4928h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.132 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[3])—Offset 492Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.133 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[4])—Offset 4930h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.134 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[5])—Offset 4934h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.135 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[6])—Offset 4938h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.136 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[7])—Offset 493Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.137 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[8])—Offset 4940h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.138 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[9])—Offset 4944h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.139 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[10])—Offset 4948h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.140 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[11])—Offset 494Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.141 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[12])—Offset 4950h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.142 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[13])—Offset 4954h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.143 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[14])—Offset 4958h

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.144 Raster Repository Content (CPGC2_RASTER_REPO_CONTENT[15])—Offset 495Ch

Flat register read access to Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Content of Raster Repository (Content):** Flat register read access to Raster Repository. The format of this is 2 consecutive addresses contain a complete 64-bit data chunk error bit-map, or one Error_Summary entry. In Mode3, there are up to 4 Row addresses for read failures for the associated Bank, based on the indicators in RASTER_REPO_CONTENT_ECC*.

5.11.145 Mode3 Fail Status LSB (CPGC2_RASTER_REPO_CONTENT_ECC1)—Offset 4960h

Lower half of the Raster Repository Mode3 Fail Status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO/V/P	**ECC Chunk 3 (ECC_chunk3):** ECC chunk 3 raster when in Mode 1.
27:26	0h RO/V/P	**Bank3 Fail Count (fail_count3):** Bank 3 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
25	0h RO/V/P	**Bank3 Any Fail (fail_any3):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
24	0h RO/V/P	**Bank3 Excessive Fail (fail_excess3):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
23:20	0h RO/V/P	**ECC Chunk 2 (ECC_chunk2):** ECC chunk 2 raster when in Mode 1.
19:18	0h RO/V/P	**Bank2 Fail Count (fail_count2):** Bank 2 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
17	0h RO/V/P	**Bank2 Any Fail (fail_any2):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
16	0h RO/V/P	**Bank2 Excessive Fail (fail_excess2):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
15:12	0h RO/V/P	**ECC Chunk 1 (ECC_chunk1):** ECC chunk 1 raster when in Mode 1.
11:10	0h RO/V/P	**Bank1 Fail Count (fail_count1):** Bank 1 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO/V/P	**Bank1 Any Fail (fail_any1):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
8	0h RO/V/P	**Bank1 Excessive Fail (fail_excess1):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
7:4	0h RO/V/P	**ECC Chunk 0 (ECC_chunk0):** ECC chunk 0 raster when in Mode 1.
3:2	0h RO/V/P	**Bank0 Fail Count (fail_count0):** Bank 0 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
1	0h RO/V/P	**Bank0 Any Fail (fail_any0):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
0	0h RO/V/P	**Bank0 Excessive Fail (fail_excess0):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.

5.11.146 Mode3 Fail Status MSB (CPGC2_RASTER_REPO_CONTENT_ECC2)—Offset 4964h

Upper half of the Raster Repository Mode3 Fail Status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO/V/P	**ECC Chunk 7 (ECC_chunk7):** ECC chunk 7 raster when in Mode 1.
27:26	0h RO/V/P	**Bank7 Fail Count (fail_count7):** Bank 7 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
25	0h RO/V/P	**Bank7 Any Fail (fail_any7):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
24	0h RO/V/P	**Bank7 Excessive Fail (fail_excess7):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
23:20	0h RO/V/P	**ECC Chunk 6 (ECC_chunk6):** ECC chunk 6 raster when in Mode 1.
19:18	0h RO/V/P	**Bank6 Fail Count (fail_count6):** Bank 6 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO/V/P	**Bank6 Any Fail (fail_any6):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
16	0h RO/V/P	**Bank6 Excessive Fail (fail_excess6):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
15:12	0h RO/V/P	**ECC Chunk 5 (ECC_chunk5):** ECC chunk 5 raster when in Mode 1.
11:10	0h RO/V/P	**Bank5 Fail Count (fail_count5):** Bank 5 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
9	0h RO/V/P	**Bank5 Any Fail (fail_any5):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
8	0h RO/V/P	**Bank5 Excessive Fail (fail_excess5):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.
7:4	0h RO/V/P	**ECC Chunk 4 (ECC_chunk4):** ECC chunk 4 raster when in Mode 1.
3:2	0h RO/V/P	**Bank4 Fail Count (fail_count4):** Bank 4 Number of failing address. 0=none or 1, 1=2, 2=3, and 3=4 entries.
1	0h RO/V/P	**Bank4 Any Fail (fail_any4):** 0 - indicates no failing address, 1 - indicates 1 or more failing address in the corresponding Content entry.
0	0h RO/V/P	**Bank4 Excessive Fail (fail_excess4):** 0 indicates no more than fail_max failing addresses, 1 - indicates more than fail_max failing addresses.

5.11.147 Read Command Count (CPGC2_READ_COMMAND_COUNT_CURRENT)—Offset 4968h

Current count of reads.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Current Read Command Count (Read_Command_Count_Current):** Current count of reads - freezes on stop_on_error conditions at the number of reads including the error that caused the stop.

5.11.148 Mask Errors on First N Reads (CPGC2_MASK_ERRS_FIRST_N_READS)—Offset 496Ch

Masking for the first N read operations - all errors are ignored.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Mask First N Reads (Mask_First_N_Reads):** 0=no masking, N= number of reads that will not result in any error indication for the raster repository.

5.11.149 Raster Repository Status (CPGC2_RASTER_REPO_STATUS)—Offset 4970h

Raster repository status.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Raster Repository Clear (RasterRepoClear):** Reset the raster repo entries. This bit auto-clears.
30	0h RW/P	**Stop on Raster Full (StopOnRaster):** If Raster Mode 1, test will stop after loading the bitmap into the raster. If Raster Mode 2, test will stop after loading 8 errors in the raster.
29:18	0h RO	Reserved.
17:16	0h RW/P	**Raster Repository Mode (RasterRepoMode):** 00 Mode 1 BitMap Mode. 01 Mode 2 Summary Mode. 10 mode 3 Filtered Failed Row Mode.
15:12	0h RO	Reserved.
11:10	0h RW/P	**Excess Failure Maximum (FailMax):** Maximum number of failing address before an additional failing address will set fail_excess for any bank. 00 one failure, 01 - two failures, 10 - three failures, 11- four failures.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO/V/P	**Summary Any Fail (FailAnyAll):** 0 - indicates no failing addresses. 1 - indicates 1 or more failing addresses.
8	0h RO/V/P	**Summary Excessive Fail (FailExcessAll):** 0 - indicates less than or exactly max_fail failing addresses on all banks. 1 - indicates at least one bank's errors exceed the max_fail limit.
7	0h RO	Reserved.
6:4	0h RO/V/P	**Number of Summary Entries (NumErrLogged):** Indicates the current number of errors loaded in the raster repo in Mode 2. Max value is 8.
3	0h RO	Reserved.
2	0h RO/V/P	**Raster Repository Full (RasterRepoFull):** Indicates when the no. of errors logged exceed max value of 8.
1	0h RO/V/P	**Summary Valid (SummaryValid):** Indicates when the summary information of the erroneous bitmap is loaded in the current summary buffer. This information consist of Algorithmic data, Physical Addr (Rank, Bank,Row,Col) and 8 2-bit error summary for every chunk.
0	0h RO/V/P	**Bitmap valid (BitmapValid):** Indicates when Mode 1 erroneous bitmap data is loaded in the raster repo.

5.11.150 Error Summary A (CPGC2_ERR_SUMMARY_A)—Offset 4974h

Most recent error sumary data, not yet written to the Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**Algorithm Summary (Algorithm_Summary):** Algorithm_Summary - currently formated as: [2:0] Offset_Command_Instruction_Current. [5:3] Offset_Address_Instruction_Current. [10:6] Command_Instruction_Current. [13:11] Algorithm_Instruction_Current. [15:14] Data_Instruction_Current.

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V/P	**Error Summary (Error_Summary):** Error_Summary - formatted as a pair of adjacent bits for each chunk, 00=no error in that chunk, 01=one error in that chunk, 10=two errors in that chunk, 11=three or more errors in that chunk.

5.11.151 Error Summary B (CPGC2_ERR_SUMMARY_B)—Offset 4978h

Most recent error sumary data, not yet written to the Raster Repository.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO/V/P	**Physical Address (Physical_Address_Summary):** Error_Summary - Physical Address encoded as: [7:0] Column, [25:8] Row, [28:26] Bank, [29] Rank.
1:0	0h RO/V/P	**Algorithm Summary (Algorithm_Summary):** Algorithm_Summary - currently formated as: [1:0] Address_Instruction_Current.

5.11.152 Future use Reserved (CPGC2_ERR_SUMMARY_C)—Offset 497Ch

Reserved for expansion of Error_Summary.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Future use Reserved (DG_Reserved):** Reserved for expansion of Error_Summary (bits 7:0).

5.11.153 Data Pattern Generation Buffer Control (CPGC_DPAT_BUF_CTL)—Offset 4980h

Data Pattern Buffer Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RO/V	**Read Buffer Pointer (RD_BUF_PTR):** Pointer to current entry in the data pattern buffers used for generating the read data.
23:20	0h RO/V	**Write Buffer Pointer (WR_BUF_PTR):** Pointer to current entry in the data pattern buffers used for generating the write data.
19	0h RO	Reserved.
18:16	0h RW	**Buffer End Pointer (BUF_END_PNTR):** Pointer to last data pattern buffer entry before wrapping back to BUF_STRT_PTR if incrementing is enabled through being different from BUF_STRT_PTR. Note: The actual size of this field depends on the # of lines supported for data generation. i.e If 1 or 2 lines are supported then it is a 1 bit field, if 8 lines are supported then 3 bits are available. Currently the RTL uses internal CPGC buffers so it has 4 lines and requires 2 bits.
15:11	0h RO	Reserved.
10:8	0h RW	**Buffer Start Pointer (BUF_STRT_PNTR):** Pointer to first buffer entry. Also used as the only entry if BUF_INC_EN is not enabled. Note: The actual size of this field depends on the # of lines supported for data generation (DATA_PAT_DEPTH_CAP), i.e If 1 or 2 lines are supported then it is a 1 bit field, if 16 lines are supported then the whole 4 bits are available. Currently the RTL uses internal CPGC buffers so it has 8 lines and requires 3 bits.
7	0h RO	Reserved.
6	0h RW	**Buffer Pointer Increment Scale (BUF_PNTR_INC_SCALE):** If set, the buffer pointer will be incremented at a linear rate given by BUF_PTR_INC_RATE, otherwise the buffer pointer will be incremented at an exponential rate given by BUF_PTR_INC_RATE. 1=Buffer Pointer Increment Rate field is treated as a linear number. 0=Buffer Pointer Increment Rate field is treated is an exponential number.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Buffer Pointer Increment Rate (BUF_PNTR_INC_RATE):** 0: Each buffer entry will be used for 2^BUF_PTR_INC_RATE number of bursts (64Bytes). 1: Each buffer entry will be used for BUF_PTR_INC_RATE + 1 number of 8-UI -- before incrementing the buffer pointer by 1. Note: To disable Buffer Pointer increments, set BUF_END_PTR==BUF_STRT_PTR.

