17.1.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.1.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.1.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved

17.1.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.1.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

17.1.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.

17.1.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved for cfg_trsvd0. Not applicable since frc_clk_srst_en is tied to '0.

5:4	1h RW	**cfg_trsvd3 (trsvd3):** cfg_trsvd3(cfg_trsvd3): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks
3:2	1h RW	**cfg_trsvd2 (trsvd2):** cfg_trsvd2(cfg_trsvd2): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Reserved (RSVD_1):** Reserved for cfg_trsvd1. Not applicable since frc_clk_srst_en is tied to 0.

17.1.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.1.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

17.1.89 Figure Of Merit Status (FOMS)—Offset 464h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.1.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.1.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 1 Transmitter Coefficient Override Enable (L1TCOE):** Lane 1 Transmitter Coefficient Override Enable (L1TCOE): When set, the transmitter coefficient override values LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Lane 0 Transmitter Coefficient Override Enable (L0TCOE):** Lane 0 Transmitter Coefficient Override Enable (L0TCOE): When set, the transmitter coefficient override values LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. 17.1.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.1.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

17.1.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.1.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

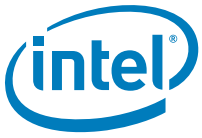
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.102 Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.



Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.103 Lane0 LF and FS (L0LFFS)—Offset 51Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.104 Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.105 Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.106 Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.117 Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.118 Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.119 Lane2 LF and FS (L2LFFS)—Offset 55Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.120 Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.1.121 Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

This minimum time of CLKOUT_SRCn[P/N] staying gated at low voltage allows for the PCIe device's voltage rail to ramp to safe level on the exit from L1Off state before being driven with clock from the PCH. 0000: 0us minimum elapsed time from Effective Mapped CLKREQ# assertion to corresponding CLKOUT_SRCn ungated Default This setting is for PCIe device that does not support L1Off. This setting must also be used when corresponding CLKOUT_SRCn is configured for non-PCIe clock use, i.e. as MEX reference clock, etc. 0001: 5us minimum elapsed time ... 0010: 10us minimum elapsed time ... 0011: 15us minimum elapsed time ... 0100: 20us minimum elapsed time ... 0101: 25us minimum elapsed time ... 0110: 30us minimum elapsed time ... 0111: 35us minimum elapsed time ... 1000: 40us minimum elapsed time ... 1001: 45us minimum elapsed time ... 1010: 50us minimum elapsed time ... 1011: 60us minimum elapsed time ... 1100: 70us minimum elapsed time ... 1101: 80us minimum elapsed time ... 1110: 90us minimum elapsed time ... 1111: 100us minimum elapsed time .
3:0	RW	0x0 (rst)	**TclkReqSRC0 (TclkReqSRC0)** Minimum Time from Effective Mapped CLKREQ# assertion to CLKOUT_SRC0 ungated (TclkreqSRC0): Minimum elapsed time from the Effective Mapped CLKREQ# signal assertion to the corresponding PCIe SRC Clock being allowed to toggle. This minimum time of CLKOUT_SRCn[P/N] staying gated at low voltage allows for the PCIe device's voltage rail to ramp to safe level on the exit from L1Off state before being driven with clock from the PCH. 0000: 0us minimum elapsed time from Effective Mapped CLKREQ# assertion to corresponding CLKOUT_SRCn ungated Default This setting is for PCIe device that does not support L1Off. This setting must also be used when corresponding CLKOUT_SRCn is configured for non-PCIe clock use, i.e. as MEX reference clock, etc. 0001: 5us minimum elapsed time ... 0010: 10us minimum elapsed time ... 0011: 15us minimum elapsed time ... 0100: 20us minimum elapsed time ... 0101: 25us minimum elapsed time ... 0110: 30us minimum elapsed time ... 0111: 35us minimum elapsed time ... 1000: 40us minimum elapsed time ... 1001: 45us minimum elapsed time ... 1010: 50us minimum elapsed time ... 1011: 60us minimum elapsed time ... 1100: 70us minimum elapsed time ... 1101: 80us minimum elapsed time ... 1110: 90us minimum elapsed time ... 1111: 100us minimum elapsed time .

17.2 Registers Summary

Table 17-2. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h

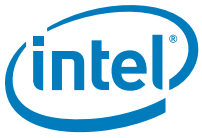

Table 17-2. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h

Table 17-2. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
120h	123h	Header Log DW2 (HL_DW2)—Offset 120h	0h
124h	127h	Header Log DW3 (HL_DW3)—Offset 124h	0h
128h	12Bh	Header Log DW4 (HL_DW4)—Offset 128h	0h
12Ch	12Fh	Root Error Command (REC)—Offset 12Ch	0h
134h	137h	Error Source Identification (ESID)—Offset 134h	0h
140h	143h	ACS Extended Capability Header (ACSECH)—Offset 140h	0h
144h	147h	ACS Capability Register (ACSCAPR)—Offset 144h	Fh
148h	14Bh	ACS Control Register (ACSCTLR)—Offset 148h	0h
150h	153h	PTM Extended Capability Header (PTMECH)—Offset 150h	0h
154h	157h	PTM Capability Register (PTMCAPR)—Offset 154h	400h
158h	15Bh	PTM Control Register (PTMCTLR)—Offset 158h	0h
200h	203h	L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h	0h
204h	207h	L1 Sub-States Capabilities (L1SCAP)—Offset 204h	28281Fh
208h	20Bh	L1 Sub-States Control 1 (L1SCTL1)—Offset 208h	0h
20Ch	20Fh	L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch	28h
220h	223h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h	0h
224h	227h	Link Control 3 (LCTL3)—Offset 224h	0h
228h	22Bh	Lane Error Status (LES)—Offset 228h	0h
22Ch	22Fh	Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch	7F7F7F7Fh
230h	233h	Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h	7F7F7F7Fh
300h	303h	PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h	A64F96h
304h	307h	PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h	1BC00B86h
328h	32Bh	PCI Express Status 1 (PCIESTS1)—Offset 328h	0h
32Ch	32Fh	PCI Express Status 2 (PCIESTS2)—Offset 32Ch	0h
330h	333h	PCI Express Compliance Measurement Mode (CMM) Port Control (PCIECMMPC)—Offset 330h	2A000016h
334h	337h	PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h	4ABCB5BCh
390h	393h	PTM Propagation Delay (PTMPD)—Offset 390h	0h
394h	397h	PTM Lower Local Master Time (PTMLLMT)—Offset 394h	0h
398h	39Bh	PTM Upper Local Master Time (PTMULMT)—Offset 398h	0h
39Ch	39Fh	PTM Pipe Stage Delay Configuration 1 (PTMPSDC1)—Offset 39Ch	0h
3A0h	3A3h	PTM Pipe Stage Delay Configuration 2 (PTMPSDC2)—Offset 3A0h	0h
3A4h	3A7h	PTM Pipe Stage Delay Configuration 3 (PTMPSDC3)—Offset 3A4h	0h
3A8h	3ABh	PTM Pipe Stage Delay Configuration 4 (PTMPSDC4)—Offset 3A8h	0h
3ACh	3AFh	PTM Pipe Stage Delay Configuration 5 (PTMPSDC5)—Offset 3ACh	0h
3B0h	3B3h	PTM Extended Config (PTMECFG)—Offset 3B0h	0h
3B4h	3B7h	PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h	0h
3B8h	3BBh	PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h	0h
414h	417h	Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h	0h

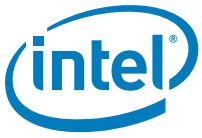

Table 17-2. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
418h	41Bh	Thermal and Power Throttling (TNPT)—Offset 418h	930h
41Ch	41Fh	Dynamic Lane Switch (DYNLNSW)—Offset 41Ch	0h
428h	42Bh	Power Control Enable (PCE)—Offset 428h	9h
42Ch	42Fh	PGCB Control1 (PGCBCTL1)—Offset 42Ch	14155555h
430h	433h	PGCB Control2 (PGCBCTL2)—Offset 430h	54h
450h	453h	Equalization Configuration 1 (EQCFG1)—Offset 450h	3102h
454h	457h	Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h	0h
458h	45Bh	Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h	0h
45Ch	45Fh	Remote Transmitter Preset Coefficient List 3 (RTPCL3)—Offset 45Ch	0h
460h	463h	Remote Transmitter Preset Coefficient List 4 (RTPCL4)—Offset 460h	0h
464h	467h	Figure Of Merit Status (FOMS)—Offset 464h	0h
468h	46Bh	Hardware Autonomous Equalization Control (HAEQ)—Offset 468h	A0080E00h
470h	473h	Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h	0h
474h	477h	Local Transmitter Coefficient Override 2 (LTCO2)—Offset 474h	0h
478h	47Bh	GEN3 L0s Control (G3L0SCTL)—Offset 478h	C00281Eh
47Ch	47Fh	Equalization Configuration 2 (EQCFG2)—Offset 47Ch	A001h
480h	483h	Monitor Mux (MM)—Offset 480h	0h
500h	503h	Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h	0h
504h	507h	Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h	0h
508h	50Bh	Lane0 P3 and P4 Preset-Coefficient Mapping (L0P3P4PCM)—Offset 508h	0h
50Ch	50Fh	Lane0 P5 and P6 Preset-Coefficient Mapping (L0P5P6PCM)—Offset 50Ch	0h
510h	513h	Lane0 P6, P7 and P8 Preset-Coefficient Mapping (L0P6P7P8PCM)—Offset 510h	0h
514h	517h	Lane0 P8 and P9 Preset-Coefficient Mapping (L0P8P9PCM)—Offset 514h	0h
518h	51Bh	Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h	0h
51Ch	51Fh	Lane0 LF and FS (L0LFFS)—Offset 51Ch	0h
520h	523h	Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h	0h
524h	527h	Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h	0h
528h	52Bh	Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h	0h
52Ch	52Fh	Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch	0h
530h	533h	Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h	0h
534h	537h	Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h	0h
538h	53Bh	Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h	0h
53Ch	53Fh	Lane1 LF and FS (L1LFFS)—Offset 53Ch	0h
540h	543h	Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h	0h
544h	547h	Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h	0h
548h	54Bh	Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h	0h
54Ch	54Fh	Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch	0h

Table 17-2. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
550h	553h	Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h	0h
554h	557h	Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h	0h
558h	55Bh	Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h	0h
55Ch	55Fh	Lane2 LF and FS (L2LFFS)—Offset 55Ch	0h
560h	563h	Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h	0h
564h	567h	Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h	0h
568h	56Bh	Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h	0h
56Ch	56Fh	Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch	0h
570h	573h	Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h	0h
574h	577h	Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h	0h
578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h

17.2.1 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

17.2.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.2.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.2.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secodary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

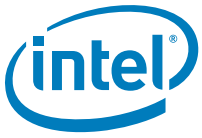
17.2.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.



17.2.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.2.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.

Bit Range	Default & Access	Field Name (ID): Description
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

17.2.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

17.2.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.2.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

17.2.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

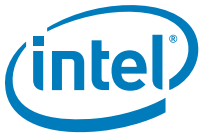
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.2.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port

Bit Range	Default & Access	Field Name (ID): Description
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

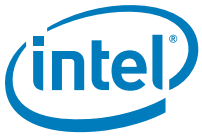
17.2.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)



Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

17.2.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

17.2.15 Link Capabilities (LCAP)—Offset 4Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance (ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL

Bit Range	Default & Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.2.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

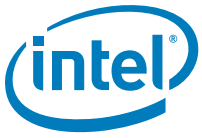
Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.



Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

17.2.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.

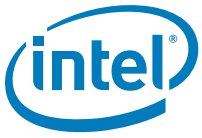
Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.2.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.2.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.2.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.2.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

17.2.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.2.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.2.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

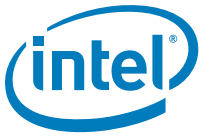
Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

17.2.25 Slot Capabilities 2 (SLCAP2)—Offset 74h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

17.2.26 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

17.2.27 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.

Bit Range	Default & Access	Field Name (ID): Description
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.2.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.2.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.2.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

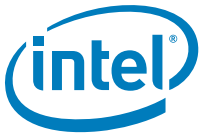
17.2.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: C8030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

17.2.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.2.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.2.34 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.2.35 Uncorrectable Error Mask (UEM)—Offset 108h

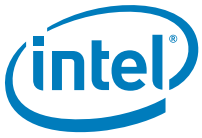
When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.2.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.2.37 Correctable Error Status (CES)—Offset 110h

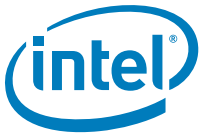
This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.2.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.2.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.2.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.2.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.2.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.2.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.2.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.2.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.2.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

17.2.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.2.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.2.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.2.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.2.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.2.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.2.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.2.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.2.55 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 28h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

17.2.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

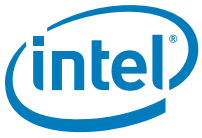
Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.



Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.2.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.2.58 Lane Error Status (LES)—Offset 228h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.

17.2.59 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 7F7F7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:28	7h RW	**Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH):** Upstream Port Lane 1 Receiver Preset Hint (UPL1RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
27:24	Fh RW	**Upstream Port Lane 1 Transmitter Preset (UPL1TP):** Upstream Port Lane 1 Transmitter Preset (UPL1TP): Field contains the Transmit Preset value sent or received during Link Equalization.
23	0h RO	**Reserved (RSVD_1):** Reserved.
22:20	7h RW	**Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH):** Downstream Port Lane 1 Receiver Preset Hint (DPL1RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 1 Transmitter Preset (DPL1TP):** Downstream Port Lane 1 Transmitter Preset (DPL1TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	**Reserved (RSVD_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	7h RW	**Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH):** Upstream Port Lane 0 Receiver Preset Hint (UPL0RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 0 Transmitter Preset (UPL0TP):** Upstream Port Lane 0 Transmitter Preset (UPL0TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved (RSVD_3):** Reserved.
6:4	7h RW	**Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH):** Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	Fh RW	**Downstream Port Lane 0 Transmitter Preset (DPL0TP):** Downstream Port Lane 0 Transmitter Preset (DPL0TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.2.60 Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 7F7F7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
30:28	7h RW	**Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH):** Upstream Port Lane 3 Receiver Preset Hint (UPL3RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
27:24	Fh RW	**Upstream Port Lane 3 Transmitter Preset (UPL3TP):** Upstream Port Lane 3 Transmitter Preset (UPL3TP): Field contains the Transmit Preset value sent or received during Link Equalization.
23	0h RO	**Reserved (RSVD_1):** Reserved
22:20	7h RW	**Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH):** Downstream Port Lane 3 Receiver Preset Hint (DPL3RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
19:16	Fh RW	**Downstream Port Lane 3 Transmitter Preset (DPL3TP):** Downstream Port Lane 3 Transmitter Preset (DPL3TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.
15	0h RO	**Reserved (RSVD_2):** Reserved
14:12	7h RW	**Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH):** Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 2 Transmitter Preset (UPL2TP):** Upstream Port Lane 2 Transmitter Preset (UPL2TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved (RSVD_3):** Reserved
6:4	7h RW	**Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH):** Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.

Bit Range	Default & Access	Field Name (ID): Description
3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.2.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: A64F96h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved,
23:20	Ah RW	**Gen 2 x1 (G2X1):** Gen 2 x1 (G2X1): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 4) * 64 link clocks. For 512B MPS: (nnn + 7) * 64 link clocks. For PCIE Gen 2 speed and x1 width For Mobile Express HS-Gear 3 speed and x1 width.

Bit Range	Default & Access	Field Name (ID): Description
19:16	6h RW	**Gen 2 x2 (G2X2):** Gen 2 x2 (G2X2): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 2) * 64 link clocks. For 512B MPS: (nnn + 4) * 64 link clocks. For PCIe Gen 2 speed and x2 width. For Mobile Express HS-Gear 3 speed and x2 width.
15:12	4h RW	**Gen 2 x4 (G2X4):** Gen 2 x4 (G2X4): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 2) * 64 link clocks. For 512B MPS: (nnn + 3) * 64 link clocks. For PCIe Gen 2 speed and x4 width. For Mobile Express HS-Gear 3 speed and x4 width.
11:8	Fh RW	**Gen 1 x1 (G1X1):** Gen 1 x1 (G1X1): Determines how many symbol times (i.e. number of link clock cycles) the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 10) * 64 link clocks. For 512B MPS: (nnn + 17) * 64 link clocks. For PCIe Gen 1 speed and x1 width. For Mobile Express HS-Gear 2 speed and x1 width.
7:4	9h RW	**Gen 1 x2 (G1X2):** Gen 1 x2 (G1X2): Determines how many symbol times (i.e. number of link clock cycles) the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 4) * 64 link clocks. For 512B MPS: (nnn + 8) * 64 link clocks. For PCIe Gen 1 speed and x2 width. For Mobile Express HS-Gear 2 speed and x2 width.

Bit Range	Default & Access	Field Name (ID): Description
3:0	6h RW	**Gen 1 x4 (G1X4):** Gen 1 x4 (G1X4): Determines how many symbol times (i.e. number of link clock cycles) the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/ Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 2) * 64 link clocks. For 512B MPS: (nnn + 3) * 64 link clocks. For PCIe Gen 1 speed and x4 width. For Mobile Express HS-Gear 2 speed and x4 width.

17.2.62 PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 1BC00B86h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Lane 0 Lane Number (L0LN):** Lane 0 Lane Number(L0LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 0 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
29:28	1h RW	**Lane 1 Lane Number (L1LN):** Lane 1 Lane Number(L1LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 1 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.

Bit Range	Default & Access	Field Name (ID): Description
27:26	2h RW	**Lane 2 Lane Number (L2LN):** Lane 2 Lane Number(L2LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 2 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
25:24	3h RW	**Lane 3 Lane Number (L3LN):** Lane 3 Lane Number(L3LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 3 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
23	1h RW	**Loopback Master EQ TS1 Enable (LMEQTS1E):** Loopback Master EQ TS1 Enable(LMEQTS1E): When set, the Loopback Master will use EQ TS1 Ordered Sets to direct the Loopback Slave into Loopback from Configuration.Linkwidth.Start. The Preset field of the EQ TS1 Ordered Sets will be specified by Upstream Port Lane X Transmitter Preset and Upstream Port Lane X Receiver Preset Hint fields in the Lane Equalization Control registers.
22	1h RW	**Loopback Master EQ Change Enable (LMEQCE):** Loopback Master EQ Change Enable(LMEQCE): This field is applicable to the case where Loopback is entered from Recovery state. When set, the Loopback Master will set the EC field of the GEN3 TS1 Ordered Sets to the appropriate value based on the ports direction(10b or 11b) to direct the Loopback Slave into Loopback from Recovery state. The Preset field of the GEN3 TS1 Ordered Sets will be specified by Upstream Port Lane X Transmitter Preset and Upstream Port Lane X Receiver Preset Hint fields in the Lane Equalization Control registers.
21:12	0h RO	**Reserved (RSVD):** Reserved
11:8	Bh RW	**Gen 3 x1 (G3X1):** Gen 3 x1 (G3X1): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 4) * 64 link clocks. For 512B MPS: (nnn + 8) * 64 link clocks. For Gen 3 speed and x1 width

Bit Range	Default & Access	Field Name (ID): Description

17.2.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

17.2.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.2.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

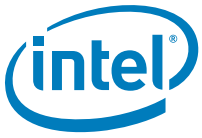
17.2.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved



17.2.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.
15:12	0h RO	**Reserved (RSVD):** Reserved
11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.2.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

17.2.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.

17.2.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved for cfg_trsvd0. Not applicable since frc_clk_srst_en is tied to '0.

1:0	0h RO	**Reserved (RSVD_1):** Reserved for cfg_trsvd1. Not applicable since frc_clk_srst_en is tied to 0.

17.2.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

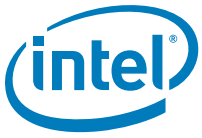
Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.



Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.2.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description

Hardware will scale the coefficient accordingly based on the remote device FS value.

17.2.89 Figure Of Merit Status (FOMS)—Offset 464h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.2.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.2.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 1 Transmitter Coefficient Override Enable (L1TCOE):** Lane 1 Transmitter Coefficient Override Enable (L1TCOE): When set, the transmitter coefficient override values LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Lane 0 Transmitter Coefficient Override Enable (L0TCOE):** Lane 0 Transmitter Coefficient Override Enable (L0TCOE): When set, the transmitter coefficient override values LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
23:18	0h RW	**Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO):** Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO): For Downstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L1TCOE = 1.
17:12	0h RW	**Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO):** Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO): For Downstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L1TCOE = 1.
11:6	0h RW	**Lane 0 Transmitter Post-Cursor Coefficient Override (L0TPOSTCO):** Lane 0 Transmitter Post-Cursor Coefficient Override (L0TPOSTCO): For Downstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L0TCOE = 1.
5:0	0h RW	**Lane 0 Transmitter Pre-Cursor Coefficient Override (L0TPRECO):** Lane 0 Transmitter Pre-Cursor Coefficient Override (L0TPRECO): For Downstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L0TCOE = 1.

17.2.92 Local Transmitter Coefficient Override 2 (LTCO2)—Offset 474h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 3 Transmitter Coefficient Override Enable (L3TCOE):** Lane 3 Transmitter Coefficient Override Enable (L3TCOE): When set, the transmitter coefficient override values LTPCO2.L3TPRECO and LTPCO2.L3TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO2.L3TPRECO and LTPCO2.L3TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
24	0h RW	**Lane 2 Transmitter Coefficient Override Enable (L2TCOE):** Lane 2 Transmitter Coefficient Override Enable (L2TCOE): When set, the transmitter coefficient override values LTPCO2.L2TPRECO and LTPCO2.L2TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO2.L2TPRECO and LTPCO2.L2TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

5:0	0h RW	**Lane 2 Transmitter Pre-Cursor Coefficient Override (L2TPRECO):** Lane 2 Transmitter Pre-Cursor Coefficient Override (L2TPRECO): For Downstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO2.L2TCOE = 1.

17.2.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.2.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

17.2.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.2.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.104 Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.105 Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.106 Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.107 Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.108 Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.

Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.119 Lane2 LF and FS (L2LFFS)—Offset 55Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.120 Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.121 Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h

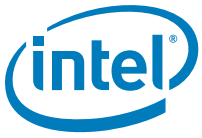
This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.122 Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.123 Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch

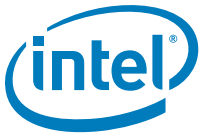
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.124 Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.125 Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h

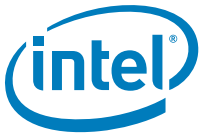
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.126 Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.2.127 Lane3 LF and FS (L3LFFS)—Offset 57Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 20 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3 Registers Summary

Table 17-3. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h

Table 17-3. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h
D4h	D7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	800h
E4h	E7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h
120h	123h	Header Log DW2 (HL_DW2)—Offset 120h	0h
124h	127h	Header Log DW3 (HL_DW3)—Offset 124h	0h
128h	12Bh	Header Log DW4 (HL_DW4)—Offset 128h	0h
12Ch	12Fh	Root Error Command (REC)—Offset 12Ch	0h
134h	137h	Error Source Identification (ESID)—Offset 134h	0h
140h	143h	ACS Extended Capability Header (ACSECH)—Offset 140h	0h
144h	147h	ACS Capability Register (ACSCAPR)—Offset 144h	Fh
148h	14Bh	ACS Control Register (ACSCTLR)—Offset 148h	0h
150h	153h	PTM Extended Capability Header (PTMECH)—Offset 150h	0h
154h	157h	PTM Capability Register (PTMCAPR)—Offset 154h	400h
158h	15Bh	PTM Control Register (PTMCTLR)—Offset 158h	0h
200h	203h	L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h	0h
204h	207h	L1 Sub-States Capabilities (L1SCAP)—Offset 204h	28281Fh
208h	20Bh	L1 Sub-States Control 1 (L1SCTL1)—Offset 208h	0h
20Ch	20Fh	L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch	28h
220h	223h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h	0h
224h	227h	Link Control 3 (LCTL3)—Offset 224h	0h
228h	22Bh	Lane Error Status (LES)—Offset 228h	0h
22Ch	22Fh	Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch	7F7F7F7Fh

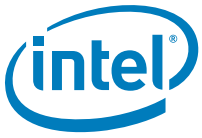


Table 17-3. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
230h	233h	Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h	7F7F7F7Fh
300h	303h	PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h	A64F96h
304h	307h	PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h	1BC00B86h
314h	317h	PCI Express Status 1 (PCIESTS1)—Offset 328h	54262A13h
328h	32Bh	PCI Express Status 1 (PCIESTS1)—Offset 328h	0h
32Ch	32Fh	PCI Express Status 2 (PCIESTS2)—Offset 32Ch	0h
330h	333h	PCI Express Compliance Measurement Mode (CMM) Port Control (PCIECMMPC)—Offset 330h	2A000016h
334h	337h	PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h	4ABCB5BCh
390h	393h	PTM Propagation Delay (PTMPD)—Offset 390h	0h
394h	397h	PTM Lower Local Master Time (PTMLLMT)—Offset 394h	0h
398h	39Bh	PTM Upper Local Master Time (PTMULMT)—Offset 398h	0h
39Ch	39Fh	PTM Pipe Stage Delay Configuration 1 (PTMPSDC1)—Offset 39Ch	0h
3A0h	3A3h	PTM Pipe Stage Delay Configuration 2 (PTMPSDC2)—Offset 3A0h	0h
3A4h	3A7h	PTM Pipe Stage Delay Configuration 3 (PTMPSDC3)—Offset 3A4h	0h
3A8h	3ABh	PTM Pipe Stage Delay Configuration 4 (PTMPSDC4)—Offset 3A8h	0h
3ACh	3AFh	PTM Pipe Stage Delay Configuration 5 (PTMPSDC5)—Offset 3ACh	0h
3B0h	3B3h	PTM Extended Config (PTMECFG)—Offset 3B0h	0h
3B4h	3B7h	PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h	0h
3B8h	3BBh	PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h	0h
414h	417h	Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h	0h
418h	41Bh	Thermal and Power Throttling (TNPT)—Offset 418h	930h
41Ch	41Fh	Dynamic Lane Switch (DYNLNSW)—Offset 41Ch	0h
420h	423h	Power Control Enable (PCE)—Offset 428h	2AE8146h
428h	42Bh	Power Control Enable (PCE)—Offset 428h	9h
42Ch	42Fh	PGCB Control1 (PGCBCTL1)—Offset 42Ch	14155555h
430h	433h	PGCB Control2 (PGCBCTL2)—Offset 430h	54h
450h	453h	Equalization Configuration 1 (EQCFG1)—Offset 450h	3102h
454h	457h	Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h	0h
458h	45Bh	Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h	0h
45Ch	45Fh	Remote Transmitter Preset Coefficient List 3 (RTPCL3)—Offset 45Ch	0h
460h	463h	Remote Transmitter Preset Coefficient List 4 (RTPCL4)—Offset 460h	0h
464h	467h	Figure Of Merit Status (FOMS)—Offset 464h	0h
468h	46Bh	Hardware Autonomous Equalization Control (HAEQ)—Offset 468h	A0080E00h
470h	473h	Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h	0h
474h	477h	Local Transmitter Coefficient Override 2 (LTCO2)—Offset 474h	0h
478h	47Bh	GEN3 L0s Control (G3L0SCTL)—Offset 478h	C00281Eh
47Ch	47Fh	Equalization Configuration 2 (EQCFG2)—Offset 47Ch	A001h
480h	483h	Monitor Mux (MM)—Offset 480h	0h
500h	503h	Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h	0h

Table 17-3. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
504h	507h	Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h	0h
508h	50Bh	Lane0 P3 and P4 Preset-Coefficient Mapping (L0P3P4PCM)—Offset 508h	0h
50Ch	50Fh	Lane0 P5 and P6 Preset-Coefficient Mapping (L0P5P6PCM)—Offset 50Ch	0h
510h	513h	Lane0 P6, P7 and P8 Preset-Coefficient Mapping (L0P6P7P8PCM)—Offset 510h	0h
514h	517h	Lane0 P8 and P9 Preset-Coefficient Mapping (L0P8P9PCM)—Offset 514h	0h
518h	51Bh	Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h	0h
51Ch	51Fh	Lane0 LF and FS (L0LFFS)—Offset 51Ch	0h
520h	523h	Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h	0h
524h	527h	Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h	0h
528h	52Bh	Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h	0h
52Ch	52Fh	Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch	0h
530h	533h	Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h	0h
534h	537h	Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h	0h
538h	53Bh	Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h	0h
53Ch	53Fh	Lane1 LF and FS (L1LFFS)—Offset 53Ch	0h
540h	543h	Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h	0h
544h	547h	Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h	0h
548h	54Bh	Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h	0h
54Ch	54Fh	Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch	0h
550h	553h	Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h	0h
554h	557h	Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h	0h
558h	55Bh	Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h	0h
55Ch	55Fh	Lane2 LF and FS (L2LFFS)—Offset 55Ch	0h
560h	563h	Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h	0h
564h	567h	Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h	0h
568h	56Bh	Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h	0h
56Ch	56Fh	Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch	0h
570h	573h	Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h	0h
574h	577h	Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h	0h
578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h

17.3.1 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

17.3.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.3.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.3.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secodary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

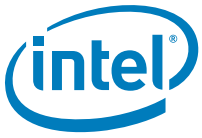
17.3.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.



Bit Range	Default & Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

17.3.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.3.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

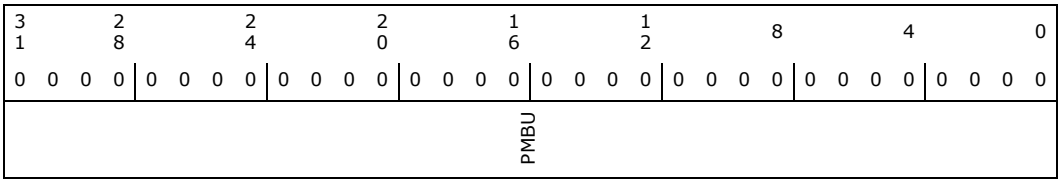
17.3.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

17.3.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.3.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

17.3.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

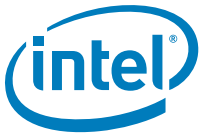
17.3.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port



Bit Range	Default & Access	Field Name (ID): Description
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

17.3.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

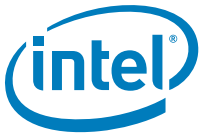
17.3.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup



Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

17.3.15 Link Capabilities (LCAP)—Offset 4Ch

Access Method

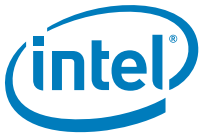
Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL

Bit Range	Default & Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h



Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.3.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.

Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

17.3.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.

Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.3.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.3.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.3.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.3.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

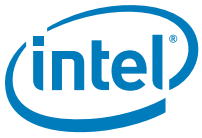
17.3.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.



Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.3.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.3.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

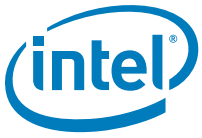
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.



Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

17.3.25 Slot Capabilities 2 (SLCAP2)—Offset 74h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

17.3.26 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

17.3.27 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.

Bit Range	Default & Access	Field Name (ID): Description
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.3.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.3.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.3.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

17.3.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: C8030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

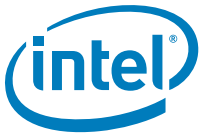
17.3.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.



Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.3.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.3.34 Uncorrectable Error Status (UES)—Offset 104h

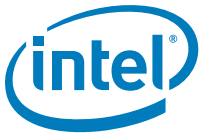
This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received



Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.3.35 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.3.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

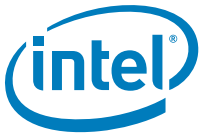
This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.



Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.3.37 Correctable Error Status (CES)—Offset 110h

This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.3.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.3.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capable (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.3.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.3.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.3.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.3.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.3.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.3.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.3.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

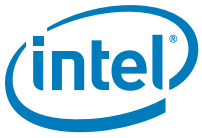
17.3.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.3.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.3.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.3.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.3.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.3.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.3.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

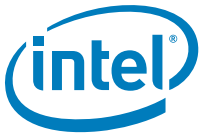
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static



Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.3.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.3.55 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 28h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

17.3.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.3.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.3.58 Lane Error Status (LES)—Offset 228h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.

17.3.59 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 7F7F7F7Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.

3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.3.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependent on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

17.3.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

17.3.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.3.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.3.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved

17.3.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.
15:12	0h RO	**Reserved (RSVD):** Reserved
11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.3.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

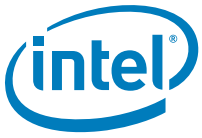
17.3.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.



17.3.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description

17.3.83 PGCB Control2 (PGCBCTL2)—Offset 430h

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 54h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved.
7:6	1h RW	**cfg_trsvd4 (trsvd4):** cfg_trsvd4(cfg_trsvd4): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Reserved (RSVD_1):** Reserved for cfg_trsvd1. Not applicable since frc_clk_srst_en is tied to 0.

17.3.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.3.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1):** Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1): For Downstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
5:0	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0):** Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0): For Downstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

17.3.86 Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h

17.3.89 Figure Of Merit Status (FOMS)—Offset 464h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.3.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.3.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

17.3.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

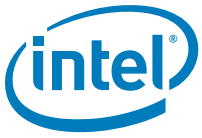
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.



Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.3.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

17.3.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.3.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.97 Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.111 Lane1 LF and FS (L1LFFS)—Offset 53Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.112 Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h

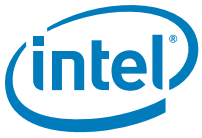
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.113 Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.114 Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h

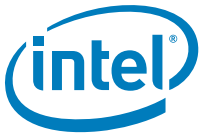
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.115 Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.116 Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.117 Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.118 Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved

29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.126 Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.3.127 Lane3 LF and FS (L3LFFS)—Offset 57Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4 Registers Summary

Table 17-4. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h

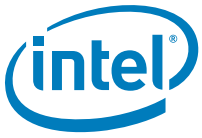

Table 17-4. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h
D4h	D7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	800h
E4h	E7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h
120h	123h	Header Log DW2 (HL_DW2)—Offset 120h	0h
124h	127h	Header Log DW3 (HL_DW3)—Offset 124h	0h
128h	12Bh	Header Log DW4 (HL_DW4)—Offset 128h	0h
12Ch	12Fh	Root Error Command (REC)—Offset 12Ch	0h
134h	137h	Error Source Identification (ESID)—Offset 134h	0h
140h	143h	ACS Extended Capability Header (ACSECH)—Offset 140h	0h
144h	147h	ACS Capability Register (ACSCAPR)—Offset 144h	Fh
148h	14Bh	ACS Control Register (ACSCTLR)—Offset 148h	0h
150h	153h	PTM Extended Capability Header (PTMECH)—Offset 150h	0h
154h	157h	PTM Capability Register (PTMCAPR)—Offset 154h	400h
158h	15Bh	PTM Control Register (PTMCTLR)—Offset 158h	0h
200h	203h	L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h	0h
204h	207h	L1 Sub-States Capabilities (L1SCAP)—Offset 204h	28281Fh
208h	20Bh	L1 Sub-States Control 1 (L1SCTL1)—Offset 208h	0h
20Ch	20Fh	L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch	28h
220h	223h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h	0h
224h	227h	Link Control 3 (LCTL3)—Offset 224h	0h
228h	22Bh	Lane Error Status (LES)—Offset 228h	0h
22Ch	22Fh	Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch	7F7F7F7Fh

Table 17-4. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
230h	233h	Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h	7F7F7F7Fh
300h	303h	PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h	A64F96h
304h	307h	PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h	1BC00B86h
314h	317h	PCI Express Status 1 (PCIESTS1)—Offset 328h	54262A13h
328h	32Bh	PCI Express Status 1 (PCIESTS1)—Offset 328h	0h
32Ch	32Fh	PCI Express Status 2 (PCIESTS2)—Offset 32Ch	0h
330h	333h	PCI Express Compliance Measurement Mode (CMM) Port Control (PCIECMMPC)—Offset 330h	2A000016h
334h	337h	PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h	4ABCB5BCh
390h	393h	PTM Propagation Delay (PTMPD)—Offset 390h	0h
394h	397h	PTM Lower Local Master Time (PTMLLMT)—Offset 394h	0h
398h	39Bh	PTM Upper Local Master Time (PTMULMT)—Offset 398h	0h
39Ch	39Fh	PTM Pipe Stage Delay Configuration 1 (PTMPSDC1)—Offset 39Ch	0h
3A0h	3A3h	PTM Pipe Stage Delay Configuration 2 (PTMPSDC2)—Offset 3A0h	0h
3A4h	3A7h	PTM Pipe Stage Delay Configuration 3 (PTMPSDC3)—Offset 3A4h	0h
3A8h	3ABh	PTM Pipe Stage Delay Configuration 4 (PTMPSDC4)—Offset 3A8h	0h
3ACh	3AFh	PTM Pipe Stage Delay Configuration 5 (PTMPSDC5)—Offset 3ACh	0h
3B0h	3B3h	PTM Extended Config (PTMECFG)—Offset 3B0h	0h
3B4h	3B7h	PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h	0h
3B8h	3BBh	PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h	0h
414h	417h	Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h	0h
418h	41Bh	Thermal and Power Throttling (TNPT)—Offset 418h	930h
41Ch	41Fh	Dynamic Lane Switch (DYNLNSW)—Offset 41Ch	0h
420h	423h	Power Control Enable (PCE)—Offset 428h	2AE8146h
428h	42Bh	Power Control Enable (PCE)—Offset 428h	9h
42Ch	42Fh	PGCB Control1 (PGCBCTL1)—Offset 42Ch	14155555h
430h	433h	PGCB Control2 (PGCBCTL2)—Offset 430h	54h
450h	453h	Equalization Configuration 1 (EQCFG1)—Offset 450h	3102h
454h	457h	Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h	0h
458h	45Bh	Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h	0h
45Ch	45Fh	Remote Transmitter Preset Coefficient List 3 (RTPCL3)—Offset 45Ch	0h
460h	463h	Remote Transmitter Preset Coefficient List 4 (RTPCL4)—Offset 460h	0h
464h	467h	Figure Of Merit Status (FOMS)—Offset 464h	0h
468h	46Bh	Hardware Autonomous Equalization Control (HAEQ)—Offset 468h	A0080E00h
470h	473h	Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h	0h
474h	477h	Local Transmitter Coefficient Override 2 (LTCO2)—Offset 474h	0h
478h	47Bh	GEN3 L0s Control (G3L0SCTL)—Offset 478h	C00281Eh
47Ch	47Fh	Equalization Configuration 2 (EQCFG2)—Offset 47Ch	A001h
480h	483h	Monitor Mux (MM)—Offset 480h	0h
500h	503h	Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h	0h

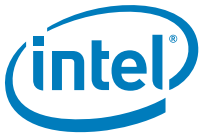

Table 17-4. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
504h	507h	Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h	0h
508h	50Bh	Lane0 P3 and P4 Preset-Coefficient Mapping (L0P3P4PCM)—Offset 508h	0h
50Ch	50Fh	Lane0 P5 and P6 Preset-Coefficient Mapping (L0P5P6PCM)—Offset 50Ch	0h
510h	513h	Lane0 P6, P7 and P8 Preset-Coefficient Mapping (L0P6P7P8PCM)—Offset 510h	0h
514h	517h	Lane0 P8 and P9 Preset-Coefficient Mapping (L0P8P9PCM)—Offset 514h	0h
518h	51Bh	Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h	0h
51Ch	51Fh	Lane0 LF and FS (L0LFFS)—Offset 51Ch	0h
520h	523h	Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h	0h
524h	527h	Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h	0h
528h	52Bh	Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h	0h
52Ch	52Fh	Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch	0h
530h	533h	Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h	0h
534h	537h	Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h	0h
538h	53Bh	Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h	0h
53Ch	53Fh	Lane1 LF and FS (L1LFFS)—Offset 53Ch	0h
540h	543h	Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h	0h
544h	547h	Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h	0h
548h	54Bh	Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h	0h
54Ch	54Fh	Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch	0h
550h	553h	Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h	0h
554h	557h	Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h	0h
558h	55Bh	Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h	0h
55Ch	55Fh	Lane2 LF and FS (L2LFFS)—Offset 55Ch	0h
560h	563h	Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h	0h
564h	567h	Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h	0h
568h	56Bh	Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h	0h
56Ch	56Fh	Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch	0h
570h	573h	Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h	0h
574h	577h	Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h	0h
578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h

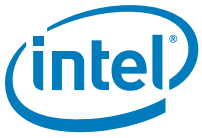
17.4.1 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

17.4.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.4.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.4.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

17.4.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

17.4.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.4.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

17.4.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

17.4.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.4.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

17.4.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

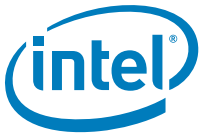
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.4.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port

Bit Range	Default & Access	Field Name (ID): Description
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

17.4.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

17.4.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completer abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

17.4.15 Link Capabilities (LCAP)—Offset 4Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL

Bit Range	Default & Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.4.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.

Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

17.4.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.

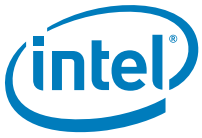
Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.4.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.4.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.4.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.4.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

17.4.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.4.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.4.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

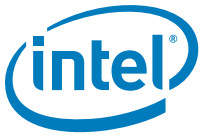
Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.4.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.4.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.4.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

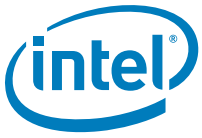
17.4.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: C8030001h



Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

17.4.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.4.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.4.34 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completer Abort Status (CA):** Indicates a completer abort was received

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.4.35 Uncorrectable Error Mask (UEM)—Offset 108h

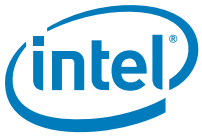
When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.4.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completer Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.4.37 Correctable Error Status (CES)—Offset 110h

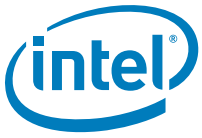
This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.4.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.4.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.4.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.4.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.4.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.4.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.4.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.4.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.4.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

17.4.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.4.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.4.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.4.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.4.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.4.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.4.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.4.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.4.55 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

17.4.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.4.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.4.58 Lane Error Status (LES)—Offset 228h

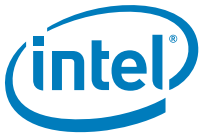
The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.



17.4.59 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

14:12	7h RW	**Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH):** Upstream Port Lane 2 Receiver Preset Hint (UPL2RPH): Field contains the Receiver Preset Hint value sent or received during Link Equalization.
11:8	Fh RW	**Upstream Port Lane 2 Transmitter Preset (UPL2TP):** Upstream Port Lane 2 Transmitter Preset (UPL2TP): Field contains the Transmit Preset value sent or received during Link Equalization.
7	0h RO	**Reserved (RSVD_3):** Reserved
6:4	7h RW	**Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH):** Downstream Port Lane 2 Receiver Preset Hint (DPL2RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.

Bit Range	Default & Access	Field Name (ID): Description
3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.4.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: A64F96h

17.4.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

17.4.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.4.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.4.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved

17.4.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.4.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

17.4.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.

17.4.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved for cfg_trsvd0. Not applicable since frc_clk_srst_en is tied to '0.

1:0	0h RO	**Reserved (RSVD_1):** Reserved for cfg_trsvd1. Not applicable since frc_clk_srst_en is tied to 0.

17.4.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.4.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1):** Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1): For Downstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
5:0	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0):** Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0): For Downstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

17.4.89 Figure Of Merit Status (FOMS)—Offset 464h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.4.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.4.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 1 Transmitter Coefficient Override Enable (L1TCOE):** Lane 1 Transmitter Coefficient Override Enable (L1TCOE): When set, the transmitter coefficient override values LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Lane 0 Transmitter Coefficient Override Enable (L0TCOE):** Lane 0 Transmitter Coefficient Override Enable (L0TCOE): When set, the transmitter coefficient override values LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

17.4.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.4.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

17.4.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.4.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.103 Lane0 LF and FS (L0LFFS)—Offset 51Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.104 Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.105 Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.106 Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.107 Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.

Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
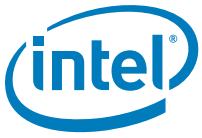
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.118 Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.119 Lane2 LF and FS (L2LFFS)—Offset 55Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.120 Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.121 Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h

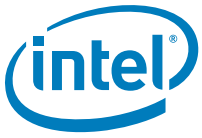
This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.122 Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.123 Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch

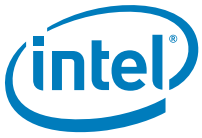
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.124 Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.125 Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h

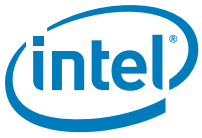
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.126 Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.4.127 Lane3 LF and FS (L3LFFS)—Offset 57Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5 Registers Summary

Table 17-5. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h

Table 17-5. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h
D4h	D7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	800h
E4h	E7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h
120h	123h	Header Log DW2 (HL_DW2)—Offset 120h	0h
124h	127h	Header Log DW3 (HL_DW3)—Offset 124h	0h
128h	12Bh	Header Log DW4 (HL_DW4)—Offset 128h	0h
12Ch	12Fh	Root Error Command (REC)—Offset 12Ch	0h
134h	137h	Error Source Identification (ESID)—Offset 134h	0h
140h	143h	ACS Extended Capability Header (ACSECH)—Offset 140h	0h
144h	147h	ACS Capability Register (ACSCAPR)—Offset 144h	Fh
148h	14Bh	ACS Control Register (ACSCTLR)—Offset 148h	0h
150h	153h	PTM Extended Capability Header (PTMECH)—Offset 150h	0h
154h	157h	PTM Capability Register (PTMCAPR)—Offset 154h	400h
158h	15Bh	PTM Control Register (PTMCTLR)—Offset 158h	0h
200h	203h	L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h	0h
204h	207h	L1 Sub-States Capabilities (L1SCAP)—Offset 204h	28281Fh
208h	20Bh	L1 Sub-States Control 1 (L1SCTL1)—Offset 208h	0h
20Ch	20Fh	L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch	28h
220h	223h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h	0h
224h	227h	Link Control 3 (LCTL3)—Offset 224h	0h
228h	22Bh	Lane Error Status (LES)—Offset 228h	0h
22Ch	22Fh	Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch	7F7F7F7Fh

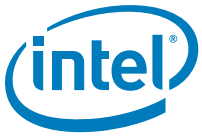


Table 17-5. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
230h	233h	Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h	7F7F7F7Fh
300h	303h	PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h	A64F96h
304h	307h	PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h	1BC00B86h
314h	317h	PCI Express Status 1 (PCIESTS1)—Offset 328h	54262A13h
328h	32Bh	PCI Express Status 1 (PCIESTS1)—Offset 328h	0h
32Ch	32Fh	PCI Express Status 2 (PCIESTS2)—Offset 32Ch	0h
330h	333h	PCI Express Compliance Measurement Mode (CMM) Port Control (PCIECMMPC)—Offset 330h	2A000016h
334h	337h	PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h	4ABCB5BCh
390h	393h	PTM Propagation Delay (PTMPD)—Offset 390h	0h
394h	397h	PTM Lower Local Master Time (PTMLLMT)—Offset 394h	0h
398h	39Bh	PTM Upper Local Master Time (PTMULMT)—Offset 398h	0h

Table 17-5. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
504h	507h	Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h	0h
508h	50Bh	Lane0 P3 and P4 Preset-Coefficient Mapping (L0P3P4PCM)—Offset 508h	0h
50Ch	50Fh	Lane0 P5 and P6 Preset-Coefficient Mapping (L0P5P6PCM)—Offset 50Ch	0h
510h	513h	Lane0 P6, P7 and P8 Preset-Coefficient Mapping (L0P6P7P8PCM)—Offset 510h	0h
514h	517h	Lane0 P8 and P9 Preset-Coefficient Mapping (L0P8P9PCM)—Offset 514h	0h
518h	51Bh	Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h	0h
51Ch	51Fh	Lane0 LF and FS (L0LFFS)—Offset 51Ch	0h
520h	523h	Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h	0h
524h	527h	Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h	0h
528h	52Bh	Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h	0h
52Ch	52Fh	Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch	0h
530h	533h	Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h	0h
534h	537h	Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h	0h
538h	53Bh	Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h	0h
53Ch	53Fh	Lane1 LF and FS (L1LFFS)—Offset 53Ch	0h
540h	543h	Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h	0h
544h	547h	Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h	0h
548h	54Bh	Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h	0h
54Ch	54Fh	Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch	0h
550h	553h	Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h	0h
554h	557h	Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h	0h
558h	55Bh	Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h	0h
55Ch	55Fh	Lane2 LF and FS (L2LFFS)—Offset 55Ch	0h
560h	563h	Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h	0h
564h	567h	Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h	0h
568h	56Bh	Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h	0h
56Ch	56Fh	Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch	0h
570h	573h	Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h	0h
574h	577h	Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h	0h
578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h

17.5.1 Device Command; Primary Status (CMD_PSTS)—Offset 4h

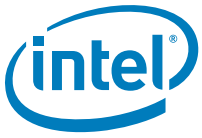
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..