5.11.154 Data Pattern Generation Configuration (CPGC_DPAT_CFG)—Offset 4984h

Data Pattern Configuration Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:24	0h RW	**Reload LFSR Seed Rate (RELOAD_LFSR_SEED_RATE):** Reload_LFSR_Seed_Rate only exists if the LFSR_Save_Restore capability is set to 1. Reload_LFSR_Seed_Rate and Save_LFSR_Seed_Rate is most often used in conjunction with Lane_Rotate_Rate where the user desires to replay the same deterministic LFSR stress as the victim aggressor patterns shifts Lanes left. When the victim aggressor pattern returns to the starting position the current LFSR stress is saved using Save_LFSR_Seed_Rate to allow the LFSR stress to advance for the new period. 2^(Reload_LFSR_Seed_Rate-1) defines the periodic Loopcount interval that the current LFSR Seed UNISEQ#_RDSTAT.Uniseq_RdStat is reloaded from CPGC_UNISEQ#_RDSAVE.Pattern_Buffer. When the Save_LFSR_Seed_Rate and Reload_LFSR_Seed_Rate is reached in the same Bit only the saving of the LFSR seed takes place. Examples: 0=Disable - The current LFSR seed is never reloaded. 1=The current LFSR seed is reloaded every Loopcount. 2=The current LFSR seed is reloaded every other Loopcount. 3=The current LFSR seed is reloaded every fourth Loopcount.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Save LFSR Seed Rate (SAVE_LFSR_SEED_RATE):** Save_LFSR_Seed_Rate only exists if the LFSR_Save_Restore capability is set to 1. See Reload_LFSR_Seed_Rate for use model. UNISEQ#_RDSAVE.Pattern_Buffer is initially loaded at the start of a test with UNISEQ#_RDSTAT.Uniseq_RdStat (the Seed). 2^(Reload_LFSR_Seed_Rate-1) * (Save_LFSR_Seed_Rate) defines the periodic Loopcount interval that the current LFSR Seed is saved into UNISEQ#_RDSAVE.Pattern_Buffer. When the Save_LFSR_Seed_Rate and Reload_LFSR_Seed_Rate is reached in the same Loopcount only the saving of the LFSR seed takes place. Examples: 0=Disable - The current LFSR seed (UNISEQ#_RDSTAT.Uniseq_RdStat) is saved only at the start of test into UNISEQ#_RDSAVE.Pattern_Buffer. 1=Illegal (Would save every Reload and effectively disable both Save and Reload). 2=The current LFSR seed is saved every other 2^(Reload_LFSR_Seed_Rate-1) Loopcounts. 3=The current LFSR seed is saved every third Reload (and Reload does not happen).
15	0h RW	**Reserved for future use (ECC_DATA_SOURCE_SEL):** Indicates whether byte 0 (Dq0-Dq7) or byte 7 (dq56-dq63) is transmitted and compared for the ECC byte. 0=byte group 0 will be transmitted and compared for the ECC byte. 1=byte group 7 will be transmitted and compared for the ECC byte. Hardware directs if ECC is included within Generation and Checking. This bit may be reserved if ECC is not supported, or if this functionality is controlled from a different register.
14	0h RW	**Reserved for future use (ECC_REPLACE_BYTE_CONTROL):** ECC_Replace_Byte_Control is used by the Read data path to mux the received ECC byte into the same byte group indicated by ECC_Data_Source_Sel. This is needed to capture ECC cacheline errors into the WDB when Enable_WDB_Error_Capture is set to 1. This bit may be reserved if ECC is not supported, or if this functionality is controlled from a different register.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**ECC Disable (ECC_DISABLE):** Setting this bit will internally disable all related ECC features in CPGC having the effect of generating all '1 in the ECC CPGC interface outputs, and of Binding to '0 all the ECC interface CPGC inputs. ECC masks and error comparisons will be disabled as well. If ECC is supported, but not directly passed to CPGC, then this bit when set will enable the ECC_REPLACE_BYTE_CONTROL and ECC_DATA_SOURCE_SEL functionality, to allow driving of ECC from another ByteLane, and replacing the incoming data with ECC for that ByteLane. When ECC is disabled with this bit, then the output of CPGC will be determined based on BE_TRAIN_ERR_EN and may output all 1's or the content of the DRAMDM and XDRAMDM registers as Byte-Enables.
12:10	0h RO	Reserved.
9	0h RW	**Read Address As Data (READ_ADDRESS_AS_DATA):** When Read_Address_as_Data is set to '1' any address fields that the CADB is overriding during a Select cycle should be used for comparing the incoming data. Otherwise, the functional path decoded address field should be used for comparing the incoming data. This override of the data will not respect any inversion, rotation or other data modification. It will only be active (override the normal output/reference) when Alternate_Data is active in either the Command_Instruction or the Offset_Command_Instruction as appropriate . The functional path decoded address field used for read comparison is repeated in chunk and should follow the Data Construction rules described below on what bytegroup relates to what decoded address: Chunk0 - Byte0 =Column(7:0). Chunk0 - Byte1 =Column(9:8) <- as many Column bits as supported. Chunk0 - Byte2 =Row(0:7). Chunk0 - Byte3 =Row(15:8). Chunk0 - Byte4 =Row(17:16)<- as many Row bits as supported. Chunk0 - Byte5 =Bank(3:0) [Note: Bank Group may be part of this field] <- as many Bank bits as supported. Chunk0 - Byte6 =Rank(1:0) <- as many Rank bits as supported (would be CS# if CADB output supported). Chunk0 - Byte7 =Reserved (set to 0).

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Write Address As Data (WRITE_ADDRESS_AS_DATA):** When Write_Address_as_Data is set to '1', any address fields that the CADB is overriding during a Select cycle should be used for generating the write data. Otherwise, the functional path decoded address field should be used for generating the write data. Data Construction rules follow the same as for READ_ADDRESS_AS_DATA. This format is subject to change based on memory technology supported and other reasons. What is to be guaranteed is that every Cacheline of data will be unique to each address.
7:6	0h RW	**Unisequencer 2 Mode (UNISEQ2_MODE):** Defines the operational mode for unified sequence 2 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.
5	0h RO	Reserved.
4:3	0h RW	**Unisequencer 1 Mode (UNISEQ1_MODE):** Defines the operational mode for unified sequence 1 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.
2	0h RO	Reserved.
1:0	0h RW	**Unisequencer 0 Mode (UNISEQ0_MODE):** Defines the operational mode for unified sequence 0 as follows: 00 - LMN Mode. 01 - Pattern Buffer Mode. 10 - LFSR Mode. 11 - Reserved for future use.

5.11.155 LFSR Configuration and Lane Rotate (CPGC_DPAT_XTRA_LFSR_CFG)—Offset 4988h

Unisequencer LFSR configuration and Lane Rotation.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
29:24	0h RW	**Lane Rotate Rate (LANE_ROTATE_RATE):** Lane_Rotate_Rate only exists if the Lane_Rotation_Support capability exists. 2^(Lane_Rotate_Rate-1) indicates the periodic Loopcount rate when the EXTBUF_# registers are rotated up by one bit. Lane_Rotate_Rate=0 disables all rotation. Lane_Rotate_Rate=1 causes the EXTBUF_# registers to be rotated every one Loopcount. Lane_Rotate_Rate=2 causes the EXTBUF_# registers to be rotated every other Loopcount. Etc.. When the EXTBUF_# registers are rotated Bit 0 shifts to Bit 1 all the way up to the Max-1 Bit and the Max bit shifts to Bit0.
23	0h RW	**Unisequencer 2 LFSR Stagger Enable (UNISEQ2_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq2_Mode is programmed to Select LFSR or the behavior is undefined.
22:21	0h RO	Reserved.
20:18	0h RW	**Unisequencer 2 LFSR Polynomial Select (UNISEQ2_LFSR_POLYNOMIAL_SIZE):** Possible Polynomial Sizes: 0x0=Use 8 bit LFSR (x8 + x6 + x5 + x4) 0x1=Use 15 bit LFSR (x15 + x14) 0x2=Use 31 bit LFSR (x31 + x28) 0x3=Use 23 bit LFSR (x23 + x18) 0x4=Use 7 bit LFSR (x7 + x6) 0x5=Use 16 bit LFSR (x16+x5+x4+x3) 0x6=Use 23 bit LFSR (x23+x21+x18+x15+x7+x2) 0x7=Use 32 bit LFSR (x32+x31+x30+x10)
17:16	0h RO	Reserved.
15	0h RW	**Unisequencer 1 LFSR Stagger Enable (UNISEQ1_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq1_Mode is programmed to Select LFSR or the behavior is undefined.
14:13	0h RO	Reserved.
12:10	0h RW	**Unisequencer 1 LFSR Polynomial Select (UNISEQ1_LFSR_POLYNOMIAL_SIZE):** Possible Polynomial Sizes: 0x0=Use 8 bit LFSR (x8 + x6 + x5 + x4) 0x1=Use 15 bit LFSR (x15 + x14) 0x2=Use 31 bit LFSR (x31 + x28) 0x3=Use 23 bit LFSR (x23 + x18) 0x4=Use 7 bit LFSR (x7 + x6) 0x5=Use 16 bit LFSR (x16+x5+x4+x3) 0x6=Use 23 bit LFSR (x23+x21+x18+x15+x7+x2) 0x7=Use 32 bit LFSR (x32+x31+x30+x10)

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RO	Reserved.
7	0h RW	**Unisequencer 0 LFSR Stagger Enable (UNISEQ0_LFSR_STAGGER):** 0=No Stagger, 1=Stagger. This bit must not be set unless Uniseq0_Mode is programmed to Select LFSR or the behavior is undefined.
6:5	0h RO	Reserved.

1:0	0h RO	Reserved.

5.11.156 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[0])—Offset 498Ch

Data Pattern Unified Sequencer 0 Seed Register.

Access Method

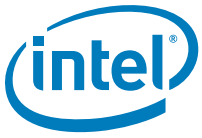
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.11.157 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[1])—Offset 4990h

Data Pattern Unified Sequencer 0 Seed Register.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.11.158 Unisequencer Data Pattern Buffer (CPGC_DPAT_UNISEQ[2])—Offset 4994h

Data Pattern Unified Sequencer 0 Seed Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA55AA55h

Bit Range	Default & Access	Field Name (ID): Description
31:0	AA55AA55h RW	**Pattern Buffer (PATTERN_BUFFER):** If UniSeq#_Mode is set to Pattern Buffer mode, then this field represents the initial content of the rotating pattern buffer for the unified sequencer. If UniSeq#_Mode is set to LFSR mode, then this field represents the 32-bit LFSR seed for the unified sequencer. Note: This is a shared register, it has a meaning according to the UniSeq# mode. **For PRBS lengths less than or equal to 8, the seed must contain 16 bits of the initial PRBS sequence.**

5.11.159 Unisequencer LMN Control (CPGC_DPAT_UNISEQ_LMN[0])—Offset 4998h

Data Pattern Unified Sequencer 0 LMN Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1010100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	1h RW	**N Count (N_CNT):** N_Count only exists if LMN_Support capability is set to 1. After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).
23:16	1h RW	**M Count (M_CNT):** M_Count only exists if LMN_Support capability is set to 1. After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).
15:8	1h RW	**L Count (L_CNT):** If LMN_Support capability is set to 0 then: A periodic square wave is generated that has the following behavior. 1) Drive L_Polarity for L_Count Bits. 2) Drive inverse of L_Polarity for L_Count Bits. 3) Go to step 1. Else if LMN_Support is set to 1 then: After L_Count bits are driven at the beginning of a test then periodic pattern is continuously repeated depending on the value of Enable_Sweep_Frequency is set to 1. If Enable_Sweep_Frequency=0 then a steady state frequency is driven (see Enable_Sweep_Frequency for exact behavior). If Enable_Sweep_Frequency=1 then a frequency sweep is continuously generated ranging from 2*(M) to 2*(N) driven (see Enable_Sweep_Frequency for exact behavior).
7:4	0h RW	**L Count High-bits (L_COUNTER_HI):** Additional 4 bits to increase the size of L Count up to 12.
3	0h RO	Reserved.
2	0h RW	**L Counter Mode Enable (L_COUNT_EN):** Used in concatenation with FREQ_SWEEP_EN to enable 3 possible modes of LMN behavior.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Frequence Sweep Mode Enable (FREQ_SWEEP_EN):** Used in concatenation with L_COUNT_EN to enable 3 possible modes of LMN behavior: {L_COUNT_EN,FREQ_SWEEP_EN} {0,0} - Normal LMN. {0,1} - Sweep clock pattern from 2*M period down to 2*N_Count period and repeat. {1,0} - L-Counter - drive clock pattern of 2*L period. {1,1} - Currently same as L-Counter mode - reserved for future use. If Normal LMN mode, then the following pattern is continuously repeated: 1) Drive L_Count bits with the polarity set by L_Polarity. 2) Drive M_Count bits with the inverse of L_Polarity. 3) Drive N_Count bits with the value of L_Polarity. 4) Go to step 2. If any L_Count, M_Count, or N_Count=0 then the state will freeze at the polarity driven for that stage. If Sweep mode, then the following pattern is continuously repeated: 1) Drive L_Count bits with the polarity set by L_Polarity. 2) X_count=M_Count 3) Drive X_Count bits with the inverse of L_Polarity. 4) Drive X_Count bits with the value of L_Polarity. 5) Drive X_Count bits with the inverse of L_Polarity. 6) If X_Count==N_Count then go to step 9. 7) X_Count=X_Count-1 8) Go to step 10. 9) X_Count=M_Count 10) Drive X_Count bits with the value of L_Polarity. 11) Go to step 3. If LCount mode, then the following pattern is continuously repeated: 1) Drive L_Polarity for L_Count Bits. 2) Drive inverse of L_Polarity for L_Count Bits. 3) Go to step 1. If {0,1}, L_Count, M_Count, and N_Count must never be programmed to 0 and is considered undefined. If {1,0}, L_Count must never be programmed to 0 and is considered undefined. If {0,1}, M_Count and N_Count must be greater than or equal to 8 or behavior may be implementation specific. If {0,1}, N_Count must be programmed less than M_Count.
0	0h RW	**Initial Output (L_SEL):** The initial logic output of the sequencer is defined as follows: 0 - Output Logic '0' for L_CNT UIs. 1 - Output Logic '1' for L_CNT UIs.

5.11.162 Invert and DC Control (CPGC_DPAT_INVDCCTL)—Offset 49A4h

Data Pattern Inversion/DC Control Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: AA0000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Mask Rotate Enable (MASK_ROTATE_EN):** If set, the inversion/DC mask will rotate to the left at a rate defined by the MASK_ROTATE_RATE field.
30	0h RW	**DC Mask Mode Enable (DC_OR_INV):** Selects between using the inversion/DC mask for inversion or DC as follows: 0 - Mask used for inversion. 1 - Mask used for driving a DC signal of polarity DC_POL.
29	0h RW	**DC Polarity (DC_POL):** Selects the polarity of the signal to be driven through the inversion/DC mask if DC_OR_INV is set to 1: 0 - Drive a logic low (zero). 1 - Drive a logic high (one).
28:25	0h RO	Reserved.
24:16	AAh RW	**Byte Group Mapping (BYTEGROUP_MAPPING):** Select between the two bytes of unique lanes being generated by the DPAT pattern generator, to be applied in each DQ byte group, as many byte groups as required by the number of DQ pins. MSB is always for the ECC byte group, used only if ECC is present.
15:12	0h RO	Reserved.
11:8	0h RW	**Mask Roate Rate (MASK_ROTATE_RATE):** If inversion mask rotation is enabled through MASK_ROTATE_EN, the mask will rotate to the left every time 2^MASK_ROTATE_RATE bursts (64Bytes) have been have been issued.
7:0	0h RW	**ECC ByteGroup Invert/DC Enable (ECC_INV_DC_MASK):** A value of for any of the bits means the corresponding ECC lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [71:64] of the continuous shift register composed of this field along with DATA_INV_DC_MASK_HI and DATA_INV_DC_MASK_LO. Note: this field is only available if ECC is supported for the current implementation, otherwise it is reserved.

5.11.163 Data Invert/DC Enable Low (CPGC_DPAT_INV_DC_MASK_LO)—Offset 49A8h

Low Data Pattern Inversion/DC Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Invert/DC Enable Low (DATA_INV_DC_MASK_LO):** A value of '1' for any of the bits means the corresponding data lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [31:0] of the continuous shift register composed of this field along with ECC_INV_DC_MASK and DATA_INV_DC_MASK_HI. DPAT generator only uses the appropriate bits based on the widest bus that this CPGC block is designed to support. This register is also used to provide the Initial value for the Alternate Data pattern generator.

5.11.164 Data Invert/DC Enable High (CPGC_DPAT_INV_DC_MASK_HI)—Offset 49ACh

High Data Pattern Inversion/DC Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Invert/DC Enable High (DATA_INV_DC_MASK_HI):** A value of '1' for any of the bits means the corresponding data lane(s) will be inverted or a DC value driven on it. Note that this field is used to load bits [63:32] of the continuous shift register composed of this field along with ECC_INV_DC_MASK and DATA_INV_DC_MASK_LO.

5.11.165 Byte Enable Mask Lower (CPGC_DPAT_DRAMDM)—Offset 49B0h

Data Pattern DRAM Data Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Byte Enable Mask Lower (DATA_MASK_LO):** A byte enable field with each bit corresponding to a data byte sent during a burst such that: 0 - Mask the Corresponding Byte. 1 - No Mask to the Corresponding Byte. The byte-to-bit mapping is given by Byte[n] -> bit[n]. This register is for the first half cacheline of data. It is only used when ECC is not present or is disabled.

5.11.166 Byte Enable Mask Upper (CPGC_DPAT_XDRAMDM)—Offset 49B4h

Extended Data Pattern DRAM Data Mask Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Byte Enable Mask Upper (DATA_MASK_HI):** A byte enable field with each bit corresponding to a data byte sent during a burst such that: 0 - Mask the Corresponding Byte. 1 - No Mask to the Corresponding Byte. The byte-to-bit mapping is given by Byte[n+32] -> bit[n]. This register is for the Second half cacheline of data. It is only used when ECC is not present or is disabled.

5.11.167 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[0])—Offset 49B8h

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.11.168 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[1])—Offset 49BCh

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.11.169 Unisequencer Status - Write (CPGC_DPAT_UNISEQ_WRSTAT[2])—Offset 49C0h

Write Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (UNISEQ_WRSTAT):** The current contents of the Pattern/LFSR buffer in write generation domain.

5.11.170 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[0])—Offset 49C4h

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.11.171 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[1])—Offset 49C8h

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

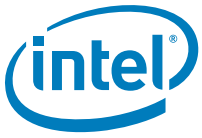
5.11.172 Unisequencer Status - Read (CPGC_DPAT_UNISEQ_RDSTAT[2])—Offset 49CCh

Read Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (UNISEQ_RDSTAT):** Reflects the current and final status of the pattern buffer in the read domain. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. 5.11.173 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[0])—Offset 49D0h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.11.174 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[1])—Offset 49D4h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.11.175 LMN Status - Write (CPGC_DPAT_LMN_WRSTAT[2])—Offset 49D8h

Write LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Status (LMN_WRSTAT):** The current contents of the LMN buffer in write comparison domain.

5.11.176 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[0])—Offset 49DCh

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.11.177 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[1])—Offset 49E0h

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.11.178 LMN Status - Read (CPGC_DPAT_LMN_RDSTAT[2])—Offset 49E4h

Read LMN Status Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Status (LMN_RDSTAT):** The current contents of the LMN buffer in read comparison domain.

5.11.179 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[0])—Offset 49E8h

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.11.180 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[1])—Offset 49ECh

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.11.181 Unisequencer Save Status - Write (CPGC_DPAT_UNISEQ_WRSAVE[2])—Offset 49F0h

Write PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEADBEEFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	DEADBEEFh RO/V	**Save Status (PATTERN_BUFFER):** The current contents of the Save register before the test stops in the write domain.

5.11.182 Unisequencer Save Status - Read (CPGC_DPAT_UNISEQ_RDSAVE[0])—Offset 49F4h

Read PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Save Status (PATTERN_BUFFER):** CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer will reflect either the initial or last saved value of CPGC_UNISEQ#_RDSTAT. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. In LFSR Mode the contents of Pattern_Buffer will interact with the LFSR in the following ways: If LFSR_Save_Restore is set then CPGC_REG_DPAT_UNISEQ_WRSAVE.Pattern_Buffer will interact with CPGC_UNISEQ#_RDSTAT in the following ways: 1) CPGC_UNISEQ#_RDSTAT will be periodically saved into CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Save_LFSR_Seed_Rate (see Save_LFSR_Seed_Rate for more details). 2) CPGC_UNISEQ#_RDSTAT will be periodically reloaded with CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer based on Reload_LFSR_Seed_Rate (see Reload_LFSR_Seed_Rate for more details).