17.5.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.5.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.5.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

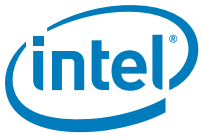
17.5.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.



Bit Range	Default & Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

17.5.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.5.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

17.5.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

17.5.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.5.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

17.5.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

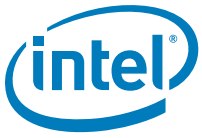
17.5.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port



Bit Range	Default & Access	Field Name (ID): Description
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

17.5.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

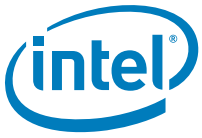
17.5.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup



Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

17.5.15 Link Capabilities (LCAP)—Offset 4Ch

Access Method

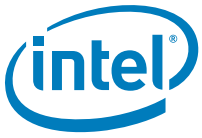
Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL

Bit Range	Default & Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h



Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.5.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

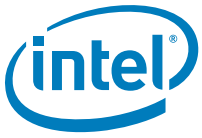
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.



Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.

Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

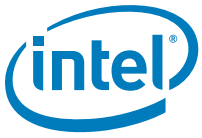
17.5.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.



Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.5.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.5.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.5.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.5.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

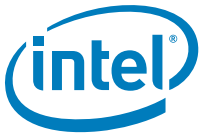
17.5.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.



Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.5.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.5.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

17.5.25 Slot Capabilities 2 (SLCAP2)—Offset 74h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

17.5.26 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

17.5.27 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.

Bit Range	Default & Access	Field Name (ID): Description
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.5.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.5.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.5.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

17.5.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: C8030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

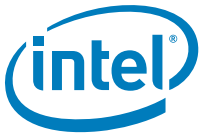
17.5.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.



Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.5.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.5.34 Uncorrectable Error Status (UES)—Offset 104h

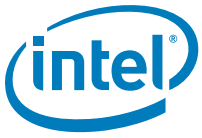
This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completer Abort Status (CA):** Indicates a completer abort was received



Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.5.35 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.5.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

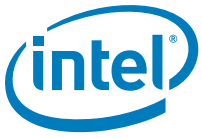
This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.



Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completer Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.5.37 Correctable Error Status (CES)—Offset 110h

This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.5.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.5.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.5.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.5.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.5.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.5.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.5.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.5.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.5.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

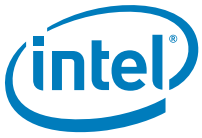
17.5.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.5.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.5.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.5.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity (LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.5.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.5.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.5.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.5.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.5.55 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 28h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

17.5.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.5.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.5.58 Lane Error Status (LES)—Offset 228h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

17.5.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

17.5.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

17.5.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.5.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.5.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved

17.5.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

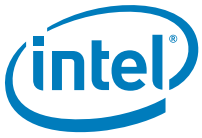
11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality



Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.5.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

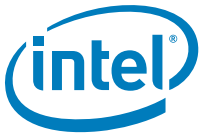
17.5.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.



17.5.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description

17.5.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.5.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1):** Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1): For Downstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
5:0	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0):** Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0): For Downstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

17.5.86 Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

17.5.89 Figure Of Merit Status (FOMS)—Offset 464h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.5.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.5.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 1 Transmitter Coefficient Override Enable (L1TCOE):** Lane 1 Transmitter Coefficient Override Enable (L1TCOE): When set, the transmitter coefficient override values LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Lane 0 Transmitter Coefficient Override Enable (L0TCOE):** Lane 0 Transmitter Coefficient Override Enable (L0TCOE): When set, the transmitter coefficient override values LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
23:18	0h RW	**Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO):** Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO): For Downstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L1TCOE = 1.
17:12	0h RW	**Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO):** Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO): For Downstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L1TCOE = 1.

17.5.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.5.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

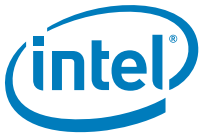
17.5.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.5.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.97 Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.110 Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.111 Lane1 LF and FS (L1LFFS)—Offset 53Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.112 Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h

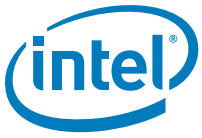
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.113 Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.114 Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h

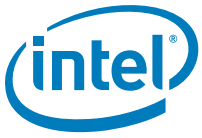
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.115 Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.116 Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h

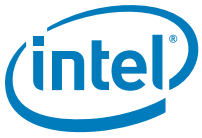
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.117 Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,

31:30	0h RO	**Reserved (RSVD):** Reserved.
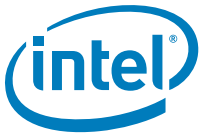
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.125 Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.126 Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.5.127 Lane3 LF and FS (L3LFFS)—Offset 57Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 2

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6 Registers Summary

Table 17-6. Summary of pcie_cfg Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	7h	Device Command; Primary Status (CMD_PSTS)—Offset 4h	100000h
8h	Bh	Revision ID;Class Code (RID_CC)—Offset 8h	60400F0h
Ch	Fh	Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch	810000h
18h	1Bh	Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h	0h
1Ch	1Fh	I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch	0h
20h	23h	Memory Base and Limit (MBL)—Offset 20h	0h
24h	27h	Prefetchable Memory Base and Limit (PMBL)—Offset 24h	10001h
28h	2Bh	Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h	0h
2Ch	2Fh	Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch	0h
34h	37h	Capabilities List Pointer (CAPP)—Offset 34h	40h
3Ch	3Fh	Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch	0h
40h	43h	Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h	428010h
44h	47h	Device Capabilities (DCAP)—Offset 44h	8001h
48h	4Bh	Device Control; Device Status (DCTL_DSTS)—Offset 48h	100000h
4Ch	4Fh	Link Capabilities (LCAP)—Offset 4Ch	710C00h
50h	53h	Link Control; Link Status (LCTL_LSTS)—Offset 50h	10000h
54h	57h	Slot Capabilities (SLCAP)—Offset 54h	40060h
58h	5Bh	Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h	0h
5Ch	5Fh	Root Control (RCTL)—Offset 5Ch	0h
60h	63h	Root Status (RSTS)—Offset 60h	0h
64h	67h	Device Capabilities 2 (DCAP2)—Offset 64h	80837h
68h	6Bh	Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h	0h
6Ch	6Fh	Link Capabilities 2 (LCAP2)—Offset 6Ch	0h
70h	73h	Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h	0h
74h	77h	Slot Capabilities 2 (SLCAP2)—Offset 74h	0h

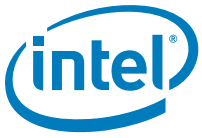


Table 17-6. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
78h	7Bh	Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h	0h
80h	83h	Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h	9005h
88h	8Bh	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Subsystem Vendor Capability (SVCAP)—Offset 90h	A00Dh
94h	97h	Subsystem Vendor IDs (SVID)—Offset 94h	0h
A0h	A3h	Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h	C8030001h
A4h	A7h	PCI Power Management Control And Status (PMCS)—Offset A4h	8h
D4h	D7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	800h
E4h	E7h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
100h	103h	Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h	0h
104h	107h	Uncorrectable Error Status (UES)—Offset 104h	0h
108h	10Bh	Uncorrectable Error Mask (UEM)—Offset 108h	0h
10Ch	10Fh	Uncorrectable Error Severity (UEV)—Offset 10Ch	60011h
110h	113h	Correctable Error Status (CES)—Offset 110h	0h
114h	117h	Correctable Error Mask (CEM)—Offset 114h	2000h
118h	11Bh	Advanced Error Capabilities and Control (AECC)—Offset 118h	0h
11Ch	11Fh	Header Log DW1 (HL_DW1)—Offset 11Ch	0h
120h	123h	Header Log DW2 (HL_DW2)—Offset 120h	0h
124h	127h	Header Log DW3 (HL_DW3)—Offset 124h	0h
128h	12Bh	Header Log DW4 (HL_DW4)—Offset 128h	0h
12Ch	12Fh	Root Error Command (REC)—Offset 12Ch	0h
134h	137h	Error Source Identification (ESID)—Offset 134h	0h
140h	143h	ACS Extended Capability Header (ACSECH)—Offset 140h	0h
144h	147h	ACS Capability Register (ACSCAPR)—Offset 144h	Fh
148h	14Bh	ACS Control Register (ACSCTLR)—Offset 148h	0h
150h	153h	PTM Extended Capability Header (PTMECH)—Offset 150h	0h
154h	157h	PTM Capability Register (PTMCAPR)—Offset 154h	400h
158h	15Bh	PTM Control Register (PTMCTLR)—Offset 158h	0h
200h	203h	L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h	0h
204h	207h	L1 Sub-States Capabilities (L1SCAP)—Offset 204h	28281Fh
208h	20Bh	L1 Sub-States Control 1 (L1SCTL1)—Offset 208h	0h
20Ch	20Fh	L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch	28h
220h	223h	Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h	0h
224h	227h	Link Control 3 (LCTL3)—Offset 224h	0h
228h	22Bh	Lane Error Status (LES)—Offset 228h	0h
22Ch	22Fh	Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch	7F7F7F7Fh

Table 17-6. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
230h	233h	Lane 2 and Lane 3 Equalization Control (L23EC)—Offset 230h	7F7F7F7Fh
300h	303h	PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h	A64F96h
304h	307h	PCI Express Replay Timer Policy 2 (PCIERTP2)—Offset 304h	1BC00B86h
314h	317h	PCI Express Status 1 (PCIESTS1)—Offset 328h	54262A13h
328h	32Bh	PCI Express Status 1 (PCIESTS1)—Offset 328h	0h
32Ch	32Fh	PCI Express Status 2 (PCIESTS2)—Offset 32Ch	0h
330h	333h	PCI Express Compliance Measurement Mode (CMM) Port Control (PCIECMMPC)—Offset 330h	2A000016h
334h	337h	PCI Express Compliance Measurement Mode Symbol Buffer (PCIECMMSB)—Offset 334h	4ABCB5BCh
390h	393h	PTM Propagation Delay (PTMPD)—Offset 390h	0h
394h	397h	PTM Lower Local Master Time (PTMLLMT)—Offset 394h	0h
398h	39Bh	PTM Upper Local Master Time (PTMULMT)—Offset 398h	0h
39Ch	39Fh	PTM Pipe Stage Delay Configuration 1 (PTMPSDC1)—Offset 39Ch	0h
3A0h	3A3h	PTM Pipe Stage Delay Configuration 2 (PTMPSDC2)—Offset 3A0h	0h
3A4h	3A7h	PTM Pipe Stage Delay Configuration 3 (PTMPSDC3)—Offset 3A4h	0h
3A8h	3ABh	PTM Pipe Stage Delay Configuration 4 (PTMPSDC4)—Offset 3A8h	0h
3ACh	3AFh	PTM Pipe Stage Delay Configuration 5 (PTMPSDC5)—Offset 3ACh	0h
3B0h	3B3h	PTM Extended Config (PTMECFG)—Offset 3B0h	0h
3B4h	3B7h	PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h	0h
3B8h	3BBh	PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h	0h
414h	417h	Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h	0h
418h	41Bh	Thermal and Power Throttling (TNPT)—Offset 418h	930h
41Ch	41Fh	Dynamic Lane Switch (DYNLNSW)—Offset 41Ch	0h
420h	423h	Power Control Enable (PCE)—Offset 428h	2AE8146h
428h	42Bh	Power Control Enable (PCE)—Offset 428h	9h
42Ch	42Fh	PGCB Control1 (PGCBCTL1)—Offset 42Ch	14155555h
430h	433h	PGCB Control2 (PGCBCTL2)—Offset 430h	54h
450h	453h	Equalization Configuration 1 (EQCFG1)—Offset 450h	3102h
454h	457h	Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h	0h
458h	45Bh	Remote Transmitter Preset Coefficient List 2 (RTPCL2)—Offset 458h	0h
45Ch	45Fh	Remote Transmitter Preset Coefficient List 3 (RTPCL3)—Offset 45Ch	0h
460h	463h	Remote Transmitter Preset Coefficient List 4 (RTPCL4)—Offset 460h	0h
464h	467h	Figure Of Merit Status (FOMS)—Offset 464h	0h
468h	46Bh	Hardware Autonomous Equalization Control (HAEQ)—Offset 468h	A0080E00h
470h	473h	Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h	0h
474h	477h	Local Transmitter Coefficient Override 2 (LTCO2)—Offset 474h	0h
478h	47Bh	GEN3 L0s Control (G3L0SCTL)—Offset 478h	C00281Eh
47Ch	47Fh	Equalization Configuration 2 (EQCFG2)—Offset 47Ch	A001h
480h	483h	Monitor Mux (MM)—Offset 480h	0h
500h	503h	Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h	0h

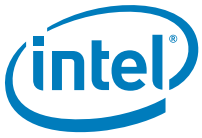

Table 17-6. Summary of pcie_cfg Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
504h	507h	Lane0 P1, P2 and P3 Preset-Coefficient Mapping (L0P1P2P3PCM)—Offset 504h	0h
508h	50Bh	Lane0 P3 and P4 Preset-Coefficient Mapping (L0P3P4PCM)—Offset 508h	0h
50Ch	50Fh	Lane0 P5 and P6 Preset-Coefficient Mapping (L0P5P6PCM)—Offset 50Ch	0h
510h	513h	Lane0 P6, P7 and P8 Preset-Coefficient Mapping (L0P6P7P8PCM)—Offset 510h	0h
514h	517h	Lane0 P8 and P9 Preset-Coefficient Mapping (L0P8P9PCM)—Offset 514h	0h
518h	51Bh	Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h	0h
51Ch	51Fh	Lane0 LF and FS (L0LFFS)—Offset 51Ch	0h
520h	523h	Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h	0h
524h	527h	Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h	0h
528h	52Bh	Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h	0h
52Ch	52Fh	Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch	0h
530h	533h	Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h	0h
534h	537h	Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h	0h
538h	53Bh	Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h	0h
53Ch	53Fh	Lane1 LF and FS (L1LFFS)—Offset 53Ch	0h
540h	543h	Lane2 P0 and P1 Preset-Coefficient Mapping (L2P0P1PCM)—Offset 540h	0h
544h	547h	Lane2 P1, P2 and P3 Preset-Coefficient Mapping (L2P1P2P3PCM)—Offset 544h	0h
548h	54Bh	Lane2 P3 and P4 Preset-Coefficient Mapping (L2P3P4PCM)—Offset 548h	0h
54Ch	54Fh	Lane2 P5 and P6 Preset-Coefficient Mapping (L2P5P6PCM)—Offset 54Ch	0h
550h	553h	Lane2 P6, P7 and P8 Preset-Coefficient Mapping (L2P6P7P8PCM)—Offset 550h	0h
554h	557h	Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h	0h
558h	55Bh	Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h	0h
55Ch	55Fh	Lane2 LF and FS (L2LFFS)—Offset 55Ch	0h
560h	563h	Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h	0h
564h	567h	Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h	0h
568h	56Bh	Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h	0h
56Ch	56Fh	Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch	0h
570h	573h	Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h	0h
574h	577h	Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h	0h
578h	57Bh	Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h	0h
57Ch	57Fh	Lane3 LF and FS (L3LFFS)—Offset 57Ch	0h

17.6.1 Device Command; Primary Status (CMD_PSTS)—Offset 4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE - Detected Parity Error (DPE):** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	1h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

17.6.2 Revision ID;Class Code (RID_CC)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 60400F0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	4h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	F0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

17.6.3 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE)—Offset Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 810000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	1h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

17.6.4 Bus Numbers; Secondary Latency Timer (BNUM_SLT)—Offset 18h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

17.6.5 I/O Base and Limit; Secondary Status (IOBL_SSTS)—Offset 1Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

17.6.6 Memory Base and Limit (MBL)—Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

17.6.7 Prefetchable Memory Base and Limit (PMBL)—Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 10001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	1h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	1h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

17.6.8 Prefetchable Memory Base Upper 32 Bits (PMBU32)—Offset 28h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

17.6.9 Prefetchable Memory Limit Upper 32 Bits (PMLU32)—Offset 2Ch

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

17.6.10 Capabilities List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	40h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

17.6.11 Interrupt Information; Bridge Control (INTR_BCTRL)—Offset 3Ch

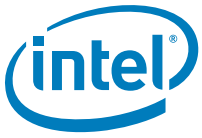
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SERR# Enable (SE):** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.



Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read, else this register returns the value from the table above.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

17.6.12 Capabilities List; PCI Express Capabilities (CLIST_XCAP)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 428010h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved. This register at one time was for TCS Routing but that was later removed from the PCIe 2.0 spec
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.
23:20	4h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port

Bit Range	Default & Access	Field Name (ID): Description
19:16	2h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	80h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	10h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

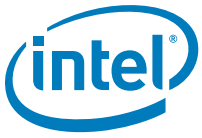
17.6.13 Device Capabilities (DCAP)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 8001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	1h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved. On previous version of the specification this was Power Indicator Present (PIP)
13	0h RO	**Reserved (RSVD_3):** Reserved. On previous version of the specification this was Attention Indicator Present (AIP)



Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**Reserved (RSVD_4):** Reserved. On previous version of the specification this was Attention Button Present (ABP)
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	1h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

17.6.14 Device Control; Device Status (DCTL_DSTS)—Offset 48h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	1h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

17.6.15 Link Capabilities (LCAP)—Offset 4Ch

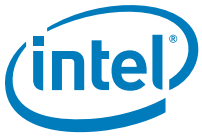
Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 710C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
22	1h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	1h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	1h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	2h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL



Bit Range	Default & Access	Field Name (ID): Description
11:10	3h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

17.6.16 Link Control; Link Status (LCTL_LSTS)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved. Previously this was defined as Link Training Error (LTE) but support for this bit was removed from subsequent versions of the PCI Express specification.
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.

Bit Range	Default & Access	Field Name (ID): Description
19:16	1h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.

Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

17.6.17 Slot Capabilities (SLCAP)—Offset 54h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 40060h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.

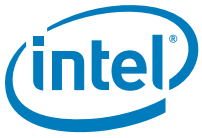
Bit Range	Default & Access	Field Name (ID): Description
18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

17.6.18 Slot Control; Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

17.6.19 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

17.6.20 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

17.6.21 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/ disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

17.6.22 Device Control 2; Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

17.6.23 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

17.6.24 Link Control 2; Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EqC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

17.6.25 Slot Capabilities 2 (SLCAP2)—Offset 74h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

17.6.26 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2)—Offset 78h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

17.6.27 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

17.6.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

17.6.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

17.6.30 Subsystem Vendor IDs (SVID)—Offset 94h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

17.6.31 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: C8030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

17.6.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

17.6.33 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Size:32 bits
The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

17.6.34 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

17.6.35 Uncorrectable Error Mask (UEM)—Offset 108h

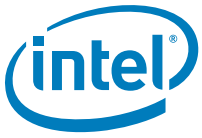
When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

17.6.36 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

17.6.37 Correctable Error Status (CES)—Offset 110h

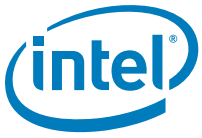
This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

17.6.38 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.

Bit Range	Default & Access	Field Name (ID): Description
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

17.6.39 Advanced Error Capabilities and Control (AECC)—Offset 118h

This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

17.6.40 Header Log DW1 (HL_DW1)—Offset 11Ch

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

17.6.41 Header Log DW2 (HL_DW2)—Offset 120h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

17.6.42 Header Log DW3 (HL_DW3)—Offset 124h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

17.6.43 Header Log DW4 (HL_DW4)—Offset 128h

Size:32 bits
These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

17.6.44 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

17.6.45 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

17.6.46 ACS Extended Capability Header (ACSECH)—Offset 140h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

17.6.47 ACS Capability Register (ACSCAPR)—Offset 144h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved for Egress Control Vector Size. This field is not applicable since ACS P2P Egress Control is not supported.
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

17.6.48 ACS Control Register (ACSCTLR)—Offset 148h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved,
6	0h RO	**ACS Direct Translated P2P Enable (T):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control Enable (E):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding Enable (U):** ACS Upstream Forwarding Enable (U): ACS Upstream Forwarding is not supported.
3	0h RW	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0h RW	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
1	0h RW	**ACS Translation Blocking (B):** ACS Translation Blocking (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
0	0h RW	**ACS Source Validation (V):** ACS Source Validation (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

17.6.49 PTM Extended Capability Header (PTMECH)—Offset 150h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

17.6.50 PTM Capability Register (PTMCAPR)—Offset 154h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved,
15:8	4h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved,
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

17.6.51 PTM Control Register (PTMCTLR)—Offset 158h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved.
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

17.6.52 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

17.6.53 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

17.6.54 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

17.6.56 Secondary PCI Express Extended Capability Header (SPEECH)—Offset 220h

Size:32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

17.6.57 Link Control 3 (LCTL3)—Offset 224h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**Perform Equalization (PE):** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

17.6.58 Lane Error Status (LES)—Offset 228h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.

17.6.59 Lane 0 and Lane 1 Equalization Control (L01EC)—Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training.
Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

3:0	Fh RW	**Downstream Port Lane 2 Transmitter Preset (DPL2TP):** Downstream Port Lane 2 Transmitter Preset (DPL2TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

17.6.61 PCI Express Replay Timer Policy 1 (PCIERTP1)—Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed.
The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

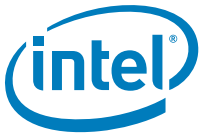
Default: 1BC00B86h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Lane 0 Lane Number (L0LN):** Lane 0 Lane Number(L0LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 0 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
29:28	1h RW	**Lane 1 Lane Number (L1LN):** Lane 1 Lane Number(L1LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 1 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.



Bit Range	Default & Access	Field Name (ID): Description
27:26	2h RW	**Lane 2 Lane Number (L2LN):** Lane 2 Lane Number(L2LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 2 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
25:24	3h RW	**Lane 3 Lane Number (L3LN):** Lane 3 Lane Number(L3LN): This field specifies the lane number to be used in the per-lane GEN3 scrambling/descrambling logic for lane 3 when entering Loopback from Configuration state, prior to Link width negotiation and for GEN3 Polling Compliance entry where the lane number is not available. This field should never be used on all other cases, including entry to Loopback from L0.
23	1h RW	**Loopback Master EQ TS1 Enable (LMEQTS1E):** Loopback Master EQ TS1 Enable(LMEQTS1E): When set, the Loopback Master will use EQ TS1 Ordered Sets to direct the Loopback Slave into Loopback from Configuration.Linkwidth.Start. The Preset field of the EQ TS1 Ordered Sets will be specified by Upstream Port Lane X Transmitter Preset and Upstream Port Lane X Receiver Preset Hint fields in the Lane Equalization Control registers.
22	1h RW	**Loopback Master EQ Change Enable (LMEQCE):** Loopback Master EQ Change Enable(LMEQCE): This field is applicable to the case where Loopback is entered from Recovery state. When set, the Loopback Master will set the EC field of the GEN3 TS1 Ordered Sets to the appropriate value based on the ports direction(10b or 11b) to direct the Loopback Slave into Loopback from Recovery state. The Preset field of the GEN3 TS1 Ordered Sets will be specified by Upstream Port Lane X Transmitter Preset and Upstream Port Lane X Receiver Preset Hint fields in the Lane Equalization Control registers.
21:12	0h RO	**Reserved (RSVD):** Reserved
11:8	Bh RW	**Gen 3 x1 (G3X1):** Gen 3 x1 (G3X1): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 4) * 64 link clocks. For 512B MPS: (nnn + 8) * 64 link clocks. For Gen 3 speed and x1 width

Bit Range	Default & Access	Field Name (ID): Description
7:4	8h RW	**Gen 3 x2 (G3X2):** Gen 3 x2 (G3X2): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 2) * 64 link clocks. For 512B MPS: (nnn + 3) * 64 link clocks. For Gen 3 speed and x2 width
3:0	6h RW	**Gen 3 x4 (G3X4):** Gen 3 x4 (G3X4): Determines how many link clock cycles the Data Link Layer will wait to replay the contents of the Retry Buffer if a valid Ack/Nak DLLP is not received. The Replay Timeout value to be used varies based on the effective Maximum Payload Size. For 128B MPS: nnn * 64 link clocks. For 256B MPS: (nnn + 1) * 64 link clocks. For 512B MPS: (nnn + 2) * 64 link clocks. For Gen 3 speed and x4 width

17.6.75 PTM Extended Config (PTMECFG)—Offset 3B0h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

17.6.76 PTM Lower T2 Time Stamp (PTMLT2TSTMP)—Offset 3B4h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Lower T2 TimeStamp (LCLT2TS):** Latest Captured Lower T2 TimeStamp (LCLT2TS). This field shows the latest lower 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

17.6.77 PTM Upper T2 Time Stamp (PTMUT2TSTMP)—Offset 3B8h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Latest Captured Upper T2 TimeStamp (LCUT2TS):** Latest Captured Upper T2 TimeStamp (LCUT2TS). This field shows the latest upper 32-bit of T2 TimeStamp captured by the Root Port in TSC Clock Domain when the Root Port received a valid PTM Request message. The renewable T2 TimeStamp due to a duplicate PTM Request would also be reflected in this field.

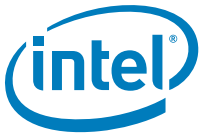
17.6.78 Strap and Fuse Configuration 2 (STRPFUSECFG2)—Offset 414h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**mod-PHY Power Gating Disable Fuse (mPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved



17.6.79 Thermal and Power Throttling (TNPT)—Offset 418h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 930h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.
15:12	0h RO	**Reserved (RSVD):** Reserved
11:10	2h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

Bit Range	Default & Access	Field Name (ID): Description
9:8	1h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	3h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW	**Throttling Timer Granuality (TTG):** Throttling Timer Granuality (TTG): This register determines the granuality of the Thermal Throttling timers. This provides a smaller granuality

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Dynamic RX Link Throttling Enable (DRXLTE):** Dynamic RX Link Throttling Enable (DRXLTE): '0b: Dynamic Link RX Throttling mechanism is disabled. '1b: Dynamic Link RX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter RXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.
0	0h RW	**Dynamic TX Link Throttling Enable (DTXLTE):** Dynamic TX Link Throttling Enable (DTXLTE): '0b: Dynamic Link TX Throttling mechanism is disabled. '1b: Dynamic Link TX Throttling mechanism is enabled. PCIe Root Port will induce the link to enter TXL0s. The duty cycle of the throttling window is configurable based on the throttling severity. Note: This field can only be set if the remote component supports TXL0s.

17.6.80 Dynamic Lane Switch (DYNLNSW)—Offset 41Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM):** Hardware Re-Do Preset to Coefficient Mapping Query After Lane Switching (HWRP2CM): When this bit is set, the PCIe-SIP Controller would query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever the Lane Switch ownership has transitioned to PCIe (from another Controller). Note that if this bit is set while the HPCMQE bit is set, the PCIe-SIP Controller would only perform the query once. Unlike the HPCMQE bit, the PCIe-SIP Controller would not clear this bit after completing the query over the PIPE interface. Register Attribute: Static.

17.6.81 Power Control Enable (PCE)—Offset 428h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
5	0h RW	**Hardware Autonomous Enable (HAE):** Hardware Autonomous Enable (HAE): If set, and the corresponding per-LTSSM state power gating enable bit is also set, then controller power gating will be done when the controller is idle and the controller power gating condition is met in that particular LTSSM state. Refer to PCIEPMECTL2 register for the per-LTSSM state power gating enable bit. If either this bit. is not set or the corresponding per-LTSSM state power gating enable bit is not set, then controller power gating will not be done in that LTSSM state. Note: For each x4 instance, only the value from Port 0 is used. NOTE: If this bit is set, then bits[lb]2:0[rb] must be '000.
4	0h RO	**Reserved (RSVD_1):** Reserved for Force Isolate and Reset Together. This bit is not used. The timing between isolate and reset can be controller through PGCBCTL register.
3	1h RW/L	**Sleep Enable (SE):** Sleep Enable (SE): If clear, Sleep indication to the retention flops will never assert. If set, Sleep indication will be assert to the retention flops as part of the hardware autonomous controller power gating entry flow.
2	0h RO	**Reserved (RSVD_2):** Reserved for D3-Hot Enable. Not supported. RTD3 is supported instead.
1	0h RO	**Reserved (RSVD_3):** Reserved for D0i3 Enable. No support for D0i3.
0	1h RW	**PMC Request Enable (PMCRE):** PMC Request Enable (PMCRE): When set, the controller will only power gate when pmc_[lt]ip[gt]_sw_pg_req_b = '0 and hardware autonomous controller power gating conditions are met. When clear, controller will power gate immediately when the hardware autonomous controller power gating conditions are met regardless of the state of pmc_[lt]ip[gt]_sw_pg_req_b.

17.6.82 PGCB Control1 (PGCBCTL1)—Offset 42Ch

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 14155555h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved for cfg_trsvd0. Not applicable since frc_clk_srst_en is tied to '0.

5:4	1h RW	**cfg_trstdown (trstdown):** cfg_trstdown(cfg_trstdown): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks

Bit Range	Default & Access	Field Name (ID): Description
3:2	1h RW	**cfg_tisolate (tisolate):** cfg_tisolate(cfg_tisolate): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks
1:0	1h RW	**cfg_tsleepact (tsleepact):** cfg_tsleepact(cfg_tsleepact): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks

17.6.83 PGCB Control2 (PGCBCTL2)—Offset 430h

This register specifies the minimum number of delay clocks the PGCB should wait between various states.
Note: For each x4 instance, only the value from Port 0 is used.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 54h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved.
7:6	1h RW	**cfg_trsvd4 (trsvd4):** cfg_trsvd4(cfg_trsvd4): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks
5:4	1h RW	**cfg_trsvd3 (trsvd3):** cfg_trsvd3(cfg_trsvd3): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks
3:2	1h RW	**cfg_trsvd2 (trsvd2):** cfg_trsvd2(cfg_trsvd2): '00: 1 clock '01: 2 clocks '10: 8 clocks '11: 256 clocks

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Reserved (RSVD_1):** Reserved for cfg_trsvd1. Not applicable since frc_clk_srst_en is tied to 0.

17.6.84 Equalization Configuration 1 (EQCFG1)—Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 3102h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Recovery Entry Count (REC):** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/ Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	1h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	1h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

17.6.85 Remote Transmitter Preset Coefficient List 1 (RTPCL1)—Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1):** Remote Transmitter Post-Cursor Coefficient List 0/Preset List 1 (RTPOSTCL0PL1): For Downstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 0 or Preset List 1 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
5:0	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0):** Remote Transmitter Pre-Cursor Coefficient List 0/Preset List 0 (RTPRECL0PL0): For Downstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 0 or Preset List 0 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**Index (I):** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.

Bit Range	Default & Access	Field Name (ID): Description
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

17.6.90 Hardware Autonomous Equalization Control (HAEQ)—Offset 468h

Size:32 bits

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: A0080E00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Ah RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/ Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.

Bit Range	Default & Access	Field Name (ID): Description
19	1h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	Eh RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

17.6.91 Local Transmitter Coefficient Override 1 (LTCO1)—Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used.
This register is not applicable when operating in Mobile Express mode.

Access Method

17.6.93 GEN3 L0s Control (G3L0SCTL)—Offset 478h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: C00281Eh

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	28h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	1Eh RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

17.6.94 Equalization Configuration 2 (EQCFG2)—Offset 47Ch

Size:32 bits
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: A001h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/ Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/ Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	Ah RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/ Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/ Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	1h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

17.6.95 Monitor Mux (MM)—Offset 480h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

17.6.96 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM)—Offset 500h

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
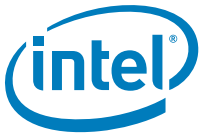
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.102 Lane0 P10 Preset-Coefficient Mapping (L0P10PCM)—Offset 518h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.



Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.103 Lane0 LF and FS (L0LFFS)—Offset 51Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.104 Lane1 P0 and P1 Preset-Coefficient Mapping (L1P0P1PCM)—Offset 520h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.105 Lane1 P1, P2 and P3 Preset-Coefficient Mapping (L1P1P2P3PCM)—Offset 524h

This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.106 Lane1 P3 and P4 Preset-Coefficient Mapping (L1P3P4PCM)—Offset 528h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.107 Lane1 P5 and P6 Preset-Coefficient Mapping (L1P5P6PCM)—Offset 52Ch

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.108 Lane1 P6, P7 and P8 Preset-Coefficient Mapping (L1P6P7P8PCM)—Offset 530h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.109 Lane1 P8 and P9 Preset-Coefficient Mapping (L1P8P9PCM)—Offset 534h

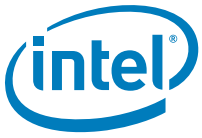
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.110 Lane1 P10 Preset-Coefficient Mapping (L1P10PCM)—Offset 538h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.117 Lane2 P8 and P9 Preset-Coefficient Mapping (L2P8P9PCM)—Offset 554h

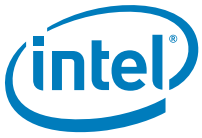
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.118 Lane2 P10 Preset-Coefficient Mapping (L2P10PCM)—Offset 558h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.119 Lane2 LF and FS (L2LFFS)—Offset 55Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.120 Lane3 P0 and P1 Preset-Coefficient Mapping (L3P0P1PCM)—Offset 560h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 1 Pre-Cursor Coefficient (P1PRECC):** Preset 1 Pre-Cursor Coefficient (P1PRECC): Pre-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 1 Cursor Coefficient (P1CC):** Preset 1 Cursor Coefficient (P1CC): Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 0 Post-Cursor Coefficient (P0PSTCC):** Preset 0 Post-Cursor Coefficient (P0PSTCC): Post-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 0 Pre-Cursor Coefficient (P0PRECC):** Preset 0 Pre-Cursor Coefficient (P0PRECC): Pre-Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 0 Cursor Coefficient (P0CC):** Preset 0 Cursor Coefficient (P0CC): Cursor coefficient for Preset 0. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.121 Lane3 P1, P2 and P3 Preset-Coefficient Mapping (L3P1P2P3PCM)—Offset 564h

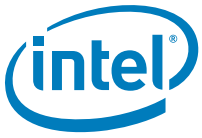
This register must be configured prior to enabling 8.0 GT/s data rate
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 3 Cursor Coefficient (P3CC):** Preset 3 Cursor Coefficient (P3CC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 2 Post-Cursor Coefficient (P2PSTCC):** Preset 2 Post-Cursor Coefficient (P2PSTCC): Post-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 2 Pre-Cursor Coefficient (P2PRECC):** Preset 2 Pre-Cursor Coefficient (P2PRECC): Pre-Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 2 Cursor Coefficient (P2CC):** Preset 2 Cursor Coefficient (P2CC): Cursor coefficient for Preset 2. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 1 Post-Cursor Coefficient (P1PSTCC):** Preset 1 Post-Cursor Coefficient (P1PSTCC): Post-Cursor coefficient for Preset 1. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.122 Lane3 P3 and P4 Preset-Coefficient Mapping (L3P3P4PCM)—Offset 568h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Preset 4 Post-Cursor Coefficient (P4PSTCC):** Preset 4 Post-Cursor Coefficient (P4PSTCC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 4 Pre-Cursor Coefficient (P4PRECC):** Preset 4 Pre-Cursor Coefficient (P4PRECC): Pre-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 4 Cursor Coefficient (P4CC):** Preset 4 Cursor Coefficient (P4CC): Post-Cursor coefficient for Preset 4. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 3 Post-Cursor Coefficient (P3PSTCC):** Preset 3 Post-Cursor Coefficient (P3PSTCC): Post-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 3 Pre-Cursor Coefficient (P3PRECC):** Preset 3 Pre-Cursor Coefficient (P3PRECC): Pre-Cursor coefficient for Preset 3. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.123 Lane3 P5 and P6 Preset-Coefficient Mapping (L3P5P6PCM)—Offset 56Ch

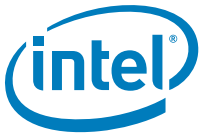
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 6 Pre-Cursor Coefficient (P6PRECC):** Preset 6 Pre-Cursor Coefficient (P6PRECC): Pre-Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 6 Cursor Coefficient (P6CC):** Preset 6 Cursor Coefficient (P6CC): Cursor coefficient for Preset 6. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 5 Post-Cursor Coefficient (P5PSTCC):** Preset 5 Post-Cursor Coefficient (P5PSTCC): Post-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 5 Pre-Cursor Coefficient (P5PRECC):** Preset 5 Pre-Cursor Coefficient (P5PRECC): Pre-Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 5 Cursor Coefficient (P5CC):** Preset 5 Cursor Coefficient (P5CC): Cursor coefficient for Preset 5. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.124 Lane3 P6, P7 and P8 Preset-Coefficient Mapping (L3P6P7P8PCM)—Offset 570h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Preset 8 Cursor Coefficient (P8CC):** Preset 8 Cursor Coefficient (P8CC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 7 Post-Cursor Coefficient (P7PSTCC):** Preset 7 Post-Cursor Coefficient (P7PSTCC): Post-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 7 Pre-Cursor Coefficient (P7PRECC):** Preset 7 Pre-Cursor Coefficient (P7PRECC): Pre-Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 7 Cursor Coefficient (P7CC):** Preset 7 Cursor Coefficient (P7CC): Cursor coefficient for Preset 7. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 6 Post-Cursor Coefficient (P6PSTCC):** Preset 6 Post-Cursor Coefficient (P6PSTCC): Post-Cursor coefficient for Preset 6. The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.125 Lane3 P8 and P9 Preset-Coefficient Mapping (L3P8P9PCM)—Offset 574h

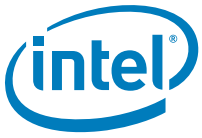
This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved,
29:24	0h RW	**Preset 9 Post-Cursor Coefficient (P9PSTCC):** Preset 9 Post-Cursor Coefficient (P9PSTCC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
23:18	0h RW	**Preset 9 Pre-Cursor Coefficient (P9PRECC):** Preset 9 Pre-Cursor Coefficient (P9PRECC): Pre-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
17:12	0h RW	**Preset 9 Cursor Coefficient (P9CC):** Preset 9 Cursor Coefficient (P9CC): Post-Cursor coefficient for Preset 9. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.



Bit Range	Default & Access	Field Name (ID): Description
11:6	0h RW	**Preset 8 Post-Cursor Coefficient (P8PSTCC):** Preset 8 Post-Cursor Coefficient (P8PSTCC): Post-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
5:0	0h RW	**Preset 8 Pre-Cursor Coefficient (P8PRECC):** Preset 8 Pre-Cursor Coefficient (P8PRECC): Pre-Cursor coefficient for Preset 8. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.126 Lane3 P10 Preset-Coefficient Mapping (L3P10PCM)—Offset 578h

This register must be configured prior to enabling 8.0 GT/s data rate.
This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17:12	0h RW	**Preset 10 Post-Cursor Coefficient (P10PSTCC):** Preset 10 Post-Cursor Coefficient (P10PSTCC): Post-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
11:6	0h RW	**Preset 10 Pre-Cursor Coefficient (P10PRECC):** Preset 10 Pre-Cursor Coefficient (P10PRECC): Pre-Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Preset 10 Cursor Coefficient (P10CC):** Preset 10 Cursor Coefficient (P10CC): Cursor coefficient for Preset 10. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

17.6.127 Lane3 LF and FS (L3LFFS)—Offset 57Ch

This register is not applicable when operating in Mobile Express mode.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 19 **Function:** 3

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RO/V	**Remote PHY Full Swing Value (RPFSV):** Remote PHY Full Swing Value (RPFSV): The FS value for remote PHY. This value is logged from Lane 0.
23:22	0h RO	**Reserved (RSVD_1):** Reserved
21:16	0h RO/V	**Remote PHY Low Frequency Value (RPLFV):** Remote PHY Low Frequency Value (RPLFV): The LF value for remote PHY. This value is logged from Lane 0.
15:14	0h RO	**Reserved (RSVD_2):** Reserved
13:8	0h RW	**Local PHY Full Swing Value (LPFSV):** Local PHY Full Swing Value (LPFSV): The FS value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to FS value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.
7:6	0h RO	**Reserved (RSVD_3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:0	0h RW	**Local PHY Low Frequency Value (LPLFV):** Local PHY Low Frequency Value (LPLFV): The LF value for local PHY. Note: BIOS is responsible to ensure that the values programmed to the Preset-Coefficient Mapping table meets the requirement defined in PCI Express base specification with respect to LF value programmed in this field. This field must be configured prior to enabling 8.0 GT/s data rate. Note: The default value of this field is modified by the hardware to reflect the value queried from local PHY when Hardware Preset to Coefficient Mapping is completed.

18 SATA

18.1 Registers Summary

Table 18-1. Summary of sata_configreg_top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	2B0h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	1h
Ch	Ch	Cache Line Size (CLS)—Offset Ch	0h
Dh	Dh	Master Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HTYPE)—Offset Eh	0h
10h	13h	MSI-X Table Base Address (MXTBA)—Offset 10h	0h
14h	17h	MXP Base Address (MXPBA)—Offset 14h	0h
18h	1Bh	SCMDBA (SCMDBA)—Offset 18h	1h
1Ch	1Fh	SCTLBA (SCTLBA)—Offset 1Ch	1h
20h	23h	AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h	1h
24h	27h	AHCI Base Address (ABAR)—Offset 24h	0h
2Ch	2Fh	Sub System Identifiers (SS)—Offset 2Ch	0h
34h	34h	Capabilities Pointer (CAP)—Offset 34h	80h
3Ch	3Dh	Interrupt Information (INTR)—Offset 3Ch	100h
70h	71h	PCI Power Management Capability ID (PID)—Offset 70h	A801h
74h	75h	PCI Power Management Control and Status (PMCS)—Offset 74h	8h
80h	81h	Message Signalled Interrupt Identifier (MID)—Offset 80h	7005h
82h	83h	Message Signalled Interrupt Message Control (MC)—Offset 82h	0h
88h	89h	Message Signaled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Port Mapping Register (MAP)—Offset 90h	0h
9Ch	9Fh	SATA General Configuration (SATAGC)—Offset 9Ch	0h
A0h	A0h	SATA Initialization Register Index (SIRI)—Offset A0h	0h
A4h	A7h	SATA Initialization Register Data (SIRD)—Offset A4h	0h
A8h	ABh	Serial ATA Capability Register 0 (SATACR0)—Offset A8h	100012h
ACh	AFh	Serial ATA Capability Register 1 (SATACR1)—Offset ACh	48h
B0h	B1h	FLR Capability ID (FLRCID)—Offset B0h	13h
B2h	B3h	FLR Capability Length and Version (FLRCAP)—Offset B2h	306h
B4h	B5h	FLR Control (FLRCTL)—Offset B4h	0h
C0h	C3h	Scratch Pad (SP)—Offset C0h	0h
D0h	D1h	MSI-X Identifiers (MXID)—Offset D0h	11h
D2h	D3h	MSI-X Message Control (MXC)—Offset D2h	0h
D4h	D7h	MSI-X Table Offset / Table BIR (MXT)—Offset D4h	0h

Table 18-1. Summary of sata_configreg_top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
D8h	DBh	MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h	0h
E0h	E3h	BIST FIS Control/Status (BFCS)—Offset E0h	0h
E4h	E7h	BIST FIS Transmit Data 1 (BFTD1)—Offset E4h	0h
E8h	EBh	BIST FIS Transmit Data 2 (BFTD2)—Offset E8h	0h
F8h	FBh	Manufacturing ID (MFID)—Offset F8h	8000FB1h

18.1.1 Command (CMD)—Offset 4h

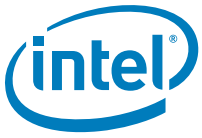
Command

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Reserved.
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	**Wait Cycle Enable (WCC):** Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	**VGA Palette Snooping Enable (VGA):** Reserved.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved.
3	0h RO	**Special Cycle Enable (SCE):** Reserved.
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.



Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

18.1.2 Device Status (STS)—Offset 6h

Device Status

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 2B0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C/V	**Signalled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C/V	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C/V	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C/V	**Signalled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved.
6	0h RO	Reserved.
5	1h RO	**66 MHz Capable (RSV):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0h RO	Reserved.

18.1.3 Revision ID (RID)—Offset 8h

Revision ID

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

18.1.4 Programming Interface (PI)—Offset 9h

Programming Interface

Access Method

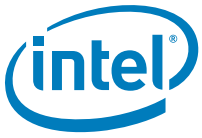
Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

18.1.5 Cache Line Size (CLS)—Offset Ch

Cache Line Size



Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

18.1.6 Master Latency Timer (MLT)—Offset Dh

Master Latency Timer

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

18.1.7 Header Type (HTYPE)—Offset Eh

Header Type

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** Indicates this controller is not part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

18.1.8 MSI-X Table Base Address (MXTBA)—Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**Base Address (BA):** Base address of memory space.
14	0h RW/V	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW/V	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

18.1.9 MXP Base Address (MXPBA)—Offset 14h

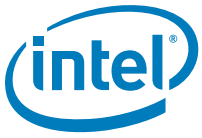
This BAR is used to allocate 256-byte Memory space for the MSI-X PBA.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Base address of memory space (aligned to 256B).
7:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.



18.1.10 SCMDBA (SCMDBA)—Offset 18h

BAR2 register define a 8-byte I/O space but this space is not implemented. Accesses to this space will get master abort. This space is created to workaround an issue in RST.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space.
2:1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

18.1.11 SCTLBA (SCTLBA)—Offset 1Ch

BAR3 register define a 4-byte I/O space but this space is not implemented. Accesses to this space will get master abort. This space is created to workaround an issue in RST.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space.
1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

18.1.12 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**Base Address (BA):** Base address of the I/O space.
4:1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

18.1.13 AHCI Base Address (ABAR)—Offset 24h

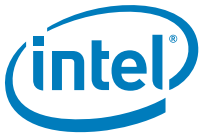
This register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted.. The Memory space size is determined by BIOS by making bit 15:11 Read-Only '1' or Read-Write '0' based on SATAGC.ASSEL[1:0].

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**Base Address (BA):** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

18.1.14 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion. This register is not reset by FLR.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

18.1.15 Capabilities Pointer (CAP)—Offset 34h

Capabilities Pointer

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signalled Interrupt capability). The following capability structures are linked by default: CAP.CP -> 80h (MSI) -> D0h (MSI-X)-> 70h (PCI Power) -> A8h (SATA) -> 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.

18.1.16 Interrupt Information (INTR)—Offset 3Ch

Interrupt Information

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

18.1.17 PCI Power Management Capability ID (PID)—Offset 70h

PCI Power Management Capability ID

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: A801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

18.1.18 PCI Power Management Control and Status (PMCS)—Offset 74h

PCI Power Management Control and Status

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from D3HOT on a wake event. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru SATAGC.SMS. This register field is not reset by FLR.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. Refer to PCI PM specification section 8.2.2. on software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

18.1.19 Message Signalled Interrupt Identifier (MID)—Offset 80h

Message Signalled Interrupt Identifier

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

18.1.20 Message Signalled Interrupt Message Control (MC)—Offset 82h

Message Signalled Interrupt Message Control

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

18.1.21 Message Signaled Interrupt Message Data (MD)—Offset 88h

Message Signaled Interrupt Message Data

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

18.1.22 Port Mapping Register (MAP)—Offset 90h

Port Mapping Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RW/O	**SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 7 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 7 physically.
22	0h RW/O	**SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 6 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 6 physically.
21	0h RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 5 physically.
20	0h RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 4 physically.
19	0h RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 & 3). 2.Fuse FFSATA8 (disable port 1 & 3). 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
18	0h RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 & 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA8 (disable port 1 & 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 1 physically.
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1.In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This field is not reset by FLR. This bit is only applicable to project(s): that has port 0 physically.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7:0	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 7: Port 7, this bit is applicable to projects: that has port 7 physically; Bit 6: Port 6, this bit is only applicable to project(s): that has port 6 physically; Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically; Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically; Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically; Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically; Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically; Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically. If a particular port is not available, software shall set the corresponding bit to 1. Software can also set the corresponding bit(s) to 1 after disabling particular port(s). Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1.

18.1.23 SATA General Configuration (SATAGC)—Offset 9Ch

SATA General Configuration

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is required to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process. This field is not reset by FLR.
30:18	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Do SERR Disable (DOSERRD):** When 1,SERR reporting is disabled (DO_SERR Sideband message sending is disabled or SERR# Wire is supressed. STS.SSE setting is not governed by this policy bit). When 0, SERR reporting is enabled (DO_SERR Sideband message sending is enabled or SERR# Wire is not supressed)
16	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 0b = AHCI mode; 1b = RAID mode; Notes : SW shall not manipulate SATAGC.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST; AHCI mode may be selected when RAID feature is enabled by fuse; RAID mode may only be selected when FFSATA5 & FFSATA3 (concatenated value not indicating No RAID); This register field is not reset by FLR.
15	0h RW	**Data Phase Parity Error Enable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled.
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0h RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handling is enabled. When 0, the command parity error handling is disabled.
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS isnot able to revert it back to Function Enable until next round of platform reset.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signalled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. Refer to Table 46 and Table 47 for resultant DIDs. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime. This field is not reset by FLR.
6	0h RW/O/V	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. Note: WBG BIOS is required to program this field to 1 together with the write to the AIE bit in a single configuration write cycle. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h. This field is not reset by FLR.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. This field is not reset by FLR.
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is 32k when MSS[1:0]=00, 16k when MSS[1:0]=01, 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is 2k when ASSEL[2:0]=000, 16k when ASSEL[2:0]=001, 32k when ASSEL[2:0]=010, 64k when ASSEL[2:0]=011, 128k when ASSEL[2:0]=100, 256k when ASSEL[2:0]=101, 512k when ASSEL[2:0]=110. This field is not reset by FLR.

18.1.24 SATA Initialization Register Index (SIRI)—Offset A0h

SATA Initialization Register Index

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written. Refer to SATA Initialization Register section for detail of the register space.
1:0	0h RO	Reserved.

18.1.25 SATA Initialization Register Data (SIRD)—Offset A4h

SATA Initialization Register Data

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

18.1.26 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 100012h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

18.1.27 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

Serial ATA Capability Register 1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:4	4h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset; ...; FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/ Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h => BAR0; 0101b = 14h => BAR1; 0110b = 18h => BAR2; 0111b = 1Ch => BAR3; 1000b = 20h => AIDPBA; 1001b = 24h => BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

18.1.28 FLR Capability ID (FLRCID)—Offset B0h

FLR Capability ID

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 13h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Capability (NEXT):** 00h indicating the final item in the Capability List.
7:0	13h RO/V	**Capability ID (CID):** The value of this field depends on the FLRCSSEL bit. • SATAGC.FLRCSSEL = 0, Capability ID = 13h. • SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

18.1.29 FLR Capability Length and Version (FLRCAP)—Offset B2h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1. This register is not reset by FLR.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 306h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9	1h RW/O	**FLR Capability (FLRCAP):** A 1 in this bit indicates support for Function Level Reset (FLR).
8	1h RW/O	**TXP Capability (TXPCAP):** A 1 in this bit indicates support for the Transactions Pending (TXP) bit. TXP must be supported if FLR is supported.
7:0	6h RO	**Capability Length (CAPL):** This field indicates the # of bytes as required by the PCI spec. It has the value of 06h for the FLR Capability.

18.1.30 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	Reserved.
8	0h RO	**Transactions Pending (TXP):** A 1 indicates that the controller has issued Non-Posted request which has not been completed. A 0 indicates that Completions for all non-posted requests have been received by the controller.
7:1	0h RO	Reserved.
0	0h RW	**Initiate FLR (Initiate_FLR):** Used to initiated FLR transition. A write of 1 indicates FLR transition. Since hardware must not respond to any cycles till FLR completion, the value read by software from this bit is 0. Refer to Function Level Reset (FLR) on specifics to SATA.

18.1.31 Scratch Pad (SP)—Offset C0h

Scratch Pad

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

18.1.32 MSI-X Identifiers (MXID)—Offset D0h

MSI-X Identifiers

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list.The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

18.1.33 MSI-X Message Control (MXC)—Offset D2h

MSI-X Message Control

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	Reserved.
10:0	0h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4..

18.1.34 MSI-X Table Offset / Table BIR (MXT)—Offset D4h

MSI-X Table Offset / Table BIR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

18.1.35 MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h

MSI-X PBA Offset / PBA BIR

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

18.1.36 BIST FIS Control/Status (BFCS)—Offset E0h

BIST FIS Control/Status

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P7E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 7 physically.
16	0h RW	**Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P6E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 6 physically.
15	0h RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P5E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 5 physically.
14	0h RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P4E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 4 physically.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P3E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 3 physically.
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P2E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 2 physically.
11	0h RW/1C/V	**BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0h RW/1C/V	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 1 physically.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 0 physically.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0h RO	Reserved.

18.1.37 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

BIST FIS Transmit Data 1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

18.1.38 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

BIST FIS Transmit Data 2

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

18.1.39 Manufacturing ID (MFID)—Offset F8h

Manufacturing ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 18 **Function:** 0

Default: 8000FB1h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	8h RO/V	**Dot portion of Process ID (DPID):** Indicates the dot. Process is reflected in bits [7:0]. This 8-bit value is received via the IOSF Sideband SetID message.
23:16	0h RO/V	**Stepping Identifier (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
15:8	Fh RO/V	**Manufacturer Identifier (MID):** This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
7:0	B1h RO/V	**Process/Dot Identifier (PID):** Indicates the Process. Dot is reflected in bits [27:24]. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.

18.2 Registers Summary

Table 18-2. Summary of sata_configreg_top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
14h	17h	AHCI Data Register (DATA)—Offset 14h	0h

18.2.1 AHCI Data Register (DATA)—Offset 14h

This registers are index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Access Method

Type: IO Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

18.3 Registers Summary

Table 18-3. Summary of sata_configreg_top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	HBA Capabilities (GHC_CAP)—Offset 0h	FF36FF07h
4h	7h	Global HBA Control (GHC)—Offset 4h	80000000h
Ch	Fh	Ports Implemented (GHC_PI)—Offset Ch	0h
10h	13h	AHCI Version (VS)—Offset 10h	10300h
1Ch	1Fh	Enclosure Management Location (EM_LOC)—Offset 1Ch	1600002h
20h	23h	Enclosure Management Control (EM_CTL)—Offset 20h	7010000h
24h	27h	HBA Capabilities Extended (GHC_CAP2)—Offset 24h	3Ch
A0h	A3h	Vendor Specific (VSP)—Offset A0h	48h
A4h	A7h	Vendor-Specific Capabilities Register (VS_CAP)—Offset A4h	1002DEh
A8h	ABh	Remapping Under NVMe (RUN)—Offset A8h	0h
C0h	C3h	RAID Platform ID (RPID)—Offset C0h	311C02h
C4h	C5h	Premium Feature Block (PFB)—Offset C4h	0h
C8h	C9h	SW Feature Mask (SFM)—Offset C8h	3Fh
100h	103h	Port [0-7] Command List Base Address (PxCLB0)—Offset 100h	0h

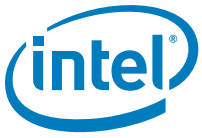


Table 18-3. Summary of sata_configreg_top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
104h	107h	Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h	0h
108h	10Bh	Port [0-7] FIS Base Address (PxFB0)—Offset 108h	0h
10Ch	10Fh	Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch	0h
110h	113h	Port [0-7] Interrupt Status (PxIS0)—Offset 110h	0h
114h	117h	Port [0-7] Interrupt Enable (PxIE0)—Offset 114h	0h
118h	11Bh	Port [0-7] Command (PxCMD0)—Offset 118h	4h
120h	123h	Port [0-7] Task File Data (PxTFD0)—Offset 120h	7Fh
124h	127h	Port [0-7] Signature (PxSIG0)—Offset 124h	FFFFFFFFh
128h	12Bh	Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h	0h
12Ch	12Fh	Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch	0h
130h	133h	Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h	0h
134h	137h	Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h	0h
138h	13Bh	Port [0-7] Commands Issued (PxCI0)—Offset 138h	0h
13Ch	13Fh	Port [0-7] SNotification (PxSNTF0)—Offset 13Ch	0h
144h	147h	Port [0-7] Device Sleep (PxDEVSLP0)—Offset 144h	1E022852h
180h	183h	Port [0-7] Command List Base Address (PxCLB1)—Offset 180h	0h
184h	187h	Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h	0h
188h	18Bh	Port [0-7] FIS Base Address (PxFB1)—Offset 188h	0h
18Ch	18Fh	Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch	0h
190h	193h	Port [0-7] Interrupt Status (PxIS1)—Offset 190h	0h
194h	197h	Port [0-7] Interrupt Enable (PxIE1)—Offset 194h	0h
198h	19Bh	Port [0-7] Command (PxCMD1)—Offset 198h	4h
1A0h	1A3h	Port [0-7] Task File Data (PxTFD1)—Offset 1A0h	7Fh
1A4h	1A7h	Port [0-7] Signature (PxSIG1)—Offset 1A4h	FFFFFFFFh
1A8h	1ABh	Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h	0h
1ACh	1AFh	Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh	0h
1B0h	1B3h	Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h	0h
1B4h	1B7h	Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h	0h
1B8h	1BBh	Port [0-7] Commands Issued (PxCI1)—Offset 1B8h	0h
1BCh	1BFh	Port [0-7] SNotification (PxSNTF1)—Offset 1BCh	0h
1C4h	1C7h	Port [0-7] Device Sleep (PxDEVSLP1)—Offset 1C4h	1E022852h
580h	583h	Enclosure Management Message Format (EM_MF)—Offset 580h	0h
584h	587h	Enclosure Management LED (EM_LED)—Offset 584h	0h

18.3.1 HBA Capabilities (GHC_CAP)—Offset 0h

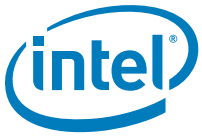
This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FF36FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queueing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activiate optimization through the FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization..
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initiallization.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.



Bit Range	Default & Access	Field Name (ID): Description
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved. Note: if (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, , FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011.
19	0h RO	**Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	1h RO	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. BIOS must clear this bit if Port Multipliers are not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RW/O/V	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. When enclosure management is supported, the HBA has implemented the EM_LOC and EM_CTL global HBA registers. When cleared to 0, indicates that the HBA does not support enclosure management and the EM_LOC and EM_CTL global HBA registers are not implemented.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	7h RO/V	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC, fuses (FFSATA7, FFSATA8) and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 8 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

18.3.2 Global HBA Control (GHC)—Offset 4h

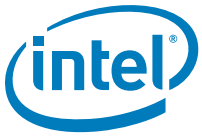
This register controls various global actions of the HBA.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC > 0 (multiple messages requested); MC.MME > 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is leass than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.

18.3.3 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/O/V	**Port 7 Implemented (PI7):** If set, then port 7 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 7 is not available.
6	0h RW/O/V	**Port 6 Implemented (PI6):** If set, then port 6 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 6 is not available.
5	0h RW/O/V	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available.
4	0h RW/O/V	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available.
3	0h RW/O/V	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available.
2	0h RW/O/V	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available.
1	0h RW/O/V	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O/V	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

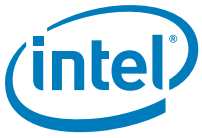
18.3.4 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10300h



Bit Range	Default & Access	Field Name (ID): Description
31:16	1h RO	**Major Version Number (MJR):** Indicates the major version is 1.
15:0	300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30.

18.3.5 Enclosure Management Location (EM_LOC)—Offset 1Ch

The enclosure management location register identifies the location and size of the enclosure management message buffer. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1600002h

Bit Range	Default & Access	Field Name (ID): Description
31:16	160h RO	**Offset (OFST):** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	2h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. Note that SATA controller only supports transmit buffer.

18.3.6 Enclosure Management Control (EM_CTL)—Offset 20h

This register is used to control and obtain status for the enclosure management interface. The register incluldes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

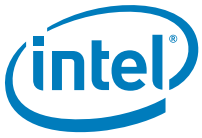
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7010000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	Reserved.
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	Reserved.
9	0h RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.



Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	Reserved.
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

18.3.7 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is required to program this field to 1.
4	1h RW/O/V	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O/V	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/O/V	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. Note: If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0h RO	Reserved.
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

18.3.8 Vendor Specific (VSP)—Offset A0h

Vendor Specific

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 48h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO/V	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO/V	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	Reserved.

18.3.9 Vendor-Specific Capabilities Register (VS_CAP)—Offset A4h

Vendor-Specific Capabilities Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1002DEh

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:16	10h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.
15:13	0h RO	Reserved.
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K in steps of 128B. Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh, which specifies the size of the remapped memory space as 34k. This field is not reset by FLR.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

18.3.10 Remapping Under NVMe (RUN)—Offset A8h

Remapping Under NVMe

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW/O	**Remapping Under NVMe Enable (RUNE):** When set to 1, AHCI Host Controller become a Remapped Device under the NVMe Host Controller hence the Bus Device Function of AHCI Host Controller is hidden from the OS. When this bit is 0, AHCI Host Controller is not remapped under NVMe Host Controller
15:8	0h RO	Reserved.
7:0	0h RW/O	**NVMe Device Function (NVMEDF):** Device and function number of NVMe Host Controller that AHCI Host Controller is remapped to. Bit 7:3 is the device number, bit 2:0 is the function number

18.3.11 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

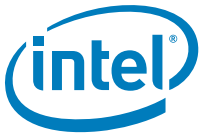
Default: 311C02h

Bit Range	Default & Access	Field Name (ID): Description
31:16	31h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO/V	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

18.3.12 Premium Feature Block (PFB)—Offset C4h

Note: Bits 4-0 are not bit-mapped to individual fuses and/or soft SKU settings; rather a single fuse FFSATA5& FFSATA 3 /soft sku is used to indicate support for all of these features (refer to VSP.PFS). These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Access Method



Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0h RO	Reserved.
4	0h RO/V	**Reserved (RSVD_1):** Read value is the same as VSP.PFS.
3	0h RO/V	**Reserved (RSVD_2):** Read value is the same as VSP.PFS.
2	0h RO/V	**Reserved (RSVD_3):** Read value is the same as VSP.PFS.
1	0h RO/V	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO/V	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

18.3.13 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 3Fh

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	Reserved.
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK (HDDUNLOCK):** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5 (R5):** If set to 1, then RAID5 is enabled.
2	1h RW/O	**R10 (R10):** If set to 1, then RAID10 is enabled.
1	1h RW/O	**R1 (R1):** If set to 1, then RAID1 is enabled.
0	1h RW/O	**R0 (R0):** If set to 1, then RAID0 is enabled.

18.3.14 Port [0-7] Command List Base Address (PxCLB0)—Offset 100h

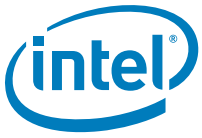
Port [0-7] Command List Base Address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.



18.3.15 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

Port [0-7] Command List Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

18.3.16 Port [0-7] FIS Base Address (PxFB0)—Offset 108h

Port [0-7] FIS Base Address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

18.3.17 Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

Port [0-7] FIS Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

18.3.18 Port [0-7] Interrupt Status (PxIS0)—Offset 110h

Port [0-7] Interrupt Status

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO/V	**Port Connect Change Status (PCS):** • 1: Change in Current Connect Status. • 0: No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

18.3.19 Port [0-7] Interrupt Enable (PxIE0)—Offset 114h

Port [0-7] Interrupt Enable

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW/V	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

18.3.20 Port [0-7] Command (PxCMD0)—Offset 118h

Port [0-7] Command

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four-bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Field Name (ID): Description
12:8	0h RO/V	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0h RO	Reserved.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initializatoin sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

18.3.21 Port [0-7] Task File Data (PxTFD0)—Offset 120h

Port [0-7] Task File Data

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

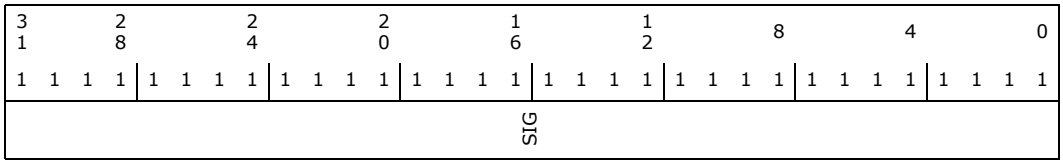
18.3.22 Port [0-7] Signature (PxSIG0)—Offset 124h

Port [0-7] Signature

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh



Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

18.3.23 Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h

Port [0-7] Serial ATA Status

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0h RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0h RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

18.3.24 Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch

Port [0-7] Serial ATA Control

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

18.3.25 Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h

Port [0-7] Serial ATA Error

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

18.3.26 Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h

Port [0-7] Serial ATA Active

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

18.3.27 Port [0-7] Commands Issued (PxCI0)—Offset 138h

Port [0-7] Commands Issued

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

18.3.28 Port [0-7] SNotification (PxSNTF0)—Offset 13Ch

Port [0-7] SNotification

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

18.3.29 Port [0-7] Device Sleep (PxDEVSLP0)—Offset 144h

Port [0-7] Device Sleep

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1E022852h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
28:25	Fh RW/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	4h RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.
14:10	Ah RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). When this bit is set to 1, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

18.3.30 Port [0-7] Command List Base Address (PxCLB1)—Offset 180h

Port [0-7] Command List Base Address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.

18.3.31 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h

Port [0-7] Command List Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

18.3.32 Port [0-7] FIS Base Address (PxFB1)—Offset 188h

Port [0-7] FIS Base Address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

18.3.33 Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch

Port [0-7] FIS Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

18.3.34 Port [0-7] Interrupt Status (PxIS1)—Offset 190h

Port [0-7] Interrupt Status

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0h RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**Port Connect Change Status (PCS):** • 1: Change in Current Connect Status. • 0: No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

18.3.35 Port [0-7] Interrupt Enable (PxIE1)—Offset 194h

Port [0-7] Interrupt Enable

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW/V	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

18.3.36 Port [0-7] Command (PxCMD1)—Offset 198h

Port [0-7] Command

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4h

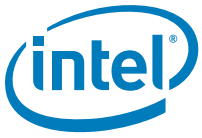
Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four-bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommeded to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Field Name (ID): Description
12:8	0h RO/V	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0h RO	Reserved.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

18.3.37 Port [0-7] Task File Data (PxTFD1)—Offset 1A0h

Port [0-7] Task File Data



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

18.3.38 Port [0-7] Signature (PxSIG1)—Offset 1A4h

Port [0-7] Signature

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

18.3.39 Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h

Port [0-7] Serial ATA Status

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0h RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0h RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

18.3.40 Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh

Port [0-7] Serial ATA Control

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

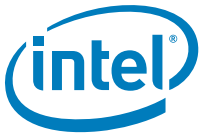
18.3.41 Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h

Port [0-7] Serial ATA Error

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

18.3.42 Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h

Port [0-7] Serial ATA Active

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

18.3.43 Port [0-7] Commands Issued (PxCI1)—Offset 1B8h

Port [0-7] Commands Issued

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

18.3.44 Port [0-7] SNotification (PxSNTF1)—Offset 1BCh

Port [0-7] SNotification

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

18.3.45 Port [0-7] Device Sleep (PxDEVSLP1)—Offset 1C4h

Port [0-7] Device Sleep

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1E022852h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).

Bit Range	Default & Access	Field Name (ID): Description
24:15	4h RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.
14:10	Ah RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.
0	0h RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). When this bit is set to 1, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

18.3.46 Enclosure Management Message Format (EM_MF)—Offset 580h

Enclosure Management Message Format

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**Message Type (MTYPE):** Specifies the type of the message. The message types are: • 0h: LED. • 1h: SAF-TE. • 2h: SES-2. • 3h: SGPIO (register based interface). • All other values reserved.
23:16	0h RW	**Data Size (DSIZE):** Specifies the data size in bytes. If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field. If there is no separate data buffer, this field shall have a value of '0'. The data directly follows the message in the message buffer. This value should always be '0'.
15:8	0h RW	**Message Size (MSIZE):** Specifies the size of the message in bytes. The message size does not include the one Dword header. A value of '0'. is invalid. The message size is always 4 bytes.
7:0	0h RO	Reserved.

18.3.47 Enclosure Management LED (EM_LED)—Offset 584h

Enclosure Management LED

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control. LED values are: 000b - LED shall be off; 001b - LED shall be solid on as perceived by human eye; All other values reserved. The LED bit locations are: Bits 2:0 - Activity LED (may be driven by hardware); Bits 5:3 - Vendor Specific LED (e.g. locate); Bits 8:6 - Vendor Specific LED (e.g. fault); Bits 15:9 - Reserved. Vendor specific message is: Bit 3:0 - Vendor Specific Pattern; Bit 15:4 - Reserved. Note: If Activity LED Hardware Driven (ATTR.ALHD) bit is set, host will output the hardware LED value sampled internally and will ignore software written activity value on bit [2:0]. Since Enclosure Management does not support port multiplier based LED message, the LED message will be generated independently based on respective port's operation activity. Vendor specific LED values Locate (Bits 5:3) and Fault (Bits 8:6) always are driven by software..
15:8	0h RW	**Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update. If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'. Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port MUltiplier. This byte should be 0.
7:0	0h RW	**HBA Information (HBA):** Specifies slot specific information related to the HBA. Bits 4:0 - HBA port number for the slot that requires the status update. Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0. Bits 7:6 - Reserved.

18.4 Registers Summary

Table 18-4. Summary of sata_configreg_top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h	0h
4h	7h	MSI-X Pending Bit Array QW 1 (MXPQW0_DW1)—Offset 4h	0h

18.4.1 MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h

MSI-X Pending Bit Array QW 0

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO/V	**MSI-X Vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

18.4.2 MSI-X Pending Bit Array QW 1 (MXPQW0_DW1)—Offset 4h

MSI-X Pending Bit Array QW 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MSI-X Vector Pending QW1 (Rsvd):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

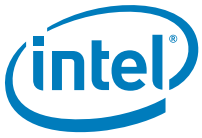
18.5 Registers Summary

Table 18-5. Summary of sata_configreg_top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h	0h
4h	7h	MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h	0h
8h	Bh	MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h	0h
Ch	Fh	MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch	1h

18.5.1 MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h

MSI-X Table Entries 0 Message Lower Address



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSI-X Message Lower Address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

18.5.2 MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h

MSI-X Table Entries 0 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI-X Message Upper 32-Bit Address (MXMUA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.

18.5.3 MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h

MSI-X Table Entries 0 Message Data

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI-X Message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

18.5.4 MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch

MSI-X Table Entries 0 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X Vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

8E10h	8E13h	GLOBAL_TIME_SYNC_CAP_REG (GLOBAL_TIME_SYNC_CAP_REG)—Offset 8E10h	12C9h
8E14h	8E17h	GLOBAL_TIME_SYNC_CTRL_REG (GLOBAL_TIME_SYNC_CTRL_REG)—Offset 8E14h	0h

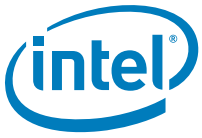

Table 19-1. Summary of 0_20_0_USBx MMIO Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
8E18h	8E1Bh	MICROFRAME_TIME_REG (MICROFRAME_TIME_REG)—Offset 8E18h	0h
8E20h	8E23h	GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW_REG)—Offset 8E20h	0h
8E24h	8E27h	GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI_REG)—Offset 8E24h	0h
8E58h	8E5Bh	Debug Status Capability Register (DEBUG_STATUS_CAPABILITY_REG)—Offset 8E58h	CBh
8E5Ch	8E5Fh	Host Ctrl USB3 Soft Error Count Register 1 (HOST_CTRL_USB3_ERR_COUNT_REG1)—Offset 8E5Ch	0h
8E60h	8E63h	Host Ctrl USB3 Soft Error Count Register 2 (HOST_CTRL_USB3_ERR_COUNT_REG2)—Offset 8E60h	0h
8E64h	8E67h	Host Ctrl USB3 Soft Error Count Register 3 (HOST_CTRL_USB3_ERR_COUNT_REG3)—Offset 8E64h	0h
8E68h	8E6Bh	Host Ctrl USB3 Soft Error Count Register 4 (HOST_CTRL_USB3_ERR_COUNT_REG4)—Offset 8E68h	0h
8E6Ch	8E6Fh	Host Ctrl USB3 Soft Error Count Register 5 (HOST_CTRL_USB3_ERR_COUNT_REG5)—Offset 8E6Ch	0h
8E70h	8E73h	Host Ctrl USB3 Soft Error Count Register 6 (HOST_CTRL_USB3_ERR_COUNT_REG6)—Offset 8E70h	0h
8E74h	8E77h	Host Ctrl USB3 Soft Error Count Register 7 (HOST_CTRL_USB3_ERR_COUNT_REG7)—Offset 8E74h	0h
0h		IOSFCTL - Control Register (IOSFCTL)—Offset 0h	Fh
1D0h		Power Management Control Register (PMCTL)—Offset 1D0h	0h
200h		PCI Configuration Control 1 Register (PCICFGCTR1)—Offset 200h	100h
4001h		c73usb280_USB2 PER PORT (USB2_PER_PORT_PP0)—Offset 4100h	5DA81h
402Bh		GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG)—Offset 402Bh	0h
402Ch		c73usb280_USB2 GLOBAL PORT 2 (USB2_GLOBAL_PORT_2)—Offset 402Ch	0h
7F04h		c73usb280_USB2 COMPBG (USB2_COMPBG)—Offset 7F04h	600h
7014h		CONFIG_3—Offset 7014h	0h
1Ch		DBC_GP2_IN_PAYLOAD_BP_LOW—Offset 1Ch	0h
20h		DBC_GP2_IN_PAYLOAD_BP_HI—Offset 20h	0h
24h		DBC_GP2_IN_PAYLOAD_QUALIFIERS—Offset 24h	0h
34h		DBC_GP2_IN_STATUS_QUALIFIERS—Offset 34h	0h
2Ch		DBC_GP2_IN_STATUS_BP_LOW—Offset 2Ch	0h
30h		DBC_GP2_IN_STATUS_BP_HI—Offset 30h	0h
00A8h		Super Speed Configuration 1 (SSCFG1) —Offset 00A8h	8Fh
00ACh		High Speed Configuration 1 (HSCFG1) —Offset 00ACh	100h
00BCh		GEN_REGRW4 —Offset 00BCh	0h

19.1.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH)**

19.1.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
15:0	100h RW/L	**Host Controller Interface Version Number (HCIVERSION)**

19.1.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

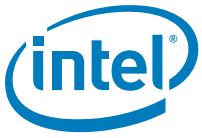
This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F000820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Fh RW/L	**Number of Ports (MaxPorts)**
23:19	0h RW/L	**Rsvd1 (Rsvd1)**
18:8	8h RW/L	**Number of Interrupters (MaxIntrs)**
7:0	20h RW/L	**Number of Device Slots (MaxSlots)**



19.1.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 94000054h

Bit Range	Default & Access	Field Name (ID): Description
31:27	12h RW/L	**Max Scratchpad Buffers LO (MaxScratchpadBufs)**
26	1h RW/L	**Scratchpad Restore (SPR)**
25:21	0h RW/L	**Max Scratchpad Buffers HI (MaxScratchpadBufs_HI)**
20:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax)**
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST)**

19.1.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4h RW/L	**U2 Device Exit Latency (U2DEL)**
15:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:0	1h RW/L	**U1 Device Exit Latency (U1DEL)**

19.1.6 Capability Parameters (HCCPARAMS)—Offset 10h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 200077C1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP)**
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize)**
11	0h RW/L	**Contiguous Frame ID Capability (CFC)**
10	1h RW/L	**Stopped EDLTA Capabilty (SEC)**
9	1h RW/L	**Stopped - Short Packet Capability (SPC)**
8	1h RW/L	**Parst All Event Data (PAE)**
7	1h RW/L	**No Secondary SID Support (NSS)**
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC)**
5	0h RW/L	**Light HC Reset Capability (LHRC)**
4	0h RW/L	**Port Indicators (PIND)**
3	0h RW/L	**Port Power Control (PPC)**
2	0h RW/L	**Context Size (CSZ)**
1	0h RW/L	**BW Negotiation Capability (BNC)**
0	1h RW/L	**64-bit Addressing Capability (AC64)**

19.1.7 Doorbell Offset (DBOFF)—Offset 14h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	C00h RO	**Doorbell Array Offset (DBAO)**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	100h RO	**Runtime Register Space Offset (RTRSO)**
4:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.9 USB Command (USBCMD)—Offset 80h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Rsvd2 (Rsvd2)**
11	0h RW	**Enable U3 MFINDEX Stop (EU3S)**
10	0h RW	**Enable Wrap Event (EWE)**
9	0h RW	**Controller Restore State (CRS)**
8	0h RW	**Controller Save State (CSS)**
7	0h RW	**Light Host Controller Reset (LHCRST)**
6:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RW	**Host System Error Enable (HSEE)**
2	0h RW	**Interrupter Enable (INTE)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Host Controller Reset (HCRST)**
0	0h RW	**Run/Stop (RS)**

19.1.10 USB Status (USBSTS)—Offset 84h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Rsvd3 (Rsvd3)**
12	0h RO	**Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.
11	0h RO	**Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.
10	0h RW/C	**Save/Restore Error (SRE)**
9	0h RO	**Restore State Status (RSS)**
8	0h RO	**Save State Status (SSS)**
7:5	0h RO	**Rsvd2 (Rsvd2)**
4	0h RW/C	**Port Change Detect (PCD)**
3	0h RW/C	**Event Interrupt (EINT)**
2	0h RW/C	**Host System Error (HSE)**
1	0h RO	**Rsvd1 (Rsvd1)**
0	1h RO	**HCHalted (HCH)**

19.1.11 Page Size (PAGESIZE)—Offset 88h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	1h RO	**Page Size (PAGESIZE)**

19.1.12 Device Notification Control (DNCTRL)—Offset 94h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Notification Enable (N0_N15)**

19.1.13 Command Ring Low (CRCR_LO)—Offset 98h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Command Ring Pointer (CRP)**
5:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RO	**Command Ring Running (CRR)**
2	0h RW/1S	**Command Abort (CA)**
1	0h RW/1S	**Command Stop (CS)**
0	0h RW	**Ring Cycle State (RCS)**

19.1.14 Command Ring High (CRCR_HI)—Offset 9Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Ring Pointer (CRP)**

19.1.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**

19.1.17 Configure (CONFIG)—Offset B8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**Max Device Slots Enabled (MaxSlotsEn)**

19.1.18 Port Status and Control USB2 (PORTSC1)—Offset 480h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

19.1.19 Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

19.1.20 Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

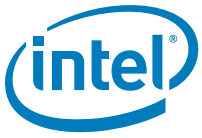
19.1.21 Port Status and Control USB2 (PORTSC2)—Offset 490h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.



Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

19.1.22 Port Power Management Status and Control USB2 (PORTPMSC2)—Offset 494h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

19.1.23 Port X Hardware LPM Control Register (PORTHLPMC2)—Offset 49Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

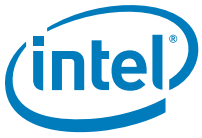
19.1.24 Port Status and Control USB2 (PORTSC3)—Offset 4A0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.



Bit Range	Default & Access	Field Name (ID): Description
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**

19.1.25 Port Power Management Status and Control USB2 (PORTPMSC3)—Offset 4A4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

19.1.26 Port X Hardware LPM Control Register (PORTHLPMC3)—Offset 4ACh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

19.1.27 Port Status and Control USB2 (PORTSC4)—Offset 4B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.

2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

19.1.41 Port X Hardware LPM Control Register (PORTHLPMC8)—Offset 4FCh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

19.1.42 Port Status and Control USB3 (PORTSC9)—Offset 500h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

19.1.43 Port Power Management Status and Control USB3 (PORTPMSC9)—Offset 504h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD)**
16	0h RW	**Force Link PM Accept (FLA)**
15:8	0h RW/S	**U2 Timeout (U2T)**
7:0	0h RW/S	**U1 Timeout (U1T)**

19.1.44 USB3 Port Link Info (PORTLI9)—Offset 508h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RO	**Link Error Count (LEC)**

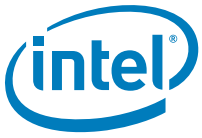
19.1.45 Port Status and Control USB3 (PORTSC10)—Offset 510h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.



Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

19.1.46 Port Power Management Status and Control USB3 (PORTPMSC10)—Offset 514h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD)**
16	0h RW	**Force Link PM Accept (FLA)**
15:8	0h RW/S	**U2 Timeout (U2T)**
7:0	0h RW/S	**U1 Timeout (U1T)**

19.1.47 USB3 Port Link Info (PORTLI10)—Offset 518h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RO	**Link Error Count (LEC)**

19.1.48 Port Status and Control USB3 (PORTSC11)—Offset 520h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**

19.1.61 Port Power Management Status and Control USB3 (PORTPMSC15)—Offset 564h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD)**
16	0h RW	**Force Link PM Accept (FLA)**
15:8	0h RW/S	**U2 Timeout (U2T)**
7:0	0h RW/S	**U1 Timeout (U1T)**

19.1.62 USB3 Port Link Info (PORTLI15)—Offset 568h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RO	**Link Error Count (LEC)**

19.1.63 Microframe Index (RTMFINDEX)—Offset 2000h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd1 (Rsvd1)**
13:0	0h RO	**Microframe Index (IMAN0)**

19.1.64 Interrupter 1 Management (IMAN0)—Offset 2020h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.65 Interrupter 1 Moderation (IMOD0)—Offset 2024h

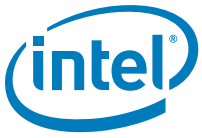
There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**



19.1.66 Event Ring Segment Table Size 1 (ERSTSZ0)—Offset 2028h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.67 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO0)—Offset 2030h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.68 Event Ring Segment Table Base Address High 1 (ERSTBA_HI0)—Offset 2034h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.69 Event Ring Dequeue Pointer Low 1 (ERDP_LO0)—Offset 2038h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.70 Event Ring Dequeue Pointer High 1 (ERDP_HI0)—Offset 203Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.71 Interrupter 2 Management (IMAN1)—Offset 2040h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.72 Interrupter 2 Moderation (IMOD1)—Offset 2044h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.73 Event Ring Segment Table Size 2 (ERSTSZ1)—Offset 2048h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.74 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO1)—Offset 2050h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.75 Event Ring Segment Table Base Address High 2 (ERSTBA_HI1)—Offset 2054h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.76 Event Ring Dequeue Pointer Low 2 (ERDP_LO1)—Offset 2058h

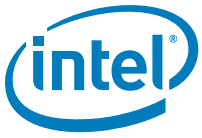
There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**



19.1.77 Event Ring Dequeue Pointer High 2 (ERDP_HI1)—Offset 205Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.78 Interrupter 3 Management (IMAN2)—Offset 2060h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.79 Interrupter 3 Moderation (IMOD2)—Offset 2064h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.80 Event Ring Segment Table Size 3 (ERSTSZ2)—Offset 2068h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.81 Event Ring Segment Table Base Address Low 3 (ERSTBA_LO2)—Offset 2070h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.82 Event Ring Segment Table Base Address High 3 (ERSTBA_HI2)—Offset 2074h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.83 Event Ring Dequeue Pointer Low 3 (ERDP_LO2)—Offset 2078h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.84 Event Ring Dequeue Pointer High 3 (ERDP_HI2)—Offset 207Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.85 Interrupter 4 Management (IMAN3)—Offset 2080h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.86 Interrupter 4 Moderation (IMOD3)—Offset 2084h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.87 Event Ring Segment Table Size 4 (ERSTSZ3)—Offset 2088h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

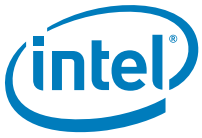
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.88 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO3)—Offset 2090h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.89 Event Ring Segment Table Base Address High 4 (ERSTBA_HI3)—Offset 2094h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.90 Event Ring Dequeue Pointer Low 4 (ERDP_LO3)—Offset 2098h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.91 Event Ring Dequeue Pointer High 4 (ERDP_HI3)—Offset 209Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.92 Interrupter 5 Management (IMAN4)—Offset 20A0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.93 Interrupter 5 Moderation (IMOD4)—Offset 20A4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.94 Event Ring Segment Table Size 5 (ERSTSZ4)—Offset 20A8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.95 Event Ring Segment Table Base Address Low 5 (ERSTBA_LO4)—Offset 20B0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.96 Event Ring Segment Table Base Address High 5 (ERSTBA_HI4)—Offset 20B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.97 Event Ring Dequeue Pointer Low 5 (ERDP_LO4)—Offset 20B8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.98 Event Ring Dequeue Pointer High 5 (ERDP_HI4)—Offset 20BCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.99 Interrupter 6 Management (IMAN5)—Offset 20C0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.100 Interrupter 6 Moderation (IMOD5)—Offset 20C4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.101 Event Ring Segment Table Size 6 (ERSTSZ5)—Offset 20C8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.102 Event Ring Segment Table Base Address Low 6 (ERSTBA_LO5)—Offset 20D0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.103 Event Ring Segment Table Base Address High 6 (ERSTBA_HI5)—Offset 20D4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.104 Event Ring Dequeue Pointer Low 6 (ERDP_LO5)—Offset 20D8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.105 Event Ring Dequeue Pointer High 6 (ERDP_HI5)—Offset 20DCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.106 Interrupter 7 Management (IMAN6)—Offset 20E0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.107 Interrupter 7 Moderation (IMOD6)—Offset 20E4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.108 Event Ring Segment Table Size 7 (ERSTSZ6)—Offset 20E8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.109 Event Ring Segment Table Base Address Low 7 (ERSTBA_LO6)—Offset 20F0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.110 Event Ring Segment Table Base Address High 7 (ERSTBA_HI6)—Offset 20F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.111 Event Ring Dequeue Pointer Low 7 (ERDP_LO6)—Offset 20F8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.112 Event Ring Dequeue Pointer High 7 (ERDP_HI6)—Offset 20FCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.113 Interrupter 8 Management (IMAN7)—Offset 2100h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

19.1.114 Interrupter 8 Moderation (IMOD7)—Offset 2104h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

19.1.115 Event Ring Segment Table Size 8 (ERSTSZ7)—Offset 2108h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

19.1.116 Event Ring Segment Table Base Address Low 8 (ERSTBA_LO7)—Offset 2110h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

19.1.117 Event Ring Segment Table Base Address High 8 (ERSTBA_HI7)—Offset 2114h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

19.1.118 Event Ring Dequeue Pointer Low 8 (ERDP_LO7)—Offset 2118h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

19.1.119 Event Ring Dequeue Pointer High 8 (ERDP_HI7)—Offset 211Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

19.1.120 Door Bell 1 (DB0)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.121 Door Bell 2 (DB1)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.122 Door Bell 3 (DB2)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.123 Door Bell 4 (DB3)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.124 Door Bell 5 (DB4)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.125 Door Bell 6 (DB5)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**DB Target (DT)**

19.1.126 Door Bell 7 (DB6)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.127 Door Bell 8 (DB7)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.128 Door Bell 9 (DB8)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.129 Door Bell 10 (DB9)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.130 Door Bell 11 (DB10)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.131 Door Bell 12 (DB11)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.132 Door Bell 13 (DB12)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.133 Door Bell 14 (DB13)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.134 Door Bell 15 (DB14)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.135 Door Bell 16 (DB15)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.136 Door Bell 17 (DB16)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.137 Door Bell 18 (DB17)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**DB Target (DT)**

19.1.138 Door Bell 19 (DB18)—Offset 3048h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.139 Door Bell 20 (DB19)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

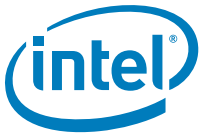
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.140 Door Bell 21 (DB20)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.141 Door Bell 22 (DB21)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.142 Door Bell 23 (DB22)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.143 Door Bell 24 (DB23)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.144 Door Bell 25 (DB24)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.145 Door Bell 26 (DB25)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.146 Door Bell 27 (DB26)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.147 Door Bell 28 (DB27)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.148 Door Bell 29 (DB28)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.149 Door Bell 30 (DB29)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**DB Target (DT)**

19.1.150 Door Bell 31 (DB30)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.151 Door Bell 32 (DB31)—Offset 307Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.152 Door Bell 32 (DB32)—Offset 3080h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

19.1.153 XECP_SUPP_USB2_0 (XECP_SUPP_USB2_0)—Offset 8000h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2000802h

Bit Range	Default & Access	Field Name (ID): Description
31:24	2h RO	**USB Major Revision: 2.0 (USB2_MAJ_REV)**
23:16	0h RO	**USB Minor Revision (USB_MIN_REV)**
15:8	8h RO	**Next Capability Pointer (NCP)**
7:0	2h RO	**Supported Protocol ID (SPID)**

19.1.154 XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1)—Offset 8004h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 20425355h

Bit Range	Default & Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1):** Namestring USB

19.1.155 XECP_SUPP_USB2_2 (XECP_SUPP_USB2_2)—Offset 8008h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30190801h

Bit Range	Default & Access	Field Name (ID): Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low)
27:21	0h RO	**Rsvd0 (Rsvd0)**
20	1h RW/L	**BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMCC registers.
19	1h RW/L	**Protocol Defined - Hardware LMP Capability (HLC)**
18	0h RO	**Protocol Defined - Integrated Hub Implementation (IHI)**
17	0h RO	**Protocol Defined - High SPeed Only (HSO)**
16	1h RO	**Reserved (RSVD)**
15:8	8h RO	**Compatible Port Count (CPC)**
7:0	1h RO	**Compatible Port Offset (CPO)**

19.1.156 XECP_SUPP_USB2_3 (Full Speed) (XECP_SUPP_USB2_3)—Offset 8010h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C0021h

Bit Range	Default & Access	Field Name (ID): Description
31:16	Ch RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	**Rsvd0 (Rsvd0)**
8	0h RO	**PSI Full Duplex (PFD)**

3:0	6h RO	**Protocol Speed ID Value (PSIV)**

19.1.168 XECP_SUPP_USB3_9 (XECP_SUPP_USB3_9)—Offset 8048h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 16C60127h

Bit Range	Default & Access	Field Name (ID): Description
31:16	16C6h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	**Rsvd0 (Rsvd0)**

Bit Range	Default & Access	Field Name (ID): Description
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	7h RO	**Protocol Speed ID Value (PSIV)**

19.1.169 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This is a register that describe the host controller the extended cap location. It includes the , XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192. This register is not subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4DFFC0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	4Dh RW/L	**Valid Length (VALID_LENGTH):** Indicates the number of valid DWords in the capability, that need to be saved and restored. 47h -> 818Bh is the last valid byte
15:8	FFh RW/L	**Next Capability Pointer (XECP_HOST_NEXT_CAP_OFFSET)**
7:0	C0h RW/L	**Supported Protocol ID (VEND_DEF_HOST_CAP_ID)**

19.1.170 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP

19.1.171 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.

19.1.172 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots

Bit Range	Default & Access	Field Name (ID): Description
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP

19.1.173 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8100h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RW	**Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** 31:25 Reserved (24): disable marking overlap flag on all TT periodic INs. (23): disable async. scheduling while periodic active to same port (22): disable "level" method of USB2 port periodic done check (on by default) (21): enable "strobe" method of USB2 port periodic done check (off by default)
20:13	4h RW	**TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved
12:11	0h RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16
10:9	0h RW	**Maximum EP Per Slot (MAX_EP_SLOT):** 0: 32 1: 16 2: 8 3: 4
8	1h RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Scheduler Host Control Reg (SCHED_HOST_CTRL):** (0): disable poll delay (1): disable TRM active in EP valid check (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) (5:4) scheduler sort pattern 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 (6): disable 1 pack scheduling limit when ISO pending in present microframe (7): enable check to stop scheduling on port that are not connected

19.1.174 Global Port Control (HOST_CTRL_PORT_CTRL)—Offset 80A0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 380Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OVERFLOW ERROR DETECTION ENABLE (OVERFLOW_ERR_DETECT_EN)**
30:12	3h RW	**HBUF_WATER_MARK (HBUF_WATER_MARK)**
11	1h RW	**CPL Cut Thru Enable (CPL_CUT_THRU_EN)**
10:4	0h RW	**RESERVED (RSVD0)**
3:0	Fh RW	**RESERVED (RSVD1)**

19.1.175 Power Management Control (PMCTRL_REG)—Offset 80A4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2DFF90h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.
30	0h RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in in reference to the source prior to the RTD3 changes.
29	0h RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate
28	0h RW	**CLR_PME_FLAG_PULSE_AUX_CCLK (CLR_PME_FLAG_PULSE_AUX_CCLK)**
27	0h RW	**RESERVED (RSVD)**
26	0h RW	**XLFPSCOUNTSRC (XLFPSCOUNTSRC):** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0h RW	**XELFPSRTC (XELFPSRTC):** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3
24	0h RW	**XMPHYSPGDD0I2 (XMPHYSPGDD0I2):** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
23	0h RW	**XMPHYSPGDD0I3 (XMPHYSPGDD0I3):** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
22	0h RW	**XMPHYSPGDRTD3 (XMPHYSPGDRTD3):** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
21:18	Bh RW	**XD3RTCPTTM (XD3RTCPTTM):** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET a detection while MODPHY SUS Power gating is enabled would be 99ms.
17	0h RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3 ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3 PHY SUS Well Power Gating is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD
15:8	FFh RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection.
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL (SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL):** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.
3	0h RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state.
2	0h RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.
1	0h RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0 RTD3 triggered 1 - Port Triggered when in L1, L2 or Disabled, Disconnected
0	0h RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled

19.1.176 PGCB Control (PGCBCTRL_REG)—Offset 80A8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 315555h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:25	0h RW	**IP_INACCESSIBLE_HYSTERESIS_TIMER (IP_INACCESSIBLE_HYSTERESIS_TIMER):** 000 ? 50us 001 ? 100us 010 ? 150us 011 ? 200us 000 ? 250us 001 ? 300us 010 ? 350us 111 ? 400us
24	0h RW	**Override_Disable (OVERRIDE_DISABLE)**
23:20	3h RW	**CDH Aggregation Minimum Wait Time (CDH_MIN_WAIT_TIME):** This field controls the minimum time that we must wait for resets to propagate before allowing Power Up flow to complete. The Power Up flow requires special handling of clocks, reset and sleep signaling which requires the CDH to monitor reset propagation. This timer allow for flexibility on when we consider all resets propagated. 0h Disabled 1h 2 clocks 2h 4 clocks 3h 8 clocks 4h 16 clocks 5h 32 clocks 6h 64 clocks 7h 128 clocks
19	0h RW	**RESERVED (CDH_RST_PROPAGATION_CNTRL):** This bit will indicate the mode of operation for the CDH Reset Propagation Aggregator. It allows for a mode where the aggregation will wait for an indication from each CDH before proceeding OR ignore the CDH indication before proceeding. Regardless of the mode, the aggregator will enforce the CDH Aggregation Mini Wait Time. 0 Aggregate all the CDH indications before triggering the CDH Aggregation Mini Wait Time. Once the Min Wait Time is met a notification to the Power Sequencer/Control will be initiated 1 Trigger the CDH Aggregation Mini Wait Time w/o waiting for CDH indication. Once the Min Wait time is met a notification to the Power Sequencer/Control will be initiated.
18	0h RW	**MMP_PFET_REQ_OVRD (MMP_PFET_REQ_OVRD):** This bit will disable the MMP PFET request condition for PGCB control. 1 MMP PFET Request Ignored 0 Default
17:16	1h RW	**PGCB Clock Gate Request to PGCB Sleep (PGCB_CLK_GATE_REQ_2_PGCB_SLEEP):** Value representing the minimum number of delay clocks required between the assertion of pgcb_ip_clkgate_b to the deassertion of pgcb_sleep on PG exit. (This is only applicable for IP-Accessible PG with state-retention enabled.) Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
15:14	1h RW	**PGCB Sleep Deassertion to PGCB ISM Unlock Req (PGCB_SLEEP_DEASRTN_2_ISM_UNLOCK_REQ):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of gcb_sleepto the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
13:12	1h RW	**PGCB Prim Reset Deassertion to PGCB Next State (PGCB_PRIMRST_DEASRTN_2_NSTATE):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
11:10	1h RW	**PGCB Side Reset Deassertion to PGCB Prim Reset Deassertion (PGCB_SIDERST_DEASRTN_2_PRIMERST_DEASRTN):** Value representing the number of delay clocks required between the deassertion of gcb_force_rst_bto the deassertion of gcb_force_prim_rst_b (This is only applicable for IP-Accessible PG.) Please see the description of cfg_tsleepact for more details.
9:8	1h RW	**PGCB Latch Isolation High to PGCB Clock Ungate Request (PGCB_LATCH_ISO_HI_2_PGCB_CLK_UNGATE_REQ):** Value representing the number of delay clocks required between the assertion of pgcb_isol_latchen to the deassertion of pgcb_ip_clkgate_req_b. Please see the description of cfg_tsleepact for more details.
7:6	1h RW	**PGCB Isolation Deassertion to PGCB Latch Isolation High Count (PGCB_ISO_DEASRTN_2_PGCB_ISO_HI_CNT):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_en_b to the assertion of gcb_isol_latchen. Please see the description of cfg_tsleepact for more details.
5:4	1h RW	**PGCB Reset Assertion to PGCB Power Down Request Count (PGCB_RST_2_PGCB_PWRDOWN_REQCNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_pmc_pg_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_sleep. Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
3:2	1h RW	**PGCB Isolation Assertion to PGCB Reset Assertion Count (PGCB_ISO_ASRTN_2_PGCB_RST_ASRTN_CNT):** Value representing the minimum number of delay clocks required between the assertion of gcb_isol_en_bto the assertion of gcb_force_prim_rst_band gcb_force_rst_b Please see the description of [1:0] for more details.
1:0	1h RW	**PGCB Sleep Assertion to PGCB Isolation Enable Count (PGCB_SLEEP_ASRTN_2_PGCB_ISO_EN_CNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_sleep (and the deassertion of pgcb_isol_latchen) to the assertion of pgcb_isol_en_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_latchen to the assertion of pgcb_isol_en_b, as well as the minimum number of delay clocks required between the assertion of pgcb_sleep to the assertion of pgcb_pmc_pg_req_b. Common for all cfg_t* inputs: 0 1 clock 1 2 clocks 0 8 clocks 1 256 clocks For any of the cfg_t* inputs that an IP may feel are a don-care and the IP does not feel they will be useful for post-silicon debug, the recommendation is to tie the input to 201 (2 clocks). Otherwise, the inputs may be tied to another relevant value or connected to a configuration register. Note: These signals may only change while pgcb_pwrupidle is asserted, if pgcb_pwrupidle is deasserted it should be valid and stable. (It may change the same cycle that ip_pgcb_pg_rdy_req_b asserts.)