5.11.183 Unisequencer Save Status - Read (CPGC_DPAT_UNISEQ_RDSAVE[1])—Offset 49F8h

Read PRBS Save Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Save Status (PATTERN_BUFFER):** CPGC_REG_DPAT_UNISEQ#_RDSAVE.Pattern_Buffer will reflect either the initial or last saved value of CPGC_UNISEQ#_RDSTAT. If PATBUF mode, then Pattern_Buffer is used as a fixed buffer that is output in serial fashion. After all the bits in the Pattern_Buffer have been transmitted the pattern will simply repeat itself continuously while a Loopback Test is in progress. If LFSR mode, then Pattern_Buffer is used as a seed to a fixed LFSR that is output in serial fashion. Over time the LFSR pattern will repeat itself continuously while a Loopback Test is in progress. 5.11.201 Error Checker Control (CPGC_ERR_CTL)—Offset 4A40h

Control for Error Checker.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/P	**Cache Line Error Check Enable (ERRCHK_MASK_CACHELINE):** Defines a periodic burst mask that repeats every 64Bytes of data as follows: Bit 0 - Burst 0 Bit 1 - Burst 1 ... Bit 7 - Burst 7 Only bursts with a corresponding bit value of '1' will be checked for errors. A burst is defined as a burst length of 64 bytes of data. In Loopback each bit of this register controls the check of each ByteTime (8-bits) on the bus.
23:16	0h RW/P	**Chunk Error Check Enable (ERRCHK_MASK_CHUNK):** Defines which chunk within the burst of data (i.e. bit within a burst of 8-bits for each lane) to check for errors. Only chunks with a corresponding bit value of '0' will be checked for errors. This field is only used for full width (64bit) DQ busses. Otherwise the upper 32 bits of the Lane Mask is used as the Chunk Enable. This field is also used for Loopback mode for all DQ sizes.
15:14	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW/P	**Stop On Error Control (STOP_ON_ERROR_CTL):** Defines test stop conditions based on error checking as follows: 00 - Never stop: Prevents any error from stopping the test. 01 - Stop On Nth Error: Stop once STOP_ERR_CNTR has accumulated at least (STOP_ON_N + 1) errors. 10 - Stop On All Byte Groups Error: Stop if every byte group indicates that at least one of its lanes accumulated at least one error. That is, if all bits BYTEGRP_ERR_STAT, (and ECC_GRP_ERR_STAT if supported), are all set. 11 - Stop On All Lanes Error: Stop if every lane within every byte group has accumulated at least one error. That is, if all bits in LANE_ERR_STAT_LO, LANE_ERR_STAT_HI, (and LANE_ERR_STATECC if supported) are all set.
11:9	0h RO	Reserved.
8	0h RW/P	**BE Training Enable (BE_TRAIN_ERR_EN):** Enable BE Training Error Detection Feature. Note this bit overrides the BE_TRAIN_ERR_EN bit in CPGC2_ALGORITHM_INSTRUCTION_CTRL.
7:6	0h RO	Reserved.
5:0	0h RW/P	**Stop On Nth Error Count (STOP_ON_N):** If STOP_ON_ERROR is set to Stop on Nth Error Mode, the test will stop after (STOP_ON_N + 1) or more errors have been accumulated in the ERR_CNTR.

5.11.202 Lane Error Mask Lower Bytes (CPGC_ERR_LNEN_LO)—Offset 4A44h

Error Lane Mask for Byte Groups 0-3.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Lower Data Lane Error Mask (DATA_ERRCHK_MASK_LO):** A mask used to disable error checking on data lanes [31:0]. Lanes selected through this mask will not be checked for errors. The lane-to-bit mapping for this mask is given by the following formula: Lane[n] -> bit[n]. Functionality will change with special mapping when buswidth is < 64 (or 72) such that ChunkMask will move to this field starting at bit [...:32] extending the necessary number of bits for a full cache line of data. The mask in ERR_CTL will be unused for these busses/modes.

5.11.203 Lane Error Mask Upper Bytes or Extended Chunk Enable (CPGC_ERR_LNEN_HI)—Offset 4A48h

Error Lane Mask for Byte Groups 4-7 or Extended Chunk Check Enable.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**Upper Data Lane Error Mask (DATA_ERRCHK_MASK_HI):** A mask used to disable error checking on data lanes [63:32]. Lanes selected through this mask will not be checked for errors. The lane-to-bit mapping for this mask is given by the following formula: Lane[n+32] -> bit[n]. Functionality will change with special mapping when buswidth is < 64 (or 72) such that ChunkMask will move to this field starting at bit [...:32] extending the necessary number of bits for a full cache line of data. The mask in ERR_CTL will be unused for these busses/modes.

5.11.204 Lane Error Mask ECC (CPGC_ERR_XLNEN)—Offset 4A4Ch

ECC Lane Error Mask.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	FFh RW/P	**ECC Lane Error Mask (ECC_ERRCHK_MASK):** A mask used to disable error checking on ECC lanes. Lanes selected through the mask will not be checked for errors. The lane-to-bit mapping is 1-to-1 and hence bit 1 corresponds to ECC lane 0, bit 1 corresponds to ECC lane 1, and so on. Note: This field is available only if ECC is supported. The default state is to disable ECC checking.

5.11.205 Lane Error Status Lower Bytes (CPGC_ERR_STAT03)—Offset 4A50h

Error Status DQ Lanes 31-0 Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Lower Data Lane Error Status (LANE_ERR_STAT_LO):** Indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to byte groups 0 - 3. Hence lanes [32:0] map to bits [32:0] respectively. The error status information is encoded as follows: 0: No mismatches detected on corresponding lane. 1: At least one mismatch detected on corresponding lane. Cleared on Local Clear Errors.

5.11.206 Lane Error Status Upper Bytes or Extended Chunk Error Status (CPGC_ERR_STAT47)—Offset 4A54h

Error Status DQ Lanes 63-32 Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Upper Data Lane Error Status (LANE_ERR_STAT_HI):** Indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to byte groups 4 - 7. Hence lanes [63:32] map to bits [32:0] respectively. If there are less than 32 data lanes, then this register is used to indicate the Extended Chunk Error Status, and the Chunk Error Status in ECC_CHNK_RANK_STAT is not used. Chunks 0 through 15 (32-bit bus) or 0 through 31 (16-bit bus). The error status information is encoded as follows: 0: No mismatches detected on corresponding lane (chunk). 1: At least one mismatch detected on corresponding lane (chunk). Cleared on Local Clear Errors.

5.11.207 ECC Lane Error Status (CPGC_ERR_ECC_CHNK_RANK_STAT)—Offset 4A58h

Error Status for ECC, Chunks and Ranks.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RO/V/P	**Rank Error Status (RANK_ERR_STAT):** A status field where each bit corresponds to a specific rank. If set, the corresponding rank has accumulated at least one error. Cleared on Local Clear Errors.
15:8	0h RO/V/P	**Chunk Error Status (CHUNK_ERR_STAT):** A flag field where each bit corresponds to a specific chunk (i.e. bit within a burst of 8-bits). If set, the corresponding chunk (UI) has accumulated at least one error. Cleared on Local Clear Errors.
7:0	0h RO/V/P	**ECC Lane Error Status (ECC_LANE_ERR_STAT):** A fag field which indicates if a mismatch was detected between the WR and the RD data on one of the lanes belonging to the ECC byte group. The error status information is encoded as follows: 0: No mismatches detected on corresponding lane. 1: At least one mismatch detected on corresponding lane. Note: this field is only available if ECC is supported for the current implementation, otherwise it is reserved. If BE Training Enable is set then this field indicates that the particular BE lane had a fault during the write pass. Cleared on Local Clear Errors.

5.11.208 ByteGroup Error Status (CPGC_ERR_BYTE_NTH_PAR_STAT)—Offset 4A5Ch

Error Status for ByteGroup and Error Stop.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:24	0h RO/V/P	**Nth Error Count Status (Nth_ERROR):** Nth_Error indicates the current Nth Error that has occurred. Nth_Error will roll over upon saturating to its maximum values. An Nth error is defined as 1 or more lane miscompares within a single comparison cycle (i.e. Chunk).
23	0h RO	Reserved.
22:20	0h RO/V/P	**Read Chunk Number Status (RD_CHUNK_NUM_STAT):** RD_Chunk_Num_Status corresponds to the chunk number being read out of the WDB (EXTBUF)for a RdCAS operation while logging an error during Loopback.Pattern. RD_Chunk_Num_Status is needed in conjunction with the lower 3 column address bits of the cacheline experiencing the error in order to deterministically rewind the LFSR/PB/LMN counter after the test is stopped due to an error condition. This is due to the pipelined nature of the data path since a cacheline can be read out of the WDB (EXTBUF) at the same time an error is being detected against an earlier read. Using RD_Chunk_Num_Status and the lower 3 column address bits of the cacheline experiencing the error allows the user to determine the skid between the LFSR/PB/LMN counter and the error detection. RD_Chunk_Num_Status can be cleared by one of two ways. 1. Local_Clear_Errors or (Global_Control and Global_Clear_Errors) to 1. 2. Writing RD_Chunk_Num_Status=0x0. One may also choose to clear individual bits in RD_Chunk_Num_Status. Setting bits in RD_Chunk_Num_Status is undefined and should be avoided. Writing a 0 to bits in RD_Chunk_Num_Status can be cleared independently of Data_Error_Status, ECC_Error_Status, Rank_Error_Status, Chunk_Error_Status, and Byte_Group_Error_Status.
19:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**ECC ByteGroup Error Status (ECCGRP_ERR_STAT):** A set bit implies that the ECC bytegroup has at least one lane that accumulated at least one error. Can also be cleared on Local Clear Errors (or Global_Control and a Global_Clear_Errors) .
7:0	0h RW/1C/V/P	**Data ByteGroup Error Status (BYTEGRP_ERR_STAT):** A flag field with each bit corresponding to a specific byte group. Bit 0 corresponds to byte group 0, bit 1 corresponds to byte group 1, bit 2 corresponds to byte group 2, and so on. A set bit implies that the corresponding byte group has at least one lane that accumulated at least one error. When BE Training Enable is set, then this field will indicate that a data error has occured that was not due to the corresponding BE signal. Can also be cleared on Local Clear Errors (or Global_Control and a Global_Clear_Errors) .

5.11.209 Error Counter Control (CPGC_ERR_CNTRCTL[0])—Offset 4A60h

Counter Control is used to control what is captured in the CPGC_ERR_ERRCNTR#.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RW/P	**Error Counter Control (COUNTER_CONTROL):** Counter_Control determines what gets counted by CPGC_ERR_CNTR_#.Error_Counter. 00=Count Errors on all Lanes - The Error Counter will capture the OR of all errors across all unmasked Lanes in a Chunk. For example, if 1 lane or 72 lanes experience an error in a Chunk then the CPGC_ERR_CNTR_#.Error_Counter will be incremented by only 1. 01=Count Errors on a particular Lane - The Error Counter will count the exact number of errors on the Lane indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. 10=Count Errors on a particular Byte Group - The Error Counter will count the number of errors on the Byte group indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER. ECC is byte group 8. An error within one Chunk within the selected ByteGroup is counted as 1 error. 11=Count Errors on a particular Chunk - The Error Counter will count the number of errors on the a particular chunk in the cacheline indicated by CPGC_ERR_CNTRCTL.COUNTER_POINTER, across all lanes.
6:0	0h RW/P	**Error Counter Pointer (COUNTER_POINTER):** Used in conjunction with Counter_Control to indicate which Lane, which ByteLane or which Chunk the CPGC_ERR_CNTR_#.Error_Counter will count errors on.

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.11.223 Error Counter (CPGC_ERR_CNTR[5])—Offset 4A98h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.11.224 Error Counter (CPGC_ERR_CNTR[6])—Offset 4A9Ch

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.11.225 Error Counter (CPGC_ERR_CNTR[7])—Offset 4AA0h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.11.226 Error Counter (CPGC_ERR_CNTR[8])—Offset 4AA4h

Indicates the current error counter value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:0	0h RO/V/P	**Error Counter Status (ERROR_COUNTER):** CPGC_ERR_ERRCNTR indicates the current error counter value which is configured by CPGC_ERR_CNTRCTL.Counter_Control. The Counter_Status will not saturate and will wrap around, but any overflow of this counter will set the corresponding overflow status bit in CPGC_ERR_ERRCNTR_OVERFLOW_STATUS.ERROR_COUNTER_OVERFLOW. Counter_Status can only be cleared by setting Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) .