19.1.177 D0I3 Control (DOI3CTRL_REG)—Offset 80ACh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3	1h RW/1C	**RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3 (D0I3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1:0	0h RO	**RESERVED (RSVD1)**

19.1.178 HOST_CTRL_MISC_REG (HOST_CTRL_MISC_REG)—Offset 80B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1037Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USB2_LTRUPDT_DIS (USB2_LTRUPDT_DIS)**
30	0h RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset.
29	0h RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected
28	0h RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling.
27	0h RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination.
26	0h RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk.
25	0h RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, we rely on gating of frame timer due to proper port state and idleness tracking from the pipeline.
24	0h RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**RESERVED (RSVD1)**
19	0h RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins.
18:16	1h RW	**Extra uFrame (EXTRA_UFRAME):** This register controls the extra number of uFrames added onto the advancing of late FID check.
15:0	37Fh RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in miliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error.

19.1.179 HOST_CTRL_MISC_REG2 (HOST_CTRL_MISC_REG2)—Offset 80B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

4	0h RW	**disable_clr_ccs_on_cas_set (DISABLE_CLR_CCS_ON_CAS_SET)**
3	0h RW	**disable_rhub_park_at_dbcDisc (DISABLE_RHUB_PARK_AT_DBCDISC)**
2	0h RW	**disable_block_wpr_on_disPorts (DISABLE_BLOCK_WPR_ON_DISPORTS)**
1:0	0h RW	**HOST_CTRL_MISC_REG2_bits1_0 (HOST_CTRL_MISC_REG2_1_0)**

19.1.180 SSPE_REG (SSPE_REG)—Offset 80B8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ssCfgBlockPwrDwn4ActLFPS (SS_CFG_BLOCK_PWRDWN_4_ACT_LFPS)**
30	0h RW	**dis_clr_ccs_4hcreset (DIS_CLR_CCS_4_HCRESET)**
29	0h RW	**disable_rawlfps_based_wake_fix (DISABLE_RAWLFPS_BASED_WAKE_FIX)**
28:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW	**SSPE_REG (SSPE_REG)**

19.1.181 (SSPITPE)—Offset 80BCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RSVD (RSVD)**
6:0	7Fh RW	**ITP Transmit Enable (ITP_TRANSMIT_EN):** Width is scaled with USB3 Port Count PortCount=4

19.1.182 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 15FC0F0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. Write 1 to this register will issue a cold reset to USB3 ports.
30	0h RW	**RESERVED (RSVD)**
29	0h RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.
28	0h RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.
27	0h RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.
26	0h RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.
25	0h RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS
24	1h RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1 prevent a reset being generated due to the USB3 port link down condition.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1 ignore the main power up reset for USB3 PIPE PHY reset.
22	1h RW	**RESERVED (RSVD_1)**
21	0h RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1' ignore HC reset to reset the USB2 Port logic
20	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1' ignore HC reset to the USB PHY power-on reset
19	1h RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core.
18	1h RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1' enable EEPROM reload on every main power-up
17	1h RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1' ignore HC reset to the PCIe PHY PIPE reset
16	1h RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1' ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset
15	1h RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1' ignore warm reset the USB PHY power on reset
14	1h RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1' allow PCIe link down to cause a reset to the rest of the core
13	0h RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1' ignore hot reset to the USB3 port logic
12	0h RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1' ignore warm reset to the USB3 port logic
11	0h RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1' ignore main power up reset to USB3 port logic
10	0h RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1' ignore main power up reset to USB2 port logic
9	0h RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1' ignore main power up reset to PCIe core
8	0h RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1' ignore main power up reset to PCIe PHY
7	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1' ignore HC reset to the USB PHY
6	1h RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1' ignore warm reset to the USB PHY
5	1h RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function

Bit Range	Default & Access	Field Name (ID): Description
4	1h RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1' allow main power off condition to trigger a main power domain reset
3	0h RW	**Ignore Wait For PERST# During Power Show Down (IGN_PERST_PSD):** When set to '1' ignore waiting for PERST# deassertion during main power show down.
2	0h RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** When fundamental reset is asserted during AUX power up, if this bit is set, then we will ignore PERST# such that purely wait for timeout to deassert fundamental reset.
1:0	0h RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset

19.1.183 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 4A4008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	4A4h RW	**Max. TT BW Allowed (MAX_TT_BWA):** see white paper
11:0	8h RW	**Per Packet Overhead SS BW (PP_OVRH_SSBW):** BW calculation: Overhead per packet for SS BW calculations. see white paper.

19.1.184 High Speed TT Bandwidth Overload (HOST_BW_OV_HS_REG)—Offset 80C8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1A01Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
23:12	1Ah RW	**Per Packet Overhead HS-TT BW (PP_OVRH_HSTTBW):** BW calculation: Overhead per packet for HS-TT BW calculations. see white paper.
11:0	1Fh RW	**Per Packet Overhead HS BW (PP_OVRH_HSBW):** BW calculation: Overhead per packet for HS BW calculations. see white paper.

19.1.185 Bandwidth Overload Full Low Speed (HOST_BW_OV_FS_LS_REG)—Offset 80CCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 14080h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	14h RW	**Per Packet Overhead FS BW (PP_OVRH_FSBW):** BW calculation: Overhead per packet for FS BW calculations. see white paper.
11:0	80h RW	**Per Packet Overhead LS BW (PP_OVRH_LSBW):** BW calculation: Overhead per packet for LS BW calculations. see white paper.

19.1.186 System Bandwidth Overload (HOST_BW_OV_SYS_REG)—Offset 80D0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 32010h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	32h RW	**Per TT Packet Overhead System BW (PTTP_OVRH_SBW):** BW calculation: Overhead per TT packet for System BW calculations. see white paper.

Bit Range	Default & Access	Field Name (ID): Description
11:0	10h RW	**Per Packet Overhead System BW (PP_OVRH_SBW):** BW calculation: Overhead per packet for System BW calculations. see white paper.

19.1.187 Scheduler Async Delay (HOST_CTRL_SCH_ASYNC_DELAY_REG)—Offset 80D4h

Global defaults for inserting delays between packets in the scheduler for async. types.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**RESERVED (RSVD)**
19	0h RW	**High-Speed Bulk Delay Enable (HS_BD_EN)**
18:16	0h RW	**High-Speed Bulk Delay Default (HS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
15	0h RW	**Full-Speed Bulk Delay Enable (FS_BD_EN)**
14:12	0h RW	**Full-Speed Bulk Delay Default (FS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
11	0h RW	**High-Speed Control Delay Enable (HS_CD_EN)**
10:8	0h RW	**High-Speed Control Delay Default (HS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
7	0h RW	**Full-Speed Control Delay Enable (FS_CD_EN)**
6:4	0h RW	**Full-Speed Control Default (FS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
3	0h RW	**Low-Speed Control Delay Enable (LS_CD_EN)**
2:0	0h RW	**Low-Speed Control Delay Default (LS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)

19.1.188 DEVICE MODE CONTROL REG 0 (DUAL_ROLE_CFG_REG0)—Offset 80D8h

All bits in this register must be in the Always ON Power domain (ungated SUS or AON as appropriate)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**XDCI_DRD_CTRL_EN (REG_IN_XDCI):** When DRD_ACCESS_MODE (bit 18) =1, 0 -- The policies below is controlled by register in the XHCI MMIO 1 -- The policies below is controlled by register in the XDCI MMIO When DRD_ACCESS_MODE =0, this bit is a don?t care.
30:28	0h RW	**DRD_WDT_TIMER (DRD_WDT_TIMER):** 0-based incremental of 500ms
27	0h RW	**EN_DRD_WDT_SWITCH_FROM_HOST_TO_DEVICE (EN_DRD_WDT_SWITCH_FROM_HOST_TO_DEVICE)**
26	0h RW	**EN_DRD_WDT_SWITCH_FROM_DEVICE_TO_HOST (EN_DRD_WDT_SWITCH_FROM_DEVICE_TO_HOST)**
25	0h RW	**EN_DRD_WDT_SWITCH_OUT_OF_COLD_RESET (EN_DRD_WDT_SWITCH_OUT_OF_COLD_RESET)**
24	0h RW	**SW_VBUS_VALID (SW_VBUS_VALID):** if SW_IDPIN_EN (bit 21) is 1, 0 ? deassert sw vbus valid 1 ? assert sw vbus valid
23	0h RW	**EN_PIPE_4_1_SYNC_PHY_STATUS (EN_PIPE_4_1_SYNC_PHY_STATUS)**
22	0h RW	**EN_PIPE_RX_ON_IDPIN (EN_PIPE_RX_ON_IDPIN):** During the connection to a device, there may be a delay in DRD switch from XDCI to XHCI mode,the rx term can be low after idpin deasserts. If this bit is 0, the rx term will be assert immediately after idpin toggle. Otherwise, the device may fall back to USB2 mode. 1 -- drive 0s on utmi rx signals to controller if not connected.
21	0h RW	**SW_IDPIN_EN (SW_IDPIN_EN):** SW_IDPIN_EN 1 -- enable SW id pin (pre DRD) 0 -- disable SW id pin.
20	0h RW	**SW_IDPIN (SW_IDPIN):** if SW_IDPIN_EN (bit 21) is 1, 0 - host mode 1 - device mode
19	0h RW	**USB2_SUSP_OR_DIS (USB2_SUSP_OR_DIS):** 1 - The DRD UTMI suspendm will be controlled by host/device based on the DRD switch. 0 - whenever device or host deassert suspendm, the DRD UTMI suspendm will be deasserted.
18	0h RW	**DRD_ACCESS_MODE (DRD_ACCESS_MODE):** 0 - The DUAL_ROLE register from host and device are ORed to control DRD 1 - The DUAL_ROLE register from host and device are selected by XDCI_DRD_CTRL_EN (bit 31) to control DRD

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN (EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN):** 0 enable the direct DRD switch on USB3 port by idpin 1 disable the direct DRD switch
16	0h RW	**SW_SWITCH_ENABLE (SW_SWITCH_ENABLE):** SW switch enable 0 (default) ID pin HW controlled DRD. 1 -- SW controlled DRD (ignore idpin), switch based on the DRD_CONFIG.
15	0h RW	**RSVD (RSVD)**
14:3	100h RW	**DEBOUNCE_VAL (DEBOUNCE_VAL):** ID ping debounce timer (DEBOUNCE_VAL): in the unit of RTC clock (33us) default to 8.448 ms
2	0h RW	**SYNCHRONIZE_SS_HS_SWITCH (SYNCHRONIZE_SS_HS_SWITCH):** Synchronize the SS and HS switch: 0 (default) Does not synchronize. i.e. HS switch on the debounced id pin, while SS switch independently controlled by the sequencer. 1 synchronize HS and SS switch. Both speeds switch when sequencer switch.
1:0	0h RW	**DRD_CONFIG (DRD_CONFIG):** 00 Dynamic DRD switch mode 01 static host mode 10 static device mode 11 -- reserved

19.1.189 DEVICE MODE CONTROL REG 1 (DUAL_ROLE_CFG_REG1)—Offset 80DCh

All bits in this register must be in the Always ON Power domain (ungated SUS or AON as appropriate)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0h RO	**DRD_STATUS_B31_30 (DRD_STATUS_30)**
29	0h RO	**DRD_MODE (DRD_MODE):** SS DRD mode 0 device mode 1 host mode
28	1h RO	**IDPIN (IDPIN):** IDPIN value hw version
27:16	0h RO	**DRD_STATUS_B27_16 (DRD_STATUS_B27_16)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DRD_CONTROL_B15_0 (DRD_CONTROL_B15_0)**

19.1.190 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 808DBCA0h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from pin input which is set 1. But we allow software to alter it if it is needed. 1: D3 hot enabled 0: D3 hot not abled.
30	0h RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.
29	0h RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.
28	0h RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.
27	0h RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset
26	0h RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.
25	0h RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.
24	0h RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.
23	1h RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.
22	0h RW	**RESERVED (RSVD_1)**

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.
20	0h RW	**cfg pcie txreg rd (CPTR)**
19	1h RW	**cfg iob drivestrength[1] (CIDS1)**
18	1h RW	**cfg iob drivestrength[0] (CIDS0)**
17	0h RW	**Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2
16	1h RW	**cfg clk gate dis (CCGD)**
15	1h RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3
14	0h RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst
13	1h RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCie PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states.
12	1h RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to whether or not eable this host engine to generate PME message.
11	1h RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation
10	1h RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function.
9	0h RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
8	0h RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle.
7	1h RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.
5	1h RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/ switching and P2 entering
4:1	0h RW	**Forced PM State (FORCED_PM_STATE)**
0	0h RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1

19.1.191 Battery Charge (BATTERY_CHARGE_REG)—Offset 80E4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable DM_SRC Battery Charge (EN_DS_BC):** 1 - Always enable battery charge DM_SRC if not connected. Don't wait for portable device detect. (spec. ver. 1.2) 0 - Battery charge spec ver. 1.1.
30:4	0h RO	**RESERVED (RSVD)**
3	0h RW	**Enable Port 3 Battery Charging (EN_P3_BC):** 0 - Battery charging disabled (Physical Port #3) 1 - Battery charging enabled (Physical Port #3)
2	0h RW	**Enable Port 2 Battery Charging (EN_P2_BC):** 0 - Battery charging disabled (Physical Port #2) 1 - Battery charging enabled (Physical Port #2)
1	0h RW	**Enable Port 1 Battery Charging (EN_P1_BC):** 0 - Battery charging disabled (Physical Port #1) 1 - Battery charging enabled (Physical Port #1)
0	0h RW	**Enable Port 0 Battery Charging (EN_P0_BC):** 0 - Battery charging disabled (Physical Port #0) 1 - Battery charging enabled (Physical Port #0)

19.1.192 Port Watermark (HOST_CTRL_WATERMARK_REG)—Offset 80E8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800080h

Bit Range	Default & Access	Field Name (ID): Description
31:16	80h RW	**RBUF water mark (RBUF_WM)**
15:0	80h RW	**XBUF water mark (XBUF_WM)**

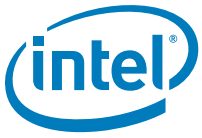
19.1.193 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 18010000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	3h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be forced This value is for test purpose only.
26	0h RW	**Direct Link LTSSM State (DL_LTSSM_ST):** 0: Normal operation mode 1: Direct link to a specific state specified by bit 31:27 This bit is for test purpose only. It shall be written 0 in normal operation mode.
25	0h RW	**Direct Link To U0 (DL_U0):** 0: Normal operation mode 1: Direct link to U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode This value is for test purpose only.
20	0h RW	**Enable Link Error Slave Count (EN_LES_CNT):** 0: Disable link error slave count 1: Enable link error slave count
19:17	0h RW	**Debug Mode Select (DEBUG_MD_SEL)**
16:15	2h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode 0: 4 cycles 1: 8 cycles 2: 16 cycles 3: 32 cycles
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us.



Bit Range	Default & Access	Field Name (ID): Description
11:9	0h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us.
8	0h RW	**Force Link Accept PM Command (FORCE_LA_PMC):** 0: Normal operation mode 1: Force link to accept power management command
7	0h RW	**Direct Link Recovery U0 (DL_REC_U0):** 0: Normal operation mode 1: Direct link to Recovery from U0
6	0h RW	**Link Fast Training Mode (LINK_FTM):** 0: Normal operation mode 1: Link fast training mode This bit should be written 0 in normal operation.
5	0h RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** 0: Enable link scrambler 1: Disable link scrambler
4	0h RW	**Direct Link U3 From U0 (DL_U3_U0):** 0: Normal operation mode 1: Direct link to U3 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
3	0h RW	**Direct Link U3 From U0 (DL_U2_U0):** 0: Normal operation mode 1: Direct link to U2 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
2	0h RW	**Direct Link U3 From U0 (DL_U1_U0):** 0: Normal operation mode 1: Direct link to U1 from U0 This bit is for test purpose only. It shall be written 0 in normal operation mode.
1	0h RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** 0: Disable link loopback master mode 1: Enable link loopback master mode
0	0h RW	**Disable Link Compliance Mode (DIS_LINK_CM):** 0: Enable link compliance mode 1: Disable link compliance mode

19.1.194 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

These set of registers is used to control USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 310803A0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.

Bit Range	Default & Access	Field Name (ID): Description
23:21	0h RW	**Reserved (RSVD0)**
20	0h RW	**L1_EXIT_RECOVERY_MODE (L1_EXIT_RECOVERY_MODE):** Mode for extended L1 Exit recovery delay: 0: 12us 1: 50us
19	1h RW	**L1_TO_INCR_MODE (L1_TO_INCR_MODE):** Mode select for L1 Timeout increments: 0: time out increments are in 125us 1: L1 Timeout increments are in 256us. Refer to USB2 PORTHLPMC.L1 Timeout in XHCI Spec for additional details
18	0h RW	**Reserved (RSVD1)**
17	0h RW	**EN_DETECT_NOMINAL_PKT_EOP (EN_DETECT_NOMINAL_PKT_EOP):** 0: Detect minimal packet EOP. 1: Detect nominal packet EOP.
16	0h RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** 0: Normal 1: Force full speed on host ports (disable chirp response)
15	0h RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** 0: Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. 1: Disable 192 byte limit check.
14	0h RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** 0: Internal FS/LS Disconnect from linestate(1:0) 1: External provided FS/LS Disconnect from hostdisconnect input
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL):** Select UTMI Reset Source (FRD UTMI Reset Only) 00: HCReset or Force PHY Reset or internal reset after disconnect/suspend for restart (default) 01,11: UTMI reset = ~UTMI suspendm 10: UTMI reset = ~UTMI suspendm and synchronization to port clk.
11	0h RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN):** 0: Enable HS Disconnect Window Function 1: Disable HS Disconnect Window Function
10	0h RW	**Disable Port Error Detection (DIS_PERR_DET):** 0: Enable Port Error Detection (default) 1: Disable Port Error Detection
9	1h RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT):** 0: Enable Peek function for ISO-OUT (default) 1: Disable Peek function for ISO-OUT
8	1h RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER):** 0: Drive Resume-K on parallel Interface 1: Drive Resume-K directly on FS/LS Serial Interface (default)
7	1h RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING):** 0: Disable Drop-Ping Function in USB2 Protocol (default) 1: Enable Drop-Ping Function in USB2 Protocol
6	0h RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING):** 0: Disable Force-Ping Function in USB2 Protocol (default) 1: Enable Force-Ping Function in USB2 Protocol

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**Enable USB2 Auto-Ping (EN_U2_AUTO_PING):** 0: Disable Auto-Ping Function 1: Enable Auto-Ping Function in USB2 Protocol (default)
4	0h RW	**Disable PHY SuspendM (DIS_PHY_SUSM):** 0: PHY is suspend=U3,U2,disconnect (default) 1: Disable PHY SuspendM in All States
3	0h RW	**UTMI Internal Clock Gate Disable (UTMI_INT_CG_DIS):** 0: Normal operation (internal clock gated in U2,U3,disconnect) 1: UTMI Internal Clock Gate Disable
2	0h RW	**Disable PHY SuspendM in Disconnect State (DIS_PSUSM_DS):** 0: PHY is suspendM=0 in Disconnect State (default) 1: Disable PHY SuspendM in Disconnect State
1	0h RW	**Force PHY Reset (FORCE_PHY_RST):** 0: Normal Operation (default) 1: Force PHY Reset
0	0h RW	**USB2 Accelerated Simulation Timing (U2_ACC_SIM_TIM):** 0: Normal Operation (default - FPGA/ASIC) 1: USB2 Accelerated Simulation Timing (default - simulation)

19.1.195 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80C40620h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Total Reset Duration[0] (TOT_RST_DUR_0):** # of microseconds for total reset duration
30:18	31h RW	**Chirp-K Duration (CHIRPK_DUR):** # of microseconds of Chirp-K to register that a device is chirping
17:5	31h RW	**K/J Disconnect Connect Delay (KJ_DIS_CON_DEL):** # of microseconds of K/J in disconnected state to register connect has occurred.
4:0	0h RW	**FS/LS Mode SE0 Disconnect Delay[12:8] (FSLS_SE0_DIS_DEL_12_8):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.

19.1.196 USB2 Port Link Control 3 (USB2_LINK_MGR_CTRL_REG3)—Offset 80F8h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F865EB6Bh

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW	**U2 Entry Ignore Linestate Changes Duration[3:0] (U2_IGN_LS_DUR_3_0):** # of microseconds after entering U2, linestate changes are ignored as bus settles
27:15	10CBh RW	**U3 Entry Ignore Linestate Changes Duration (U3_IGN_LS_DUR):** # of microseconds after entering U3, linestate changes are ignored as bus settles
14:0	6B6Bh RW	**Total Reset Duration[15:1] (TOT_RST_DUR_15_1):** # of microseconds for total reset duration

19.1.197 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8003h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED (RSVD)**
21:9	40h RW	**U2 Detect Remote Wake Delay (U2D_RWAKE_DEL):** #of microseconds after detecting U2 remote wake condition to reflect K
8:0	3h RW	**U2 Entry Ignore Linestate Changes Duration[12:4] (U2_IGN_LS_DUR_12_4):** # of microseconds after entering U2, linestate changes are ignored as bus settles

19.1.198 Bandwidth Calc Control (HOST_CTRL_BW_CTRL_REG)—Offset 8100h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:0	8008h RW	**Reserved (RSVD_1)**

19.1.199 Host Interface Control (HOST_IF_CTRL_REG)—Offset 8108h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**Rsvd1 (Rsvd1)**
0	1h RW	**Host IF (HOSTIF)**

19.1.200 Bandwidth Overload Burst (HOST_BW_OV_BURST_REG)—Offset 810Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
23:12	8h RW	**Per Burst Overhead System BW (PB_OVRH_SBW):** BW calculation: Overhead per burst for system BW calculations. see white paper.
11:0	20h RW	**Per Burst Overhead System BW (PB_OVRH_SSBW):** BW calculation: Overhead per burst for SS BW calculations. see white paper.

19.1.201 USB Max Bandwidth Control 4 (HOST_CTRL_BW_MAX_REG)—Offset 8128h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: F42528505647F42h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**Reserved (RSVD)**
59:48	F42h RW	**PCIe Max BW Units (PCIE_MAX_BW):** Max. Number of BW units for PCIe (system interface) (denominator in 90% calculation)
47:36	528h RW	**TT Max BW Units (TT_MAX_BW):** Max. Number of BW units for TTs. (denominator in 90% calculation)
35:24	505h RW	**FS/LS Max BW Units (FSLS_MAX_BW):** Max. Number of BW units for FS/LS ports. (denominator in 90% calculation)
23:12	647h RW	**HS Max BW Units (HS_MAX_BW):** Max. Number of BW units for HS ports. (denominator in 80% calculation)
11:0	F42h RW	**SS Max BW Units (SS_MAX_BW):** Max. Number of BW units for SS ports. (denominator in 90% calculation)

19.1.202 USB2 Linestate Debug (LINESTATE_DEBUG_REG)—Offset 8130h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:26	0h RO	**Port 14 UTMI Linestate (P14_UTMI_LS)**
25:24	0h RO	**Port 13 UTMI Linestate (P13_UTMI_LS)**
23:22	0h RO	**Port 12 UTMI Linestate (P12_UTMI_LS)**

23:16	5h RW	**GAP time after HS RX (HSRX_GAP_TIME)**
15:8	14h RW	**GAP time after HS TX SOF (HSTXSOF_GAP_TIME)**
7:0	Ch RW	**GAP time HS TX Packet (HSTX_GAP_TIME)**

19.1.204 USB2 Protocol Bus Timeout Timer (USB2_PROTOCOL_BTO_TIMER_REG)—Offset 813Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8D4258B8h

Bit Range	Default & Access	Field Name (ID): Description
31:21	46Ah RW	**Bus timeout count for LS (LS_BUS_TO)**
20:10	96h RW	**Bus timeout count for FS (FS_BUS_TO)**
9:0	B8h RW	**Bus timeout count for HS (HS_BUS_TO)**

19.1.205 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A019132h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ah RW	**Engine Idle Hysteresis (EIH):** This register controls the min. idle span that has to be observed from the engine idle indicators before the power state flags (xhc_*_idle) will indicate a 1.

Bit Range	Default & Access	Field Name (ID): Description
23:12	19h RW	**Backbone PLL Shutdown Advance Wake (BPSAW):** This register controls the time before the next scheduled transaction where the Backbone PLL request will assert. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)
11:0	132h RW	**Backbone PLL Shutdown Min. Idle Duration (BPSMID):** The sum of this register plus the Backbone PLL Shutdown Advance Wake form to a Total Idle time. When the next scheduled periodic transaction is after present time + Total Idle, the Backbone PLL request will de-assert, allowing the PLL to shutdwon. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)

19.1.206 Power Scheduler Control-2 (PWR_SCHED_CTRL2)—Offset 8144h

These bit enable by EP type those EPs classes that are considered for determining next periodic active interval for pre-wake of the periodic_active signal. EP classes that are disabled may never be observed in setting of the periodic_active signal.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 33Fh

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD)**
9	1h RW	**HS Interrupt-OUT Alarm (HS_INT_OUT_ALRM)**
8	1h RW	**HS Interrupt-IN Alarm (HS_INT_IN_ALRM)**
7	0h RW	**SS Interrupt-OUT FC Alarm (SS_INT_OUT_FC_ALRM)**
6	0h RW	**SS Interrupt-IN Alarm (SS_INT_IN_FC_ALRM)**
5	1h RW	**SS Interrupt-OUT & not in FC Alarm (SS_INT_OUT_ALRM)**
4	1h RW	**SS Interrupt-IN & not in FC Alarm (SS_INT_IN_ALRM)**
3	1h RW	**HS ISO-OUT Alarm (HS_ISO_OUT_ALRM)**
2	1h RW	**HS ISO-IN Alarm (HS_ISO_IN_ALRM)**
1	1h RW	**SS ISO-OUT Alarm (SS_ISO_OUT_ALRM)**

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW	**SS ISO-IN Alarm (SS_ISO_IN_ALRM)**

19.1.207 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 81390206h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**DIS_L1P2_EXIT_ON_WAKE_EN (DIS_L1P2_EXIT_ON_WAKE_EN):** This bit disables the dependency on Wake Enables defined in PORTSC for L1P2 exit when in D0
30:28	0h RW	**RESERVED0 (RSVD0)**
27:25	0h RW	**RESERVED (RSVD)**
24	1h RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCie core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature.
23	0h RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection
22	0h RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2 (TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2):** This bit enables a feature in PCie core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature.

Bit Range	Default & Access	Field Name (ID): Description
21	1h RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if we are in D3Hot.
20	1h RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2
19	1h RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state
18	0h RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0 (EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0):** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature
17	0h RW	**U2_EXIT_LFPS_TIMER_VALUE (U2_EXIT_LFPS_TIMER_VALUE):** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain
16	1h RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP (EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP):** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.
15:14	0h RW	**P3_ENTRY_TIMEOUT (P3_ENTRY_TIMEOUT):** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us)
13	0h RW	**Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL)**
10	0h RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0
8:4	0h RW	**Debug Mode Select Register (DEB_MODE_SEL)**
3	0h RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition.
2	1h RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2.
1	1h RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed.
0	0h RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.

19.1.208 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FCh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD)**
7	1h RW	**EN_CMDM_TXRXB (EN_CMDM_TXRXB):** Enable Command Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
6	1h RW	**EN_TTE_TXRXB (EN_TTE_TXRXB):** Enable TTE Active indication for Tx/Rx Bias circuit HS Phy PM Policy
5	1h RW	**EN_IDMA_TXRXB (EN_IDMA_TXRXB):** Enable IDMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
4	1h RW	**EN_ODMA_TXRXB (EN_ODMA_TXRXB):** Enable ODMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
3	1h RW	**EN_TRM_TXRXB (EN_TRM_TXRXB):** Enable Transfer Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW	**EN_SCH_TXRXB (EN_SCH_TXRXB):** Enable Scheduler Active indication for Tx/Rx Bias circuit HS Phy PM Policy
1	0h RW	**Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)
0	0h RW	**Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)

19.1.209 USB Power Gating Control (USB_PGC)—Offset 8168h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 282EEh

Bit Range	Default & Access	Field Name (ID): Description
31:1	14177h RO	**Reserved (RSVD)**
0	0h RW	**USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse.

19.1.210 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD)**
19	0h RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.
17	0h RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.
16	0h RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.
15	0h RO	**Reserved1 (RSVD1):** Reserved
14	0h RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.
11:8	4h RW	**U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. 0x0: 1us 0x1: 128us 0x2: 256us 0x3: 512us 0x4: 640us 0x5: 768us 0x6: 896us 0x7: 1024us Others: Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.
6	0h RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
4	0h RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
3	0h RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
2	0h RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
1	0h RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
0	0h RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

19.1.211 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 96090032h

Bit Range	Default & Access	Field Name (ID): Description
31:22	258h RW	**USB2_LPM_REG_RSM_U3_DET_NORM (USB2_LPM_REG_RSM_U3_DET_NORM)**
21:19	1h RW	**Min U3 Exit LFPS Duration (MIN_U3E_LFPS_D):** Min U3 Exit LFPS Duration This field defines the minimum duration of LFPS driven by Host Controller upon U3 exit LFPS handshake. Note that theres an uncertainty of +-16us in actual duration driven by the Host Controller. 0b000: 96us 0b001: 160us 0b010: 224us 0b011: 288us 0b100: 352us 0b101: 416us 0b110: 480us 0b111: 544us
18:16	1h RW	**Min U2 Exit LFPS Duration (MIN_U2_ELFPS_D):** Min U2 Exit LFPS Duration This field defines the minimum duration of LFPS driven by Host Controller upon U2 exit LFPS handshake. Note that theres an uncertainty of +-16us in actual duration driven by the Host Controller. 0b000: 96us 0b001: 160us 0b010: 224us 0b011: 288us 0b100: 352us 0b101: 416us 0b110: 480us 0b111: 544us
15	0h RW	**Max PING LFPS Rx Detection (XHCI_MAX_PING_LFPS):** This field defines the maximum timing for PING LFPS. If an incoming LFPS will be considered a PING if it has a timing such that it is less than or equal to the selected value. Otherwise it will be considered for the other types of LFPS. 0b Max PING LFPS timing set to 256 ns (32 link clocks) 1b Max PING LFPS timing set to 320 ns (40 link clocks)
14:10	0h RO	**Reserved (RSVD_1)**
9:0	32h RW	**xHCI BESL to HIRD Distance (XHCI_BESL_HIRD_DT):** This field defines the gap between BESL and duration of Resume signalling from Host upon Host Initiated Resume from USB2.0 LPM. Default value of this register corresponds to xHCI spec defined 50us value. Value BESL to HIRD Distance 000h 0us 001h 1us 002h 2us 3FFh 1023us

19.1.212 xHC Latency Tolerance Parameters - LTV Control (XLTP_LTV1)—Offset 8174h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40047Dh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR):** 0: (default) allow scheduler direct transition from IDLE to NO requirement 1: Disable scheduler direct transition from IDLE to NO requirement
30:26	0h RW	**Reserved (RSVD)**
25	0h RW	**XHCI LTR Transition Policy (XLTRTP):** When '0', LTR messaging state machine transitions from High, Medium, or Low LTR states to Active state upon the Alarm Timer timout and stays in Active until the next service boundary. When '1', the LTR messaging state machine transitions through High ? Med ? Low ? Active states assuming enough latency is available for each transition.
24	0h RW	**XHCI LTR Enable (XLTRE):** This bit must be set to enable LTV messaging from XHCI to the PMC.

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Rsvd (Rsvd)**
17:16	0h RW	**U2P3 LFPS Periodic Sampling Control (XU2P3LPSC):** This field controls the OFF time for the LFPS periodic sampling for SS port in U2P3. If LFPSPM for a port is 1, it will override the OFF time and LFPS receiver will remain OFF permanently. For Fast Sim mode, 500us will be equivalent to 5us. 0x0 Polling Disable. (RXDET Polling will become 100ms.) 0x1 500us OFF Time 0x2 1ms OFF Time 0x3 1.5ms OFF Time
15:10	8h RW	**RSVD**
9:0	C8h RW	**XLFPSONCNTSS (XLFPSONCNTSS):** This time would describe the number of clocks LFPS will remain ON. LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 200.

19.1.227 (D0i2_CTRL_REG)—Offset 81BCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 84204B0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD)**
29:26	2h RW	**D0i2 Minimum Residency (D0I2_MIN_RESIDENCY):** This field controls the minimum time that we must stay in D0i2 to ensure that the entry sequence has settled before we attempt to exit. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 128 clocks 5h 256 clocks 6h 512 clocks 7h 1024 clocks

Bit Range	Default & Access	Field Name (ID): Description
25:22	1h RW	**D0i2 Entry Hysteresis Timer (D0I2_ENTRY_HYSTERESIS_TIMER):** This field allows for a hysteresis timer to be implemented specifically for D0i2. This will allow for D0i2 entry to be controlled independently from the timer used for D0i3 and D3. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 64 clocks 5h 128 clocks 6h 256 clocks 7h 512 clocks
21	0h RW	**Active Periodic EP Disable (ACTIVE_PERIODIC_EP_DISABLE):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of active Periodic EPs. Setting this field will allow D0i2 only when there are no active Periodic EPs on the schedule. Either there are no active DB or any active Interrupt EP is flow controlled.
20:16	2h RW	**MSI D0i2 Pre Wake Time (MSID0I2PWT):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the MSI module. Example: If while allowing D0i2 there is an MSI generation that will trigger in 250 us from now ,the MSI module will trigger a D0i2 wake up 250 us MSI D0i2 Pre Wake Time. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 3:0 250 ns ticks 0h 0 ns 1h 250 ns . 1Fh 3750 ns
15:4	4Bh RW	**MSI Idle Threshold (MSI_IDLE_THRESHOLD):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of pending MSI. This field is valid only if Pending MSI Disable is 0, allowing D0i2 in the presence of pending MSIs. D0i2 will be prevented if the amount of idle time between Event Ring being idle to the time an MSI will be generated does not exceed this time. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)
3	0h RW	**Pending MSI Disable (PENDING_MSI_DISABLE):** This field allows the xHC to disable D0i2 when there are pending MSIs in the event manager. Setting this field will require all IMOD counters to be 0h and all MSIs delivered. Clearing this field will allow for D0i2 power gating while there are 1 or more IMOD counters decrementing which implies that an MSI is pending and will be generated once the corresponding IMOD counter reaches 0h.
2	0h RW	**Frame Timer Run Disable (FRAME_TIMER_RUN_DISABLE):** This field allows the xHC to disable D0i2 when the frame timer is running. Clearing this field will allow D0i2 when the frame timer is required as defined in the XHCI Spec. Setting this field will not allow D0i2 when the frame timer is required and will limit D0i2 for the condition where the frame timer is not required.
1	0h RW	**USB2 L1 Disable (USB2_L1_DISABLE):** This field allows the xHC to disable D0i2 when USB2 ports are in L1. This implies that D0i2 will only be triggered when ports are in L2 or deeper.
0	0h RW	**USB3 U2 Disable (USB3_U2_DISABLE):** This field allows the xHC to disable D0i2 when USB3 ports are in U2. This implies that D0i2 will only be triggered when ports are in U3 or deeper.

19.1.228 (D0i2_SCH_ALARM_CTRL_REG)—Offset 81C0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD)**
28:16	0h RW	**D0i2 Idle Time (D0I2IT):** This is the minimum schedule idle time that must be available before D0i2 can allowed. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s (0 124s) This field controls how much scheduler idle time is required to trigger D0i2. The scheduler idle time is the same idle time that is used by other functions implementing alarm timers such as PLL shutdown, LTR and USB2 L1 override. If there is a need to require other alarm timers to have been set such as LTR has triggered a Low Idle time, then this field needs to be as aggressive as LTR Low Min Idle Time to ensure D0i2 is triggered once the scheduler has detected IDLE in the schedule. This is only to be used as alternate modes of operation or back up modes.
15:13	0h RO	**Reserved (RSVD1)**
12:0	0h RW	**D0i2 Wake Latency (D0I2WL):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the scheduler. Example: If while allowing D0i2 there is an alarm that will trigger in 250 us from now , the scheduler will allow D0i2 and track this alarm with an adjustment to wake up 250ns D0I2WL) from. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s (0124s)

19.1.229 (USB2PMCTRL_REG)—Offset 81C4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated. 0 Do not
10:8	0h RW	**USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC):** This controls the amount of hysteresis time the controller will enforce after detecting the USB2 PHY SUS Power Gate entry condition. 0h 0 clocks 1h 32 clocks 2h 64 clocks 3h 128 clocks 4h 256 clocks 5h 512 clocks 6h 1024 clocks 7h 2048 clocks
7:4	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT):** This field represents the worst case latency for the USB2 Common Lane to enter and exit its power gate state. This fields is required to be compared to a ports HIRD/HIRD value for the ports that have allowed L1 to L2 mapping to determine if the Common Lane can be allowed to power off. If the power gate entry/exit latency is greater than the HIRD/HIRDD then the common lane should not be allowed to power gate as this will result in a L1 exit violation. 0h 100 us 1h 200 us 2h 300 us Eh 1500us Fh 1600 us
3:2	0h RW	**USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP):** This field controls when to enable the USB2 PHY SUS Well Power Gating when the proper conditions are met. 00 USB2 PHY SUS Power Gating is Disabled. 01 USB2 PHY SUS Power Gating is Enabled in Only D0 and D0i2 (Excludes D0i3 and D3) 10 USB2 PHY SUS Power Gating is Eanabled in only in D0, D0i2 and D0i3 (Excludes D3) 11 USB2 PHY SUS Power Gating is Eanabled in D0/ D0i2/D0i3/D3
1	0h RW	**USB2 Common Lane Power Gating Enable During L1 to L2 Mapping for USB2 PHY Power Gating (U2CLPGEL1L2):** This field when set enables the controller to allow for the common lane power gating to be enabled when all ports are exposed as in L2 to the USB2 PHY while at least 1 port has been mapped to L2 from L1. This field alone does not guarantee power gating since the L1 HIRD/HIRDD Value must be compared with the PHYs power gate exit latency (U2CLPGLAT) held in this register to ensure that L1 exit is not violated. 0 USB2 Common Lane Power Gating is disabled when any port has been mapped from L1 to L2. 1 USB2 Common Lane Power Gating is allowed when any port has been mapped to L2 from L1 with the additional condition that the HIRD/ HIRDD is greater than the PHYs Power Gate exit latency.
0	0h RW	**USB2 Data Lane L1 to L2 Mapping Enable for USB2 PHY Power Gating (U2DLL1L2ME):** This field when set enables the controller to map an L1 entry directly to L2 to allow the USB2 PHY to trigger its Autonomous Power Gating. The USB2 PHY will trigger PG only when in L2 since it does not fully understand the requirements for L1. 0 USB2 L1 to L2 mapping is disabled for all ports 1 USB2 L1 to L2 mapping is enabled for all ports

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**ENGINE_RF_ECC_POISONING_VECTOR (ENGINE_RF_ECC_POISONING_VECTOR):** XHCI Engine RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width
22:14	0h RW	**USB3_RF_ECC_POISONING_VECTOR (USB3_RF_ECC_POISONING_VECTOR):** USB3 RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width

Bit Range	Default & Access	Field Name (ID): Description
13:5	0h RW	**USB2_RF_ECC_POISONING_VECTOR (USB2_RF_ECC_POISONING_VECTOR):** USB2 RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width
4:3	0h RO	**RSVD (RSVD)**
2	0h RW	**ENGINE_RF_ECC_POISONING_EN (ENGINE_RF_ECC_POISONING_EN):** Enable ECC Poisoning for XHCI Engine related RFs that support ECC
1	0h RW	**USB3_RF_ECC_POISONING_EN (USB3_RF_ECC_POISONING_EN):** Enable ECC Poisoning for USB3 Port related RFs that support ECC. Setting this bit enables poisoning of USB3 Port related RFs. This applies to all USB3 ports
0	0h RW	**USB2_RF_ECC_POISONING_EN (USB2_RF_ECC_POISONING_EN):** Enable ECC Poisoning for USB2 Port related RFs that support ECC. Setting this bit enables poisoning of USB2 Port related RFs. This applies to all USB2 ports

19.1.232 USB2_PORT_STATE_REG (USB2_PORT_STATE_REG)—Offset 8400h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RO	**RSVD (RSVD)**
15:0	0h RO	**USB2_PORT_STATE_REG (USB2_PORT_STATE_REG):** Per USB2 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

19.1.233 USB3_PORT_STATE_REG (USB3_PORT_STATE_REG)—Offset 8408h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:14	0h RO	**RSVD (RSVD)**
13:0	0h RO	**USB3_PORT_STATE_REG (USB3_PORT_STATE_REG):** Per USB3 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

19.1.234 FUS1_REG (FUS1_REG)—Offset 8410h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**RSVD (RSVD)**
20:18	0h RO	**DEV_ID (DEV_ID):** Provides a fuse over-ride for the lower 3 bits of device ID.
17	0h RO	**XHC_DPGDIS (XHC_DPGDIS):** When asserted, it indicates that the xHCI will not dynamically power gate the controller.
16	1h RO	**USBR_DIS (USBR_DIS):** When asserted, it indicates that xHCI does not support USBr
15	0h RO	**XHC_FXN_DIS (XHC_FXN_DIS):** When asserted, it indicates the xHCI is fused to function disabled.
14:10	0h RO	**USB2_PORT_COUNT (USB2_PORT_COUNT):** 0x0 = MAX USB2 Ports enabled 0x1 = Max USB2 Ports -1 enabled 0x1F = All ports disabled
9:5	0h RO	**USB3_PORT_COUNT (USB3_PORT_COUNT):** 0x0 = MAX USB3 Ports enabled 0x1 = Max USB3 Ports -1 enabled 0x1F = All ports disabled
4	0h RO	**DEBUG_MODE_ENABLE (DEBUG_MODE_ENABLE):** 0 = USB debug mode disabled 1 = USB debug mode enabled.
3	0h RO	**XHC_DCGDIS (XHC_DCGDIS):** 0= USB3 (xHC) dynamic clock gating enabled 1= USB3 (xHC) dynamic clock gating disabled
2	0h RO	**REGFILE_DPGDIS (REGFILE_DPGDIS):** 0 = USB3 (xHC) dynamic RF power gating enabled 1 = USB3 (xHC) dynamic RF power gating disabled

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	**USBIO_PMDIS (USBIO_PMDIS):** 0=USB2 HW LPM and USB3 HW Ux under xHC enabled 1= USB2 HW LPM and USB3 HW Ux under xHC disabled
0	0h RO	**USB2_PLL_SHUTDOWN_DIS (USB2_PLL_SHUTDOWN_DIS):** 0= USB2 PLL Shutdown enabled 1= USB2 PLL Shutdown disabled

19.1.235 FUS2_REG (FUS2_REG)—Offset 8414h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RSVD (RSVD)**
11:0	0h RO	**PORT_MAP_FUS1 (PORT_MAP_FUS1):** 1:0 Port 1 3:2 Port 2 5:4 Port 3 31:30 Port 16 Bit Description: 00: Port assgned to USB3 01: Port assigned to non-XHCI controller 10: Port assigned to Flex IO mapping. Mapping is based on Soft Straps. 11: Reserved.

19.1.236 FUS3_REG (FUS3_REG)—Offset 8418h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RSVD (RSVD)**

19.1.237 STRAP1_REG (STRAP1_REG)—Offset 841Ch

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RSVD (RSVD)**
5:0	0h RO	**FlexIO mapping (FLEX_IO_MAPPING):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is owned by XHCI 1: Port is not owned by XHCI

19.1.238 STRAP2_REG (STRAP2_REG)—Offset 8420h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RSVD (RSVD)**

19.1.239 STRAP3_REG (STRAP3_REG)—Offset 8424h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**RSVD (RSVD)**
1:0	0h RO	**XHCI_PRI_CLK_FREQ_SEL (XHCI_PRI_CLK_FREQ_SEL):** Specifies the frequency of the Primary clock (iosf_prim_mux_clk) used by XHCI 00 : 200 MHz (default) 01 : 125 MHz 10 : 250 MHz

19.1.240 DFT_REG1 (DFT_REG1)—Offset 8430h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RSVD**
15:12	0h RO	**RSVD0 (RSVD0):** RSVD0
11	0h RW	**DFTLFPSSEL (DFTLFPSSEL):** DFTLFPSSEL 0: Rxelecidle is driven from GPIO Pin 1: Rxelecidle is Driven as specified by Super Speed DFT LFPS Mode Select
10	0h RW	**Super Speed DFT LFPS Mode Select (SSDFTLMSEL):** This bit selects the Super Speed DFT LFPS mode, and will only take effect when Super Speed HBP mode is enabled. 0b: HBP logic will internally loopback TX LFPS as RX LFPS and AFE RX LFPS path to the controller is disconnected. 1b: RX LFPS path works normally
9:6	0h RW	**RSVD**
5	0h RO	**RSVD1 (RSVD1):** RSVD1
4:0	0h RW	**RSVD**

19.1.241 DFT_REG2 (DFT_REG2)—Offset 8434h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**HS TX CRC (TXCRC):** These register bits contain the value of TX CRC. This TX CRC is placed right after the 480MHz XCLKQ.
15:11	0h RW	**UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved

Bit Range	Default & Access	Field Name (ID): Description
10:7	0h RW	**Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) +E27
6:5	0h RW	**Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved
4	0h RW	**Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled
3:2	0h RW	**Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved
1:0	0h RW	**UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.