5.11.227 Error Counter Overflow (CPGC_ERR_CNTR_OV)—Offset 4AA8h

Indicates the current error counter overflow value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8:0	0h RW/1C/V/P	**Error Counter Overflow Status (ERROR_COUNTER_OVERFLOW):** Contains the overflow flags for all Error Counters. Bit 0 corresponds to ERROR_COUNTER_0. Bit 1 corresponds to ERROR_COUNTER_1. .. Bit 8 corresponds to ERROR_COUNTER_8. Error Counter Overflow Status can be cleared by one of two ways: 1. Local_Clear_Errors (or Global_Control and a Global_Clear_Errors) to 1. 2. Writing the correspoing Error Counter Overflow Status bit to 1. Writing a 0 to bits in Counter_Overflow_Status can be cleared independently of Data_Error_Status, Byte_Group_Error_Status, Chunk_Error_Status, and ECC_Error_Status.

5.11.228 Error Log Control and Status (CPGC_ERRLOG_CTL_STAT)—Offset 4AACh

Error Logging Control and Status - All Error Log information must be read out before doing a Local Clear Errors.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW/1S	**Error Log Clear Read Buffer Pointer (CLR_DUN_RDBUF_PTR):** Initializes the Error Log Current Read Pointer. Do this prior to the start of a test.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1S	**Error Log Increment Chunk Count (INC_CHUNK_COUNT):** Advance to next portion of data which is then available in the Error Log Data Register.
14	0h RW/1S	**Error Log Auto Seek to Error (ERRLOG_AUTO):** Asserting this bit will have the effect of CPGC automatically generating the needed Read transactions such as the current Read Pointer targets the last failing cachline. Instead of manually browsing, user can set this bit and logic will make sure that CURR_RD_PTR==ERROR_RD_PTR. This bit will always return '0' if read by software.
13	0h RW/1S	**Error Log Increment Current Read Pointer (ERRLOG_MOVE):** Asserting this bit will have the effect of incrementing by one the Current Read Pointer at the actual Read Data Buffer. User can manually browse through the Read Data Buffer and dump its contents. This bit will always return '0' if read by software.
12	0h RW/P	**Error Log Auto Chunk Increment (ERRLOG_AUTO_CHNK_INC):** Signal that will allow auto-increment feature for each 32bit data chunk read from the Error Log Data register. Note: If this bit is set, when doing the last 32bit data access via reading the Error Log Data register, the Error Log Current Read Pointer will auto increment as well.
11:9	0h RO	Reserved.
8:5	0h RO/V/P	**Error Log Error Read Pointer (ERROR_RD_PTR):** Provides the Read Pointer location that caused the error that triggered STOP_ON_ERROR. This will be used for knowing exactly which entry in the Read Data Buffer contains the faulty cacheline data.
4	0h RO	Reserved.
3:0	0h RO/V/P	**Error Log Current Read Pointer (CURR_RD_PTR):** Provides the current Read Pointer location indexed at the Read Data Buffer. This will be used for knowing how many Reads the user needs to issue to return the pointer to the actual failing entry.

5.11.229 Error Log Data Access (CPGC_ERRLOG_DATA)—Offset 4AB0h

Error Logging Data Access Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**Error Log Data (ERRLOG_DATA):** 32 bits of data corresponding to one of eight (or four for ANN) 32 bit PMI chunks available per Read Pointer location. If ERRLOG_AUTO_CHNK_INC is set, then each read to this register will read out a successive 32 bit PMI chunk of data.

5.11.230 Loopback Error Status (CPGC_ERR_TEST_ERR_STAT)—Offset 4AB4h

Indicates when a test is complete and if any errors occurred for Loopback mode.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RO/V	**Loopback Test in Progress (TEST_IN_PROGRESS):** Used to indicate a loopback test is in progress.
0	0h RO/V/P	**Loopback Local Error Status (ERROR_STATUS):** Bit set during the loopback test. Cleared when Local_Clear_Error in Loopback Sequencer Control is set.

5.11.231 Rank Logical To Physical Map (CPGC_SEQ_RANK_L2P_MAPPING)—Offset 4AB8h

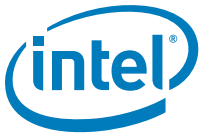
Rank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 76543210h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:28	7h RW	**Rank 7 Mapping (L2P_RANK7_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).



Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	Reserved.
26:24	6h RW	**Rank 6 Mapping (L2P_RANK6_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
23	0h RO	Reserved.
22:20	5h RW	**Rank 5 Mapping (L2P_RANK5_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
19	0h RO	Reserved.
18:16	4h RW	**Rank 4 Mapping (L2P_RANK4_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
15	0h RO	Reserved.
14:12	3h RW	**Rank 3 Mapping (L2P_RANK3_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
11	0h RO	Reserved.
10:8	2h RW	**Rank 2 Mapping (L2P_RANK2_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
7	0h RO	Reserved.
6:4	1h RW	**Rank 1 Mapping (L2P_RANK1_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).
3	0h RO	Reserved.
2:0	0h RW	**Rank 0 Mapping (L2P_RANK0_MAPPING):** Defines what physical Rank address (Memory Controller Rank Mapping) is mapped to this logical Rank address (Sequence Address Logic Domain).

5.11.232 Bank Logical to Physical Map Low (CPGC_SEQ_BANK_L2P_MAPPING_A)—Offset 4ABCh

Bank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 76543210h

Bit Range	Default & Access	Field Name (ID): Description
31:28	7h RW	**Bank 7 Mapping (L2P_BANK7_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
27:24	6h RW	**Bank 6 Mapping (L2P_BANK6_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
23:20	5h RW	**Bank 5 Mapping (L2P_BANK5_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
19:16	4h RW	**Bank 4 Mapping (L2P_BANK4_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
15:12	3h RW	**Bank 3 Mapping (L2P_BANK3_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
11:8	2h RW	**Bank 2 Mapping (L2P_BANK2_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
7:4	1h RW	**Bank 1 Mapping (L2P_BANK1_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
3:0	0h RW	**Bank 0 Mapping (L2P_BANK0_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).

5.11.233 Bank Logical to Physical Map High (CPGC_SEQ_BANK_L2P_MAPPING_B)—Offset 4AC0h

Bank Logical to Physical Mapping Lookup Table Register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FEDCBA98h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW	**Bank 15 Mapping (L2P_BANK15_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
27:24	Eh RW	**Bank 14 Mapping (L2P_BANK14_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
23:20	Dh RW	**Bank 13 Mapping (L2P_BANK13_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
19:16	Ch RW	**Bank 12 Mapping (L2P_BANK12_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
15:12	Bh RW	**Bank 11 Mapping (L2P_BANK11_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
11:8	Ah RW	**Bank 10 Mapping (L2P_BANK10_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
7:4	9h RW	**Bank 9 Mapping (L2P_BANK9_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).
3:0	8h RW	**Bank 8 Mapping (L2P_BANK8_MAPPING):** Defines what physical Bank address (Memory Controller Bank Mapping) is mapped to this logical Bank address (Sequence Address Logic Domain).

5.11.234 Rank Address Swizzle (CPGC_SEQ_RANK_ADDR_SWIZZLE)—Offset 4AC4h

This register is used to swizzle the Logical to Physical Rank bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FEDCh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:12	Fh RW	**Rank 3 Swizzle (L2P_RANK3_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Only Rank address bits available to the memory controller are valid, others should be set to 0xF.
11:8	Eh RW	**Rank 2 Swizzle (L2P_RANK2_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
7:4	Dh RW	**Rank 1 Swizzle (L2P_RANK1_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
3:0	Ch RW	**Rank 0 Swizzle (L2P_RANK0_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.

5.11.235 Bank Address Swizzle (CPGC_SEQ_BANK_ADDR_SWIZZLE)—Offset 4AC8h

This register is used to swizzle the Logical Bank and Row address bits to Physical Bank bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: DEB38h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:15	1Bh RW	**Bank 3 Swizzle (L2P_BANK3_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value. Only Bank address bits available to the memory controller are valid, others should be set to 0x1F.
14:10	1Ah RW	**Bank 2 Swizzle (L2P_BANK2_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.
9:5	19h RW	**Bank 1 Swizzle (L2P_BANK1_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.

Bit Range	Default & Access	Field Name (ID): Description
4:0	18h RW	**Bank 0 Swizzle (L2P_BANK0_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Bank address. The bits are essentially swizzled with each other.

5.11.236 Row Address Swizzle Low (CPGC_SEQ_ROW_ADDR_SWIZZLE_A)—Offset 4ACCh

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A418820h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	5h RW	**Row 5 Swizzle (L2P_ROW5_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
24:20	4h RW	**Row 4 Swizzle (L2P_ROW4_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	3h RW	**Row 3 Swizzle (L2P_ROW3_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	2h RW	**Row 2 Swizzle (L2P_ROW2_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	1h RW	**Row 1 Swizzle (L2P_ROW1_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Row 0 Swizzle (L2P_ROW0_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.11.237 Row Address Swizzle Mid (CPGC_SEQ_ROW_ADDR_SWIZZLE_B)—Offset 4AD0h

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 16A4A0E6h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	Bh RW	**Row 11 Swizzle (L2P_ROW11_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
24:20	Ah RW	**Row 10 Swizzle (L2P_ROW10_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	9h RW	**Row 9 Swizzle (L2P_ROW9_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	8h RW	**Row 8 Swizzle (L2P_ROW8_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	7h RW	**Row 7 Swizzle (L2P_ROW7_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	6h RW	**Row 6 Swizzle (L2P_ROW6_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.11.238 Row Address Swizzle High (CPGC_SEQ_ROW_ADDR_SWIZZLE_C)—Offset 4AD4h

This register is used to swizzle the Logical to Physical Row bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2307B9ACh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:25	11h RW	**Row 17 Swizzle (L2P_ROW17_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value. Only Row address bits available to the memory controller are valid, others should be set to 0x1F.
24:20	10h RW	**Row 16 Swizzle (L2P_ROW16_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
19:15	Fh RW	**Row 15 Swizzle (L2P_ROW15_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
14:10	Eh RW	**Row 14 Swizzle (L2P_ROW14_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.
9:5	Dh RW	**Row 13 Swizzle (L2P_ROW13_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

Bit Range	Default & Access	Field Name (ID): Description
4:0	Ch RW	**Row 12 Swizzle (L2P_ROW12_SWIZZLE):** Defines how a particular Logical Row or Bank bit is remapped to a Physical Row address. The bits are essentially swizzled with each other. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.11.239 Row Address XOR (CPGC_SEQ_ROW_ADDR_SWIZZLE_X)—Offset 4AD8h

Row XOR source selection for lower order Row addresses.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW	**Address DQ Invert Enable (ADDR_DQ_INV_EN):** Enables the lookup table to invert the DQs based on select Row address bits.
28:20	0h RO	Reserved.
19:15	1Fh RW	**Row 3 XOR Swizzle (L2P_ROW3_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
14:10	1Fh RW	**Row 2 XOR Swizzle (L2P_ROW2_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
9:5	1Fh RW	**Row 1 XOR Swizzle (L2P_ROW1_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR.
4:0	1Fh RW	**Row 0 XOR Swizzle (L2P_ROW0_XOR_SWIZZLE):** Row XOR source selection for lower order Row addresses. Select 31 if only using a direct mapping with no XOR. Bank Bits start at select value of 24. A value of 31 will select a constant '0' value.

5.11.240 Column Address Swizzle Low (CPGC_SEQ_COL_ADDR_SWIZZLE_A)—Offset 4ADCh

This register is used to swizzle the Logical to Physical COL bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 65432100h

Bit Range	Default & Access	Field Name (ID): Description
31:28	6h RW	**Column 6 Swizzle (L2P_COL6_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Rank Bits start at select value of 12. A value of 11 will select a constant '0' value.
27:24	5h RW	**Column 5 Swizzle (L2P_COL5_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
23:20	4h RW	**Column 4 Swizzle (L2P_COL4_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
19:16	3h RW	**Column 3 Swizzle (L2P_COL3_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
15:12	2h RW	**Column 2 Swizzle (L2P_COL2_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
11:8	1h RW	**Column 1 Swizzle (L2P_COL1_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.
7:4	0h RW	**Column 0 Swizzle (L2P_COL0_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Column Address Bit 0 always corresponds to the logical A[6] for 64B requests and A[5] for 32B requests.
3:0	0h RO	Reserved.

5.11.241 Column Address Swizzle High (CPGC_SEQ_COL_ADDR_SWIZZLE_B)—Offset 4AE0h

This register is used to swizzle the Logical to Physical COL bits.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 87h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:4	8h RW	**Column 8 Swizzle (L2P_COL8_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other. Rank Bits start at select value of 12. A value of 11 will select a constant '0' value. Only Row address bits available to the memory controller are valid, others should be set to 11.
3:0	7h RW	**Column 7 Swizzle (L2P_COL7_SWIZZLE):** Defines how a particular Logical COL or RANK bit is remapped to a Physical COL address. The bits are essentially swizzled with each other.

5.11.242 DQ Inversion Lookup Data Low (CPGC_SEQ_ROW_ADDR_DQ_MAP0)—Offset 4AE8h

DQ Map Register 0 - This register should be 64-bit aligned at an even address - 0x0 or 0x8.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** Data written to this register will be placed in the DQ Map register as a stack. Data is read from the bottom of the stack (higher locations). The last write covers Row addresses of Row[11:4] = (0..31). Reading requires you to write into the stack to get the next location. Since this is destructive, if the data is to be preserved, then the data read should be used for the write.

5.11.243 DQ Inversion Lookup Data High (CPGC_SEQ_ROW_ADDR_DQ_MAP1)—Offset 4AECh

DQ Map Register 1 - This register should be 64-bit aligned at the following odd address - 0x4 or 0xC.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** Data written to this register will be placed in the DQ Map register as a stack. Data is read from the bottom of the stack (higher locations). The last write covers Row addresses of Row[11:4] = (32..63). Reading requires you to write into the stack to get the next location. Since this is destructive, if the data is to be preserved, then the data read should be used for the write.

5.12 Registers Summary

Table 5-12. Summary of cpgc_t_submap Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3C00h	3C03h	SAI Control Policy LSB (CPGC2_ACCESS_CONTROL_POLICY_L)—Offset 3C00h	61010202h
3C04h	3C07h	SAI Control Policy MSB (CPGC2_ACCESS_CONTROL_POLICY_H)—Offset 3C04h	C00h
3C08h	3C0Bh	SAI Read Policy LSB (CPGC2_ACCESS_READ_POLICY_L)—Offset 3C08h	FFFFFF3Fh
3C0Ch	3C0Fh	SAI Read Policy MSB (CPGC2_ACCESS_READ_POLICY_H)—Offset 3C0Ch	1371FFFh
3C10h	3C13h	SAI Write Policy LSB (CPGC2_ACCESS_WRITE_POLICY_L)—Offset 3C10h	1000212h
3C14h	3C17h	SAI Write Policy MSB (CPGC2_ACCESS_WRITE_POLICY_H)—Offset 3C14h	C00h
3C18h	3C1Bh	Address Decode Repeats (CPGC2_ADDRESS_CONTROL)—Offset 3C18h	0h
3C1Ch	3C1Ch	Address Instruction (CPGC2_ADDRESS_INSTRUCTION[0])—Offset 3C1Ch	0h
3C1Dh	3C1Dh	Address Instruction (CPGC2_ADDRESS_INSTRUCTION[1])—Offset 3C1Dh	0h
3C1Eh	3C1Eh	Address Instruction (CPGC2_ADDRESS_INSTRUCTION[2])—Offset 3C1Eh	0h
3C1Fh	3C1Fh	Address Instruction (CPGC2_ADDRESS_INSTRUCTION[3])—Offset 3C1Fh	0h
3C20h	3C20h	Data Instruction (CPGC2_DATA_INSTRUCTION[0])—Offset 3C20h	0h
3C21h	3C21h	Data Instruction (CPGC2_DATA_INSTRUCTION[1])—Offset 3C21h	0h
3C22h	3C22h	Data Instruction (CPGC2_DATA_INSTRUCTION[2])—Offset 3C22h	0h
3C23h	3C23h	Data Instruction (CPGC2_DATA_INSTRUCTION[3])—Offset 3C23h	0h
3C24h	3C27h	Data Rotation Repeats (CPGC2_DATA_CONTROL)—Offset 3C24h	0h
3C28h	3C2Bh	Address and Data Repeats Status (CPGC2_ADDRESS_DATA_STATUS)—Offset 3C28h	0h
3C2Ch	3C2Ch	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[0])—Offset 3C2Ch	0h
3C2Dh	3C2Dh	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[1])—Offset 3C2Dh	0h
3C2Eh	3C2Eh	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[2])—Offset 3C2Eh	0h
3C2Fh	3C2Fh	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[3])—Offset 3C2Fh	0h

Table 5-12. Summary of cpgc_t_submap Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3C30h	3C30h	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[4])—Offset 3C30h	0h
3C31h	3C31h	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[5])—Offset 3C31h	0h
3C32h	3C32h	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[6])—Offset 3C32h	0h
3C33h	3C33h	Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[7])—Offset 3C33h	0h
3C34h	3C34h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[0])—Offset 3C34h	0h
3C35h	3C35h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[1])—Offset 3C35h	0h
3C36h	3C36h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[2])—Offset 3C36h	0h
3C37h	3C37h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[3])—Offset 3C37h	0h
3C38h	3C38h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[4])—Offset 3C38h	0h
3C39h	3C39h	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[5])—Offset 3C39h	0h
3C3Ah	3C3Ah	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[6])—Offset 3C3Ah	0h
3C3Bh	3C3Bh	Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[7])—Offset 3C3Bh	0h
3C3Ch	3C3Fh	Wait Timer Current (CPGC2_ALGORITHM_WAIT_COUNT_CURRENT)—Offset 3C3Ch	0h
3C40h	3C43h	Algorithm Wait Event Control (CPGC2_ALGORITHM_WAIT_EVENT_CONTROL)—Offset 3C40h	0h
3C44h	3C47h	Base Repeats (CPGC2_BASE_REPEATS)—Offset 3C44h	0h
3C48h	3C4Bh	Current Base Repeats (CPGC2_BASE_REPEATS_CURRENT)—Offset 3C48h	0h
3C4Ch	3C4Fh	Base Column Repeats (CPGC2_BASE_COL_REPEATS)—Offset 3C4Ch	0h
3C50h	3C53h	Block Repeats (CPGC2_BLOCK_REPEATS)—Offset 3C50h	0h
3C54h	3C57h	Current Block Repeats (CPGC2_BLOCK_REPEATS_CURRENT)—Offset 3C54h	0h
3C58h	3C58h	Command Instruction (CPGC2_COMMAND_INSTRUCTION[0])—Offset 3C58h	0h
3C59h	3C59h	Command Instruction (CPGC2_COMMAND_INSTRUCTION[1])—Offset 3C59h	0h
3C5Ah	3C5Ah	Command Instruction (CPGC2_COMMAND_INSTRUCTION[2])—Offset 3C5Ah	0h
3C5Bh	3C5Bh	Command Instruction (CPGC2_COMMAND_INSTRUCTION[3])—Offset 3C5Bh	0h
3C5Ch	3C5Ch	Command Instruction (CPGC2_COMMAND_INSTRUCTION[4])—Offset 3C5Ch	0h
3C5Dh	3C5Dh	Command Instruction (CPGC2_COMMAND_INSTRUCTION[5])—Offset 3C5Dh	0h
3C5Eh	3C5Eh	Command Instruction (CPGC2_COMMAND_INSTRUCTION[6])—Offset 3C5Eh	0h

Table 5-12. Summary of cpgc_t_submap Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3C5Fh	3C5Fh	Command Instruction (CPGC2_COMMAND_INSTRUCTION[7])—Offset 3C5Fh	0h
3C60h	3C60h	Command Instruction (CPGC2_COMMAND_INSTRUCTION[8])—Offset 3C60h	0h
3C61h	3C61h	Command Instruction (CPGC2_COMMAND_INSTRUCTION[9])—Offset 3C61h	0h

3EE0h	3EE3h	Column Address Swizzle High (CPGC_SEQ_COL_ADDR_SWIZZLE_B)—Offset 3EE0h	87h
3EE8h	3EEBh	DQ Inversion Lookup Data Low (CPGC_SEQ_ROW_ADDR_DQ_MAP0)—Offset 3EE8h	0h
3EECh	3EEFh	DQ Inversion Lookup Data High (CPGC_SEQ_ROW_ADDR_DQ_MAP1)—Offset 3EECh	0h

5.12.1 SAI Control Policy LSB (CPGC2_ACCESS_CONTROL_POLICY_L)—Offset 3C00h

Lower half of the SAI Control Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 61010202h

Bit Range	Default & Access	Field Name (ID): Description
31:0	61010202h RW	**Access Control Policy LSB (Control_Policy_L):** Lower half of the SAI Control Policy Value [31:0].

5.12.2 SAI Control Policy MSB (CPGC2_ACCESS_CONTROL_POLICY_H)—Offset 3C04h

Upper half of the SAI Control Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	C00h RW	**Access Control Policy MSB (Control_Policy_H):** Upper half of the SAI Control Policy Value [63:32].

5.12.3 SAI Read Policy LSB (CPGC2_ACCESS_READ_POLICY_L)—Offset 3C08h

Lower half of the SAI Read Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFF3Fh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFF3Fh RW	**Access Read Policy LSB (Read_Policy_L):** Lower half of the SAI Read Policy Value [31:0].

5.12.4 SAI Read Policy MSB (CPGC2_ACCESS_READ_POLICY_H)—Offset 3C0Ch

Upper half of the SAI Read Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1371FFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	1371FFFh RW	**Access Read Policy MSB (Read_Policy_H):** Upper half of the SAI Read Policy Value [63:32].

5.12.5 SAI Write Policy LSB (CPGC2_ACCESS_WRITE_POLICY_L)—Offset 3C10h

Lower half of the SAI Write Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1000212h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1000212h RW	**Access Write Policy LSB (Write_Policy_L):** Lower half of the SAI Write Policy Value [31:0].