19.1.242 DFT_REG3 (DFT_REG3)—Offset 8438h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern
15:2	0h RW	**Loopback Lane Select (UTMILPBKSEL_13_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet
0	0h RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported

19.1.243 dft_reg4 (DFT_REG4)—Offset 843Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RW	**RSVD (RSVD)**
10:0	0h RW	**Loopback Pattern (UTMILPBKPATSEL):** Loopback Lane Select (UTMILPBKSEL): Port is selected if the corresponding bit (zero based) is selected Bit 0 = Port 1 Bit 1 = Port 2 Etc.

19.1.244 dft_reg5 (DFT_REG5)—Offset 8440h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**High Speed Bypass Enable (HIGH_SPEED_BYPASS_ENABLE):** 0000 - Disable all HBP 0001 - Enable SS HBP 0010 - Enable HS HBP 0011
27	0h RW	**DFTIDPINSEL (DFTIDPINSEL):** Select Between Device and Host Controller in HBP mode 0h : Device Controller is selected 1h : Host Controller is selected
26	0h RW/O	**Lock Bit (LOCK):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to HBP Enable is disabled (locked state). When set to '0', the write access to bit locked are enable (unlocked state). Writable once after platform reset.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW/L	**Loopback Enable (UTMILPBKEN):** Enable loopback test mode. If asserted, loopback test mode is enabled
24:0	0h RO	**Rsvd (Rsvd)**

19.1.245 XECP_CMDM_STS0 (XECP_CMDM_STS0)—Offset 8448h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IDMA_OWNS_CNTX (IDMA_OWNS_CNTX):** Indicates that IDMA module owns the context access currently
30	0h RO	**ODMA_OWNS_CNTX (ODMA_OWNS_CNTX):** Indicates that ODMA module owns the context access currently
29	0h RO	**TRM_OWNS_CNTX (TRM_OWNS_CNTX):** Indicates that TRM modules owns the context access currently
28	0h RO	**CMD_RING_REQUESTED_CNTX_LOCK (CMD_RING_REQUESTED_CNTX_LOCK):** Indicates that Command Manager has requested a context lock
27	0h RO	**CMD_RING_STOP_IN_PROGRESS (CMD_RING_STOP_IN_PROGRESS):** Indicates that Command Ring stop command is in progress
26	0h RO	**SCH_UPDATE_CLR_EP_IN_PROGRESS (SCH_UPDATE_CLR_EP_IN_PROGRESS):** Indicates that clearing an EP out of schedule is in progress
25	0h RO	**ADDR_DEV_DONE (ADDR_DEV_DONE):** Indicates that current address device command is done by ODMA
24	0h RO	**ADDR_DEV_IN_PROGRESS (ADDR_DEV_IN_PROGRESS):** Indicates that ODMA has an address device command in progress
23	0h RO	**EP_STATE_UPDATE_IN_PROGRESS (EP_STATE_UPDATE_IN_PROGRESS):** Indicates that updating of EP state is in progress
22	0h RO	**EP_STATE_IN_PROGRESS_FROM_STOP_DUE_TO_DB (EP_STATE_IN_PROGRESS_FROM_STOP_DUE_TO_DB):** Indicates that doorbell manager is issuing and EP update due to a doorbell ring on an EP that is in stop state

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_EP_ERROR (EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_EP_ERROR):** Indicates that transfer ring manager is isuing and EP update due to an EP error condition detected
20	0h RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_STALL (EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_STALL):** Indicates that transfer ring manager is issuing an EP state update due to stall received
19	0h RO	**Reserved (RSVD)**
18	0h RO	**STOP in progress (STOP_IN_PROGRESS):** Indicates that a STOP on the Command Ring is in progress
17	0h RO	**commend ring has doorbell pending (CMD_RING_DB_PENDING):** Indicates that the commend ring has doorbell pending
16	0h RO	**commend ring running (CMD_RING_RUNNING):** Indicates that the commend ring is running
15:8	0h RO	**Command next capability offset (CMD_NEXT_CAP_OFFSET)**
7:0	0h RO	**Vendor defined capability ID (VID)**

19.1.246 XECP_CMDM_STS1 (XECP_CMDM_STS1)—Offset 844Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3FC0000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Rsvd0 (Rsvd0)**
25:18	FFh RO	**Event manager Producer Cycle State (EMPCS)**

19.1.247 XECP_CMDM_STS2 (XECP_CMDM_STS2)—Offset 8450h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Rsvd0 (Rsvd0)**
4:0	0h RO	**Event Ring Segment Table (ERST):** count low

19.1.248 XECP_CMDM_STS3 (XECP_CMDM_STS3)—Offset 8454h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd0 (Rsvd0)**
15:0	0h RO	**Event Ring Segment Table (ERST):** count high

19.1.249 XECP_CMDM_STS4 (XECP_CMDM_STS4)—Offset 8458h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer Low (EREPL)**

19.1.250 XECP_CMDM_STS5 (XECP_CMDM_STS5)—Offset 845Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer High (EREPH)**

19.1.251 AUX Power PHY Reset (UPORTS_PON_RST_REG)—Offset 8460h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3:0	0h WO	**Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY

19.1.252 Latency Tolerance Control 0 (HOST_IF_LAT_TOL_CTRL_REG0)—Offset 8464h

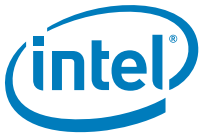
The Latency Tolerance Control Register is used by SW to control which BELT is returned when this register is read. SW shall write to this register to program a Slot-ID, Port-ID and BELT Select to determine which BELT is selected. When this register is read the selected BELT is returned.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: D0000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h WO	**BELT Select (BELT_SEL):** This field determines what value will be selected to read back from SW when reading this register 0: Returns the SW programmed Latency Tolerance Value 1: Returns the Lowest BELT in the Host 2: Returns the BELT for the requested Slot-ID (Slot Select) 3: Returns the BELT for the requested Port-ID (Port Select)
29:20	0h RO	**Rsvd1 (Rsvd1)**



Bit Range	Default & Access	Field Name (ID): Description
19:16	Dh WO	**Port Select (PORT_SEL):** Used to select the BELT for a given Port # when the BELT Select is programmed to select the Port-ID (this field is 0 based)
15:12	0h RO	**Rsvd (Rsvd)**
11:5	0h RO	**BELT Value (BELTV):** Value of selected BELT is return in this field
4:0	0h RW	**Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)

19.1.253 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2201h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Rsvd2 (Rsvd2)**
24	0h RW	**HC OS Owned Semaphore (HCOSOS)**
23:17	0h RO	**Rsvd1 (Rsvd1)**

0	0h RW	**USB SMI Enable (USBSMIE)**

19.1.255 Port Disable Override capability register (PDO_CAPABILITY)—Offset 84F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3C6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	3h RO	**Next Capability Pointer (NCP)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	C6h RO	**Capability ID (CID)**

19.1.256 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW/O	**USB2PDO (USB2PDO)**

19.1.257 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd1 (Rsvd1)**
6:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** A '1' in a bit position prevents the corresponding USB3 port from reporting a Device Connection to the XHC.

19.1.258 HW state capability register (HW_STATE_CAPABILITY)—Offset 8500h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1F40C7h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Rsvd (Rsvd)**
23:16	1Fh RO	**Save Length (SAVE_LENGTH):** Indicates the number of DWords in this capability starting at offset 04h, that need to be saved and restored
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C7h RO	**Capability ID (CID)**

19.1.259 HW state register 1 (HW_STATE_REG1)—Offset 8504h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG1 (HW_STATE_REG1)**

19.1.260 HW state register 2 (HW_STATE_REG2)—Offset 8508h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG2 (HW_STATE_REG2)**

19.1.261 HW state register 3 (HW_STATE_REG3)—Offset 850Ch

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG3 (HW_STATE_REG3)**

19.1.262 HW state register 4 (HW_STATE_REG4)—Offset 8510h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG4 (HW_STATE_REG4)**

19.1.263 CONFIG mirror capability register (CONFIG_MIRROR_CAPABILITY)—Offset 8600h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40C2h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C2h RO	**Capability ID (CID)**

19.1.264 Command (CMD_MMIO)—Offset 8604h

Dummy register, mirror of physical register as CMD

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD)**
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

19.1.265 Device Status (STS_MMIO)—Offset 8606h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD)**

19.1.266 Revision ID (RID_MMIO)—Offset 8608h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

19.1.267 Programming Interface (PI_MMIO)—Offset 8609h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

19.1.268 Sub Class Code (SCC_MMIO)—Offset 860Ah

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

19.1.269 Base Class Code (BCC_MMIO)—Offset 860Bh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

19.1.270 Master Latency Timer (MLT_MMIO)—Offset 860Dh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

19.1.271 Header Type (HT_MMIO)—Offset 860Eh

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

19.1.272 Memory Base Address (MBAR_MMIO)—Offset 8610h

Dummy register, mirror of physical register as MBAR. Value in this register will be different after the enumeration process.

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

19.1.273 USB Subsystem Vendor ID (SSVID_MMIO)—Offset 862Ch

Dummy register, mirror of physical register as SSVID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

19.1.274 USB Subsystem ID (SSID_MMIO)—Offset 862Eh

Dummy register, mirror of physical register as SSID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

19.1.275 Capabilities Pointer (CAP_PTR_MMIO)—Offset 8634h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

19.1.276 Interrupt Line (ILINE_MMIO)—Offset 863Ch

Dummy register, mirror of physical register as ILINE.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

19.1.277 Interrupt Pin (IPIN_MMIO)—Offset 863Dh

Dummy register, mirror of physical register as IPIN.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

19.1.278 XHC System Bus Configuration 1 (XHCC1_MMIO)—Offset 8640h

Dummy register, mirror of physical register as XHCC1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/ unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**Reserved**
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables.

Bit Range	Default & Access	Field Name (ID): Description
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

19.1.279 XHC System Bus Configuration 2 (XHCC2_MMIO)—Offset 8644h

Dummy register, mirror of physical register as XHCC2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**Reserved.**
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

19.1.280 Clock Gating (XHCLKGTEN_MMIO)—Offset 8650h

Dummy register, mirror of physical register as XHCLKGTEN

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2 (Rsvd2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

19.1.281 Audio Time Synchronization (AUDSYNC_MMIO)—Offset 8658h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Rsvd2 (Rsvd2)**
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

19.1.282 Serial Bus Release Number (SBRN_MMIO)—Offset 8660h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

19.1.283 Frame Length Adjustment (FLADJ_MMIO)—Offset 8661h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Read-Only. These bits are reserved for future use and should read as "00".
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

19.1.284 Best Effort Service Latency (BESL_MMIO)—Offset 8662h

Dummy register, mirror of physical register as BESL. Bset Effort Service Latency.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

19.1.285 PCI Power Management Capability ID (PM_CID_MMIO)—Offset 8670h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

19.1.286 Next Item Pointer #1 (PM_NEXT_MMIO)—Offset 8671h

Dummy register, mirror of physical register as PM_NEXT. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

19.1.287 Power Management Capabilities (PM_CAP_MMIO)—Offset 8672h

Dummy register, mirror of physical register as PM_CAP. Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The SoC reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD)**
3	0h RW/L	**PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#.

Bit Range	Default & Access	Field Name (ID): Description
2:0	2h RW/L	**Version (Version):** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

19.1.288 Power Management Control/Status (PM_CS_MMIO)—Offset 8674h

Dummy register, mirror of physical register as PM_CS

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The SoC hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The SoC hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD)**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2)**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the SoC must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

19.1.289 Message Signaled Interrupt CID (MSI_CID_MMIO)—Offset 8680h

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

19.1.290 Next item pointer (MSI_NEXT_MMIO)—Offset 8681h

Dummy register, mirror of physical register as MSI_NEXT

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

19.1.291 Message Signaled Interrupt Message Control (MSI_MCTL_MMIO)—Offset 8682h

Dummy register, mirror of physical register as MSI_MCTL

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD)**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

19.1.292 Message Signaled Interrupt Message Address (MSI_MAD_MMIO)—Offset 8684h

Dummy register, mirror of physical register as MSI_MAD

Access Method

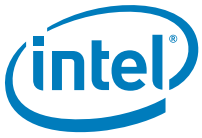
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD)**

19.1.293 Message Signaled Interrupt Upper Address (MSI_MUAD_MMIO)—Offset 8688h

Dummy register, mirror of physical register as MSI_MUAD



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

19.1.294 Message Signaled Interrupt Message Data (MSI_MD_MMIO)—Offset 868Ch

Dummy register, mirror of physical register as MSI_MD

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

19.1.295 Device Idle Capability (DEVIDLE_MMIO)—Offset 8690h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VID (VID)**
27:24	0h RO	**REV (REV)**
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long.
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CID)**

19.1.296 Vendor Specific Header (VSHDR_MMIO)—Offset 8694h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

19.1.297 SW LTR POINTER (SWLTRPTR_MMIO)—Offset 8698h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

19.1.298 Device Idle Pointer Register (DEVIDLEPTR_MMIO)—Offset 869Ch

Dummy register, mirror of physical register as DEVIDLEPTR

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	80ACh RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/L	**Valid (VALID):** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

19.1.299 Device Idle Power ON Latency (DEVIDLEPOL_MMIO)—Offset 86A0h

Dummy register, mirror of physical register as DEVIDLEPOL

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

19.1.300 High Speed Configuration 2 (HSCFG2_MMIO)—Offset 86A4h

Dummy register, mirror of physical register as HSCFG2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd1 (Rsvd1)**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indication
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Active may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Active will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

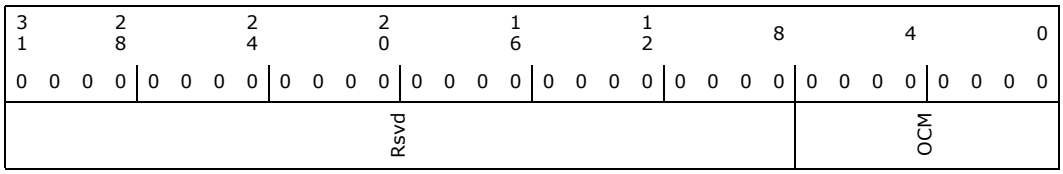
19.1.301 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1_MMIO)—Offset 86B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd (Rsvd):** Reserved
7:0	0h RW/L	**OC Mapping (OCM)**

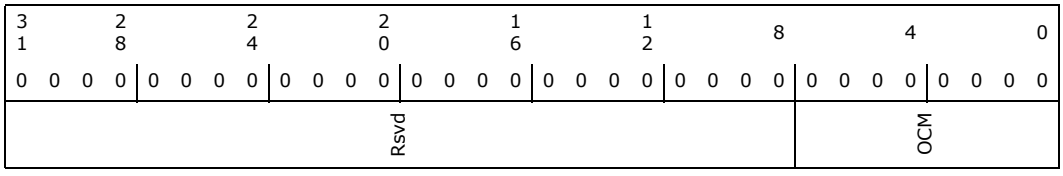
19.1.302 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2_MMIO)—Offset 86B4h

Reserved

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd (Rsvd):** Reserved
7:0	0h RW/L	**OC Mapping (OCM)**

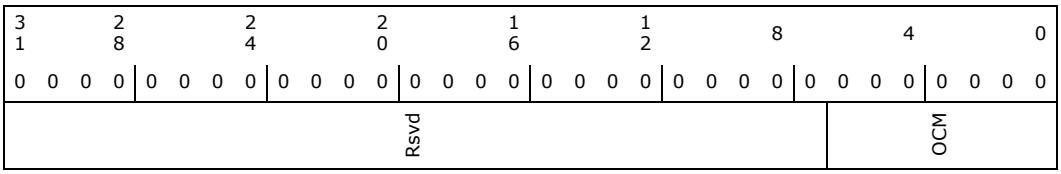
19.1.303 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1_MMIO)—Offset 86D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



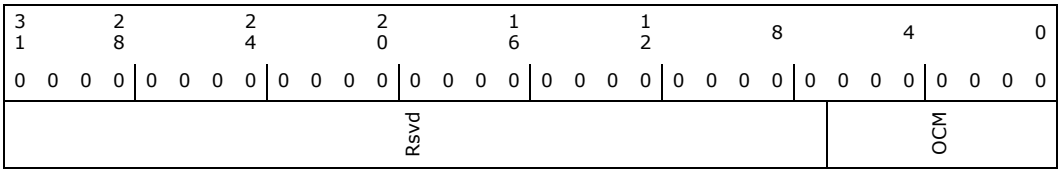
Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

19.1.304 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2_MMIO)—Offset 86D4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

19.1.305 XHCC3 (XHCC3_MMIO)—Offset 86FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Rsvd1):** Reserved
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface
1	1h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

19.1.306 Debug Capability ID Register (DCID)—Offset 8700h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 5100Ah

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD)**
20:16	5h RW	**Debug Capability Event Ring Segment Table Max (DCERSTM):** Note: This register is sticky.
15:8	10h RW	**Next Capability Pointer (NCP):** Note: This register is sticky.
7:0	Ah RW	**Capability ID (CID):** Note: This register is sticky.

19.1.307 Debug Capability Doorbell Register (DCDB)—Offset 8704h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:8	0h RW	**Doorbell Target (DBTGT):** This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. Value Definition 0 Data EP 1 OUT Enqueue Pointer Update 1 Data EP 1 IN Enqueue Pointer Update 2:255 Reserved This field returns '0' when read and the value should be treated as undefined by software.
7:0	0h RW	**Reserved (RSVD_1)**

19.1.308 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8708h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Debug Capability Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the DCERST Max field in the DCID register Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.

19.1.309 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8710h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3:0	0h RW	**Reserved (RSVD)**

19.1.310 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8718h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3	0h RW	**Reserved (RSVD)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

19.1.311 Debug Capability Control Register (DCCTRL)—Offset 8720h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Debug Capability Enable (DCE)**

Bit Range	Default & Access	Field Name (ID): Description
30:24	0h RO	**Device Address (DADDR)**
23:16	0h RO	**Debug Max Burst Size (DMBS)**

19.1.312 Debug Capability Status Register (DCST)—Offset 8724h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.
23:1	0h RO	**Reserved (RSVD)**
0	0h RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register.

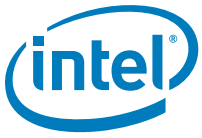
19.1.313 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 8728h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23	0h RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.
22	0h RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1)**
17	0h RW/C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2)**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.
9	0h RO	**Reserved (RSVD_3)**
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.



Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4)**
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

19.1.314 Debug Capability Context Pointer Register (DCCP)—Offset 8730h

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.
3:0	0h RO	**Reserved (RSVD)**

19.1.315 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 8738h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80870000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	8087h RW	**Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor idVendor field.
15:8	0h RO	**Reserved (RSVD)**
7:0	0h RW	**DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor bInterfaceProtocol field. Value Function 0 Debug Target vendor defined. 1 GNU Remote Debug Command Set supported. 2-255 Reserved.

19.1.316 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 873Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field.
15:0	0h RW	**Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field.

19.1.317 Debug Capability Descriptor Parameters (DCDP)—Offset 8740h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 30C3h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	0h RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.
15:8	30h RW/S	**NEXT CAPABILITY POINTER (NCP)**
7:0	C3h RW/S	**Capability ID (CID)**

19.1.318 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8748h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**Reserved (RSVD)**
18	0h RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
17:14	0h RW	**Reserved (RSVD_1)**

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
12:9	0h RW	**Reserved (RSVD_2)**
8	0h RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines
7	0h RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports
6	0h RW	**Reserved (RSVD_3)**
5	0h RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state
4	0h RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state
3	0h RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state
2:0	0h RW	**Reserved (RSVD_4)**

19.1.319 DBC Control Register 1 (DBCCTL_REG)—Offset 8760h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** RSVD
7	0h RW	**SW_DCE_SEL (SW_DCE_SEL)**
6:3	0h RW	**DISC_RXD_CNT (DISC_RXD_CNT)**
2	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Force DCE Mode (FORCE_DCE_MODE):** 0: When DCE is set, the DbC switches to Mode 2 1: When DCE is set, the DbC switches to Mode 3
0	0h RW	**Force Disconnect upon DCE (FORCE_DISCONNECT_ON_DCE):** If this bit is set by BIOS, the DbC will temporarily disconnect from the remote host if the DCE is set, and shortly thereafter re-connect. This allows the DbC to switch from Mode1 to Mode2 or Mode 3 operation upon DCE being set.

19.1.320 (PORT1_PROFILE_ATTRIBUTES_REG0)—Offset 890Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

19.1.321 (PORT1_PROFILE_ATTRIBUTES_REG1)—Offset 8910h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

19.1.322 (PORT1_PROFILE_ATTRIBUTES_REG2)—Offset 8914h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

19.1.323 (PORT1_PROFILE_ATTRIBUTES_REG3)—Offset 8918h

Access Method

19.1.384 GLOBAL_TIME_SYNC_CAP_REG (GLOBAL_TIME_SYNC_CAP_REG)—Offset 8E10h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 12C9h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (RSVD)**
15:8	12h RO	**Next Capability pointer (NCP)**
7:0	C9h RO	**Capability ID (CID)**

19.1.385 GLOBAL_TIME_SYNC_CTRL_REG (GLOBAL_TIME_SYNC_CTRL_REG)—Offset 8E14h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1S	**Time Stamp Counter Capture Initiate (TIME_STAMP_CNTR_CAPTURE_INITIATE):** SW sets this bit to initiate a time capture. Once the time capture is complete and the time values are valid in the Local and Global time capture registers, HW clears the bit.

19.1.386 MICROFRAME_TIME_REG (MICROFRAME_TIME_REG)—Offset 8E18h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED (RSVD)**
29:16	0h RO	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits [29:16] reflect state of bits [13:0] of FRINDEX
15:13	0h RO	**RESERVED1 (RSVD1)**
12:0	0h RO	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done via Bus Interval Adjust (BIA).

19.1.387 GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW_REG)—Offset 8E20h

Global Time Value (Low):

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW):** Global Time Value (Low):

19.1.388 GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI_REG)—Offset 8E24h

Global Time Value (High):

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI):** Global Time Value (High):

19.1.389 Debug Status Capability Register (DEBUG_STATUS_CAPABILITY_REG)—Offset 8E58h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: CBh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	0h RO	**Next Capability Pointer (NCP)**
7:0	CBh RO	**Capability ID (CID)**

19.1.390 Host Ctrl USB3 Soft Error Count Register 1 (HOST_CTRL_USB3_ERR_COUNT_REG1)—Offset 8E5Ch

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.391 Host Ctrl USB3 Soft Error Count Register 2 (HOST_CTRL_USB3_ERR_COUNT_REG2)—Offset 8E60h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.392 Host Ctrl USB3 Soft Error Count Register 3 (HOST_CTRL_USB3_ERR_COUNT_REG3)—Offset 8E64h

This register is updated by hardware and cleared by software

Access Method

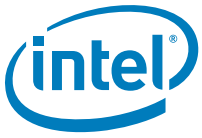
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.393 Host Ctrl USB3 Soft Error Count Register 4 (HOST_CTRL_USB3_ERR_COUNT_REG4)—Offset 8E68h

This register is updated by hardware and cleared by software



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.394 Host Ctrl USB3 Soft Error Count Register 5 (HOST_CTRL_USB3_ERR_COUNT_REG5)—Offset 8E6Ch

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.395 Host Ctrl USB3 Soft Error Count Register 6 (HOST_CTRL_USB3_ERR_COUNT_REG6)—Offset 8E70h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.396 Host Ctrl USB3 Soft Error Count Register 7 (HOST_CTRL_USB3_ERR_COUNT_REG7)—Offset 8E74h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

19.1.397 IOSFCTL - Control Register (IOSFCTL)—Offset 0h

Register controls some of the behaviors of the IOSF interface

Access Method

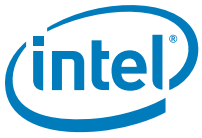
Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: Fh

Range	Access Type	Default (reset)	Description
31:8	RO	0x0 (rst)	**Reserved0** Reserved
7:7	RW	0x0 (rst)	**NSNPDIS** Non-snoop Disable. When set, all requests from the Bridge on IOSF Primary are snooped.
6:4	RO	0x0 (rst)	**Reserved1** Reserved
3:0	RW	0xF (rst)	**MAX_RD_PEND** Maximum number of upstream outstanding reads from the Bridge toward the IOSF Primary Channel

19.1.398 Power Management Control Register (PMCTL)—Offset 1D0h

Register controls Power Management function of the Bridge



Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:6	RO	0x0 (rst)	**Reserved0** Reserved
5:5	RW	0x0 (rst)	**IOSFSB_TRUNK_GATE_EN** SB Trunk Gate enable
4:4	RW	0x0 (rst)	**IOSFPRIM_TRUNK_GATE_EN** Primary Trunk Gate Enable
3:3	RW	0x0 (rst)	**IOSFSBCLK_GATE_EN** SB clock gate enable
2:2	RW	0x0 (rst)	**OCPCLK_TRUNK_GATE_EN** OCP clk trunk gate enable
1:1	RW	0x0 (rst)	**OCPCLK_GATE_EN** OCP clock gate enable
0:0	RW	0x0 (rst)	**IOSFPRIMCLK_GATE_EN** Primary clock gate enable

19.1.399 PCI Configuration Control 1 Register (PCICFGCTR1)—Offset 200h

Controls the PCI configuration space.

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:29	RO	0x0 (rst)	**Reserved0** Reserved
28:28	RW	0x0 (rst)	**DIS_PCI_IDLE_CAP1**

Range	Access Type	Default (reset)	Description
27:20	RW	0x0 (rst)	**PCI_IRQ1** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	RW	0x0 (rst)	**ACPI_IRQ1** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	RW	0x1 (rst)	**IPIN1** Interrupt Pin: This register indicates the values to be used for Global Interrupts.
7:7	RW	0x0 (rst)	**BAR1_DISABLE1** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	RW	0x0 (rst)	**PME_Support1** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1:1	RW	0x0 (rst)	**ACPI_INTR_EN1** When set, the Bridge uses ACPI Sideband opcodes for messages When cleared, the Bridge uses global IOSF opcodes
0:0	RW	0x0 (rst)	**PCI_CFG_DIS1** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

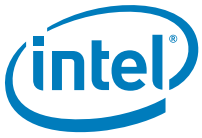
19.1.400 c73usb280_USB2 PER PORT (USB2_PER_PORT_PP0)—Offset 4100h

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:31	RW	0x0 (SUS)	**PPUOCGE (Per-Port UTMI_CLK Output Clock Gating Enable)** 1: Dynamic Clock Gating is enabled based on L1/L2 suspend indicator. This is the recommended setting for SYNOPSYS based controllers. 0: Output UTMI_CLK is running unless USB PLL is shutdown. This is the recommended setting for FRESCO based controllers.



Range	Access Type	Default (reset)	Description
30:30	RW	0x0 (SUS)	**RXENAC (RX EN AFE Control)** 1: Enables the dynamic RX EN behavior. This allows compensation code updates at various boundaries. 0: Disables the dynamic RX EN behavior (function of TXVALID only). RXENAC, RXBIASAC: 00: Legacy mode 01: Illegal 10: Allows additional code update window 11: Allows additional code update window with power saving
29:29	RW	0x0 (SUS)	**RXBIASAC (RX BIAS AFE Control)** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal RXBIAS policy is selected (SELSBRXBIASEN = 0b).
28:28	RW	0x0 (SUS)	**TXBIASAC (TX BIAS AFE Control)** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal TXBIAS policy is selected (SELSBTXBIASEN = 0b).
27:27	RW	0x0 (SUS)	**RXCLKENACG (RX CLKEN AFE Clock Gating)** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal RXCLKEN policy is selected (SELRXCLKEN = 0b).
26:26	RW	0x0 (SUS)	**TXCLKENACG (TX CLKEN AFE Clock Gating)** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal TXCLKEN policy is selected (SELTXCLKEN = 0b).
25:25	RW	0x0 (SUS)	**ENHSCLK2PORT (ENHSCLK2PORT)** This per-port pin will generate HS clock data pattern for testing purposes for that port and ignore the core data during Tx: 1: The port will transmit 10101..clock data pattern when txen=1. 0: The port will resume to c73usb280_normal operation where data is generated by the controller.
24:24	RW	0x0 (SUS)	**SELSBRXBIASEN (SELSBRXBIASEN)** This is to select between the UTMI internal vs. side-band control over the AFE RX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.

Range	Access Type	Default (reset)	Description
23:23	RW	0x0 (SUS)	**SELSBTXBIASEN (SELSBTXBIASEN)** This is to select between the UTMI internal vs. side-band control over the AFE TX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
22:22	WO	0x0 (SUS)	**RSVD (RSVD)** RSVD
21:21	RW	0x0 (SUS)	**SELTXCLKEN (SELTXCLKEN)** This is to select between internal mode vs. side-band control on the TX clock enable signal. 0 - override for TXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
20:20	RW	0x0 (SUS)	**SELRXCLKEN (SELRXCLKEN)** This is to select between internal mode vs. side-band control on the RX clock enable signal. 0 - override for RXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
19:17	RW	0x2 (SUS)	**PERPORTRXISET (PerPort HS Receiver Bias)** Config bit (per port) HS Receiver Bias current offset bit (2:0) 000 - 80uA 001 - 90uA 010 (default) - 100uA 011 - 110uA 100 - 120uA 101 - 130uA 110 - 140uA 111 - 150uA
16:16	RW	0x1 (SUS)	**PERPORTTXPRECHARGEEN (PerPort Common Mode Pre-charge)** Config bit (per port) To select whether to enable or disable the common mode pre-charge during SOP and EOP. Pre-charge hold for 4 cycles before first data transmission. This is to allow common choke ring back to settle down before driving first data bit to meet eye opening spec. 1 - pre-charge ON 0 - pre-charge OFF
15:15	RW	0x1 (SUS)	**RXERROR_FIXEN (RX ERROR FIX ENABLE)** When reg_utmi_rxerror_fixen = 1'b1, Rxerror fix is enabled When reg_utmi_rxerror_fixen = 1'b0, Rxerror fix is disabled

Range	Access Type	Default (reset)	Description
14:14	RW	0x1 (SUS)	**PERPORTTXPEHALF (PerPort Half Bit Pre-emphasis)** Config bit (per port) to select between half-bit or full-bit implementation 1 - select half-bit pre-emphasis 0 - select full-bit pre-emphasis
13:11	RW	0x3 (SUS)	**PERPORTPETXISET (PerPort HS Pre-emphasis Bias)** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
10:8	RW	0x2 (SUS)	**PERPORTTXISET (PerPort HS Transmitter Bias)** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
7:4	RW	0x8 (SUS)	**PORTRESERVED (PORTRESERVED_0123)** PORTRESERVED (PORTRESERVED): Reserved pin for future functionality of the respective ports iusbportreserved[0] is used for differential disconnect purpose. 0 - Differential disconnect and HS squelch uses the same voltage reference (sqref-sqrefb = diffdiscref - diffdiscrefb) 1 - Differential disconnect and HS squelch uses different voltage reference (sqref-sqrefb != diffdiscref - diffdiscrefb) iusbportreserved[1] - iusbafedaten_h_dfxoveride 0 - functional mode. iusbafedaten will be controlled functionally by PCS logic 1 - test mode. The iusbafedaten will be forced to 1 to ensure CL TX is never blocked. iusbportreserved[3:2] - reserved for future functionality.

Range	Access Type	Default (reset)	Description
3:3	RW	0x0 (SUS)	**CLTXEMIREDCCTBYPASS (CL TX EMI Reduction Circuit Bypass)** Assert 1 to bypass the EMI reduction circuit. Default is 0b. AFE pin remains as PORTRESERVED for this project.
2:2	RW	0x0 (SUS)	**PERPORTALLPORTZ (PERPORT ALLPORTZ)** Legacy pin. No longer carries any functionality as the pull-down enable is now controlled by ilane5:0usbpdnen_h
1:1	RW	0x0 (SUS)	**PERPORTPPDPDMBSEL (PERPORT PPDPDMBSEL)** Config bit to select comparator 2:1 mux input either dp or dm for HS TX per port current calibration 1 - select dp (for debug purpose only) 0 - select dm (without 1.5K pullup)
0:0	RW	0x1 (SUS)	**PERPORTTXEOS (PERPORT TX EOS protection enable)** Set to 1b enables the TX EOS protection. To protect high speed driver passgate.

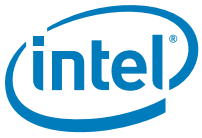
19.1.401 GLB ADP VBUS COMP REG (GLB_ADP_VBUS_COMP_REG)—Offset 402Bh

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 2A4005h

Range	Access Type	Default (reset)	Description
31:30	RO/V	0x0 (SUS)	RSVD (RESERVED)
29:23	RW	0x0 (SUS)	RSVD_1 (RESERVED)
22:22	RW	0x0 (SUS)	**DIFFDISCEN (DIFFDISCEN)** Feed directly to SHIP or AFE : AFE Functional or Test Mode : Functional 0: Used existing single ended disconnect detector 1:Mux over to enable differential disconnect detector.
21:21	RW	0x1 (SUS)	**VBUS_SESS_SAMPLING_EN (VBUS SESSION SAMPLING ENABLE)** Enable vbus session comparator for vbus and session sampling.



Range	Access Type	Default (reset)	Description
20:19	RW	0x1 (SUS)	**IUSBADPRER (IUSBADPRER)** Adp vref select signal 2'b00 = 0.65 2'b01 = 0.675 2'b10 = 0.7 2'b11 = 0.725
18:16	RW	0x2 (SUS)	**IUSBVBUSREF (IUSBVBUSREF)** Vbus vref select signal 3'b000 = 0.7 3'b001 = 0.75 3'b010 = 0.8 3'b011 = 0.85 3'b100 = 0.9 3'b101 = 0.95 3'b110 = xxxx 3'b111 = xxxx
15:14	RW	0x1 (SUS)	**IUSBVBUSSVLDREF_LV (IUSBVBUSSVLDREF_LV)** Vbus sense valid vref select signal 2'b00 = 0.2 2'b01 = 0.25 2'b10 = 0.3 2'b11 = 0.4
13:13	RO/V	0x0 (SUS)	**OUSBIDDIGLVGEN (OUSBIDDIGLVGEN)** OTG ID dig status readout.
12:12	RO/V	0x0 (SUS)	**OUSBVBUSSSESVLDLVGEN (OUSBVBUSSSESVLDLVGEN)** VBUS sense status readout.
11:11	RO/V	0x0 (SUS)	**OUSBVBUSVLDLVGEN (OUSBVBUSVLDLVGEN)** VBUS valid status readout.
10:10	RO/V	0x0 (SUS)	**OADPSNSUSBLVGEN (OADPSNSUSBLVGEN)** ADP sense status readout.
9:9	RO/V	0x0 (SUS)	**OADPPRBUSBLVGEN (OADPPRBUSBLVGEN)** ADP probe status readout.
8:8	RW	0x0 (SUS)	**IUSBIDPULLUPLVGEN (IUSBIDPULLUPLVGEN)** OTG ID dig pullup enable for DCIO.
7:7	RW	0x0 (SUS)	**IUSBADPCHRGENLVGEN (IUSBADPCHRGENLVGEN)** ADP charge enable for DCIO.
6:6	RW	0x0 (SUS)	**IADPSNSENUSBLVGEN (IADPSNSENUSBLVGEN)** ADP sense enable for DCIO.
5:5	RW	0x0 (SUS)	**IADPPRBENUSBLVGEN (IADPPRBENUSBLVGEN)** ADP probe enable for DCIO.
4:4	RW	0x0 (SUS)	**DCMONOTGADP (DC OTG ADP MONITOR)** Enable DC monitor for OTG and ADP.

Range	Access Type	Default (reset)	Description
3:2	RW	0x1 (SUS)	**USBVBUSOFSTMAXLIMIT (USBVBUSOFSTMAXLIMIT)** This register defines the counter limit for the VBUS valid detector offset cancellation SM. 11b = not supporting 10b = not supporting 01b = 5-bits 00b = 4-bits
1:0	RW	0x1 (SUS)	**USBADPOFSTMAXLIMIT (USBADPOFSTMAXLIMIT)** This register defines the counter limit for the ADP probe detector offset cancellation SM. 11b = Not supporting 10b = Not supporting 01b = 5-bits 00b = 4-bits

19.1.402 c73usb280_USB2 GLOBAL PORT 2 (USB2_GLOBAL_PORT_2)—Offset 402Ch

Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 1E25000h

Range	Access Type	Default (reset)	Description
31:30	RO/V	0x0 (SUS)	RSVD_RO (RESERVED)
29:28	RW	0x0 (SUS)	RSVD_RW (RESERVED)
27:27	RW	0x0 (SUS)	**REG_GBLCORE_PWRGATE_EN (Global lane core power gating enable)** Feed directly to SHIP or AFE: AFE Functional or Test Mode: Test Mode 1: Enable global lane core well shuf off once all ports are off. 0:Disable global lane shut off when all per-port are off. ie. Global lane will remain on and not autonomously shuf off once all ports are off.
26:26	RW	0x0 (SUS)	**HSDEVCHRPBYPASS (HSDEVCHRPBYPASS)** Enable to bypass the pull-up on Dm pin during device chirp K mode.
25:25	RW	0x0 (SUS)	RSVD_1 (RESERVED)

Range	Access Type	Default (reset)	Description
24:23	RW	0x3 (SUS)	**IUSBEOSDETREFEN (EOS REFERENCE ENABLE SELECT)** Sel signal to select eosdet vref 2'b00 = 0.75V 2'b01 = 0.725V 2'b10 = 0.775V 2'b11 = 0.8V
22:22	RW	0x1 (SUS)	**PWRGATE_FORCE_ON (Power gating DFX force on)** 1: Disallow perport power gating. All LDO remains ON regardless of ihost_phy_pwr_req or suspendm. 0:Allow dynamic control based on ihost_phy_pwr_req or suspend.
21:21	RW	0x1 (SUS)	**PWRGATE_SUSPENDM_POLICY (Per Port Power gating suspend policy)** 1: Per Port power gating based on utmi suspendm only. Once suspendm=0, phy will initiate perport power gating. 0: Per Port power gating based on utmi suspendm and ihost_ppXpwr_req.
20:18	RW	0x0 (SUS)	**IUSBCMPPWRDROOPDET_FREQSEL (High pass frequency select)** Power droop detect control signals to select for High Pass frequency. 000b - 1MHz 001b - 5MHz 010b - 10MHz 011b - 50MHz 100b - 100MHz 101b - 500MHz 110b - Invalid 111b - Invalid
17:17	RW	0x1 (SUS)	**IUSBCMPPWRDROOPDET_CAPBYP_H (Bypass capacitor)** Signal to bypass the high pass filters capacitor.
16:16	RW	0x0 (SUS)	**IUSBCMPPWRDROOPDET_RST_H (Power droop detect reset)** Power droop detect reset signal for common lane.
15:15	RO/V	0x0 (SUS)	**IUSBCMPPWRDROOPDETOUT_H (Power droop detect observation)** Power droop detect output observation signal for common lane.
14:13	RW	0x2 (SUS)	**IUSBCFGKICKTX_L (Transmit kicker)** Kicker strength control during HS Tx 00 - Turn Off kicker 01 - Lowest kicker strength 10 - Default kicker strength 11 - Highest kicker strength

Range	Access Type	Default (reset)	Description
12:11	RW	0x2 (SUS)	**IUSBCFGKICKRX_L (Receive kicker)** Kicker strength control during HS Rx 00 - Turn Off kicker 01 - Lowest kicker strength 10 - Default kicker strength 11 - Highest kicker strength
10:10	RW	0x0 (SUS)	**IUSBMONPORTEN (Enable monitoring or power droop)** 1b1 when monitoring or power droop detector is enabled. 1b0 when using external clock.
9:9	RW	0x0 (SUS)	**VBUSCOMP_DISABLE (DISABLING AFE VBUS COMPARATOR)** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE vbus comparator 0: Allow dynamic sampling enabling
8:8	RW	0x0 (SUS)	**IDDIGCOMP_DISABLE (DISABLING AFE IDDIG COMPARATOR)** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE iddig comparator 0: Allow dynamic sampling enabling
7:7	RW	0x0 (SUS)	**SENSECOMP_DISABLE (DISABLING AFE SENSE COMPARATOR)** Feed directly to SHIP or AFE : SHIP Functional or Test Mode : Test mode 1: Disable AFE sense comparator 0: Allow dynamic sampling enabling
6:6	RW	0x0 (SUS)	**DCMONCOMP (DC MONITOR FOR COMPARATOR)** Enable DC monitor for comparator.
5:4	RW	0x0 (SUS)	**SNSPOL (Session valid Sample Policy)** 00: Bypass 01: Force SNS valid output to 0b to the UTMI+ 10: Force SNS valid output to 1b to the UTMI+ 11: Sample mode (10 ms period)
3:2	RW	0x0 (SUS)	**VBSPOL (VBUS valid Sample Policy)** 00: Bypass 01: Force VBUS valid output to 0b to the UTMI+ 10: Force VBUS valid output to 1b to the UTMI+ 11: Sample mode (10 ms period)

Range	Access Type	Default (reset)	Description
1:0	RW	0x0 (SUS)	**IDSPOL (IDDIG Sample Policy)** 00: Bypass 01: Force IDDIG output to 0b to the UTMI+ 10: Force IDDIG output to 1b to the UTMI+ 11: Sample mode (2 ms period)

19.1.403 c73usb280_USB2 COMPBG (USB2_COMPBG)—Offset 7F04h

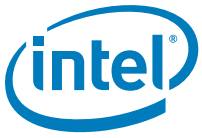
Access Method

Type: CR Register (Size: 32 bits)	**Device:** **Function:**

Default: 600h

Range	Access Type	Default (reset)	Description
31:31	RW	0x0 (SUS)	**COMPRESERVED9 (COMPRESERVED9)** Spare bits related to compensation.
30:30	RO/V	0x0 (SUS)	**CAL_IN_PROGRESS (CAL IN PROGRESS)** This bit is to indicate that Compensation State Machine is still in progress and rcomp/icomp value are not yet updated
29:29	WO	0x0 (SUS)	**FORCECOMP (FORCECOMP)** When set to 1b, this will force global comp Finite State Machine to start calibrating. BIOS has to wait for sufficient time for the calibration complete. This is a pulse trigger event.
28:28	RW	0x0 (SUS)	**COMPRESERVED8 (COMPRESERVED8)** Spare bits related to compensation.
27:27	RW	0x0 (SUS)	**COMPRESERVED7 (COMPRESERVED7)** Spare bits related to compensation.
26:26	RW	0x0 (SUS)	**COMPRESERVED6 (COMPRESERVED6)** Spare bits related to compensation.
25:23	RW	0x0 (SUS)	**OFSTCALREFEN (OFSTCALREFEN)** Comparator Offset CAL reference voltage (500mV) select signal to select reference voltage to AFE global COMP. ofstrefen2 ofstrefen1 ofstrefen0 0 0 0 500mV 0 0 1 300mV 0 1 0 350mV 0 1 1 400mV 1 0 0 450mV 1 0 1 550mV 1 1 0 600mV 1 1 1 650mV

Range	Access Type	Default (reset)	Description
22:22	RW	0x0 (SUS)	**COMPRESERVED5 (COMPRESERVED5)** Spare bits related to compensation.
21:21	RW	0x0 (SUS)	**COMPRESERVED4 (COMPRESERVED4)** Spare bits related to compensation.
20:20	RW	0x0 (SUS)	**COMPRESERVED3 (COMPRESERVED3)** Spare bits related to compensation.
19:17	RW	0x0 (SUS)	**IREFREFEN (IREFREFEN)** IREF reference voltage (300mV) select signal to select reference voltage to AFE global icomp. irefrefen2 irefrefen1 irefrefen0 Value 1 1 1 500mV 1 1 0 487.5mV 1 0 1 475mV 1 0 0 462.5mV 0 1 1 437.5mV 0 1 0 425mV 0 0 1 412.5mV 0 0 0 450mV
16:16	RW	0x0 (SUS)	**COMPRESERVED2 (COMPRESERVED2)** Spare bits related to compensation.
15:15	RW	0x0 (SUS)	**COMPRESERVED1 (COMPRESERVED1)** Spare bits related to compensation. COMPRESERVED1 is used to select the voltage reference for SE HS DISC or DIFF HS DISC. 1b is to select voltage reference for DIFF HS DISC 0b is to select voltage refrence for SE HS DISC
14:13	RW	0x0 (SUS)	**HSSQREFEN (HSSQREFEN)** HS SQ reference voltage (312.5mV) enable signal to select reference voltage to AFE hssqrefen1 hssqrefen0 Vref 1 1 350mV 1 0 325mV 0 1 300mV 0 0 312.5mV



Range	Access Type	Default (reset)	Description
12:11	RW	0x0 (SUS)	**HSSQREFBEN (HSSQREFBEN)** HS SQ reference voltage (200mV) enable signal to select reference voltage to AFE hssqrefben1 hssqrefben0 Vref 1 1 250mV 1 0 225mV 0 1 175mV 0 0 200mV
10:9	RW	0x3 (SUS)	**HSDISCREFEN (HSDISCREFEN)** HS DISC BG reference voltage (675mV) select signal to select reference voltage to AFE port. When COMPRESERVED1=0b, SE HS DISC is selected. This register is combined together with HSSQREFBEN register to produce the following truth table. discrefen1 discrefen0 discrefben1 discrefben0 Vref x 1 1 1 575mV x 1 1 0 650mV x 1 0 1 800mV x 1 0 0 750mV x 0 1 1 625mV x 0 1 0 700mV x 0 0 1 600mV x 0 0 0 675mV(default) When COMPRESERVED1=1b, Diff HS DISC is selected discrefen1 discrefen0 discrefben1 discrefben0 Vref 1 1 1 1 437.5mV 1 1 1 0 562.5mV 1 1 0 1 812.5mV 1 1 0 0 687.5mV(default) 1 0 1 1 375mV 1 0 1 0 500mV 1 0 0 1 750mV 1 0 0 0 625mV 0 1 1 1 312.5mV 0 1 1 0 437.5mV 0 1 0 1 687.5mV 0 1 0 0 562.5mV 0 0 1 1 500mV 0 0 1 0 625mV 0 0 0 1 875mV 0 0 0 0 750mV
8:7	RW	0x0 (SUS)	**HSDISCREFBEN (HSDISCREFBEN)** HS DISC reference voltage enable signal to select reference voltage to AFE port. This bits are comnbined with iusbhsdiscrefen for final voltage selection depending on SE or Diff HS DISC mode

Range	Access Type	Default (reset)	Description
6:6	RW	0x0 (SUS)	**COMPRESERVED0 (COMPRESERVED0)** Spare bits related to compensation.
5:3	RW	0x0 (SUS)	**HSPUREFEN (HSPUREFEN)** HS Pull-up Rcal reference voltage (500mV) select signal to select reference voltage to AFE global comp. hspurefen2 hspurefen1 hspurefen0 Value 1 1 1 387.5mV 1 1 0 375mV 1 0 1 362.5mV 1 0 0 337.5mV 0 1 1 325mV 0 1 0 312.5mV 0 0 1 300mV 0 0 0 350mV

3:0	RW	0x0 (core)	**ROOT_SPACE (ROOT_SPACE)**

19.1.409 DBC_GP2_IN_STATUS_BP_LOW—Offset 2Ch

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:0	RW	0x0 (core)	**DBC_GP2_IN_STATUS_BP_LOW (DBC_GP2_IN_STATUS_BP_LOW)** Lower DW of STATUS Address Pointer

19.1.410 DBC_GP2_IN_STATUS_BP_HI—Offset 30h

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:0	RW	0x0 (core)	**DBC_GP2_IN_STATUS_BP_HI (DBC_GP2_IN_STATUS_BP_HI)** Upper DW of STATUS Address Pointer

19.1.411 Power Control Enable (PCE_REG) —Offset 00A2h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** **Function:**

Default: 8h

Range	Access Type	Default (reset)	Description
15:6	RO	0x0 (SUS)	Rsvd (Rsvd)
5:5	RW	0x0 (SUS)	**HAE (Hardware Autonomous Enable)** If set, then the PGCB may request a PG whenever it is idle.
4:4	RW	0x0 (SUS)	Rsvd1 (Rsvd1)
3:3	RW	0x1 (SUS)	**SE (Sleep Enable)** If clear, then IP will never asset Sleep to the retention flops. If set, then IP may assert Sleep during PGing. Note that some platforms may default this bit to 0, others to 1
2:2	RW	0x0 (SUS)	**D3_HOT_EN (D3 HOT ENABLE)** if set, then IP will PG when idle and the PMCSR register in the IP = 11
1:1	RW	0x0 (SUS)	**DEVIDLEN (DEVIDLE Enable)** If '1', then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.