5.12.6 SAI Write Policy MSB (CPGC2_ACCESS_WRITE_POLICY_H)—Offset 3C14h

Upper half of the SAI Write Policy.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	C00h RW	**Access Write Policy MSB (Write_Policy_H):** Upper half of the SAI Write Policy Value [63:32].

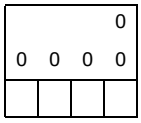
5.12.7 Address Decode Repeats (CPGC2_ADDRESS_CONTROL)—Offset 3C18h

If Algorithm_Address_#.Bits(6:6) is set to 1, then Address Decode is enabled.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5:0	0h RW	**Address Decode Repeats (Address_Decode_Rotate_Repeats):** Number of times the current Address_Instruction will repeat if Address_Decode_Enable is set (as N-1) (0=1 time). If for the current Address_Instruction, Address_Decode_Enable is set, then at the start of that Address_Instruction, initialize the XOR_Address_Pattern to a single 1 in the LSB of Column Address. Otherwise, it is initialized to all zero's. For (Address_Decode_Rotate_Repeat_Current = 0; Current_ Address_Decode_Rotate_Repeat_Current <= Address_Decode_Rotate_Repeat; Address_Decode_Rotate_Repeat_Current ++) Execute the entire Algorithm (Block Traversal, Algorithm_Instruction, Commands) with the following behavior: At the end of each complete Block Traversal, rotate the XOR Address Pattern 1 bit position from LSB to MSB (Column through Region_Bits_Column, Region_Bits_Row, Region_Num_Banks, and through Region_Num_Ranks). Region_Size.Num_Bank and Region_Size.Num_Rank numbers are converted to the equivalent number of adddress bits to cover their range (ceil(log2(Num+1))) and should be programmed to a power of 2 value (minus 1): 1,3,7, or 15. If only one Rank is being tested, then you should limit the amount in this register to the sum of the number of address bits without Rank bits.

5.12.8 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[0])—Offset 3C1Ch

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.12.9 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[1])—Offset 3C1Dh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.12.10 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[2])—Offset 3C1Eh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.12.11 Address Instruction (CPGC2_ADDRESS_INSTRUCTION[3])—Offset 3C1Fh

Address Instruction controlling Address_Order and Address_Direction reversal and decode rotation/loop.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Address Instruction (Last):** If set, then this is the last Address Instruction and the test will terminate following full execution of this instruction. If there are no Last bits set in the Address Instruction list, then the test will not stop due to a completion of the test, but will be an Infinite Test.
6	0h RW	**Address Decode Enable (Address_Decode_Enable):** Enables rotating XOR of address bits. Used in concert with the Address_Decode_Enable field in the Command_Instruction list. This bit enables repeating of the current Address_Instruction for Address_Decode_Rotate_Repeats times.

Bit Range	Default & Access	Field Name (ID): Description
5:3	0h RW	**Address Direction (Address_Direction): Address_Direction** There are 4 basic address directions and their inverse for a total of 8. We will denote this as a combination of a 1-bit field and a 2-bit field. **(0)(00) FastY -North** Increment Column and Carry Increment into Row. **(1)(00) Inv(FastY) - South** Decrement Column and Carry Decrement into Row. **(0)(01) Diagonal North East** Increment Row and Column together and Carry Increment Column into Row. **(1)(01) Inv(Diagonal) South West** Decrement Row and Column together and Carry Decrement Column into Row. **(0)(10) FastX South East** Decrement Column and Increment Row and Carry Increment Column into Row. **(1)(10) Inv(FastX) - North West** Increment Column and Decrement Row and Carry Decrement Column into Row. **(0)(11) Diagonal2 - East** Increment Row and Carry Increment into Column. **(1)(11) Inv(Diagonal2) West** Decrement Row and Carry Decrement into Column. Note that the Bank and Rank Address direction follows the same as the Column (Increment or Decrement). Note for diagonal directions, a Carry results in twice the normal increment/decrement of the Row field. Incrementing fields start at 0, and Decrementing fields start at 2^(field_block_size)-2^(field_increment)= top of block.
2:0	0h RW	**Address Order (Address_Order):** Controls the fastest changing address field, and how that carries into higher order fields. 000 Rank, Bank, Row/Col. 001 Rank, Row/Col, Bank. 010 Bank, Rank, Row/Col. 011 Bank, Row/Col, Rank. 100 Row/Col, Rank, Bank. 101 Row/Col, Bank, Rank. 110 Row/Col (Used for Offset) Rank and Bank are unchanged. 111 Row-Col (Used for Stripe Offset) No Carry from any field to another. Carry order between Row and Column is dependent on the Address_Direction field.

5.12.12 Data Instruction (CPGC2_DATA_INSTRUCTION[0])—Offset 3C20h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.12.13 Data Instruction (CPGC2_DATA_INSTRUCTION[1])—Offset 3C21h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.12.14 Data Instruction (CPGC2_DATA_INSTRUCTION[2])—Offset 3C22h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.12.15 Data Instruction (CPGC2_DATA_INSTRUCTION[3])—Offset 3C23h

Data Instruction controlling Alternate Data rotation, Background inversion pattern and Data Inversion.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Data Instruction (Last):** Last Data_Instruction indication, execution is continued at Data_Instruction[0] if the test does not otherwise terminate. This bit is implied to be set for Data_Instruction[3].
6	0h RW	**Invert Data (Invert_Data):** Globally Invert all data. Combined with the Algorithm_Instruction Invert_Data field, and the Command_Instruction or Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5:4	0h RW	**Data Background (Data_Background):** 00 - Solid 01 - Column Stripes 10 - Row Stripes 11 - Checkerboard

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Data Select Rotate Enable (Data_Select_Rotation_Enable):** Enables rotating lane pattern data. Used in concert with the Data_Select_Rotation_Enable field in the Data_Instruction list. This bit enables repeating of the current Data_Instruction for Data_Select_Rotation_Repeat times. Data generated using the advanced pattern generation will rotate by one data bit (LSB toward MSB) for each Data_Select_Rotation_Repeat. For the purpose of this shift, the order follows the Address_Instruction Address_Order and the Algorithm_Instruction[0] Address_Direction.
2:0	0h RO	Reserved.

5.12.16 Data Rotation Repeats (CPGC2_DATA_CONTROL)—Offset 3C24h

Number of times an enabled Data_Instruction will be repeated.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Data Rotation Repeats (Data_Select_Rotation_Repeats):** Any Data_Instruction with Data_Select_Rotation_Enable will repeat this many times. As N-1. (0=1 time)

5.12.17 Address and Data Repeats Status (CPGC2_ADDRESS_DATA_STATUS)—Offset 3C28h

Current number of remaining repeats for Data and Address Repeats loops.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RO/V	**Current Remaining Data Rotation Loops (Data_Select_Rotation_Repeats_Current):** Current state of Data_Select_Rotation_Repeats loop (down count).
15:6	0h RO	Reserved.
5:0	0h RO/V	**Current Remaining Address Decode Loops (Address_Decode_Rotate_Repeats_Current):** Current state of Address_Decode_Rotate_Repeats loop (down count).

5.12.18 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[0])—Offset 3C2Ch

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.19 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[1])—Offset 3C2Dh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.20 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[2])—Offset 3C2Eh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.21 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[3])—Offset 3C2Fh

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.22 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[4])—Offset 3C30h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

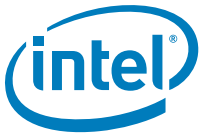
Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.23 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[5])—Offset 3C31h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.



Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.24 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[6])—Offset 3C32h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.25 Algorithm Instruction (CPGC2_ALGORITHM_INSTRUCTION[7])—Offset 3C33h

Algorithm Instruction controlling the starting Command_Instruction and data and address direction reversal.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Algorithm Instruction (Last):** If set this is the last Algorithm instruction, and the memory block is moved at its completion. Execution continues at the first Algorithm_Instruction until the test is complete. Algorithm_Instruction[7] has this bit set implicitly.
6	0h RW	**Invert Data (Invert_Data):** Invert all data for this Algorithm_Instruction. Combined with the Data_Instruction Invert_Data field, and the Command_Instruction and Offset_Command_Instruction Invert_Data field to determine the final data polarity.
5	0h RW	**Inverse Direction (Inverse_Direction):** Invert the direction as set in the current Address_Instruction for the duration of this Algorithm_Instruction.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RW	**Command Start Pointer (Command_Start_Pointer):** Starting Command_Instruction for exection of this Algorithm_Instruction. The Command_Inxtruction_Current cycles from Command_Start_Pointer, incrementing until a Command_Instruction contains the Last bit set, and then repeats for each Base_Address, Base_Repeats. Pointer to which one of the 24 command list to start with.

5.12.26 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[0])—Offset 3C34h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgment must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset to zero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. If Wait_Count_Start = 1 then the start of the Algorithm_Instruction is stalled until the Wait_Time_Current is equal to the Wait_Time. Wait_Time_Current represent the current count value from when it was last reset either by a Test starting or Wait_Count_Clear. Wait_Time_Current is a free running counter that accurately reflects the time from when it was last reset by using the following formula. Time elapsed = Wait_Timer_Current * (1/(frequency selected by Count_Value_Frequency). If Wait_Count_Clear = 1 then prior to starting the current Algorithm_Instruction, Wait_Time_Current is reset tzero. Wait_Time_Current is frozen if a Test encounters any stop condition. Wait_Time_Current is reset to zer0 when a test starts (Start_Test is asserted). Wait_Time_Current rolls over at the maximum value back tzero. Wait_Clock_Frequency(1:0) set the frequency that increment Current_Repeat_Value. The possible frequencies that can be selected are the following. Wait_Clock_Frequency = 00 = 1GHz (time = 1ns). Wait_Clock_Frequency = 01 = 1MHZ (time = 1us). Wait_Clock_Frequency = 10 = 1KHZ (time = 1ms). Wait_Clock_Frequency = 11 = DUNIT clock.
2	0h RW	**Wait Count Clear (Wait_Count_Clear):** Reset the Wait Timer at the start of this Algorithm Instruction.
1	0h RW	**Base Range Row (Base_Range_Row):** Instead of using the Base_Repeats setting, use Base_Col_Repeats setting for the size of the block for this instruction as the size of the block. This may be used for a rapid short test hitting all banks to open pages etc, or to initialize a row worth of data.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**FastY Init (FastY_Init):** FastY_Init is used to allow a background write initialization type algorithm to use FastY with Columns as the LSB address field to ensure the fastest initialization possible. ^(wD1) is a the most typical background Init function. MEMTEL uses the keyword INIT() to reference this feature. FastY_Init enables the current Algorithm_Instruction to override the current Address_Instruction[].Address_Direction and Address_Order. If set, then use the Address_Direction=000 (FastY) and Address_Order=000 (Rank, Bank, Row/Col), else use the settings defined in the current Address_Instruction.