Range	Access Type	Default (reset)	Description
0:0	RW	0x0 (SUS)	**PMCRE (PMC Request Enable)** If this bit is set to '1', the function will power gate when idle and pmc_ip_sw_pg_req_b ='0'. NOTE: PMCSR[1:0] may be any value and the function must power gate if this bit is set and pmc_ip_sw_pg_req_b is asserted and the device is idle. Default value may be SOC and/or IP specific .

19.1.412 Super Speed Configuration 1 (SSCFG1) —Offset 00A8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 8Fh

Range	Access Type	Default (reset)	Description
31:22	RW	0x0 (Core)	**ECO1 (ECO1)** ECO bits are used during silicon bringup for FIBing.
21:18	WO	0x0 (SUS)	**LFPSPMU3 (LFPS Power Management in U3 Enable)** This field allows xHC to turn off LFPS Receiver when the port is in U3. This allows the Host Controller to save some extra power (about 50W per port) in idle states if device connected on a port is not Resume capable or Resume enabled. This choice has to be done by BIOS and based on platform knowledge. For example, if an in-box device is not Resume Capable, BIOS could allow xHC to turn-off Rx LFPS when the port is in U3.Each bit represents a port. Bit (16) is for USB3.0 Port 0, Bit (17) is for USB3.0 Port 1 and so on.0 in a bit position: LFPS Receiver shall be kept enabled when the port is in U3. 1 in a bit position: LFPS Receiver shall be disabled when the port is in U3.
17:17	RW	0x0 (SUS)	**LFPSPME (LFPS Power Management Enable)** This field provides programmability of LFPS Receiver power management capability when USB3.0 ports are Disabled or in Disconnected state.0: Do not power manage LFPS receiver. LFPS receivers are enabled in all states. 1: Power manage LFPS receiver. LFPS receivers will be turned off if USB3.0 port is Disabled or Disconnected.Note: Default value is being kept at 0 in case EXI architecture/design takes the path of not doing dynamic Rx LFPS enabling for EXI signature detect and disable LFPS Power Management to keep Rx LFPS buffer on for debug.
16:16	RW	0x0 (Core)	**SSPPEN (USB3 SS Port Polling Enable)** 0: Prevent USB3 Super-speed port to start Polling.LFPS. 1: Allow USB3 Super-speed port to start Polling.LFPS. NOTE: This bit will take effect in allowing/preventing USB3 SS port from starting Polling.LFPS only if SSPPENAB is cleared.
15:15	RO	0x0 (Core)	Rsvd1 (Rsvd1)
14:14	RW	0x0 (Core)	**MPHYPGEU2 (MODPHY Power Gate Enable for U2)** This bit controls whether xHC will allow modPHY power gating or not when a port is in U2 state.Note that this single bit controls all ports of xHC.0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met.

Range	Access Type	Default (reset)	Description
13:13	RW	0x0 (Core)	**MPHYPGENONU2 (MODPHY Power Gate Enable for non-U2 states)** This bit controls whether xHC will allow modPHY power gating or not when a port is in states other than U2.Note that this single bit controls all ports of xHC.0b xHC shall not initiate Power Gate Request If xHC had initiated Power Gate Request before this bit is programmed to 0, xHC shall initiate the handshake to wake modPHY from power gated state. 1b xHC is enabled to initiate Power Gate Request if power gating conditions are met.
12:12	RW	0x0 (Core)	**SSAAPE (xHC SS Async Active Propogation Enable)** This register controls the ss async active exposusre to PMC via the xHC active indication 0 SS Async Active is not propogated to PMC 1 SS Async Active is propogated to PMC
11:8	RO	0x0 (Core)	**Rsvd2 (Rsvd2)** Reserved
7:7	RW	0x1 (SUS)	**SSPPENAB (USB3 SS Port Polling Enable Active)** 0: Allow blocking of USB3 Super-speed port from starting Polling.LFPS. 1: Disallow blocking of USB3 Super-speed port from starting Polling.LFPS (A stepping behavior). NOTE: When this bit is cleared, Polling.LFPS blocking is controlled by SSPPEN bit.
6:6	RW	0x0 (SUS)	**ECO2 (ECO2)** ECO bits are used during silicon bringup for FIBing.
5:5	RW	0x0 (SUS)	**RXDETSTGDIS (Receiver Detect Staggering Disable)** When set, this regiter bit disables receiver detect staggering between all 6 USB3 lanes Note that the bit is ONLY meant for SW to disable the staggering if desired. Once it is set to disabled, SW is not allowed to re-enable the staggering by clearing the bit.
4:3	RW	0x1 (SUS)	**G2RXPTTV (Gotorxelecidle Polling Timer Timeout Value)** Timeout value for Gotorxelecidle Polling Timer: 00: 1 to 2 us (Simulation speed up mode only). 01: 19 to 20 us (Default). 10: 23 to 24 us. 11: 199 to 200 us. This register needs to be programmed when G2RXPOLLTMREN = 0.
2:2	RW	0x1 (SUS)	**G2RXPTE (Gotorxelecidle Polling Timer Enable)** If enabled (1), Gasket starts a timer after transmitting high speed data AND not receiving LFPS, and will only de-assert GoToRxElecIdle after timer expires during Polling. If disabled (0), Gasket will assert / de-assert GoToRxElecIdle purely based on Gotorxelecidle assertion upon RxElecIdle de-assertion (LFPS detected) enable bit (G2RXERXEE) and Gotorxelecidle assertion when not transmitting high speed data enable bit (G2RXETXHSDE)
1:1	RW	0x1 (SUS)	**G2RXERXEE (GotoRxElecidle Assertion Upon RxElecIdle Exit Enable)** When enabled (set to '1'), allow Gasket to assert GoToRxElecIdle to UAFE to turn off its receiver upon the de-assertion of GoToRxElecIdle (LFPS detected). This bit needs to be programmed when the USB3 port is not enabled.
0:0	RW	0x1 (SUS)	**G2RXETXHSDE (GotoRxElecidle Assertion When Transmitting High Speed Data Enable)** When enabled (set to '1'), allow Gaskets to assert GoToRxElecIdle to UAFE to turn off its receiver when not transmitting high speed data: P0 and TxElecIdle = 1. This bit needs to be programmed when the USB3 port is not enabled.

19.1.413 High Speed Configuration 1 (HSCFG1) —Offset 00ACh

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Range	Access Type	Default (reset)	Description
31:23	RW	0x0 (Core)	**ECO1 (ECO bits Core)** ECO bits are used during silicon bringup for FIBing.
22:22	RW	0x0 (Core)	**SOF_WINDOW_QUAL_DIS (SOF Window Qualification Disable)**
21:21	RW	0x0 (Core)	**FS_LS_SERIAL_MODE_BLOCK_DIS (FS/LS Serial Mode Blocking Disable)**
20:20	RW	0x0 (Core)	**RX_EN_OPT_DIS (RXEN Optimization Disable)**
19:19	RW	0x0 (Core)	**UTMI_GASKET_LOCAL_SUSPENDED_PORT (UTMI Gasket Local Suspended Port)** 480/60/48MHz Clock Gating Enable When set, enables the clock gating when a USB2 port is NOT in suspend. This mode is currently not recommended for production.
18:18	RW	0x0 (Core)	**UTMI_GASKET_LOCAL_SPEED_PORT (UTMI Gasket Local Speed Port)** 480/60/48MHz Clock Gating Enable When set, enables the clock gating when a USB2 port is in Suspend.
17:17	RW	0x0 (Core)	**RX_ACTIVE_EARLY_DEASSERTION_DISABLE (RXACTIVE Early Deassertion Disable)**
16:16	RW	0x0 (Core)	**RST_EN_CLK_CNTR_UPON_TX_VALID_DISABLE (Reset ENCLK Counter Upon TXValid Disable)**
15:11	RO	0x0 (Core)	Rsvd1 (Rsvd1)
10:10	RW	0x0 (Core)	**USBR_CLK_REQ_CONSOLIDATION_DIS (USBr Clock Request Consolidation Disable)** When set xHC will not take into account USBr for the request of bb_clock.
9:9	RW	0x0 (Core)	**HSAAPE (xHC HS Async Active Propogation Enable)** This register controls the hs async active exposusre to PMC via the xHC active indication 0 HS Async Active is not propogated to PMC 1 HS Async Active is propogated to PMC
8:8	RW	0x1 (Core)	**PAPE (xHC Periodic Active Propogation Enable)** This register controls the periodic active exposusre to PMC via the xHC active indication 0 Periodic Active is not propogated to PMC 1 Periodic Active is propogated to PMC
7:2	RW	0x0 (SUS)	**ECO2 (ECO bits SUS)** ECO bits are used during silicon bringup for FIBing.
1:1	RW	0x0 (SUS)	**RSVD**

Range	Access Type	Default (reset)	Description
0:0	RW	0x0 (SUS)	**RSVD**

19.1.414 GEN_REGRW4 —Offset 00BCh

General Purpose Read Write Register4

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Range	Access Type	Default (reset)	Description
31:3	RW	0x0 (rst)	**GEN_REG_RW4** reserved
2:2	RW	0x0 (rst)	**XDCI_PIPE_CLK_GATE_DIS** xdci pipe clock gating disable
1:1	RW	0x0 (rst)	**XDCI_SB_CLK_GATE_DIS** xdci sideband clock gating disable
0:0	RW	0x0 (rst)	**XDCI_PRIM_CLK_GATE_DIS** xdci primary clock gating disable

19.2 Registers Summary

Table 19-2. Summary of 0_20_0_USBx PCI Config Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	8C31h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	290h

Table 19-2. Summary of 0_20_0_USBx PCI Config Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	30h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
Dh	Dh	Master Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HT)—Offset Eh	80h
10h	17h	Memory Base Address (MBAR)—Offset 10h	4h
2Ch	2Dh	USB Subsystem Vendor ID (SSVID)—Offset 2Ch	0h
2Eh	2Fh	USB Subsystem ID (SSID)—Offset 2Eh	0h
34h	34h	Capabilities Pointer (CAP_PTR)—Offset 34h	70h
3Ch	3Ch	Interrupt Line (ILINE)—Offset 3Ch	0h

A4h	A7h	High Speed Configuration 2 (HSCFG2)—Offset A4h	2000h
A8h	ABh	XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h	8Fh
B0h	B3h	XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h	0h

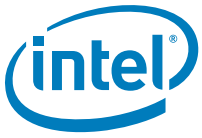

Table 19-2. Summary of 0_20_0_USBx PCI Config Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
B4h	B7h	XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2)—Offset B4h	0h
B8h	BBh	XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM3)—Offset B8h	0h
BCh	BFh	XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM4)—Offset BCh	0h
D0h	D3h	XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h	0h
D4h	D7h	XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset D4h	0h
D8h	DBh	XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM3)—Offset D8h	0h
DCh	DFh	XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM4)—Offset DCh	0h
FCh	FFh	XHCC3 (XHCC3)—Offset FCh	2h

19.2.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

19.2.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 8C31h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8C31h RO/V	**Device ID (DID):** See Global Device ID table in Chap. 6 for value

19.2.3 Command (CMD)—Offset 4h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD)**
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

19.2.4 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD)**

19.2.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

19.2.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

19.2.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

19.2.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

19.2.9 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

19.2.10 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

19.2.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

Access Method

Type: CFG Register (Size: 64 bits)	**Device:** 21 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

19.2.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

19.2.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

19.2.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

19.2.15 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

19.2.16 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

19.2.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 1FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/ unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**Reserved**
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables.
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represents the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

19.2.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 3C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**Reserved.**

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

19.2.19 Clock Gating (XHCLKGTEN)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2 (Rsvd2):** Reserved
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

19.2.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Rsvd2 (Rsvd2)**
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

19.2.21 Serial Bus Release Number (SBRN)—Offset 60h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

19.2.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Read-Only. These bits are reserved for future use and should read as "00".
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

19.2.23 Best Effort Service Latency (BESL)—Offset 62h

Bset Effort Service Latency.

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

19.2.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

19.2.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

19.2.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The SoC reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD)**
3	0h RW/L	**PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#.

Bit Range	Default & Access	Field Name (ID): Description
2:0	2h RW/L	**Version (Version):** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

19.2.27 Power Management Control/Status (PM_CS)—Offset 74h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The SoC hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The SoC hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD)**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2)**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the SoC must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

19.2.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

19.2.29 Next item pointer (MSI_NEXT)—Offset 81h

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

19.2.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD)**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

19.2.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD)**

19.2.32 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

19.2.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

19.2.34 Device Idle Capability (DEVIDLE)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VID (VID)**
27:24	0h RO	**REV (REV)**
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CID)**

19.2.35 Vendor Specific Header (VSHDR)—Offset 94h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

19.2.36 SW LTR POINTER (SWLTRPTR)—Offset 98h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

19.2.37 Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 80AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	80ACh RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	1h RW/L	**Valid (VALID):** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

19.2.38 Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 21 **Function:** 0

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

19.2.39 High Speed Configuration 2 (HSCFG2)—Offset A4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd1 (Rsvd1)**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

19.2.40 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Rsvd (Rsvd):** Reserved
4:0	0h RW/L	**OC Mapping (OCM)**

19.2.41 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2)—Offset B4h

Reserved

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Rsvd (Rsvd):** Reserved
4:0	0h RW/L	**OC Mapping (OCM)**

19.2.42 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM3)—Offset B8h

Reserved

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Rsvd (Rsvd):** Reserved
4:0	0h RW/L	**OC Mapping (OCM)**

19.2.43 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM4)—Offset BCh

Reserved

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Rsvd (Rsvd):** Reserved
4:0	0h RW/L	**OC Mapping (OCM)**

19.2.44 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Rsvd (Rsvd)**
3:0	0h RW/L	**OC Mapping (OCM)**

19.2.45 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset D4h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Rsvd (Rsvd)**
3:0	0h RW/L	**OC Mapping (OCM)**

19.2.46 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM3)—Offset D8h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Rsvd (Rsvd)**
3:0	0h RW/L	**OC Mapping (OCM)**

19.2.47 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM4)—Offset DCh

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Rsvd (Rsvd)**
3:0	0h RW/L	**OC Mapping (OCM)**

19.2.48 XHCC3 (XHCC3)—Offset FCh

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 0

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Rsvd1):** Reserved
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

19.3.1 DBC_GP2_OUT_PAYLOAD_BP_LOW (DBC_GP2_OUT_PAYLOAD_BP_LOW)—Offset 0h

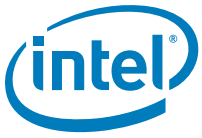
Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_PAYLOAD_BP_LOW (DBC_GP2_OUT_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer



19.3.2 DBC_GP2_OUT_PAYLOAD_BP_HI (DBC_GP2_OUT_PAYLOAD_BP_HI)—Offset 4h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_PAYLOAD_BP_HI (DBC_GP2_OUT_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

19.3.3 DBC_GP2_OUT_PAYLOAD_QUALIFIERS (DBC_GP2_OUT_PAYLOAD_QUALIFIERS)—Offset 8h

DbC GP2 OUT Payload Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.4 DBC_GP2_OUT_PAYLOAD_TRANSFER_LENGTH (DBC_GP2_OUT_PAYLOAD_TRANSFER_LENGTH)—Offset Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

19.3.5 DBC_GP2_OUT_STATUS_BP_LOW (DBC_GP2_OUT_STATUS_BP_LOW)—Offset 10h

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_STATUS_BP_LOW (DBC_GP2_OUT_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

19.3.6 DBC_GP2_OUT_STATUS_BP_HI (DBC_GP2_OUT_STATUS_BP_HI)—Offset 14h

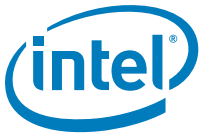
Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_STATUS_BP_HI (DBC_GP2_OUT_STATUS_BP_HI):** Upper DW of STATUS Address Pointer



19.3.7 DBC_GP2_OUT_STATUS_QUALIFIERS (DBC_GP2_OUT_STATUS_QUALIFIERS)—Offset 18h

DbC GP2 OUT STATUS Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.8 DBC_GP2_IN_PAYLOAD_BP_LOW (DBC_GP2_IN_PAYLOAD_BP_LOW)—Offset 1Ch

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_PAYLOAD_BP_LOW (DBC_GP2_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

19.3.9 DBC_GP2_IN_PAYLOAD_BP_HI (DBC_GP2_IN_PAYLOAD_BP_HI)—Offset 20h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_PAYLOAD_BP_HI (DBC_GP2_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

19.3.10 DBC_GP2_IN_PAYLOAD_QUALIFIERS (DBC_GP2_IN_PAYLOAD_QUALIFIERS)—Offset 24h

DbC GP2 OUT Payload Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.11 DBC_GP2_IN_PAYLOAD_TRANSFER_LENGTH (DBC_GP2_IN_PAYLOAD_TRANSFER_LENGTH)—Offset 28h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet

Bit Range	Default & Access	Field Name (ID): Description
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

19.3.12 DBC_GP2_IN_STATUS_BP_LOW (DBC_GP2_IN_STATUS_BP_LOW)—Offset 2Ch

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_STATUS_BP_LOW (DBC_GP2_IN_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

19.3.13 DBC_GP2_IN_STATUS_BP_HI (DBC_GP2_IN_STATUS_BP_HI)—Offset 30h

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_STATUS_BP_HI (DBC_GP2_IN_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

19.3.14 DBC_GP2_IN_STATUS_QUALIFIERS (DBC_GP2_IN_STATUS_QUALIFIERS)—Offset 34h

DbC GP2 OUT STATUS Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.15 DBC_DFX_OUT_CONTROL (DBC_DFX_OUT_CONTROL)—Offset 38h

DBC_DFX_OUT_CONTROL

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RESERVED (RSVD)**
8	0h RW	**Credit De-allocate Update (CREDIT_DE_ALLOC_UPDATE):** This is sent by ExI Bridge to DbC whenever a packet is dispatched from the Inbound Buffer or in response to credit Init request. 1: 1 credit dispatched due to deallocation 0: Absolute value of credits in response to a Credit Init request from DbC
7:5	0h RO	**RESERVED (RSVD1)**
4:0	0h RW	**AVAILABLE_CREDITS (AVAILABLE_CREDITS):** ExI Bridge writes the absolute value of the available credit count into this register each time it drains an entry from its buffer. Each credit represents a 64 Byte ExI Packet. Also, coming out of reset, DbC will request for a Credit Init, and ExI Bridge will write the absolute value of available credit to this register.

19.3.16 DBC_DFX_IN_PAYLOAD_BP_LOW (DBC_DFX_IN_PAYLOAD_BP_LOW)—Offset 3Ch

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_PAYLOAD_BP_LOW (DBC_DFX_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

19.3.17 DBC_DFX_IN_PAYLOAD_BP_HI (DBC_DFX_IN_PAYLOAD_BP_HI)—Offset 40h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_PAYLOAD_BP_HI (DBC_DFX_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

19.3.18 DBC_DFX_IN_PAYLOAD_TRANSFER_LENGTH (DBC_DFX_IN_PAYLOAD_TRANSFER_LENGTH)—Offset 44h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

19.3.19 DBC_DFX_IN_STATUS_BP_LOW (DBC_DFX_IN_STATUS_BP_LOW)—Offset 48h

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_STATUS_BP_LOW (DBC_DFX_IN_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

19.3.20 DBC_DFX_IN_STATUS_BP_HI (DBC_DFX_IN_STATUS_BP_HI)—Offset 4Ch

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_STATUS_BP_HI (DBC_DFX_IN_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

19.3.21 DBC_TRACE_IN_PAYLOAD_BP_LOW (DBC_TRACE_IN_PAYLOAD_BP_LOW)—Offset 50h

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_PAYLOAD_BP_LOW (DBC_TRACE_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

19.3.22 DBC_TRACE_IN_PAYLOAD_BP_HI (DBC_TRACE_IN_PAYLOAD_BP_HI)—Offset 54h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_PAYLOAD_BP_HI (DBC_TRACE_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

19.3.23 DBC_TRACE_IN_PAYLOAD_QUALIFIERS (DBC_TRACE_IN_PAYLOAD_QUALIFIERS)—Offset 58h

DbC TRACE OUT Payload Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.24 DBC_TRACE_IN_PAYLOAD_TRASNFER_DOORBELL (DBC_TRACE_IN_PAYLOAD_TRANSFER_DOORBELL)—Offset 5Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**RSVD (RSVD)**
18:11	0h RW	**PAYLOAD_OFFSET (PAYLOAD_OFFSET):** The Offset in multiples of 1024B from the base pointer from which to transfer the payload referenced by this doorbell.
10:0	0h RW	**PAYLOAD_TRASNFER_LENGTH (PAYLOAD_TRASNFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

19.3.25 DBC_TRACE_IN_STATUS_BP_LOW (DBC_TRACE_IN_STATUS_BP_LOW)—Offset 60h

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_STATUS_BP_LOW (DBC_TRACE_IN_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

19.3.26 DBC_TRACE_IN_STATUS_BP_HI (DBC_TRACE_IN_STATUS_BP_HI)—Offset 64h

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_STATUS_BP_HI (DBC_TRACE_IN_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

19.3.27 DBC_TRACE_IN_STATUS_QUALIFIERS (DBC_TRACE_IN_STATUS_QUALIFIERS)—Offset 68h

DbC TRACE OUT STATUS Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

19.3.28 DBC_ERROR_CONTROL_STATUS_REG (DBC_ERROR_CONTROL_STATUS_REG)—Offset 6Ch

DBC_ERROR_CONTROL_STATUS_REG

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD)**
8	0h RW	**DBC_TRACE_IN (DBC_TRACE_IN)**
7	0h RW	**DBC_DFX_OUT (DBC_DFX_OUT)**

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**DBC_DFX_IN (DBC_DFX_IN)**
5	0h RW	**DBC_GP2_OUT (DBC_GP2_OUT)**
4	0h RW	**DBC_GP2_IN (DBC_GP2_IN)**
3	0h RW	**DBC_GP1_OUT (DBC_GP1_OUT)**
2	0h RW	**DBC_GP1_IN (DBC_GP1_IN)**
1	0h RW	**CONTROL_EP (CONTROL_EP)**
0	0h RW	**STATUS_WRITE_ON_ERROR_EN (STATUS_WRITE_ON_ERROR_EN):** Enable status write generation on detecting error on Trace/DFx/GP2 EPs

19.3.29 DBC_EXI_CONTROL_STATUS_REG (DBC_EXI_CONTROL_STATUS_REG)—Offset 70h

DBC_EXI_CONTROL_STATUS_REG

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**DBC_GP2_IN_STATUS_LOG (DBC_GP2_IN_STATUS_LOG):** Set when the DMA transfer request status for GP2 IN is completed. Cleared when a new DMA transfer request is received.
30	0h RO	**DBC_GP2_OUT_STATUS_LOG (DBC_GP2_OUT_STATUS_LOG):** Set when the DMA transfer request status for GP2 OUT is completed. Cleared when a new DMA transfer request is received.
29:13	0h RO	**RSVD (RSVD)**
12	0h RW	**DBC_EXI_CLK_GATING_CTRL (DBC_EXI_CLK_GATING_CTRL):** Disable gating for prim_clk for DbC-ExI logic. By default clock gating is enabled.
11	0h RW	**DBC_SAI_CHECK_POLICY (DBC_SAI_CHECK_POLICY):** 1: Disable SAI checking on read requests only 0: Enable Default SAI check (on Reads & Writes)

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**TRACE_SEQUENCER_PIPELINE_DISABLE (TRACE_SEQUENCER_PIPELINE_DISABLE):** Set to disable pipelining of read requests to fabric for different trace transfer requests. By default, trace sequencer would start issuing reads requests to Fabric for a subsequent transfer request while the reads for the previous one hasnt been returned back to DbC 0: Read Pipelining enabled for Trace 1: Disable read pipelining for Trace
9:7	0h RW	**DBC_MAX_PKT_SIZE (DBC_MAX_PKT_SIZE):** Configurable MPS for Trace, DFx, GP2 EPs Default = 1KB 000 : 1KB 001 : 64B 010 : 128B 011 : 256B 100 : 512B Others : Reserved
6:1	0h RW	**DBC_NUM_PENDING_READS (DBC_NUM_PENDING_READS):** Constrain number of read requests pending on Fabric on behalf of DbC Eps. Sequencers limit the number of read requests that will be initiated on Fabric at any given time to NUM_PENDING_READ. NUM_PENDING_READ = [1..READS_PER_MPS] Where READS_PER_MPS is the number of read requests require for 1 MPS for the given EP. Applies for DbC.[Trace|DFx|GP2] IN EPs
0	0h RW	**DBC_TRACE_PIPELINE_DEPTH1 (DBC_TRACE_PIPELINE_DEPTH1):** Constrain DbC.Trace IN Pipeline to 1 deep. Limit processing of DbC Trace to one transfer at any time. In other words, Until Trace data for the first transfer request from NPKH is completed on USB3 interface and status returned back to NPKH, subsequent transfer request is not started, only 1 Trace sequencer is active at any given time.

19.3.30 FABRIC_AGENT_UPSTREAM_GRANT_COUNT_REG (FABRIC_AGENT_UPSTREAM_GRANT_COUNT_REG)—Offset 74h

FABRIC_AGENT_UPSTREAM_GRANT_COUNT_REG

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 9249249h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:27	1h RW	**IN_PORT_ARB_GRANT_COUNT (IN_PORT_ARB_GRANT_COUNT)**
26:24	1h RW	**GP2_IN_PORT_ARB_GRANT_COUNT (GP2_IN_PORT_ARB_GRANT_COUNT)**

Bit Range	Default & Access	Field Name (ID): Description

19.3.31 DBC_ECO_POLICY_REG1 (DBC_ECO_POLICY_REG1)—Offset 78h

ECO Policy registers for future use

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40F00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**RESERVED (RSVD)**
23	0h RW	**GP2_IN_BACK2BACK_SHORT_PKT_FIX_EN (GP2_IN_BACK2BACK_SHORT_PKT_FIX_EN)**
22	0h RW	**DFX_IN_BACK2BACK_SHORT_PKT_FIX_EN (DFX_IN_BACK2BACK_SHORT_PKT_FIX_EN)**
21	0h RW	**TRACE_IN_BACK2BACK_SHORT_PKT_FIX_EN (TRACE_IN_BACK2BACK_SHORT_PKT_FIX_EN)**
20:18	1h RW	**OUT_PORT_ARB_GRANT_COUNT (OUT_PORT_ARB_GRANT_COUNT)**
17	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**OUT_EP_BURST_SIZE (OUT_EP_BURST_SIZE):** Default: HW selects the burst size for OUT EPs based on the mode of operation Kernel Debug Mode Only: Supported OUT EP = 1 (GP1) ; Burst Size = 4 Platform Debug Mode Only: Supported OUT EPs = 2 (DFx, GP2), Burst Size = 2 Kernel and Platform debug mode: Supported OUT EPs = 3 (GP1, DFx, GP2) ; Burst Size = 1 When Set to 1 ; Burst Size = 1
15	0h RW	**IGNORE_EXI_EN (IGNORE_EXI_EN)**
14	0h RW	**IGNORE_DCE (IGNORE_DCE)**
13	0h RW	**DBC_EXI_HCRESET_DISABLE (DBC_EXI_HCRESET_DISABLE):** When set to 1, DBC/DBC-EXI will not take any action on HCReset. Default behavior is to trigger HCReset flow.
12	0h RW	**DBC_ALLOW_PG (DBC_ALLOW_PG):** When set to 1, DBC/ DBC-EXI will allow PG under HW initiated low power modes (D0ix). This could be used in a flow where XHC is allowed to enter low power modes, while debug data will subsequently transported to debug host after re-entry into
11:8	Fh RW	**HC_RESET_WPR_HANDLING_TIMEOUT_VALUES (HC_RESET_WPR_HANDLING_TIMEOUT_VALUES):** 0000 : 0 us (trigger exit right away) 0001 : 250 us 0010 : 500 us 1111 : 3.75 ms
7	0h RW	**TIMEOUT_BASED_HC_RESET_WPR_HANDLING (TIMEOUT_BASED_HC_RESET_WPR_HANDLING):** When set, enable timer based mechanism to allow HCReset and Warm Port Reset to override any hung situation due to any flows not completing as expected. Use HC Reset/WPR Handling Timeout values for forcing HCReset/ WPR flows
6	0h RW	**RSVD1 (RSVD1):** Reserved
5	0h RW	**INTERNAL_DBC_EXI_ENABLE (INTERNAL_DBC_EXI_ENABLE):** Enable address decode of transactions using Source Decode transactions based on Source ID instead of the default MBAR based address based decode.
4	0h RW	**EXI_ENABLE_OVERRIDE_ENABLE (EXI_ENABLE_OVERRIDE_ENABLE):** When this bit is set, the Internal DBC ExI Enable takes priority over the external ExI Enable signal received from EXI Bridge IP Default behavior is to use exio_scr_ectrl_eavails input from ExI Bridge
3	0h RW	**TRACE_STATUS_ADDRESS (TRACE_STATUS_ADDRESS):** When this bit is set, the address for Status Write request will include the address offset. Default address for Trace Status is the base address of the trace request

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**ENABLE_NON_TRANSFER_STATUS (ENABLE_NON_TRANSFER_STATUS):** Enables generation of a status write on each of the interfaces with status indicating the cause of an exception flow trigger condition Default behavior is for the sequencer to return a status completion (for transfer success, or exception scenarios) only when a pending/active DMA is in progress
1	0h RW	**ENABLE_DBC_EXI_ON_CREDIT_INIT_COMPLETION (ENABLE_DBC_EXI_ON_CREDIT_INIT_COMPLETION):** Setting this bit will enforce Credit Init completion as necessary condition to allow transfers on all 3 interfaces (Trace, GP2, DFx). Default behavior requires successful Credit Init completion as necessary condition only to allow DFX OUT EP transfer and not affect other interfaces (Trace, GP2)
0	0h RW	**CREDIT_INIT_TRIGGER (CREDIT_INIT_TRIGGER):** Writing a 1 to this bit will trigger Credit Init request. A Credit Init request will be initiated irrespective of the status of the last Credit Init request initiated.

19.3.32 DBC_ECO_POLICY_REG2 (DBC_ECO_POLICY_REG2)—Offset 7Ch

ECO Policy registers for future use

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**RESERVED (RSVD)**
5	0h RO	**DBC_EXI_RUN (DBC_EXI_RUN):** Internal version of RUN. Set only when DBC_EXI is enabled and link up as upstream port was due to DBC_EXI =1
4	0h RO	**DBC_RUN (DBC_RUN):** Internal version of RUN bit. Set only when DBC(DD) is enabled and link up as upstream port was due to DCE=1
3	0h RO	**DBC_EXI_EN (DBC_EXI_EN):** DBC_EXI_EN Internal version of EXI_EN
2	0h RO	**DBC_EN (DBC_EN):** DBC_EN Internal version of DBC_EN tracked by HW

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**CREDIT_INIT_STATUS (CREDIT_INIT_STATUS):** Tracks the status of Credit Init Handshake. HW updates this register. 00 : Credit Init not yet requested 01 : Credit Init Pending: request sent to ExI Bridge Not received Init Credit value from ExI Bridge 10 : Credit Init Done : Received Init Credit value from ExI Bridge 11 : Reserved

19.3.33 DBC_ECO_POLICY_REG3 (DBC_ECO_POLICY_REG3)—Offset 80h

ECO Policy registers for future use

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_ECO_POLICY_REG3 (DBC_ECO_POLICY_REG3)**

19.3.34 DBC_ECO_POLICY_REG4 (DBC_ECO_POLICY_REG4)—Offset 84h

ECO Policy registers for future use

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_ECO_POLICY_REG4 (DBC_ECO_POLICY_REG4)**

19.3.35 DBConEXI Capability Port Status and Control Register (DBC_EXI_DCPORTSC)—Offset 88h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23	0h RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.
22	0h RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1)**
17	0h RW/C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2)**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.
9	0h RO	**Reserved (RSVD_3)**
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DBC_EXI_DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4)**
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DBC_EXI_DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

19.3.36 DEBUG_SW_CONTROL_STATUS_REG (DEBUG_SW_CONTROL_STATUS_REG)—Offset 100h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RSVD (RSVD)**
7	0h RW	**FAST_SW_TIMEOUT_MODE (FAST_SW_TIMEOUT_MODE):** 1 : Enable Fast Timeout Simulation Mode. When set, timeout values used for SW response Timeout mode will be in micro-seconds. 0 : Normal mode. Timeout values are as defined by SW response Timeout register.
6	0h RW/1C	**SW_TIMEOUT_STATUS (SW_TIMEOUT_STATUS):** 1: Set by HW when Timeout occurred and HW disabled SW Handling 0: Timeout not triggered Set by HW, Cleared by SW. Timeout will also clear Debug SW Available bit.
5:2	0h RW	**SW_RESPONSE_TIMEOUT (SW_RESPONSE_TIMEOUT):** 0000 : 1 ms 0001: 20 ms 0010: 40 ms 0011: 60 ms 0100: 80 ms 0101: 100 ms 0110: 200ms 1111: 1100ms
1	0h RW	**SW_RESPONSE_TIMEOUT_ENABLE (SW_RESPONSE_TIMEOUT_ENABLE):** 1: HW will timeout and trigger STALL response if SW did not respond within SW Timeout period 0: Timeout is not triggered.
0	0h RW	**DEBUG_SW_AVAILABLE (DEBUG_SW_AVAILABLE):** 1: Debug SW has been loaded and is available 0: Debug SW is not available When Debug SW is available, then HW presents the Control Transfer requests to SW and relies on SW to handle the requests.

19.3.37 DEBUG_REQUEST_INFO_AND_STATUS_REG (DEBUG_REQUEST_INFO_AND_STATUS_REG)—Offset 104h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RESPONSE_PACKET_LAST (RESPONSE_PACKET_LAST):** Specifies that this response packet is the last packet for satisfying the current request or if there is additional packets to complete the request. 1 : Current response packet is the last data packet for the current request 0: Current response packet is not the last data packet for the current request. There is one or more additional data packets required to complete the request. For example, If the response data buffer is 512B, and the response is > 512B, then there will be multiple response data packets required, and this bit is set to 0 except for the last one.

Bit Range	Default & Access	Field Name (ID): Description
30:27	0h RW	**RESPONSE_TYPE (RESPONSE_TYPE):** Specifies the type of response that needs to be generated 000 : DATA Response 001: ACK 010: STALL (Request not supported) Others: Reserved For DATA response, associate DATA is written into the Response Stack by SW.
26	0h RW/1S	**DEBUG_RESPONSE_AVAIL (DEBUG_RESPONSE_AVAIL):** 1: Valid SW response available for HW 0: No response available SW sets this bit when it has generated a response for a debug request received. HW clears this bit after the response has been consumed (completed the transfer to host).
25:15	0h RO	**RSVD (RSVD)**
14:12	0h RW	**DEBUG_REQUEST_ERROR_TYPE (DEBUG_REQUEST_ERROR_TYPE):** Indicates that cause/Type of the error detect. Valid only when Debug Request Error Detected bit is 1
11	0h RW	**DEBUG_REQUEST_ERROR_DETECTED (DEBUG_REQUEST_ERROR_DETECTED):** HW sets this bit to indicate to Debug SW that an error was detected on the packet received on the USB3 link
10:1	0h RO	**DEBUG_REQUEST_LENGTH (DEBUG_REQUEST_LENGTH):** Length of any data associated with the current request. This field is valid only when a debug request is pending.
0	0h RW/1C	**DEBUG_REQUEST_PENDING (DEBUG_REQUEST_PENDING):** 1: Debug request is available for SW to consume 0: No request is pending for SW HW sets this bit to indicate to Debug SW that a control transfer request is pending for SW to handle. SW clears this bit once it has consumed the request.

19.3.38 DEBUG_REQUEST_STACK (DEBUG_REQUEST_STACK_REG_0)—Offset 108h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.65 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_10)—Offset 1A8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.66 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_11)—Offset 1ACh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.67 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_12)—Offset 1B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.68 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_13)—Offset 1B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.69 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_14)—Offset 1B8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.70 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_15)—Offset 1BCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.71 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_16)—Offset 1C0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.72 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_17)—Offset 1C4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.73 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_18)—Offset 1C8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.74 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_19)—Offset 1CCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.75 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_20)—Offset 1D0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.76 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_21)—Offset 1D4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.77 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_22)—Offset 1D8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.78 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_23)—Offset 1DCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.79 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_24)—Offset 1E0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.80 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_25)—Offset 1E4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.81 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_26)—Offset 1E8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.82 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_27)—Offset 1ECh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.83 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_28)—Offset 1F0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.84 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_29)—Offset 1F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.85 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_30)—Offset 1F8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.86 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_31)—Offset 1FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.87 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_32)—Offset 200h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.88 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_33)—Offset 204h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.89 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_34)—Offset 208h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.90 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_35)—Offset 20Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.91 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_36)—Offset 210h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.92 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_37)—Offset 214h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.93 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_38)—Offset 218h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.94 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_39)—Offset 21Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.95 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_40)—Offset 220h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.96 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_41)—Offset 224h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.97 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_42)—Offset 228h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.98 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_43)—Offset 22Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.99 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_44)—Offset 230h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.100 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_45)—Offset 234h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.101 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_46)—Offset 238h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.102 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_47)—Offset 23Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.103 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_48)—Offset 240h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.104 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_49)—Offset 244h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.105 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_50)—Offset 248h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.106 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_51)—Offset 24Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.107 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_52)—Offset 250h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.108 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_53)—Offset 254h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.109 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_54)—Offset 258h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.110 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_55)—Offset 25Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.111 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_56)—Offset 260h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.112 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_57)—Offset 264h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.113 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_58)—Offset 268h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.114 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_59)—Offset 26Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.115 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_60)—Offset 270h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.116 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_61)—Offset 274h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.117 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_62)—Offset 278h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.118 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_63)—Offset 27Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.119 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_64)—Offset 280h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.120 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_65)—Offset 284h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.121 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_66)—Offset 288h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.122 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_67)—Offset 28Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.123 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_68)—Offset 290h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.124 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_69)—Offset 294h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.125 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_70)—Offset 298h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.126 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_71)—Offset 29Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.127 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_72)—Offset 2A0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.128 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_73)—Offset 2A4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.129 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_74)—Offset 2A8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.130 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_75)—Offset 2ACh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.131 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_76)—Offset 2B0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.132 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_77)—Offset 2B4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.133 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_78)—Offset 2B8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.134 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_79)—Offset 2BCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.135 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_80)—Offset 2C0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.136 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_81)—Offset 2C4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.137 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_82)—Offset 2C8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.138 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_83)—Offset 2CCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.139 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_84)—Offset 2D0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.140 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_85)—Offset 2D4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.141 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_86)—Offset 2D8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.142 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_87)—Offset 2DCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.143 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_88)—Offset 2E0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.144 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_89)—Offset 2E4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.145 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_90)—Offset 2E8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.146 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_91)—Offset 2ECh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.147 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_92)—Offset 2F0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.148 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_93)—Offset 2F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.149 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_94)—Offset 2F8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.150 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_95)—Offset 2FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.151 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_96)—Offset 300h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.152 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_97)—Offset 304h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.153 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_98)—Offset 308h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.154 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_99)—Offset 30Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.155 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_100)—Offset 310h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.156 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_101)—Offset 314h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.157 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_102)—Offset 318h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.158 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_103)—Offset 31Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.159 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_104)—Offset 320h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.160 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_105)—Offset 324h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.161 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_106)—Offset 328h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.162 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_107)—Offset 32Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.163 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_108)—Offset 330h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.164 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_109)—Offset 334h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.165 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_110)—Offset 338h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.166 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_111)—Offset 33Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.167 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_112)—Offset 340h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.168 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_113)—Offset 344h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.169 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_114)—Offset 348h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.170 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_115)—Offset 34Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.171 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_116)—Offset 350h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.172 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_117)—Offset 354h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.173 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_118)—Offset 358h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.174 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_119)—Offset 35Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.175 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_120)—Offset 360h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.176 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_121)—Offset 364h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.177 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_122)—Offset 368h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.178 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_123)—Offset 36Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.179 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_124)—Offset 370h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.180 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_125)—Offset 374h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.181 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_126)—Offset 378h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.182 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_127)—Offset 37Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

19.3.183 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_0)—Offset 380h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

19.3.184 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_1)—Offset 384h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

19.3.185 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_2)—Offset 388h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

19.4 Registers Summary

Table 19-4. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C700h	C703h	DCFG (DCFG)—Offset C700h	80804h
C704h	C707h	DCTL (DCTL)—Offset C704h	F00000h
C708h	C70Bh	DEVTEN (DEVTEN)—Offset C708h	0h
C70Ch	C70Fh	DSTS (DSTS)—Offset C70Ch	520004h
C710h	C713h	DGCMDPAR (DGCMDPAR)—Offset C710h	0h
C714h	C717h	DGCMD (DGCMD)—Offset C714h	0h
C720h	C723h	DALEPENA (DALEPENA)—Offset C720h	0h
C800h	C803h	DEPCMDPAR2_0 (DEPCMDPAR2_0)—Offset C800h	0h
C804h	C807h	DEPCMDPAR1_0 (DEPCMDPAR1_0)—Offset C804h	0h
C808h	C80Bh	DEPCMDPAR0_0 (DEPCMDPAR0_0)—Offset C808h	0h
C80Ch	C80Fh	DEPCMD_0 (DEPCMD_0)—Offset C80Ch	0h
C810h	C813h	DEPCMDPAR2_1 (DEPCMDPAR2_1)—Offset C810h	0h
C814h	C817h	DEPCMDPAR1_1 (DEPCMDPAR1_1)—Offset C814h	0h
C818h	C81Bh	DEPCMDPAR0_1 (DEPCMDPAR0_1)—Offset C818h	0h
C81Ch	C81Fh	DEPCMD_1 (DEPCMD_1)—Offset C81Ch	0h
C820h	C823h	DEPCMDPAR2_2 (DEPCMDPAR2_2)—Offset C820h	0h
C824h	C827h	DEPCMDPAR1_2 (DEPCMDPAR1_2)—Offset C824h	0h
C828h	C82Bh	DEPCMDPAR0_2 (DEPCMDPAR0_2)—Offset C828h	0h
C82Ch	C82Fh	DEPCMD_2 (DEPCMD_2)—Offset C82Ch	0h
C830h	C833h	DEPCMDPAR2_3 (DEPCMDPAR2_3)—Offset C830h	0h
C834h	C837h	DEPCMDPAR1_3 (DEPCMDPAR1_3)—Offset C834h	0h

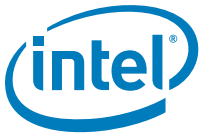

Table 19-4. Summary of USBX device top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C838h	C83Bh	DEPCMDPAR0_3 (DEPCMDPAR0_3)—Offset C838h	0h
C83Ch	C83Fh	DEPCMD_3 (DEPCMD_3)—Offset C83Ch	0h
C840h	C843h	DEPCMDPAR2_4 (DEPCMDPAR2_4)—Offset C840h	0h
C844h	C847h	DEPCMDPAR1_4 (DEPCMDPAR1_4)—Offset C844h	0h
C848h	C84Bh	DEPCMDPAR0_4 (DEPCMDPAR0_4)—Offset C848h	0h
C84Ch	C84Fh	DEPCMD_4 (DEPCMD_4)—Offset C84Ch	0h
C850h	C853h	DEPCMDPAR2_5 (DEPCMDPAR2_5)—Offset C850h	0h
C854h	C857h	DEPCMDPAR1_5 (DEPCMDPAR1_5)—Offset C854h	0h
C858h	C85Bh	DEPCMDPAR0_5 (DEPCMDPAR0_5)—Offset C858h	0h
C85Ch	C85Fh	DEPCMD_5 (DEPCMD_5)—Offset C85Ch	0h
C860h	C863h	DEPCMDPAR2_6 (DEPCMDPAR2_6)—Offset C860h	0h
C864h	C867h	DEPCMDPAR1_6 (DEPCMDPAR1_6)—Offset C864h	0h
C868h	C86Bh	DEPCMDPAR0_6 (DEPCMDPAR0_6)—Offset C868h	0h
C86Ch	C86Fh	DEPCMD_6 (DEPCMD_6)—Offset C86Ch	0h
C870h	C873h	DEPCMDPAR2_7 (DEPCMDPAR2_7)—Offset C870h	0h
C874h	C877h	DEPCMDPAR1_7 (DEPCMDPAR1_7)—Offset C874h	0h
C878h	C87Bh	DEPCMDPAR0_7 (DEPCMDPAR0_7)—Offset C878h	0h
C87Ch	C87Fh	DEPCMD_7 (DEPCMD_7)—Offset C87Ch	0h
C880h	C883h	DEPCMDPAR2_8 (DEPCMDPAR2_8)—Offset C880h	0h
C884h	C887h	DEPCMDPAR1_8 (DEPCMDPAR1_8)—Offset C884h	0h
C888h	C88Bh	DEPCMDPAR0_8 (DEPCMDPAR0_8)—Offset C888h	0h
C88Ch	C88Fh	DEPCMD_8 (DEPCMD_8)—Offset C88Ch	0h
C890h	C893h	DEPCMDPAR2_9 (DEPCMDPAR2_9)—Offset C890h	0h
C894h	C897h	DEPCMDPAR1_9 (DEPCMDPAR1_9)—Offset C894h	0h
C898h	C89Bh	DEPCMDPAR0_9 (DEPCMDPAR0_9)—Offset C898h	0h
C89Ch	C89Fh	DEPCMD_9 (DEPCMD_9)—Offset C89Ch	0h
C8A0h	C8A3h	DEPCMDPAR2_10 (DEPCMDPAR2_10)—Offset C8A0h	0h
C8A4h	C8A7h	DEPCMDPAR1_10 (DEPCMDPAR1_10)—Offset C8A4h	0h
C8A8h	C8ABh	DEPCMDPAR0_10 (DEPCMDPAR0_10)—Offset C8A8h	0h
C8ACh	C8AFh	DEPCMD_10 (DEPCMD_10)—Offset C8ACh	0h
C8B0h	C8B3h	DEPCMDPAR2_11 (DEPCMDPAR2_11)—Offset C8B0h	0h
C8B4h	C8B7h	DEPCMDPAR1_11 (DEPCMDPAR1_11)—Offset C8B4h	0h
C8B8h	C8BBh	DEPCMDPAR0_11 (DEPCMDPAR0_11)—Offset C8B8h	0h
C8BCh	C8BFh	DEPCMD_11 (DEPCMD_11)—Offset C8BCh	0h
C8C0h	C8C3h	DEPCMDPAR2_12 (DEPCMDPAR2_12)—Offset C8C0h	0h
C8C4h	C8C7h	DEPCMDPAR1_12 (DEPCMDPAR1_12)—Offset C8C4h	0h
C8C8h	C8CBh	DEPCMDPAR0_12 (DEPCMDPAR0_12)—Offset C8C8h	0h
C8CCh	C8CFh	DEPCMD_12 (DEPCMD_12)—Offset C8CCh	0h
C8D0h	C8D3h	DEPCMDPAR2_13 (DEPCMDPAR2_13)—Offset C8D0h	0h
C8D4h	C8D7h	DEPCMDPAR1_13 (DEPCMDPAR1_13)—Offset C8D4h	0h