5.12.27 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[1])—Offset 3C35h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgment must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset tzero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. If Wait_Count_Start = 1 then the start of the Algorithm_Instruction is stalled until the Wait_Time_Current is equal to the Wait_Time. Wait_Time_Current represent the current count value from when it was last reset either by a Test starting or Wait_Count_Clear. Wait_Time_Current is a free running counter that accurately reflects the time from when it was last reset by using the following formula. Time elapsed = Wait_Timer_Current * (1/(frequency selected by Count_Value_Frequency). If Wait_Count_Clear = 1 then prior to starting the current Algorithm_Instruction, Wait_Time_Current is reset tzero. Wait_Time_Current is frozen if a Test encounters any stop condition. Wait_Time_Current is reset to zer0 when a test starts (Start_Test is asserted). Wait_Time_Current rolls over at the maximum value back tzero. 5.12.30 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[4])—Offset 3C38h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgment must be a known fixed value (preventing a hang situation). The Current_Repeat_Value is reset tzero.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Wait Count Start (Wait_Count_Start):** Wait_Count_Start and Wait_Time are used to synchronize a specific time an Algorithm should start. Wait_Time is commonly used for Pause Refresh test where the read to a particular address needs to be a specific time away from when the write to an address occurs. If Wait_Count_Start = 0 then the start of the Algorithm_Instruction is not stalled. If Wait_Count_Start = 1 then the start of the Algorithm_Instruction is stalled until the Wait_Time_Current is equal to the Wait_Time. Wait_Time_Current represent the current count value from when it was last reset either by a Test starting or Wait_Count_Clear. Wait_Time_Current is a free running counter that accurately reflects the time from when it was last reset by using the following formula. Time elapsed = Wait_Timer_Current * (1/(frequency selected by Count_Value_Frequency). If Wait_Count_Clear = 1 then prior to starting the current Algorithm_Instruction, Wait_Time_Current is reset tzero. Wait_Time_Current is frozen if a Test encounters any stop condition. Wait_Time_Current is reset to zer0 when a test starts (Start_Test is asserted). Wait_Time_Current rolls over at the maximum value back tzero. Wait_Clock_Frequency(1:0) set the frequency that increment Current_Repeat_Value. The possible frequencies that can be selected are the following. Wait_Clock_Frequency = 00 = 1GHz (time = 1ns). Wait_Clock_Frequency = 01 = 1MHZ (time = 1us). Wait_Clock_Frequency = 10 = 1KHZ (time = 1ms). Wait_Clock_Frequence = 11 = DUNIT clock.
2	0h RW	**Wait Count Clear (Wait_Count_Clear):** Reset the Wait Timer at the start of this Algorithm Instruction.
1	0h RW	**Base Range Row (Base_Range_Row):** Instead of using the Base_Repeats setting, use Base_Col_Repeats setting for the size of the block for this instruction as the size of the block. This may be used for a rapid short test hitting all banks to open pages etc, or to initialize a row worth of data.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**FastY Init (FastY_Init):** FastY_Init is used to allow a background write initialization type algorithm to use FastY with Columns as the LSB address field to ensure the fastest initialization possible. ^(wD1) is a the most typical background Init function. MEMTEL uses the keyword INIT() to reference this feature. FastY_Init enables the current Algortihm_Instruction to override the current Address_Instruction[].Address_Direction and Address_Order. If set, then use the Address_Direction=000 (FastY) and Address_Order=000 (Rank, Bank, Row/Col), else use the settings defined in the current Address_Instruction.

5.12.31 Algorithm Instruction Control (CPGC2_ALGORITHM_INSTRUCTION_CTRL[5])—Offset 3C39h

Control portion of each Algorithm_Instruction.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BE Training Check Enable (BE_Train_Err_En):** Enable the BE Training Error Detection feature for individual Algorithm Instructions. This bit is inactive unless the BE_TRAIN_ERR_ENABLE bit is set in CPGC_ERR_CTL.
6	0h RW	**Select On (Select_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during chip select cycles.
5	0h RW	**Deselect On (Deselect_On):** If set, the CADB will be able to issue harassment patterns into the command and address bus during non Chip Select cycles.
4	0h RW	**Wait Event Start (Wait_Event_Start):** Wait_Event_Start causes the delay in beginning the current Algorithm_Instruction until the Event indicated by Select_Event has been acknowledged to have occurred. The Select_Event is acknowledged to be in progress. The latency between the event and the acknowledgment must be a known fixed value (preventing a hang situation). 5.12.34 Wait Timer Current (CPGC2_ALGORITHM_WAIT_COUNT_CURRENT)—Offset 3C3Ch

Current wait timer value.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**Current Wait Timer (Wait_Timer_Current):** Current wait timer value. See Wait_Time description. (down count)

5.12.35 Algorithm Wait Event Control (CPGC2_ALGORITHM_WAIT_EVENT_CONTROL)—Offset 3C40h

Algorithm wait event control.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Select Event (Select_Event):** Select_Event is decoded in the following ways. Select_Event = 00 = Read/Write Pending CAS cue is empty Select_Event = 01 = CKE Power Down Select_Event = 10 = Refresh Select_Event = 11 = Self Refresh
29:26	0h RO	Reserved.
25:24	0h RW	**Wait Clock Frequency (Wait_Clock_Frequency):** 00 - 1GHz 01 - 1MHz 10 - 1KHz 11 - Native DUNIT clock
23:20	0h RW	**Select Event Hold Timer (Timer):** Exponential timer (timer value calculated as 2^Timer). If WaitEventStart is set in the currently executing Algorithm Instruction, this timer dynamically replaces the current Wait_Time counter following the Select_Event occurring (such as SelfRefresh or PowerDown), to add a fixed delay for the Select_Event condition to remain before CPGC activity resumes.
19:16	0h RO	Reserved.
15:0	0h RW	**Wait Time (Wait_Time):** Number of clocks at Wait_Clock_Frequency to wait before starting current Algorithm_Instruction if Wait_Start = 1.

5.12.36 Base Repeats (CPGC2_BASE_REPEATS)—Offset 3C44h

Base Address Loopcount.

Access Method

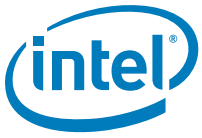
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Repeats (Base_Repeats):** Base Address Loopcount - Typically the number of Base Addresses within the Block (Row*Col*Bank*Rank) As N-1 value. This is the number of times the current Algorithm Instruction will be executed.

5.12.37 Current Base Repeats (CPGC2_BASE_REPEATS_CURRENT)—Offset 3C48h

Current Base Address Loopcount.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Base Loops (Base_Repeats_Current):** Current remaining Base Address loops (down count).

5.12.38 Base Column Repeats (CPGC2_BASE_COL_REPEATS)—Offset 3C4Ch

Base Address Loopcount - Alternate.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Column Repeats (Base_Col_Repeats):** Alternate Base_Address_Loopcount. Often used to initialize a Row or Column worth of data. This is used when Base_Range_Row field of ALGORITHM_INSTRUCTION_CTL is activated. This is the number of times the current Algorithm Instruction will be executed.

5.12.39 Block Repeats (CPGC2_BLOCK_REPEATS)—Offset 3C50h

Block Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Block Repeats (Block_Repeats):** Block Loopcount. Typically the number of Blocks to be tested to traverse the entire Tested Region. (2^region_size/2^block_size -1) As N-1 value. This is the number of times the entire list of Algorithm Instructions will be executed.

5.12.40 Current Block Repeats (CPGC2_BLOCK_REPEATS_CURRENT)—Offset 3C54h

Current Block Loopcount.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Current Remaining Block Loops (Block_Repeats_Current):** Current Block Loopcount (down count).

5.12.41 Command Instruction (CPGC2_COMMAND_INSTRUCTION[0])—Offset 3C58h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.42 Command Instruction (CPGC2_COMMAND_INSTRUCTION[1])—Offset 3C59h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.43 Command Instruction (CPGC2_COMMAND_INSTRUCTION[2])—Offset 3C5Ah

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.44 Command Instruction (CPGC2_COMMAND_INSTRUCTION[3])—Offset 3C5Bh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.45 Command Instruction (CPGC2_COMMAND_INSTRUCTION[4])—Offset 3C5Ch

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.46 Command Instruction (CPGC2_COMMAND_INSTRUCTION[5])—Offset 3C5Dh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.47 Command Instruction (CPGC2_COMMAND_INSTRUCTION[6])—Offset 3C5Eh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.48 Command Instruction (CPGC2_COMMAND_INSTRUCTION[7])—Offset 3C5Fh

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.49 Command Instruction (CPGC2_COMMAND_INSTRUCTION[8])—Offset 3C60h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.50 Command Instruction (CPGC2_COMMAND_INSTRUCTION[9])—Offset 3C61h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.51 Command Instruction (CPGC2_COMMAND_INSTRUCTION[10])—Offset 3C62h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.52 Command Instruction (CPGC2_COMMAND_INSTRUCTION[11])—Offset 3C63h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.53 Command Instruction (CPGC2_COMMAND_INSTRUCTION[12])—Offset 3C64h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.54 Command Instruction (CPGC2_COMMAND_INSTRUCTION[13])—Offset 3C65h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.55 Command Instruction (CPGC2_COMMAND_INSTRUCTION[14])—Offset 3C66h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.56 Command Instruction (CPGC2_COMMAND_INSTRUCTION[15])—Offset 3C67h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.57 Command Instruction (CPGC2_COMMAND_INSTRUCTION[16])—Offset 3C68h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Last Command Instruction (Last):** If set this is the last Command Instruction for this Algorithm Command Sequence.Command_Instruction[23] has this bit set implicitly. Execution continues at the Command_Instruction pointed to by the Algorithm_Instruction's Command_Start_Pointer until the end of the Algorithm_Instruction.
6	0h RW	**Invert Data (Invert_Data):** Invert the data used for this command. This is combined with the Algorithm_Instruction and Data_Instruction Invert_Data bits for Base accesses. For Offset accesses, it is further combined with the Offset_Command Invert_Data bit.
5	0h RW	**Address Decode or PRBS Enable (Address_Decode_or_PRBS_En):** Enable rotating XOR of address bits or PRBS address generation. If the Address_Decode_Enable field in the Address_Instruction list is active, and [name] is also active, then for the access of this Command_Instruction, the address will be XOR with the XOR_Address_Pattern. If the Address_Decode_Enable field in the Address_Instruction list is inactive (0), and the Address_PRBS_Enable bit in the Address_PRBS_Control register is set, then the desired address bits will be replaced with the PRBS generated value.
4	0h RW	**Alternate Data Select (Alternate_Data):** Use the alternate zero data source instead of the UniSequencers and Pattern_Select.
3	0h RW	**Hammer Enable (Hammer):** This Base command will be repeated Hammer_Repeats times.
2	0h RW	**Offset Command Enable (Offset):** If set, this is an Offset operation, and the selected Offset_Group will be executed in its place. In this case the Write, Hammer, and Alternate_Data fields are ignored.
1	0h RW	**Offset Group Selection (Offset_Group):** Selects which Offset_Group will be used if Offset field is set.
0	0h RW	**Write Command (Write):** A Base Write operation will be performed.

5.12.58 Command Instruction (CPGC2_COMMAND_INSTRUCTION[17])—Offset 3C69h

Command Instruction controlling access type, data polarity, and offset sequence selection.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