Table 19-4. Summary of USBX device top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C8D8h	C8DBh	DEPCMDPAR0_13 (DEPCMDPAR0_13)—Offset C8D8h	0h
C8DCh	C8DFh	DEPCMD_13 (DEPCMD_13)—Offset C8DCh	0h
C8E0h	C8E3h	DEPCMDPAR2_14 (DEPCMDPAR2_14)—Offset C8E0h	0h
C8E4h	C8E7h	DEPCMDPAR1_14 (DEPCMDPAR1_14)—Offset C8E4h	0h
C8E8h	C8EBh	DEPCMDPAR0_14 (DEPCMDPAR0_14)—Offset C8E8h	0h
C8ECh	C8EFh	DEPCMD_14 (DEPCMD_14)—Offset C8ECh	0h
C8F0h	C8F3h	DEPCMDPAR2_15 (DEPCMDPAR2_15)—Offset C8F0h	0h
C8F4h	C8F7h	DEPCMDPAR1_15 (DEPCMDPAR1_15)—Offset C8F4h	0h
C8F8h	C8FBh	DEPCMDPAR0_15 (DEPCMDPAR0_15)—Offset C8F8h	0h
C8FCh	C8FFh	DEPCMD_15 (DEPCMD_15)—Offset C8FCh	0h
C900h	C903h	DEPCMDPAR2_16 (DEPCMDPAR2_16)—Offset C900h	0h
C904h	C907h	DEPCMDPAR1_16 (DEPCMDPAR1_16)—Offset C904h	0h
C908h	C90Bh	DEPCMDPAR0_16 (DEPCMDPAR0_16)—Offset C908h	0h
C90Ch	C90Fh	DEPCMD_16 (DEPCMD_16)—Offset C90Ch	0h
C910h	C913h	DEPCMDPAR2_17 (DEPCMDPAR2_17)—Offset C910h	0h
C914h	C917h	DEPCMDPAR1_17 (DEPCMDPAR1_17)—Offset C914h	0h
C918h	C91Bh	DEPCMDPAR0_17 (DEPCMDPAR0_17)—Offset C918h	0h
C91Ch	C91Fh	DEPCMD_17 (DEPCMD_17)—Offset C91Ch	0h
C920h	C923h	DEPCMDPAR2_18 (DEPCMDPAR2_18)—Offset C920h	0h
C924h	C927h	DEPCMDPAR1_18 (DEPCMDPAR1_18)—Offset C924h	0h
C928h	C92Bh	DEPCMDPAR0_18 (DEPCMDPAR0_18)—Offset C928h	0h
C92Ch	C92Fh	DEPCMD_18 (DEPCMD_18)—Offset C92Ch	0h
C930h	C933h	DEPCMDPAR2_19 (DEPCMDPAR2_19)—Offset C930h	0h
C934h	C937h	DEPCMDPAR1_19 (DEPCMDPAR1_19)—Offset C934h	0h
C938h	C93Bh	DEPCMDPAR0_19 (DEPCMDPAR0_19)—Offset C938h	0h
C93Ch	C93Fh	DEPCMD_19 (DEPCMD_19)—Offset C93Ch	0h
C940h	C943h	DEPCMDPAR2_20 (DEPCMDPAR2_20)—Offset C940h	0h
C944h	C947h	DEPCMDPAR1_20 (DEPCMDPAR1_20)—Offset C944h	0h
C948h	C94Bh	DEPCMDPAR0_20 (DEPCMDPAR0_20)—Offset C948h	0h
C94Ch	C94Fh	DEPCMD_20 (DEPCMD_20)—Offset C94Ch	0h
C950h	C953h	DEPCMDPAR2_21 (DEPCMDPAR2_21)—Offset C950h	0h
C954h	C957h	DEPCMDPAR1_21 (DEPCMDPAR1_21)—Offset C954h	0h
C958h	C95Bh	DEPCMDPAR0_21 (DEPCMDPAR0_21)—Offset C958h	0h
C95Ch	C95Fh	DEPCMD_21 (DEPCMD_21)—Offset C95Ch	0h
C960h	C963h	DEPCMDPAR2_22 (DEPCMDPAR2_22)—Offset C960h	0h
C964h	C967h	DEPCMDPAR1_22 (DEPCMDPAR1_22)—Offset C964h	0h
C968h	C96Bh	DEPCMDPAR0_22 (DEPCMDPAR0_22)—Offset C968h	0h
C96Ch	C96Fh	DEPCMD_22 (DEPCMD_22)—Offset C96Ch	0h
C970h	C973h	DEPCMDPAR2_23 (DEPCMDPAR2_23)—Offset C970h	0h
C974h	C977h	DEPCMDPAR1_23 (DEPCMDPAR1_23)—Offset C974h	0h

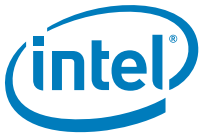

Table 19-4. Summary of USBX device top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C978h	C97Bh	DEPCMDPAR0_23 (DEPCMDPAR0_23)—Offset C978h	0h
C97Ch	C97Fh	DEPCMD_23 (DEPCMD_23)—Offset C97Ch	0h
C980h	C983h	DEPCMDPAR2_24 (DEPCMDPAR2_24)—Offset C980h	0h
C984h	C987h	DEPCMDPAR1_24 (DEPCMDPAR1_24)—Offset C984h	0h
C988h	C98Bh	DEPCMDPAR0_24 (DEPCMDPAR0_24)—Offset C988h	0h
C98Ch	C98Fh	DEPCMD_24 (DEPCMD_24)—Offset C98Ch	0h
C990h	C993h	DEPCMDPAR2_25 (DEPCMDPAR2_25)—Offset C990h	0h
C994h	C997h	DEPCMDPAR1_25 (DEPCMDPAR1_25)—Offset C994h	0h
C998h	C99Bh	DEPCMDPAR0_25 (DEPCMDPAR0_25)—Offset C998h	0h
C99Ch	C99Fh	DEPCMD_25 (DEPCMD_25)—Offset C99Ch	0h
C9A0h	C9A3h	DEPCMDPAR2_26 (DEPCMDPAR2_26)—Offset C9A0h	0h
C9A4h	C9A7h	DEPCMDPAR1_26 (DEPCMDPAR1_26)—Offset C9A4h	0h
C9A8h	C9ABh	DEPCMDPAR0_26 (DEPCMDPAR0_26)—Offset C9A8h	0h
C9ACh	C9AFh	DEPCMD_26 (DEPCMD_26)—Offset C9ACh	0h
C9B0h	C9B3h	DEPCMDPAR2_27 (DEPCMDPAR2_27)—Offset C9B0h	0h
C9B4h	C9B7h	DEPCMDPAR1_27 (DEPCMDPAR1_27)—Offset C9B4h	0h
C9B8h	C9BBh	DEPCMDPAR0_27 (DEPCMDPAR0_27)—Offset C9B8h	0h
C9BCh	C9BFh	DEPCMD_27 (DEPCMD_27)—Offset C9BCh	0h
C9C0h	C9C3h	DEPCMDPAR2_28 (DEPCMDPAR2_28)—Offset C9C0h	0h
C9C4h	C9C7h	DEPCMDPAR1_28 (DEPCMDPAR1_28)—Offset C9C4h	0h
C9C8h	C9CBh	DEPCMDPAR0_28 (DEPCMDPAR0_28)—Offset C9C8h	0h
C9CCh	C9CFh	DEPCMD_28 (DEPCMD_28)—Offset C9CCh	0h
C9D0h	C9D3h	DEPCMDPAR2_29 (DEPCMDPAR2_29)—Offset C9D0h	0h
C9D4h	C9D7h	DEPCMDPAR1_29 (DEPCMDPAR1_29)—Offset C9D4h	0h
C9D8h	C9DBh	DEPCMDPAR0_29 (DEPCMDPAR0_29)—Offset C9D8h	0h
C9DCh	C9DFh	DEPCMD_29 (DEPCMD_29)—Offset C9DCh	0h
C9E0h	C9E3h	DEPCMDPAR2_30 (DEPCMDPAR2_30)—Offset C9E0h	0h
C9E4h	C9E7h	DEPCMDPAR1_30 (DEPCMDPAR1_30)—Offset C9E4h	0h
C9E8h	C9EBh	DEPCMDPAR0_30 (DEPCMDPAR0_30)—Offset C9E8h	0h
C9ECh	C9EFh	DEPCMD_30 (DEPCMD_30)—Offset C9ECh	0h
C9F0h	C9F3h	DEPCMDPAR2_31 (DEPCMDPAR2_31)—Offset C9F0h	0h
C9F4h	C9F7h	DEPCMDPAR1_31 (DEPCMDPAR1_31)—Offset C9F4h	0h
C9F8h	C9FBh	DEPCMDPAR0_31 (DEPCMDPAR0_31)—Offset C9F8h	0h
C9FCh	C9FFh	DEPCMD_31 (DEPCMD_31)—Offset C9FCh	0h

19.4.1 DCFG (DCFG)—Offset C700h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80804h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RW	**reserved_32_25 (reserved_32_25)**
24	0h RW	**reserved_24 (reserved_24)**
23	0h RW	**IgnStrmPP (IgnStrmPP)**
22	0h RW	**LPMCAP (LPMCAP)**
21:17	4h RW	**NUMP (NUMP)**
16:12	0h RW	**INTRNUM (INTRNUM)**
11:10	2h RW	**PERFRINT (PERFRINT)**
9:3	0h RW	**DEVADDR (DEVADDR)**
2:0	4h RW	**DEVSPD (DEVSPD)**

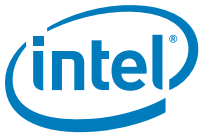
19.4.2 DCTL (DCTL)—Offset C704h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RUN_STOP (RUN_STOP)**
30	0h RW	**CSFTRST (CSFTRST)**
29	0h RO	**reserved_30_29 (reserved_30_29)**
28:24	0h RW	**HIRDTHRES (HIRDTHRES)**
23:20	Fh RW	**LPM_NYET_thres (LPM_NYET_thres)**
19	0h RW	**KeepConnect (KeepConnect)**
18	0h RW	**L1HibernationEn (L1HibernationEn)**
17	0h RW	**CRS (CRS)**



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**CSS (CSS)**
15:13	0h RO	**reserved_16_13 (reserved_16_13)**
12	0h RW	**INITU2ENA (INITU2ENA)**
11	0h RW	**ACCEPTU2ENA (ACCEPTU2ENA)**
10	0h RW	**INITU1ENA (INITU1ENA)**
9	0h RW	**ACCEPTU1ENA (ACCEPTU1ENA)**
8:5	0h WO	**ULSTCHNGREQ (ULSTCHNGREQ)**
4:1	0h RW	**TSTCTL (TSTCTL)**
0	0h RO	**reserved_1_0 (reserved_1_0)**

19.4.3 DEVTEN (DEVTEN)—Offset C708h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**reserved_32_14 (reserved_32_14)**
13	0h RW	**Reserved_13_13 (Reserved_13_13)**
12	0h RW	**VENDEVTSTRCVDEN (VENDEVTSTRCVDEN)**
11	0h RO	**reserved_12_11 (reserved_12_11)**
10	0h RO	**reserved_11_10 (reserved_11_10)**
9	0h RW	**ERRTICERREVTEN (ERRTICERREVTEN)**
8	0h RO	**reserved_9_8 (reserved_9_8)**
7	0h RW	**SOFTEVTEN (SOFTEVTEN)**

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**U3L2L1SuspEn (U3L2L1SuspEn)**
5	0h RW	**HibernationReqEvtEn (HibernationReqEvtEn)**
4	0h RW	**WKUPEVTEN (WKUPEVTEN)**
3	0h RW	**ULSTCNGEN (ULSTCNGEN)**
2	0h RW	**CONNECTDONEEVTEN (CONNECTDONEEVTEN)**
1	0h RW	**USBRSTEVTEN (USBRSTEVTEN)**
0	0h RW	**DISSCONNEVTEN (DISSCONNEVTEN)**

19.4.4 DSTS (DSTS)—Offset C70Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 520004h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**reserved_32_30 (reserved_32_30)**
29	0h RO	**DCNRD (DCNRD)**
28	0h RO	**reserved_29_28 (reserved_29_28)**
27	0h RW	**PLC (PLC)**
26	0h RW	**CSC (CSC)**
25	0h RO	**RSS (RSS)**
24	0h RO	**SSS (SSS)**
23	0h RO	**COREIDLE (COREIDLE)**
22	1h RO	**DEVCTRLHLT (DEVCTRLHLT)**
21:18	4h RO	**USBLNKST (USBLNKST)**

Bit Range	Default & Access	Field Name (ID): Description
17	1h RO	**RXFIFOEMPTY (RXFIFOEMPTY)**
16:3	0h RO	**SOFFN (SOFFN)**
2:0	4h RO	**CONNECTSPD (CONNECTSPD)**

19.4.5 DGCMDPAR (DGCMDPAR)—Offset C710h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.6 DGCMD (DGCMD)—Offset C714h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**reserved_32_16 (reserved_32_16)**
15:12	0h RO	**CMDSTATUS (CMDSTATUS)**

10	0h NA	**CMDACT (CMDACT)**
9	0h RO	**reserved_10_9 (reserved_10_9)**
8	0h RW	**CMDIOC (CMDIOC)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**CMDTYP (CMDTYP)**

19.4.7 DALEPENA (DALEPENA)—Offset C720h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**USBACTEP (USBACTEP)**

19.4.8 DEPCMDPAR2_0 (DEPCMDPAR2_0)—Offset C800h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.9 DEPCMDPAR1_0 (DEPCMDPAR1_0)—Offset C804h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.10 DEPCMDPAR0_0 (DEPCMDPAR0_0)—Offset C808h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.11 DEPCMD_0 (DEPCMD_0)—Offset C80Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.12 DEPCMDPAR2_1 (DEPCMDPAR2_1)—Offset C810h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.13 DEPCMDPAR1_1 (DEPCMDPAR1_1)—Offset C814h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.14 DEPCMDPAR0_1 (DEPCMDPAR0_1)—Offset C818h

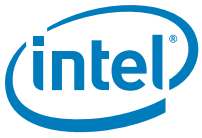
Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.15 DEPCMD_1 (DEPCMD_1)—Offset C81Ch



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.16 DEPCMDPAR2_2 (DEPCMDPAR2_2)—Offset C820h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.17 DEPCMDPAR1_2 (DEPCMDPAR1_2)—Offset C824h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.18 DEPCMDPAR0_2 (DEPCMDPAR0_2)—Offset C828h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.19 DEPCMD_2 (DEPCMD_2)—Offset C82Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.20 DEPCMDPAR2_3 (DEPCMDPAR2_3)—Offset C830h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.21 DEPCMDPAR1_3 (DEPCMDPAR1_3)—Offset C834h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.22 DEPCMDPAR0_3 (DEPCMDPAR0_3)—Offset C838h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.23 DEPCMD_3 (DEPCMD_3)—Offset C83Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.24 DEPCMDPAR2_4 (DEPCMDPAR2_4)—Offset C840h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.25 DEPCMDPAR1_4 (DEPCMDPAR1_4)—Offset C844h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.26 DEPCMDPAR0_4 (DEPCMDPAR0_4)—Offset C848h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.27 DEPCMD_4 (DEPCMD_4)—Offset C84Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.28 DEPCMDPAR2_5 (DEPCMDPAR2_5)—Offset C850h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.29 DEPCMDPAR1_5 (DEPCMDPAR1_5)—Offset C854h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.30 DEPCMDPAR0_5 (DEPCMDPAR0_5)—Offset C858h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.31 DEPCMD_5 (DEPCMD_5)—Offset C85Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.32 DEPCMDPAR2_6 (DEPCMDPAR2_6)—Offset C860h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.33 DEPCMDPAR1_6 (DEPCMDPAR1_6)—Offset C864h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.34 DEPCMDPAR0_6 (DEPCMDPAR0_6)—Offset C868h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.35 DEPCMD_6 (DEPCMD_6)—Offset C86Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.36 DEPCMDPAR2_7 (DEPCMDPAR2_7)—Offset C870h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.37 DEPCMDPAR1_7 (DEPCMDPAR1_7)—Offset C874h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.38 DEPCMDPAR0_7 (DEPCMDPAR0_7)—Offset C878h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.39 DEPCMD_7 (DEPCMD_7)—Offset C87Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.40 DEPCMDPAR2_8 (DEPCMDPAR2_8)—Offset C880h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.41 DEPCMDPAR1_8 (DEPCMDPAR1_8)—Offset C884h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.42 DEPCMDPAR0_8 (DEPCMDPAR0_8)—Offset C888h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.43 DEPCMD_8 (DEPCMD_8)—Offset C88Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**

19.4.68 DEPCMDPAR2_15 (DEPCMDPAR2_15)—Offset C8F0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.69 DEPCMDPAR1_15 (DEPCMDPAR1_15)—Offset C8F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.70 DEPCMDPAR0_15 (DEPCMDPAR0_15)—Offset C8F8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.71 DEPCMD_15 (DEPCMD_15)—Offset C8FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.129 DEPCMDPAR1_30 (DEPCMDPAR1_30)—Offset C9E4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.130 DEPCMDPAR0_30 (DEPCMDPAR0_30)—Offset C9E8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.131 DEPCMD_30 (DEPCMD_30)—Offset C9ECh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**

19.4.132 DEPCMDPAR2_31 (DEPCMDPAR2_31)—Offset C9F0h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.133 DEPCMDPAR1_31 (DEPCMDPAR1_31)—Offset C9F4h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

19.4.134 DEPCMDPAR0_31 (DEPCMDPAR0_31)—Offset C9F8h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER)**

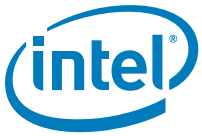
19.4.135 DEPCMD_31 (DEPCMD_31)—Offset C9FCh

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**COMMANDPARAM (COMMANDPARAM)**
15:12	0h RW	**CMDSTATUS (CMDSTATUS)**
11	0h RW	**HIPRI_FORCERM (HIPRI_FORCERM)**
10	0h RW	**CMDACT (CMDACT)**
9	0h RW	**reserved_10_1 (reserved_10_1)**
8	0h RW	**CMDIOC (CMDIOC)**
7:4	0h RW	**reserved_8_4 (reserved_8_4)**
3:0	0h RW	**CMDTYP (CMDTYP)**



19.5 Registers Summary

Table 19-5. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C100h	C103h	GSBUSCFG0 (GSBUSCFG0)—Offset C100h	6h
C104h	C107h	GSBUSCFG1 (GSBUSCFG1)—Offset C104h	F00h
C108h	C10Bh	GTXTHRCFG (GTXTHRCFG)—Offset C108h	0h
C10Ch	C10Fh	GRXTHRCFG (GRXTHRCFG)—Offset C10Ch	24400000h
C110h	C113h	GCTL (GCTL)—Offset C110h	102000h
C114h	C117h	GPMSTS (GPMSTS)—Offset C114h	0h
C118h	C11Bh	GSTS (GSTS)—Offset C118h	3E800000h
C11Ch	C11Fh	GUCTL1 (GUCTL1)—Offset C11Ch	2h
C120h	C123h	GSNPSID (GSNPSID)—Offset C120h	5533260Ah
C124h	C127h	GGPIO (GGPIO)—Offset C124h	0h
C128h	C12Bh	GUID (GUID)—Offset C128h	8086A0h
C12Ch	C12Fh	GUCTL (GUCTL)—Offset C12Ch	10h
C130h	C133h	GBUSERRADDRLO (GBUSERRADDRLO)—Offset C130h	0h
C134h	C137h	GBUSERRADDRHI (GBUSERRADDRHI)—Offset C134h	0h
C138h	C13Bh	GPRTBIMAPLO (GPRTBIMAPLO)—Offset C138h	0h
C13Ch	C13Fh	GPRTBIMAPHI (GPRTBIMAPHI)—Offset C13Ch	0h
C140h	C143h	GHWPARAMS0 (GHWPARAMS0)—Offset C140h	40204008h
C144h	C147h	GHWPARAMS1 (GHWPARAMS1)—Offset C144h	260C93Bh
C148h	C14Bh	GHWPARAMS2 (GHWPARAMS2)—Offset C148h	8086A0h
C14Ch	C14Fh	GHWPARAMS3 (GHWPARAMS3)—Offset C14Ch	10420085h
C150h	C153h	GHWPARAMS4 (GHWPARAMS4)—Offset C150h	47A22004h
C154h	C157h	GHWPARAMS5 (GHWPARAMS5)—Offset C154h	4202088h
C158h	C15Bh	GHWPARAMS6 (GHWPARAMS6)—Offset C158h	2F60020h
C15Ch	C15Fh	GHWPARAMS7 (GHWPARAMS7)—Offset C15Ch	38507E6h
C160h	C163h	GDBGFIFOSPACE (GDBGFIFOSPACE)—Offset C160h	420000h
C164h	C167h	GDBGLTSSM (GDBGLTSSM)—Offset C164h	1010440h
C168h	C16Bh	GDBGLNMCC (GDBGLNMCC)—Offset C168h	0h
C16Ch	C16Fh	GDBGBMU (GDBGBMU)—Offset C16Ch	0h
C170h	C173h	GDBGLSPMUX_DEV (GDBGLSPMUX_DEV)—Offset C170h	3F0000h
C174h	C177h	GDBGLSP (GDBGLSP)—Offset C174h	0h
C178h	C17Bh	GDBGEPINFO0 (GDBGEPINFO0)—Offset C178h	0h
C17Ch	C17Fh	GDBGEPINFO1 (GDBGEPINFO1)—Offset C17Ch	800000h
C180h	C183h	GPRTBIMAP_HSLO (GPRTBIMAP_HSLO)—Offset C180h	0h
C184h	C187h	GPRTBIMAP_HSHI (GPRTBIMAP_HSHI)—Offset C184h	0h
C188h	C18Bh	GPRTBIMAP_FSLO (GPRTBIMAP_FSLO)—Offset C188h	0h
C18Ch	C18Fh	GPRTBIMAP_FSHI (GPRTBIMAP_FSHI)—Offset C18Ch	0h
C200h	C203h	GUSB2PHYCFG_0 (GUSB2PHYCFG_0)—Offset C200h	2400h
C240h	C243h	GUSB2I2CCTL_0 (GUSB2I2CCTL_0)—Offset C240h	0h

Table 19-5. Summary of USBX device top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C280h	C283h	GUSB2PHYACC_ULPI_0 (GUSB2PHYACC_ULPI_0)—Offset C280h	0h
C2C0h	C2C3h	GUSB3PIPECTL_0 (GUSB3PIPECTL_0)—Offset C2C0h	2020002h
C300h	C303h	GTXFIFOSIZ0_0 (GTXFIFOSIZ0_0)—Offset C300h	42h
C304h	C307h	GTXFIFOSIZ1_0 (GTXFIFOSIZ1_0)—Offset C304h	420184h
C308h	C30Bh	GTXFIFOSIZ2_0 (GTXFIFOSIZ2_0)—Offset C308h	1C60184h
C30Ch	C30Fh	GTXFIFOSIZ3_0 (GTXFIFOSIZ3_0)—Offset C30Ch	34A0184h
C310h	C313h	GTXFIFOSIZ4_0 (GTXFIFOSIZ4_0)—Offset C310h	4CE0082h
C314h	C317h	GTXFIFOSIZ5_0 (GTXFIFOSIZ5_0)—Offset C314h	5500082h
C318h	C31Bh	GTXFIFOSIZ6_0 (GTXFIFOSIZ6_0)—Offset C318h	5D20082h
C31Ch	C31Fh	GTXFIFOSIZ7_0 (GTXFIFOSIZ7_0)—Offset C31Ch	6540082h
C320h	C323h	GTXFIFOSIZ8_0 (GTXFIFOSIZ8_0)—Offset C320h	6D60022h
C324h	C327h	GTXFIFOSIZ9_0 (GTXFIFOSIZ9_0)—Offset C324h	6F80022h
C328h	C32Bh	GTXFIFOSIZ10_0 (GTXFIFOSIZ10_0)—Offset C328h	71A0022h
C32Ch	C32Fh	GTXFIFOSIZ11_0 (GTXFIFOSIZ11_0)—Offset C32Ch	73C0022h
C330h	C333h	GTXFIFOSIZ12_0 (GTXFIFOSIZ12_0)—Offset C330h	75E0022h
C334h	C337h	GTXFIFOSIZ13_0 (GTXFIFOSIZ13_0)—Offset C334h	7800022h
C338h	C33Bh	GTXFIFOSIZ14_0 (GTXFIFOSIZ14_0)—Offset C338h	7A20022h
C33Ch	C33Fh	GTXFIFOSIZ15_0 (GTXFIFOSIZ15_0)—Offset C33Ch	7C40022h
C380h	C383h	GRXFIFOSIZ0_0 (GRXFIFOSIZ0_0)—Offset C380h	385h
C400h	C403h	GEVNTADRLO_0 (GEVNTADRLO_0)—Offset C400h	0h
C404h	C407h	GEVNTADRHI_0 (GEVNTADRHI_0)—Offset C404h	0h
C408h	C40Bh	GEVNTSIZ_0 (GEVNTSIZ_0)—Offset C408h	0h
C40Ch	C40Fh	GEVNTCOUNT_0 (GEVNTCOUNT_0)—Offset C40Ch	0h
C600h	C603h	GHWPARAMS8 (GHWPARAMS8)—Offset C600h	2F6h
C610h	C613h	GTXFIFOPRIDEV (GTXFIFOPRIDEV)—Offset C610h	0h
C630h	C633h	GFLADJ (GFLADJ)—Offset C630h	0h

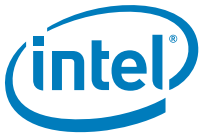
19.5.1 GSBUSCFG0 (GSBUSCFG0)—Offset C100h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**reserved_32_16 (reserved_32_16)**



Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**reserved_16_15 (reserved_16_15)**
14:13	0h RW	**reserved_15_13 (reserved_15_13)**
12	0h RW	**STOREANDFORWARD (STOREANDFORWARD)**
11	0h RW	**DATBIGEND (DATBIGEND)**
10	0h RW	**DESBIGEND (DESBIGEND)**
9:8	0h RO	**reserved_10_8 (reserved_10_8)**
7	0h RW	**INCR256BRSTENA (INCR256BRSTENA)**
6	0h RW	**INCR128BRSTENA (INCR128BRSTENA)**
5	0h RW	**INCR64BRSTENA (INCR64BRSTENA)**
4	0h RW	**INCR32BRSTENA (INCR32BRSTENA)**
3	0h RW	**INCR16BRSTENA (INCR16BRSTENA)**
2	1h RW	**INCR8BRSTENA (INCR8BRSTENA)**
1	1h RW	**INCR4BRSTENA (INCR4BRSTENA)**
0	0h RW	**INCRBRSTENA (INCRBRSTENA)**

19.5.2 GSBUSCFG1 (GSBUSCFG1)—Offset C104h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F00h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**reserved_32_13 (reserved_32_13)**
12	0h RW	**EN1KPAGE (EN1KPAGE)**
11:8	Fh RW	**PipeTransLimit (PipeTransLimit)**

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW	**DATADRSPC (DATADRSPC)**
3:0	0h RW	**DESADRSPC (DESADRSPC)**

19.5.3 GTXTHRCFG (GTXTHRCFG)—Offset C108h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

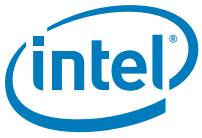
Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USBISOTHREN (USBISOTHREN)**
30	0h RW	**reserved_31_30 (reserved_31_30)**
29	0h RO	**USBTxPktCntSel (USBTxPktCntSel)**
28	0h RO	**reserved_29_28 (reserved_29_28)**
27:24	0h RO	**USBTxPktCnt (USBTxPktCnt)**
23:16	0h RW	**USBMaxTxBurstSize (USBMaxTxBurstSize)**
15	0h RW	**Reserved_15_15 (Reserved_15_15)**
14	0h RW	**reserved_15_14 (reserved_15_14)**
13:11	0h RO	**reserved_14_11 (reserved_14_11)**
10:0	0h RW	**reserved_11_0 (reserved_11_0)**

19.5.4 GRXTHRCFG (GRXTHRCFG)—Offset C10Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 24400000h



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**reserved_32_30 (reserved_32_30)**
29	1h RW	**USBRxPktCntSel (USBRxPktCntSel)**
28	0h RO	**reserved_29_28 (reserved_29_28)**
27:24	4h RW	**USBRxPktCnt (USBRxPktCnt)**
23:19	8h RW	**USBMaxRxBurstSize (USBMaxRxBurstSize)**
18:16	0h RO	**reserved_19_16 (reserved_19_16)**
15	0h RW	**reserved_16_15 (reserved_16_15)**
14:11	0h RO	**reserved_15_11 (reserved_15_11)**
10:0	0h RO	**reserved_11_0 (reserved_11_0)**

19.5.5 GCTL (GCTL)—Offset C110h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 102000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	2h RW	**PWRDNSCALE (PWRDNSCALE)**
18	0h RW	**MASTERFILTBYPASS (MASTERFILTBYPASS)**
17	0h RW	**BYPSSETADDR (BYPSSETADDR)**
16	0h RW	**U2RSTECN (U2RSTECN)**
15:14	0h RW	**FRMSCLDWN (FRMSCLDWN)**
13:12	2h RW	**PRTCAPDIR (PRTCAPDIR)**
11	0h RW	**CORESOFTRESET (CORESOFTRESET)**
10	0h RW	**SOFITPSYNC (SOFITPSYNC)**

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**U1U2TimerScale (U1U2TimerScale)**
8	0h RW	**DEBUGATTACH (DEBUGATTACH)**
7:6	0h RW	**RAMCLKSEL (RAMCLKSEL)**
5:4	0h RW	**SCALEDOWN (SCALEDOWN)**
3	0h RW	**DISSCRAMBLE (DISSCRAMBLE)**
2	0h RW	**U2EXIT_LFPS (U2EXIT_LFPS)**
1	0h RW	**GblHibernationEn (GblHibernationEn)**
0	0h RW	**DSBLCLKGTNG (DSBLCLKGTNG)**

19.5.6 GPMSTS (GPMSTS)—Offset C114h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h WO	**PortSel (PortSel)**
27:16	0h RW	**Reserved_16_27 (Reserved_16_27)**
15:12	0h RO	**U3Wakeup (U3Wakeup)**
11:9	0h RW	**Reserved_9_11 (Reserved_9_11)**
8:0	0h RO	**U2Wakeup (U2Wakeup)**

19.5.7 GSTS (GSTS)—Offset C118h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3E800000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	3E8h RO	**CBELT (CBELT)**
19:12	0h RO	**reserved_20_12 (reserved_20_12)**
11	0h RO	**RSVD**
10	0h RO	**OTG_IP (OTG_IP)**
9	0h RO	**BC_IP (BC_IP)**
8	0h RO	**ADP_IP (ADP_IP)**
7	0h RO	**Host_IP (Host_IP)**
6	0h RO	**Device_IP (Device_IP)**
5	0h RO	**CSRTimeout (CSRTimeout)**
4	0h RO	**BUSERRADDRVLD (BUSERRADDRVLD)**
3:2	0h RO	**reserved_4_2 (reserved_4_2)**
1:0	0h RO	**CURMOD (CURMOD)**

19.5.8 GUCTL1 (GUCTL1)—Offset C11Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**reserved_32_15 (reserved_32_15)**
14:9	0h RW	**Reserved_15_9 (Reserved_15_9)**
8	0h RW	**L1_SUSP_THRLD_EN_FOR_HOST (L1_SUSP_THRLD_EN_FOR_HOST)**
7:4	0h RW	**L1_SUSP_THRLD_FOR_HOST (L1_SUSP_THRLD_FOR_HOST)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**HC_ERRATA_ENABLE (HC_ERRATA_ENABLE)**
2	0h RW	**HC_PARCHK_DISABLE (HC_PARCHK_DISABLE)**
1	1h RW	**OVRLD_L1_SUSP_COM (OVRLD_L1_SUSP_COM)**
0	0h RW	**LOA_FILTER_EN (LOA_FILTER_EN)**

19.5.9 GSNPSID (GSNPSID)—Offset C120h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 5533260Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	5533260Ah RO	**SYNOPSYSID (SYNOPSYSID)**

19.5.10 GGPIO (GGPIO)—Offset C124h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**GPO (GPO)**
15:0	0h RO	**GPI (GPI)**

19.5.11 GUID (GUID)—Offset C128h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8086A0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	8086A0h RW	**USERID (USERID)**

19.5.12 GUCTL (GUCTL)—Offset C12Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RW	**REFCLKPER (REFCLKPER)**
21	0h RW	**NoExtrDl (NoExtrDl)**
20:18	0h RW	**PSQExtrResSp (PSQExtrResSp)**
17	0h RW	**SprsCtrlTransEn (SprsCtrlTransEn)**
16	0h RO	**reserved_17_16 (reserved_17_16)**
15	0h RO	**reserved_16_15 (reserved_16_15)**
14	0h RW	**USBHstInAutoRetryEn (USBHstInAutoRetryEn)**
13	0h RW	**EnOverlapChk (EnOverlapChk)**
12	0h RW	**ExtCapSupptEN (ExtCapSupptEN)**
11	0h RW	**InsrtExtrFSBODI (InsrtExtrFSBODI)**
10:9	0h RW	**DTCT (DTCT)**
8:0	10h RW	**DTFT (DTFT)**

19.5.13 GBUSERRADDRLO (GBUSERRADDRLO)—Offset C130h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**BUSERRADDR (BUSERRADDR)**

19.5.14 GBUSERRADDRHI (GBUSERRADDRHI)—Offset C134h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**BUSERRADDR (BUSERRADDR)**

19.5.15 GPRTBIMAPLO (GPRTBIMAPLO)—Offset C138h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**BINUM8 (BINUM8)**
27:24	0h RO	**BINUM7 (BINUM7)**
23:20	0h RO	**BINUM6 (BINUM6)**
19:16	0h RO	**BINUM5 (BINUM5)**
15:12	0h RO	**BINUM4 (BINUM4)**
11:8	0h RO	**BINUM3 (BINUM3)**

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	**BINUM2 (BINUM2)**
3:0	0h RW	**BINUM1 (BINUM1)**

19.5.16 GPRTBIMAPHI (GPRTBIMAPHI)—Offset C13Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**reserved_32_28 (reserved_32_28)**
27:24	0h RO	**BINUM15 (BINUM15)**
23:20	0h RO	**BINUM14 (BINUM14)**
19:16	0h RO	**BINUM13 (BINUM13)**
15:12	0h RO	**BINUM12 (BINUM12)**
11:8	0h RO	**BINUM11 (BINUM11)**
7:4	0h RO	**BINUM10 (BINUM10)**
3:0	0h RO	**BINUM9 (BINUM9)**

19.5.17 GHWPARAMS0 (GHWPARAMS0)—Offset C140h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40204008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	40h RO	**DWC_USB3_ADWIDTH_31_24 (DWC_USB3_ADWIDTH_31_24)**
23:16	20h RO	**DWC_USB3_SDWIDTH_23_16 (DWC_USB3_SDWIDTH_23_16)**
15:8	40h RO	**DWC_USB3_MDWIDTH_15_8 (DWC_USB3_MDWIDTH_15_8)**
7:6	0h RO	**DWC_USB3_SBUS_TYPE_7_6 (DWC_USB3_SBUS_TYPE_7_6)**
5:3	1h RO	**DWC_USB3_MBUS_TYPE_5_3 (DWC_USB3_MBUS_TYPE_5_3)**
2:0	0h RO	**DWC_USB3_MODE_2_0 (DWC_USB3_MODE_2_0)**

19.5.18 GHWPARAMS1 (GHWPARAMS1)—Offset C144h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 260C93Bh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved_31 (Reserved_31)**
30	0h RO	**DWC_USB3_RM_OPT_FEATURES_30 (DWC_USB3_RM_OPT_FEATURES_30)**
29	0h RO	**Reserved1_29 (Reserved1_29)**
28	0h RO	**DWC_USB3_RAM_BUS_CLKS_SYNC_28 (DWC_USB3_RAM_BUS_CLKS_SYNC_28)**

Default: 6D60022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	6D6h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.50 GTXFIFOSIZ9_0 (GTXFIFOSIZ9_0)—Offset C324h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 6F80022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	6F8h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.51 GTXFIFOSIZ10_0 (GTXFIFOSIZ10_0)—Offset C328h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 71A0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	71Ah RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.52 GTXFIFOSIZ11_0 (GTXFIFOSIZ11_0)—Offset C32Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 73C0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	73Ch RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.53 GTXFIFOSIZ12_0 (GTXFIFOSIZ12_0)—Offset C330h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 75E0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	75Eh RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.54 GTXFIFOSIZ13_0 (GTXFIFOSIZ13_0)—Offset C334h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7800022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	780h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.55 GTXFIFOSIZ14_0 (GTXFIFOSIZ14_0)—Offset C338h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7A20022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	7A2h RW	**TXFSTADDR_N (TXFSTADDR_N)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.56 GTXFIFOSIZ15_0 (GTXFIFOSIZ15_0)—Offset C33Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 7C40022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	7C4h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

19.5.57 GRXFIFOSIZ0_0 (GRXFIFOSIZ0_0)—Offset C380h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 385h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RXFSTADDR_N (RXFSTADDR_N)**
15:0	385h RW	**RXFDEP_N (RXFDEP_N)**

19.5.58 GEVNTADRLO_0 (GEVNTADRLO_0)—Offset C400h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRLO (EVNTADRLO)**

19.5.59 GEVNTADRHI_0 (GEVNTADRHI_0)—Offset C404h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRHI (EVNTADRHI)**

19.5.60 GEVNTSIZ_0 (GEVNTSIZ_0)—Offset C408h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**EVNTINTRPTMASK (EVNTINTRPTMASK)**
30:16	0h RO	**reserved_31_16 (reserved_31_16)**
15:0	0h RW	**EVENTSIZ (EVENTSIZ)**

19.5.61 GEVNTCOUNT_0 (GEVNTCOUNT_0)—Offset C40Ch

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**reserved_32_16 (reserved_32_16)**
15:0	0h NA	**EVNTCOUNT (EVNTCOUNT)**

19.5.62 GHWPARAMS8 (GHWPARAMS8)—Offset C600h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 2F6h

Bit Range	Default & Access	Field Name (ID): Description
31:0	2F6h RO	**DWC_USB3_DCACHE_DEPTH_INFO_32_0 (DWC_USB3_DCACHE_DEPTH_INFO_32_0)**

19.5.63 GTXFIFOPRIDEV (GTXFIFOPRIDEV)—Offset C610h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**reserved_32_16 (reserved_32_16)**
15:0	0h RW	**gtxfifopridev (gtxfifopridev)**

19.5.64 GFLADJ (GFLADJ)—Offset C630h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GFLADJ_REFCLK_240MHZDECR_PLS1 (GFLADJ_REFCLK_240MHZDECR_PLS1)**
30:24	0h RW	**GFLADJ_REFCLK_240MHZ_DECR (GFLADJ_REFCLK_240MHZ_DECR)**
23	0h RW	**GFLADJ_REFCLK_LPM_SEL (GFLADJ_REFCLK_LPM_SEL)**
22	0h RW	**reserved_22 (reserved_22)**
21:8	0h RW	**GFLADJ_REFCLK_FLADJ (GFLADJ_REFCLK_FLADJ)**
7	0h RW	**GFLADJ_30MHZ_SDBND_SEL (GFLADJ_30MHZ_SDBND_SEL)**
6	0h RW	**reserved_6 (reserved_6)**
5:0	0h RW	**GFLADJ_30MHZ (GFLADJ_30MHZ)**

19.6 Registers Summary

Table 19-6. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10F808h	10F809h	APBFC_U3PMU_CFG0 (APBFC_U3PMU_CFG0)—Offset 10F808h	800h
10F80Ch	10F80Dh	APBFC_U3PMU_CFG1 (APBFC_U3PMU_CFG1)—Offset 10F80Ch	0h
10F810h	10F811h	APBFC_U3PMU_CFG2 (APBFC_U3PMU_CFG2)—Offset 10F810h	Bh
10F814h	10F815h	APBFC_U3PMU_CFG3 (APBFC_U3PMU_CFG3)—Offset 10F814h	1008h
10F818h	10F819h	APBFC_U3PMU_CFG4 (APBFC_U3PMU_CFG4)—Offset 10F818h	0h
10F81Ch	10F81Dh	APBFC_U3PMU_CFG5 (APBFC_U3PMU_CFG5)—Offset 10F81Ch	0h
10F820h	10F821h	APBFC_U3PMU_CFG6 (APBFC_U3PMU_CFG6)—Offset 10F820h	1000h
10F830h	10F831h	APBFC_D0I3C (APBFC_D0I3C)—Offset 10F830h	8h

19.6.1 APBFC_U3PMU_CFG0 (APBFC_U3PMU_CFG0)—Offset 10F808h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**DRD_CONTROL_BIT_15 (DRD_CONTROL_BIT_15)**
14:3	100h RW	**DEBOUNCE_VAL (DEBOUNCE_VAL):** ID ping debounce timer (DEBOUNCE_VAL): in the unit of RTC clock (33us) default to 8.448 ms
2	0h RW	**SYNCHRONIZE_SS_HS_SWITCH (SYNCHRONIZE_SS_HS_SWITCH):** Synchronize the SS and HS switch: 0 (default) Does not synchronize. i.e. HS switch on the debounced id pin, while SS switch independently controlled by the sequencer. 1 synchronize HS and SS switch. Both speeds switch when sequencer switch.
1:0	0h RW	**DRD_CONFIG (DRD_CONFIG):** 00 Dynamic DRD switch mode 01 static host mode 10 static device mode 11 -- reserved

19.6.2 APBFC_U3PMU_CFG1 (APBFC_U3PMU_CFG1)—Offset 10F80Ch

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**XDCI_DRD_CTRL_EN (DRD_CONTROL_BIT_31):** When DRD_ACCESS_MODE (bit 2) =1, 0 -- The policies below is controlled by register in the XHCI MMIO 1 -- The policies below is controlled by register in the XDCI MMIO When DRD_ACCESS_MODE =0, this bit is a don?t care.
14:12	0h RW	**DRD_WDT_VAL (DRD_WDT_VAL):** DRD WDT timer: 0-based incremental of 500ms
11	0h RW	**EN_HOST_TO_DEV_WDT (EN_HOST_TO_DEV_WDT):** enable DRD WDT switch from host to device 0 - disable watchdog timer 1- enable watchdog timer
10	0h RW	**EN_DEV_TO_HOST_WDT (EN_DEV_TO_HOST_WDT):** enable DRD WDT switch from device to host 0 - disable watchdog timer 1- enable watchdog timer
9	0h RW	**EN_RST_WDT (EN_RST_WDT):** enable DRD WDT switch out of cold reset 0 - disable watchdog timer 1- enable watchdog timer
8	0h RW	**SW_VBUS_VALID (SW_VBUS_VALID):** if SW_IDPIN_EN (bit 5) is 1, 0 - deassert sw vbus valid 1 - assert sw vbus valid
7	0h RW	**RSVD1 (RSVD1):** RESERVED

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**EN_PIPE_RX_ON_IDPIN (EN_PIPE_RX_ON_IDPIN):** During the connection to a device, there may be a delay in DRD switch from XDCI to XHCI mode,the rx term can be low after idpin deasserts. If this bit is 0, the rx term will be assert immediately after idpin toggle. Otherwise, the device may fall back to USB2 mode. 1 -- drive 0s on utmi rx signals to controller if not connected.
5	0h RW	**SW_IDPIN_EN (SW_IDPIN_EN):** SW_IDPIN_EN 1 -- enable SW id pin (pre DRD) 0 -- disable SW id pin.
4	0h RW	**SW_IDPIN (SW_IDPIN):** if SW_IDPIN_EN (bit 21) is 1, 0 - host mode 1 - device mode
3	0h RW	**USB2_SUSP_OR_DIS (USB2_SUSP_OR_DIS):** 1 - The DRD UTMI suspendm will be controlled by host/device based on the DRD switch. 0 - whenever device or host deassert suspendm, the DRD UTMI suspendm will be deasserted.
2	0h RW	**DRD_ACCESS_MODE (DRD_ACCESS_MODE):** 0 - The DUAL_ROLE register from host and device are ORed to control DRD 1 - The DUAL_ROLE register from host and device are selected by XDCI_DRD_CTRL_EN (bit 31) to control DRD
1	0h RW	**EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN (EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN):** 1 enable the direct DRD switch on USB3 port by idpin 0 disable the direct DRD switch
0	0h RW	**SW_SWITCH_ENABLE (SW_SWITCH_ENABLE):** SW switch enable 0 (default) ID pin HW controlled DRD. 1 -- SW controlled DRD (ignore idpin), switch based on the DRD_CONFIG.

19.6.3 APBFC_U3PMU_CFG2 (APBFC_U3PMU_CFG2)—Offset 10F810h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: Bh

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**ltdb_sub_state_2_0:** USB3 Link sub state[3:0]
12	0h RO	**reserved1**
11:10	0h RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0h RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0h RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0h RO	**utmi_l1_suspend_com_n:** Common L1 suspend
4	0h RO	**utmi_suspend_com_n:** Common suspend
3	1h RO	**utmi_suspend_n:** USB 2.0 Port Suspend
2:1	1h RO	**usb2_enumspeed:** Device Enumerated Speed
0	1h RO	**b2rl_cur_mode:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device

19.6.4 APBFC_U3PMU_CFG3 (APBFC_U3PMU_CFG3)—Offset 10F814h

General Purpose Input Register

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1008h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
14	0h RO	**gsts_buserraddvld:** Bus error
13	0h RO	**DRD_MODE (DRD_MODE):** SS DRD mode 0 device mode 1 host mode
12	1h RO	**IDPIN (IDPIN):** IDPIN value (debounce)
11:10	0h RO	**u2_dssr_state:** USB2 DSSR State

Bit Range	Default & Access	Field Name (ID): Description
9:5	0h RO	**u2_prt_state:** USB2 Port State
4:1	4h RO	**ltdb_link_state:** USB3 Link state
0	0h RO	**ltdb_sub_state_3:** USB3 Link sub state[3]

19.6.5 APBFC_U3PMU_CFG4 (APBFC_U3PMU_CFG4)—Offset 10F818h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW	**hub_port_perm_attach:** reserved
13	0h RW	**host_port_power_control:** reserved
12	0h RW	**xhci_revision:** reserved
11:8	0h RW	**bus_filter_bypass:** Bus Filter Bypass. Disables the internal bus filters that are enabled by DWC_USB3_EN_BUS_FILTERS coreConsultant parameter. This static signal is present only when DWC_USB3_EN_BUS_FILTERS is 1. It is expected that this signal is set or reset at power-on reset and is not changed during the normal operation of the core.
7	0h RW	**Reserved2:** reserved
6	0h RW	**Reserved1:** reserved
5	0h RW	**otg_phy_pwr_off_veto:** reserved
4	0h RW	**otg_cnt_pwr_off_veto:** Indicates that controller power should not power off even on RTD3hot.Also a veto signal to keep LPPLL on. Note: Currently LPPLL results in a veto for S0iX flows
3	0h RW	**Brdg_rst:** reset the core see also regRW1[31]
2	0h RW	**USB2PHY_BVALID_MASK_DIS:** 0: enable USB2 PHY BVALID mask 1: disable

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**pm_power_state_request:** This port defines the PCI power management state requested by the software. When the core is configured with two power rail support (DWC_USB3_EN_PWROPT=2), the valid states are: ? 00: D0 ? 11: D3 Active State

19.6.6 APBFC_U3PMU_CFG5 (APBFC_U3PMU_CFG5)—Offset 10F81Ch

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Brdg_rst_mux:** This is a mux the core reset between the normal reset or reset and with bdg_reset regRW1[3]
14	0h RW	**En_otg_interrupt:** reserved
13:8	0h RW	**fladj_30mhz_reg:** HS jitter adjusment
7	0h RW	**core_hub_port_overcurrent:** This is a generic register provided for product specific behavior
6	0h RW	**GEN_REG_RW1:** This is a generic register provided for product specific behavior
5	0h RW	**otg_phy_pwr_off_req:** reserved
4	0h RW	**u2_pme_en:** Determines whether ULPI flis PME events are allowed to trigger PME events to brige/GPIO
3	0h RW	**u3_pme_en:** Determines whether USB3 flis PME events are allowed to trigger PME events to brige/GPIO
2	0h RW	**core_pme_en:** Determines whether core PME events are allowed to trigger PME events to brige/GPIO
1	0h RW	**ulpiphy_refclk_disable:** reserved
0	0h RW	**ipma_cmn_refclk_disable:** reserved

19.6.7 APBFC_U3PMU_CFG6 (APBFC_U3PMU_CFG6)—Offset 10F820h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1000h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**HW_BVALID_DEV:** HW Vbus Bvalid indication
14	0h RO	**RESERVED (RSVD2)**
13	0h RO	**HOST_OWNED_DEV:** DRD mode,0 is device mode 1 is host mode
12	1h RO	**IDPIN_DEV:** ID pin Debounced version
11:0	0h RO	**RESERVED (RSVD3)**

19.6.8 APBFC_D0I3C (APBFC_D0I3C)—Offset 10F830h

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0h RW	**RESERVED (RSVD)**
3	1h RW/1C	**RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3 (D0I3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1:0	0h RW	**RESERVED (RSVD1)**

19.7 Registers Summary

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
B8h	BBh	(GEN_REGRW3)—Offset B8h	0h
BCh	BFh	(GEN_REGRW4)—Offset BCh	0h
C0h	C3h	(GEN_INPUT_REGRW)—Offset C0h	1008000Bh

19.7.1 (GEN_REGRW1)—Offset B0h

General Purpose Read Write Register1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1**

19.7.2 (GEN_REGRW2)—Offset B4h

General Purpose Read Write Register2

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2**

19.7.3 (GEN_REGRW3)—Offset B8h

General Purpose Read Write Register3

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3**

19.7.4 (GEN_REGRW4)—Offset BCh

General Purpose Read Write Register4

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**GEN_REG_RW4:** reserved
2	0h RW	**XDCI_PIPE_CLK_GATE_DIS:** xdci pipe clock gating disable
1	0h RW	**XDCI_SB_CLK_GATE_DIS:** xdci sideband clock gating disable
0	0h RW	**XDCI_PRIM_CLK_GATE_DIS:** xdci primary clock gating disable

19.7.5 (GEN_INPUT_REGRW)—Offset C0h

General Purpose Input Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 1008000Bh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0h RO	**gsts_buserraddvld:** Bus error
29	0h RO	**DRD_MODE (DRD_MODE):** SS DRD mode 0 device mode 1 host mode
28	1h RO	**IDPIN (IDPIN):** IDPIN value (debounce)
27:26	0h RO	**u2_dssr_state:** USB2 DSSR State

Bit Range	Default & Access	Field Name (ID): Description
25:21	0h RO	**u2_prt_state:** USB2 Port State
20:17	4h RO	**ltdb_link_state:** USB3 Link state
16:13	0h RO	**ltdb_sub_state:** USB3 Link sub state
12	0h RO	**reserved1**
11:10	0h RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	0h RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0h RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0h RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0h RO	**utmi_l1_suspend_com_n:** Common L1 suspend
4	0h RO	**utmi_suspend_com_n:** Common suspend
3	1h RO	**utmi_suspend_n:** USB 2.0 Port Suspend
2:1	1h RO	**usb2_enumspeed:** Device Enumerated Speed
0	1h RO	**b2rl_cur_mode:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device

19.8 Registers Summary

Table 19-8. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
B0h	B3h	(GEN_REGRW1)—Offset B0h	0h
B4h	B7h	(GEN_REGRW2)—Offset B4h	0h

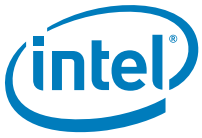
C0h	C3h	(GEN_INPUT_REGRW)—Offset C0h	1008000Bh



19.8.1 (GEN_REGRW1)—Offset B0h

General Purpose Read Write Register1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1**

19.8.2 (GEN_REGRW2)—Offset B4h

General Purpose Read Write Register2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2**

19.8.3 (GEN_REGRW3)—Offset B8h

General Purpose Read Write Register3

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3**

19.8.4 (GEN_REGRW4)—Offset BCh

General Purpose Read Write Register4

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**GEN_REG_RW4:** reserved
2	0h RW	**XDCI_PIPE_CLK_GATE_DIS:** xdci pipe clock gating disable
1	0h RW	**XDCI_SB_CLK_GATE_DIS:** xdci sideband clock gating disable
0	0h RW	**XDCI_PRIM_CLK_GATE_DIS:** xdci primary clock gating disable

19.8.5 (GEN_INPUT_REGRW)—Offset C0h

General Purpose Input Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1008000Bh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0h RO	**gsts_buserraddvld:** Bus error
29	0h RO	**DRD_MODE (DRD_MODE):** SS DRD mode 0 device mode 1 host mode
28	1h RO	**IDPIN (IDPIN):** IDPIN value (debounce)
27:26	0h RO	**u2_dssr_state:** USB2 DSSR State
25:21	0h RO	**u2_prt_state:** USB2 Port State
20:17	4h RO	**ltdb_link_state:** USB3 Link state
16:13	0h RO	**ltdb_sub_state:** USB3 Link sub state
12	0h RO	**reserved1**

Bit Range	Default & Access	Field Name (ID): Description
11:10	0h RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	0h RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0h RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0h RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0h RO	**utmi_l1_suspend_com_n:** Common L1 suspend
4	0h RO	**utmi_suspend_com_n:** Common suspend
3	1h RO	**utmi_suspend_n:** USB 2.0 Port Suspend
2:1	1h RO	**usb2_enumspeed:** Device Enumerated Speed
0	1h RO	**b2rl_cur_mode:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device

19.9 Registers Summary

Table 19-9. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	(DEVVENDID)—Offset 0h	8086h
4h	7h	(STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	(REVCLASSCODE)—Offset 8h	C03FE00h
Ch	Fh	(CLLATHEADERBIST)—Offset Ch	0h
10h	17h	(BAR)—Offset 10h	4h
18h	1Fh	(BAR1)—Offset 18h	4h
2Ch	2Fh	(SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	(EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	(CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	(INTERRUPTREG)—Offset 3Ch	100h
80h	83h	(POWERCAPID)—Offset 80h	48039001h
84h	87h	(PMECTRLSTATUS)—Offset 84h	8h
90h	93h	(PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	(DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h

Table 19-9. Summary of USBX device top Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
98h	9Bh	(D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	(DEVICE_IDLE_POINTER_REG)—Offset 9Ch	10F8301h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	80800h

19.9.1 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

19.9.2 (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

19.9.3 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: C03FE00h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C03FEh RO	**CLASS_CODES**
7:0	0h RO	**RID**

19.9.4 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

19.9.5 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 64 bits)	**Device:** 21 **Function:** 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**BASEADDR**
20:12	0h RO	**RSVD**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

19.9.6 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: CFG Register (Size: 64 bits)	**Device:** 21 **Function:** 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**BASEADDR1_HIGH**
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

19.9.7 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

19.9.8 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

19.9.9 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

19.9.10 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	1h RO	**INTPIN**
7:0	0h RW	**INTLINE**

19.9.11 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

19.9.12 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

19.9.13 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

19.9.14 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

19.9.15 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**SW_LAT_VALID**

19.9.16 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 10F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

19.9.17 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 21 **Function:** 1

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	0h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**D3_ENABLE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

19.10 Registers Summary

Table 19-10. Summary of USBX device top Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	(DEVVENDID)—Offset 0h	8086h
4h	7h	(STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	(REVCLASSCODE)—Offset 8h	C03FE00h
Ch	Fh	(CLLATHEADERBIST)—Offset Ch	0h
10h	17h	(BAR)—Offset 10h	4h
18h	1Fh	(BAR1)—Offset 18h	4h
2Ch	2Fh	(SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	(EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	(CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	(INTERRUPTREG)—Offset 3Ch	100h
80h	83h	(POWERCAPID)—Offset 80h	48039001h
84h	87h	(PMECTRLSTATUS)—Offset 84h	8h
90h	93h	(PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	(DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	(D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	(DEVICE_IDLE_POINTER_REG)—Offset 9Ch	10F8301h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	80800h

19.10.1 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

19.10.2 (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

19.10.3 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: C03FE00h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C03FEh RO	**CLASS_CODES**
7:0	0h RO	**RID**

19.10.4 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

19.10.5 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**BASEADDR**
20:12	0h RO	**RSVD**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

19.10.6 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**BASEADDR1_HIGH**
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

19.10.7 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

19.10.8 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

19.10.9 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

19.10.10 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	1h RO	**INTPIN**
7:0	0h RW	**INTLINE**

19.10.11 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

19.10.12 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

19.10.13 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

19.10.14 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

19.10.15 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**
0	0h RO	**SW_LAT_VALID**

19.10.16 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 10F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

19.10.17 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	0h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**
16	0h RW	**D3_ENABLE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

20.1 Registers Summary

Table 20-1. Summary of CONVERGE_LAYER Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
804h	807h	(SW_LTR_val)—Offset 804h	800h
808h	80Bh	(Auto_LTR_val)—Offset 808h	800h
810h	813h	(Cap_byps)—Offset 810h	0h
814h	817h	(Cap_byps_reg1)—Offset 814h	3041EF3Ch
818h	81Bh	(Cap_byps_reg2)—Offset 818h	40040C8h
81Ch	81Fh	(reg_D0i3)—Offset 81Ch	8h
820h	823h	(Tx_CMD_dly)—Offset 820h	400h
824h	827h	(Tx_DATA_dly_1)—Offset 824h	A18h
828h	82Bh	(Tx_DATA_dly_2)—Offset 828h	1C1C1C00h
82Ch	82Fh	(Rx_CMD_Data_dly_1)—Offset 82Ch	0h
830h	833h	(Rx_Strobe_Ctrl_Path)—Offset 830h	0h
834h	837h	(Rx_CMD_Data_dly_2)—Offset 834h	0h
838h	83Bh	(Master_Dll)—Offset 838h	1h
840h	843h	(Auto_tuning)—Offset 840h	0h
900h	903h	(emmc_Root_Space)—Offset 900h	0h

20.1.1 (SW_LTR_val)—Offset 804h

Sets the Software Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

20.1.2 (Auto_LTR_val)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved_low:** Reserved_low
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

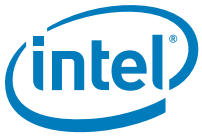
20.1.3 (Cap_byps)—Offset 810h

Capabilities Bypass Control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable_Cap_Bypass:** 8'h5A - Enable Capabilities Bypass. All other - Capabilities Bypass Disable (using default values)

20.1.4 (Cap_byps_reg1)—Offset 814h

eMMC Capabilities Bypass register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3041EF3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400_support:** 1: HS400 Mode Supported. 0: HS400 Mode NOT Supported
28	1h RW	**timeout_clock_unit:** 1'b1 - to Select MHz Clock ,1'b0 - to Select KHz Clock
27:22	1h RW	**timeout_clock_freq:** Timeout clock frequency
21	0h RW	**SPI_mode_support:** SPI Mode Support 1'b1 - SPI Mode Supported ,1'b0 - SPI Mode Not Supported
20:17	0h RW	**timer_count:** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4'b0 disables Re-Tuning Timer
16	1h RW	**tuning_for_SDR50:** Use Tuning for SDR50 1'b1 - Use Tuning 1'b0 - Don't use Tuning
15	1h RW	**ddr50_support:** 1: DDR50 Mode Supported. 0: DDR50 Mode NOT Supported
14	1h RW	**sdr104_support:** 1: SDR104 Mode Supported. 0: SDR104 Mode NOT Supported
13	1h RW	**sdr50_support:** 1: SDR50 Mode Supported. 0: SDR50 Mode NOT Supported
12:11	1h RW	**Slot_Type:** 00 - Removable SD Card Slot. 01 - Embedded Slot for One Device. 10 - Shared Bus Slot. 11 - Reserved
10	1h RW	**Async_Interrupt_Support:** 1: Asynchronous Interrupt Supported. 0: Asynchronous Interrupt NOT Supported
9	1h RW	**Sys_Addr_64bit_Support:** 1 - Core supports 64-bit System Address Bus. 0 - Core supports only 32-bit System Address Bus

Bit Range	Default & Access	Field Name (ID): Description
8	1h RW	**Voltage_Support_1_8V:** 1: 1.8V Supported. 0: 1.8V NOT Supported
7	0h RW	**Voltage_Support_3V:** 1: 3.0V Supported. 0: 3.0V NOT Supported
6	0h RW	**Voltage_Support_3_3V:** 1: 3.3V Supported. 0: 3.3V NOT Supported
5	1h RW	**Suspend_Resume_Support:** 1: Suspend/Resume Supported. 0: Suspend/Resume NOT Supported
4	1h RW	**SDMA_Support:** 1: SDMA mode Supported. 0: SDMA mode NOT Supported
3	1h RW	**High_Speed_Support:** 1: HIGH_SPEED mode Supported. 0: HIGH_SPEED mode NOT Supported
2	1h RW	**ADMA2_Support:** 1: ADMA2 mode Supported. 0: ADMA2 mode NOT Supported
1:0	0h RW	**Max_Burst_Length:** Maximum Block Length supported by the Core/Device. 00: 512 (Bytes). 01: 1024. 10: 2048. 11: Reserved

20.1.5 (Cap_byps_reg2)—Offset 818h

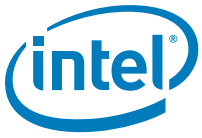
eMMC Capabilities Bypass register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**tuning_count_val:** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0h RW	**tuning_dis:** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0h RW	**driver_type_4:** Driver Type 4 Support 1'b1 - Supported 1'b0 - NOT Supported
18	0h RW	**driver_type_D:** Driver Type D Support 1'b1 - Supported 1'b0 - NOT Supported
17	0h RW	**driver_type_C:** Driver Type C Support 1'b1 - Supported 1'b0 - NOT Supported



Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**driver_type_A:** Driver Type A Support 1'b1 - Supported 1'b0 - NOT Supported
15	0h RO	Reserved.
14	1h RW	**support_8_bit_embedded:** 8-bit Support for Embedded Device 1'b1 - Supported 1'b0 - NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**base_sd_clock:** Base Clock Frequency for SD Clock

20.1.6 (reg_D0i3)—Offset 81Ch

D0i3 Control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RW/1C	**RestoreRequired:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**Interrupt_Request:** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0h RO	**Cmd_In_Progress:** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

20.1.7 (Tx_CMD_dly)—Offset 820h

Front end module Tx Command Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	4h RW	**ddr_mode:** Tx CMD Delay (DDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr_mode:** Tx CMD Delay (SDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved

20.1.8 (Tx_DATA_dly_1)—Offset 824h

Front end module Tx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A18h

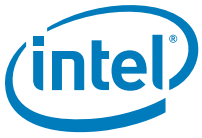
Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**hs400_mode:** Tx Data Delay (HS400 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
7	0h RO	Reserved.
6:0	18h RW	**sdr104_hs200:** Tx Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.1.9 (Tx_DATA_dly_2)—Offset 828h

Front end module Tx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**



Default: 1C1C1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**sdr50_mode:** Tx Data Delay (SDR50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved
23	0h RO	Reserved.
22:16	1Ch RW	**ddr50_mode:** Tx Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.
14:8	1Ch RW	**sdr25_hs50_mode:** Tx Data Delay (SDR25/HS50 Mode)0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12_comp_mode:** Tx Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.1.10 (Rx_CMD_Data_dly_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**sdr50_mode:** Rx CMD + Data Delay (SDR50 Mode). 0 - 79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
23	0h RO	Reserved.
22:16	0h RW	**ddr50_mode:** Rx CMD + Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:8	0h RW	**sdr25_hs50:** Rx CMD + Data Delay (SDR25/HS50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12_comp:** Rx CMD + Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.1.11 (Rx_Strobe_Ctrl_Path)—Offset 830h

Front end module Rx strobe Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**auto_tuning:** Enable Auto Tuning for HS400 Strobe Path 0 - Auto Tuning Disabled 1 - Auto Tuning Enabled
15	0h RO	Reserved.
14:8	0h RW	**hs400_mode1:** Rx Strobe Delay DLL 1(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 0 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**hs400_mode2:** Rx Strobe Delay DLL 2(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 40 - 63 - Reserved

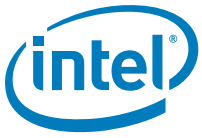
20.1.12 (Rx_CMD_Data_dly_2)—Offset 834h

Front end module Rx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**clk_source:** Clock Source for Rx Path 00 - Rx Clock after Output Buffer 01 - Rx Clock before Output Buffer 10 - Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.
13:8	0h RW	**path_pll:** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39 - Select the required delay, as a multiple of 125pSec.40 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**cmd_data_sdr104_hs200:** Rx CMD + Data Delay (SDR104/ HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved

20.1.13 (Master_Dll)—Offset 838h

Master DLL Software control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**SW_reset_dll:** SW reset for Master DLL 0 - No SW Reset for Master DLL 1 - Force Reset for Master DLL
23	0h RO	**DLL_lock:** Master DLL Lock Indication
22:8	0h RW	**coarse_code:** Set coarse code to DLL. (only valid when Software control is Enabled)
7:4	0h RW	**fine_code:** Set fine code to DLL. (only valid when Software control is Enabled)
3	0h RO/V	**less:** Phase Detection Less Indication
2	0h RO/V	**more:** Phase Detector More Indication
1	0h RW	**Master_DLL_Software_Ctrl:** Master DLL Software Ctrl. 0 - Master DLL Automatic Control (SW Control Disabled). 1 - Master DLL Software Control Enabled

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW	**Ctrl_of_Mst_DLL_Ref_Clk:** Ctrl of Master DLL Ref Clock. 0 - Clock is Disabled. 1 - Clock is Enabled

20.1.14 (Auto_tuning)—Offset 840h

Auto Tuning Value

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto_tuning_val**

20.1.15 (emmc_Root_Space)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**root_space:** Root Space Select Selects the Root Space in which the IP output its upstream accesses 0 - Root Space 0 1 - Root Space 1

20.2 Registers Summary

Table 20-2. Summary of CONVERGE_LAYER Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
804h	807h	(SW_LTR_val)—Offset 804h	800h
808h	80Bh	(Auto_LTR_val)—Offset 808h	800h

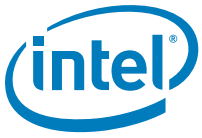


Table 20-2. Summary of CONVERGE_LAYER Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
810h	813h	(Cap_byps)—Offset 810h	0h
814h	817h	(Cap_byps_reg1)—Offset 814h	3041EF3Ch
818h	81Bh	(Cap_byps_reg2)—Offset 818h	40040C8h
81Ch	81Fh	(reg_D0i3)—Offset 81Ch	8h
820h	823h	(Tx_CMD_dly)—Offset 820h	400h
824h	827h	(Tx_DATA_dly_1)—Offset 824h	A18h
828h	82Bh	(Tx_DATA_dly_2)—Offset 828h	1C1C1C00h
82Ch	82Fh	(Rx_CMD_Data_dly_1)—Offset 82Ch	0h
830h	833h	(Rx_Strobe_Ctrl_Path)—Offset 830h	0h
834h	837h	(Rx_CMD_Data_dly_2)—Offset 834h	0h
838h	83Bh	(Master_Dll)—Offset 838h	1h
840h	843h	(Auto_tuning)—Offset 840h	0h
900h	903h	(emmc_Root_Space)—Offset 900h	0h

20.2.1 (SW_LTR_val)—Offset 804h

Sets the Software Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

20.2.2 (Auto_LTR_val)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved_low:** Reserved_low
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

20.2.3 (Cap_byps)—Offset 810h

Capabilities Bypass Control register

Access Method

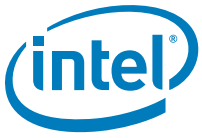
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable_Cap_Bypass:** 8'h5A - Enable Capabilities Bypass. All other - Capabilities Bypass Disable (using default values)

20.2.4 (Cap_byps_reg1)—Offset 814h

eMMC Capabilities Bypass register 1



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3041EF3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400_support:** 1: HS400 Mode Supported. 0: HS400 Mode NOT Supported
28	1h RW	**timeout_clock_unit:** 1'b1 - to Select MHz Clock ,1'b0 - to Select KHz Clock
27:22	1h RW	**timeout_clock_freq:** Timeout clock frequency
21	0h RW	**SPI_mode_support:** SPI Mode Support 1'b1 - SPI Mode Supported ,1'b0 - SPI Mode Not Supported
20:17	0h RW	**timer_count:** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4'b0 disables Re-Tuning Timer
16	1h RW	**tuning_for_SDR50:** Use Tuning for SDR50 1'b1 - Use Tuning 1'b0 - Don't use Tuning
15	1h RW	**ddr50_support:** 1: DDR50 Mode Supported. 0: DDR50 Mode NOT Supported
14	1h RW	**sdr104_support:** 1: SDR104 Mode Supported. 0: SDR104 Mode NOT Supported
13	1h RW	**sdr50_support:** 1: SDR50 Mode Supported. 0: SDR50 Mode NOT Supported
12:11	1h RW	**Slot_Type:** 00 - Removable SD Card Slot. 01 - Embedded Slot for One Device. 10 - Shared Bus Slot. 11 - Reserved
10	1h RW	**Async_Interrupt_Support:** 1: Asynchronous Interrupt Supported. 0: Asynchronous Interrupt NOT Supported
9	1h RW	**Sys_Addr_64bit_Support:** 1 - Core supports 64-bit System Address Bus. 0 - Core supports only 32-bit System Address Bus
8	1h RW	**Voltage_Support_1_8V:** 1: 1.8V Supported. 0: 1.8V NOT Supported
7	0h RW	**Voltage_Support_3V:** 1: 3.0V Supported. 0: 3.0V NOT Supported
6	0h RW	**Voltage_Support_3_3V:** 1: 3.3V Supported. 0: 3.3V NOT Supported
5	1h RW	**Suspend_Resume_Support:** 1: Suspend/Resume Supported. 0: Suspend/Resume NOT Supported
4	1h RW	**SDMA_Support:** 1: SDMA mode Supported. 0: SDMA mode NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
3	1h RW	**High_Speed_Support:** 1: HIGH_SPEED mode Supported. 0: HIGH_SPEED mode NOT Supported
2	1h RW	**ADMA2_Support:** 1: ADMA2 mode Supported. 0: ADMA2 mode NOT Supported
1:0	0h RW	**Max_Burst_Length:** Maximum Block Length supported by the Core/Device. 00: 512 (Bytes). 01: 1024. 10: 2048. 11: Reserved

20.2.5 (Cap_byps_reg2)—Offset 818h

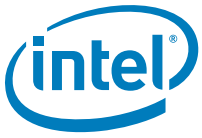
eMMC Capabilities Bypass register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**tuning_count_val:** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0h RW	**tuning_dis:** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0h RW	**driver_type_4:** Driver Type 4 Support 1'b1 - Supported 1'b0 - NOT Supported
18	0h RW	**driver_type_D:** Driver Type D Support 1'b1 - Supported 1'b0 - NOT Supported
17	0h RW	**driver_type_C:** Driver Type C Support 1'b1 - Supported 1'b0 - NOT Supported
16	0h RW	**driver_type_A:** Driver Type A Support 1'b1 - Supported 1'b0 - NOT Supported
15	0h RO	Reserved.
14	1h RW	**support_8_bit_embedded:** 8-bit Support for Embedded Device 1'b1 - Supported 1'b0 - NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**base_sd_clock:** Base Clock Frequency for SD Clock



20.2.6 (reg_D0i3)—Offset 81Ch

D0i3 Control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RW/1C	**RestoreRequired:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**Interrupt_Request:** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0h RO	**Cmd_In_Progress:** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

20.2.7 (Tx_CMD_dly)—Offset 820h

Front end module Tx Command Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	4h RW	**ddr_mode:** Tx CMD Delay (DDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	Reserved.
6:0	0h RW	**sdr_mode:** Tx CMD Delay (SDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved

20.2.8 (Tx_DATA_dly_1)—Offset 824h

Front end module Tx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**hs400_mode:** Tx Data Delay (HS400 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
7	0h RO	Reserved.
6:0	18h RW	**sdr104_hs200:** Tx Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.2.9 (Tx_DATA_dly_2)—Offset 828h

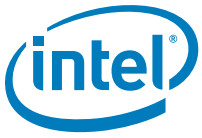
Front end module Tx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1C1C1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**sdr50_mode:** Tx Data Delay (SDR50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved
23	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
22:16	1Ch RW	**ddr50_mode:** Tx Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.
14:8	1Ch RW	**sdr25_hs50_mode:** Tx Data Delay (SDR25/HS50 Mode)0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12_comp_mode:** Tx Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.2.10 (Rx_CMD_Data_dly_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**sdr50_mode:** Rx CMD + Data Delay (SDR50 Mode). 0 - 79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
23	0h RO	Reserved.
22:16	0h RW	**ddr50_mode:** Rx CMD + Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.
14:8	0h RW	**sdr25_hs50:** Rx CMD + Data Delay (SDR25/HS50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12_comp:** Rx CMD + Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.2.11 (Rx_Strobe_Ctrl_Path)—Offset 830h

Front end module Rx strobe Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**auto_tuning:** Enable Auto Tuning for HS400 Strobe Path 0 - Auto Tuning Disabled 1 - Auto Tuning Enabled
15	0h RO	Reserved.
14:8	0h RW	**hs400_mode1:** Rx Strobe Delay DLL 1(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 0 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**hs400_mode2:** Rx Strobe Delay DLL 2(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 40 - 63 - Reserved

20.2.12 (Rx_CMD_Data_dly_2)—Offset 834h

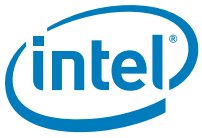
Front end module Rx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**clk_source:** Clock Source for Rx Path 00 - Rx Clock after Output Buffer 01 - Rx Clock before Output Buffer 10 - Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
13:8	0h RW	**path_pll:** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39 - Select the required delay, as a multiple of 125pSec.40 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**cmd_data_sdr104_hs200:** Rx CMD + Data Delay (SDR104/ HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved

20.2.13 (Master_Dll)—Offset 838h

Master DLL Software control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**SW_reset_dll:** SW reset for Master DLL 0 - No SW Reset for Master DLL 1 - Force Reset for Master DLL
23	0h RO	**DLL_lock:** Master DLL Lock Indication
22:8	0h RW	**coarse_code:** Set coarse code to DLL. (only valid when Software control is Enabled)
7:4	0h RW	**fine_code:** Set fine code to DLL. (only valid when Software control is Enabled)
3	0h RO/V	**less:** Phase Detection Less Indication
2	0h RO/V	**more:** Phase Detector More Indication
1	0h RW	**Master_DLL_Software_Ctrl:** Master DLL Software Ctrl. 0 - Master DLL Automatic Control (SW Control Disabled). 1 - Master DLL Software Control Enabled
0	1h RW	**Ctrl_of_Mst_DLL_Ref_Clk:** Ctrl of Master DLL Ref Clock. 0 - Clock is Disabled. 1 - Clock is Enabled

20.2.14 (Auto_tuning)—Offset 840h

Auto Tuning Value

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto_tuning_val**

20.2.15 (emmc_Root_Space)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**root_space:** Root Space Select Selects the Root Space in which the IP output its upstream accesses 0 - Root Space 0 1 - Root Space 1

20.3 Registers Summary

Table 20-3. Summary of CONVERGE_LAYER Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
804h	807h	(SW_LTR_val)—Offset 804h	800h
808h	80Bh	(Auto_LTR_val)—Offset 808h	800h
810h	813h	(Cap_byps)—Offset 810h	0h
814h	817h	(Cap_byps_reg1)—Offset 814h	3041EF3Ch
818h	81Bh	(Cap_byps_reg2)—Offset 818h	40040C8h
81Ch	81Fh	(reg_D0i3)—Offset 81Ch	8h
820h	823h	(Tx_CMD_dly)—Offset 820h	400h
824h	827h	(Tx_DATA_dly_1)—Offset 824h	A18h
828h	82Bh	(Tx_DATA_dly_2)—Offset 828h	1C1C1C00h
82Ch	82Fh	(Rx_CMD_Data_dly_1)—Offset 82Ch	0h
830h	833h	(Rx_Strobe_Ctrl_Path)—Offset 830h	0h

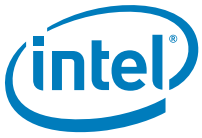


Table 20-3. Summary of CONVERGE_LAYER Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
834h	837h	(Rx_CMD_Data_dly_2)—Offset 834h	0h
838h	83Bh	(Master_Dll)—Offset 838h	1h
840h	843h	(Auto_tuning)—Offset 840h	0h
900h	903h	(emmc_Root_Space)—Offset 900h	0h

20.3.1 (SW_LTR_val)—Offset 804h

Sets the Software Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

20.3.2 (Auto_LTR_val)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirement:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved_low:** Reserved_low
12:10	2h RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value:** 10-bit latency value

20.3.3 (Cap_byps)—Offset 810h

Capabilities Bypass Control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable_Cap_Bypass:** 8'h5A - Enable Capabilities Bypass. All other - Capabilities Bypass Disable (using default values)

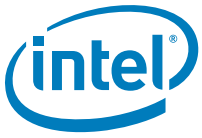
20.3.4 (Cap_byps_reg1)—Offset 814h

eMMC Capabilities Bypass register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 3041EF3Ch



Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400_support:** 1: HS400 Mode Supported. 0: HS400 Mode NOT Supported
28	1h RW	**timeout_clock_unit:** 1'b1 - to Select MHz Clock ,1'b0 - to Select KHz Clock
27:22	1h RW	**timeout_clock_freq:** Timeout clock frequency
21	0h RW	**SPI_mode_support:** SPI Mode Support 1'b1 - SPI Mode Supported ,1'b0 - SPI Mode Not Supported
20:17	0h RW	**timer_count:** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4'b0 disables Re-Tuning Timer
16	1h RW	**tuning_for_SDR50:** Use Tuning for SDR50 1'b1 - Use Tuning 1'b0 - Don't use Tuning
15	1h RW	**ddr50_support:** 1: DDR50 Mode Supported. 0: DDR50 Mode NOT Supported
14	1h RW	**sdr104_support:** 1: SDR104 Mode Supported. 0: SDR104 Mode NOT Supported
13	1h RW	**sdr50_support:** 1: SDR50 Mode Supported. 0: SDR50 Mode NOT Supported
12:11	1h RW	**Slot_Type:** 00 - Removable SD Card Slot. 01 - Embedded Slot for One Device. 10 - Shared Bus Slot. 11 - Reserved
10	1h RW	**Async_Interrupt_Support:** 1: Asynchronous Interrupt Supported. 0: Asynchronous Interrupt NOT Supported
9	1h RW	**Sys_Addr_64bit_Support:** 1 - Core supports 64-bit System Address Bus. 0 - Core supports only 32-bit System Address Bus
8	1h RW	**Voltage_Support_1_8V:** 1: 1.8V Supported. 0: 1.8V NOT Supported
7	0h RW	**Voltage_Support_3V:** 1: 3.0V Supported. 0: 3.0V NOT Supported
6	0h RW	**Voltage_Support_3_3V:** 1: 3.3V Supported. 0: 3.3V NOT Supported
5	1h RW	**Suspend_Resume_Support:** 1: Suspend/Resume Supported. 0: Suspend/Resume NOT Supported
4	1h RW	**SDMA_Support:** 1: SDMA mode Supported. 0: SDMA mode NOT Supported
3	1h RW	**High_Speed_Support:** 1: HIGH_SPEED mode Supported. 0: HIGH_SPEED mode NOT Supported
2	1h RW	**ADMA2_Support:** 1: ADMA2 mode Supported. 0: ADMA2 mode NOT Supported
1:0	0h RW	**Max_Burst_Length:** Maximum Block Length supported by the Core/Device. 00: 512 (Bytes). 01: 1024. 10: 2048. 11: Reserved

20.3.5 (Cap_byps_reg2)—Offset 818h

eMMC Capabilities Bypass register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**tuning_count_val:** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0h RW	**tuning_dis:** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0h RW	**driver_type_4:** Driver Type 4 Support 1'b1 - Supported 1'b0 - NOT Supported
18	0h RW	**driver_type_D:** Driver Type D Support 1'b1 - Supported 1'b0 - NOT Supported
17	0h RW	**driver_type_C:** Driver Type C Support 1'b1 - Supported 1'b0 - NOT Supported
16	0h RW	**driver_type_A:** Driver Type A Support 1'b1 - Supported 1'b0 - NOT Supported
15	0h RO	Reserved.
14	1h RW	**support_8_bit_embedded:** 8-bit Support for Embedded Device 1'b1 - Supported 1'b0 - NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**base_sd_clock:** Base Clock Frequency for SD Clock

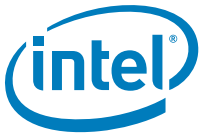
20.3.6 (reg_D0i3)—Offset 81Ch

D0i3 Control register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 8h



Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RW/1C	**RestoreRequired:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**Interrupt_Request:** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0h RO	**Cmd_In_Progress:** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

20.3.7 (Tx_CMD_dly)—Offset 820h

Front end module Tx Command Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	4h RW	**ddr_mode:** Tx CMD Delay (DDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr_mode:** Tx CMD Delay (SDR Mode). 0 - 39 - Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved

20.3.8 (Tx_DATA_dly_1)—Offset 824h

Front end module Tx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: A18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**hs400_mode:** Tx Data Delay (HS400 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
7	0h RO	Reserved.
6:0	18h RW	**sdr104_hs200:** Tx Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.3.9 (Tx_DATA_dly_2)—Offset 828h

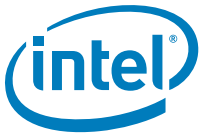
Front end module Tx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1C1C1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**sdr50_mode:** Tx Data Delay (SDR50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved
23	0h RO	Reserved.
22:16	1Ch RW	**ddr50_mode:** Tx Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.
14:8	1Ch RW	**sdr25_hs50_mode:** Tx Data Delay (SDR25/HS50 Mode)0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RW	**sdr12_comp_mode:** Tx Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.3.10 (Rx_CMD_Data_dly_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**sdr50_mode:** Rx CMD + Data Delay (SDR50 Mode). 0 - 79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
23	0h RO	Reserved.
22:16	0h RW	**ddr50_mode:** Rx CMD + Data Delay (DDR50 Mode). 0 - 78 - Select number of active delay elements. Each = 125pSec. 79 - 127 - Reserved
15	0h RO	Reserved.
14:8	0h RW	**sdr25_hs50:** Rx CMD + Data Delay (SDR25/HS50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12_comp:** Rx CMD + Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 - 127 - Reserved

20.3.11 (Rx_Strobe_Ctrl_Path)—Offset 830h

Front end module Rx strobe Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**auto_tuning:** Enable Auto Tuning for HS400 Strobe Path 0 - Auto Tuning Disabled 1 - Auto Tuning Enabled
15	0h RO	Reserved.
14:8	0h RW	**hs400_mode1:** Rx Strobe Delay DLL 1(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 0 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**hs400_mode2:** Rx Strobe Delay DLL 2(HS400 Mode) 0 - 39 - Select number of active delay elements. Each = 125pSec 40 - 63 - Reserved

20.3.12 (Rx_CMD_Data_dly_2)—Offset 834h

Front end module Rx data Path Delay register 2

Access Method

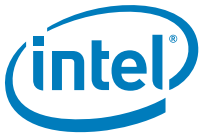
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**clk_source:** Clock Source for Rx Path 00 - Rx Clock after Output Buffer 01 - Rx Clock before Output Buffer 10 - Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.
13:8	0h RW	**path_pll:** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39 - Select the required delay, as a multiple of 125pSec.40 - 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**cmd_data_sdr104_hs200:** Rx CMD + Data Delay (SDR104/ HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 - 127 - Reserved

20.3.13 (Master_Dll)—Offset 838h

Master DLL Software control register



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**SW_reset_dll:** SW reset for Master DLL 0 - No SW Reset for Master DLL 1 - Force Reset for Master DLL
23	0h RO	**DLL_lock:** Master DLL Lock Indication
22:8	0h RW	**coarse_code:** Set coarse code to DLL. (only valid when Software control is Enabled)
7:4	0h RW	**fine_code:** Set fine code to DLL. (only valid when Software control is Enabled)
3	0h RO/V	**less:** Phase Detection Less Indication
2	0h RO/V	**more:** Phase Detector More Indication
1	0h RW	**Master_DLL_Software_Ctrl:** Master DLL Software Ctrl. 0 - Master DLL Automatic Control (SW Control Disabled). 1 - Master DLL Software Control Enabled
0	1h RW	**Ctrl_of_Mst_DLL_Ref_Clk:** Ctrl of Master DLL Ref Clock. 0 - Clock is Disabled. 1 - Clock is Enabled

20.3.14 (Auto_tuning)—Offset 840h

Auto Tuning Value

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto_tuning_val**

20.3.15 (emmc_Root_Space)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**root_space:** Root Space Select Selects the Root Space in which the IP output its upstream accesses 0 - Root Space 0 1 - Root Space 1

20.4 Registers Summary

Table 20-4. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	(DEVVENDID)—Offset 0h	8086h
4h	7h	(STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	(REVCLASSCODE)—Offset 8h	8050100h
Ch	Fh	(CLLATHEADERBIST)—Offset Ch	0h
10h	13h	(BAR)—Offset 10h	4h
14h	17h	(BAR_HIGH)—Offset 14h	0h
18h	1Bh	(BAR1)—Offset 18h	4h
1Ch	1Fh	(BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	(SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	(EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	(CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	(INTERRUPTREG)—Offset 3Ch	0h
80h	83h	(POWERCAPID)—Offset 80h	39001h
84h	87h	(PMECTRLSTATUS)—Offset 84h	8h
90h	93h	(PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	(DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	(D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	8041h
9Ch	9Fh	(DEVICE_IDLE_POINTER_REG)—Offset 9Ch	81C1h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	290800h

20.4.1 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

20.4.2 (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

20.4.3 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 8050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	80501h RO	**CLASS_CODES**
7:0	0h RO	**RID**

20.4.4 (CLLATHEADERBIST)—Offset Ch

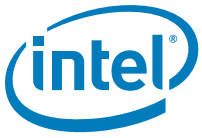
CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**



20.4.5 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

20.4.6 (BAR_HIGH)—Offset 14h

BAR -Base Address Register High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH**

20.4.7 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

20.4.8 (BAR1_HIGH)—Offset 1Ch

BAR1 -Base Address Register1 High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH**

20.4.9 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

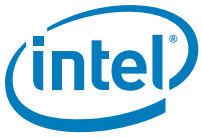
Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

20.4.10 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address



Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

20.4.11 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

20.4.12 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	0h RO	**INTPIN**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**INTLINE**

20.4.13 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 39001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

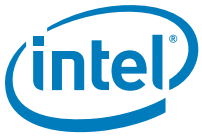
20.4.14 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**



Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

20.4.15 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

20.4.16 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**

Bit Range	Default & Access	Field Name (ID): Description
15:0	10h RO	**VSECID**

20.4.17 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 8041h

Bit Range	Default & Access	Field Name (ID): Description
31:4	804h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**
0	1h RO	**SW_LAT_VALID**

20.4.18 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

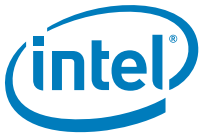
Default: 81C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	81Ch RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

20.4.19 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method



Type: CFG Register (Size: 32 bits)	**Device:** 28 **Function:** 0

Default: 290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	1h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**
16	1h RW	**PMCRE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

20.5 Registers Summary

Table 20-5. Summary of SDHOST_OCP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h	0h
4h	5h	BlockSize Register (blocksize)—Offset 4h	0h
6h	7h	BlockCount Register (blockcount)—Offset 6h	0h
8h	Bh	Argument1 Register (argument1)—Offset 8h	0h
Ch	Dh	TransferMode Register (transfermode)—Offset Ch	0h
Eh	Fh	Command Register (command)—Offset Eh	0h
10h	13h	Response Register (response01)—Offset 10h	0h
14h	15h	Response Register (response2)—Offset 14h	0h
16h	17h	Response Register (response3)—Offset 16h	0h
18h	19h	Response Register (response4)—Offset 18h	0h
1Ah	1Bh	Response Register (response5)—Offset 1Ah	0h
1Ch	1Dh	Response Register (response6)—Offset 1Ch	0h
1Eh	1Fh	Response Register (response7)—Offset 1Eh	0h

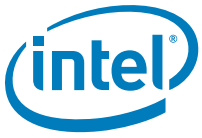
Table 20-5. Summary of SDHOST_OCP Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
20h	23h	Buffer DataPort Register (dataport)—Offset 20h	0h
28h	28h	HostControl1 Register (hostcontrol1)—Offset 28h	0h
29h	29h	PowerControl Register (powercontrol)—Offset 29h	0h
2Ah	2Ah	BlockGapControl Register (blockgapcontrol)—Offset 2Ah	80h
2Bh	2Bh	Wakeup Control Register (wakeupcontrol)—Offset 2Bh	0h
2Ch	2Dh	Clock Control Register (clockcontrol)—Offset 2Ch	0h
2Eh	2Eh	Timeout Control Register (timeoutcontrol)—Offset 2Eh	0h
2Fh	2Fh	Software Reset Register (softwarereset)—Offset 2Fh	0h
30h	31h	Normal Interrupt Status Register (normalintrsts)—Offset 30h	0h
32h	33h	ErrorInterruptStatus_Register (errorintrsts)—Offset 32h	0h
34h	35h	Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h	0h
36h	37h	Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h	0h
38h	39h	Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h	0h
3Ah	3Bh	Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah	0h
3Ch	3Dh	Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch	0h
3Eh	3Fh	Host Control2 Register (hostcontrol2)—Offset 3Eh	0h
40h	47h	Capabilities Register (capabilities)—Offset 40h	0h
48h	4Fh	Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h	0h
50h	51h	Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h	0h
52h	53h	Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h	0h
54h	54h	ADMA Error Status Register (admaerrsts)—Offset 54h	0h
58h	5Bh	ADMA System Address Register0&1 (admasysaddr01)—Offset 58h	0h
5Ch	5Dh	ADMA System Address Register1 (admasysaddr2)—Offset 5Ch	0h
5Eh	5Fh	ADMA System Address Register1 (admasysaddr3)—Offset 5Eh	0h
70h	73h	Boot Timeout Control Register (boottimeoutcnt)—Offset 70h	0h
FCh	FDh	Slot Interrupt Status Register (slotintrsts)—Offset FCh	0h
FEh	FFh	Host Controller Version Register (hostcontrollerver)—Offset FEh	1002h

20.5.1 SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h

This register contains concatinates reg_sdmasysaddrlo and reg_sdmasysaddrhi

Access Method



Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdma_sysaddress (sdma_sysaddress):** refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi

20.5.2 BlockSize Register (blocksize)—Offset 4h

This register is used to configure the number of bytes in a data block

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14:12	0h	**sdma_bufboundary (sdma_bufboundary):** This Field specifies DMA Buffer Boundary
11:0	0h	**xfer_blocksize (xfer_blocksize):** This Field specifies Block Size for Data Transfers

20.5.3 BlockCount Register (blockcount)—Offset 6h

This register is used to configure the number of data blocks

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**xfer_blockcount (xfer_blockcount):** This Register specifies Block Size for Data Transfers

20.5.4 Argument1 Register (argument1)—Offset 8h

This register contains concatinates argument1lo and argument1hi registers to result SD Command Argument

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_argument1 (command_argument1):** refer t oreg_argument1lo and reg_argument1hi.

20.5.5 TransferMode Register (transfermode)—Offset Ch

This register is used to control the operations of data transfers

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h	**xfermode_multiblksel (xfermode_multiblksel):** This bit enables multiple block data transfers.
4	0h	**xfermode_dataxferdir (xfermode_dataxferdir):** This bit defines the direction of data transfers.
3:2	0h	**xfermode_autocmdena (xfermode_autocmdena):** This field determines use of auto command functions.
1	0h	**xfermode_blkcntena (xfermode_blkcntena):** This bit is used to enable the Block count register, which is only relevant for multiple block transfers
0	0h	**xfermode_dmaenable (xfermode_dmaenable):** '1' to enable DMA,

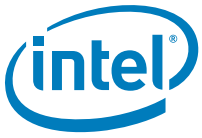
20.5.6 Command Register (command)—Offset Eh

This register is used to program the Command for host controller

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	0h	**command_cmdindex (command_cmdindex):** This bit shall be set to the command number (CMD0-63, ACMD0-63).
7:6	0h	**command_cmdtype (command_cmdtype):** This bit is used for select different command types.
5	0h	**command_datapresent (command_datapresent):** This bit is used to checking whether data present or not.
4	0h	**command_indexchkena (command_indexchkena):** This bit is used to enable/disable Command Index checking.
3	0h	**command_crcchkena (command_crcchkena):** This bit is used to enable/disable CRC checking.
2	0h RO	Reserved.
1:0	0h	**command_responsetype (command_responsetype):** Response Type Select.

20.5.7 Response Register (response01)—Offset 10h

This register is used to store responses from SD Cards (concatinates response0 & response1 registers)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.8 Response Register (response2)—Offset 14h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.9 Response Register (response3)—Offset 16h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.10 Response Register (response4)—Offset 18h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.11 Response Register (response5)—Offset 1Ah

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.12 Response Register (response6)—Offset 1Ch

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.13 Response Register (response7)—Offset 1Eh

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.5.14 Buffer DataPort Register (dataport)—Offset 20h

This register is used to access internal buffer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdhcdmactrl_piobufrddata (sdhcdmactrl_piobufrddata):** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

20.5.15 HostControl1 Register (hostcontrol1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h	**hostctrl1_cdsigselect (hostctrl1_cdsigselect):** This bit selects source for card detection.
6	0h	**hostctrl1_cdtestlevel (hostctrl1_cdtestlevel):** This bit is used for indicating whether card is inserted or not.
5	0h	**hostctrl1_extdatawidth (hostctrl1_extdatawidth):** This bit controls 8-bit bus width mode for embedded device.
4:3	0h	**hostctrl1_dmaselect (hostctrl1_dmaselect):** One of supported DMA modes can be selected.
2	0h	**hostctrl1_highspeedena (hostctrl1_highspeedena):** This bit is used for setting speed mode.
1	0h	**hostctrl1_datawidth (hostctrl1_datawidth):** This bit selects the data width of the HC.
0	0h	**hostctrl1_ledcontrol (hostctrl1_ledcontrol):** This bit is used to caution the user not to remove the card while the SD card is being accessed.

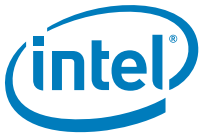
20.5.16 PowerControl Register (powercontrol)—Offset 29h

This register is used to program the SD Bus power and voltage level

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h	**emmc_hwreset (emmc_hwreset):** Hardware reset signal is generated for eMMC card.
3:1	0h	**pwrctrl_sdbusvoltage (pwrctrl_sdbusvoltage):** By setting these bits, the HD selects the voltage level for the SD card.
0	0h	**pwrctrl_sdbuspower (pwrctrl_sdbuspower):** This bit is used detect whether power is on or off.

20.5.17 BlockGapControl Register (blockgapcontrol)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h	**blkgapctrl_bootackena (blkgapctrl_bootackena):** To check for the boot acknowledge in boot operation.
6	0h	**blkgapctrl_altbootmode (blkgapctrl_altbootmode):** To start boot code access in alternative mode.
5	0h	**blkgapctrl_bootenable (blkgapctrl_bootenable):** To start boot code access. '0' To stop boot code access, '1' To start boot code access
4	0h	**blkgapctrl_spimode (blkgapctrl_spimode):** SPI mode enable bit. '0' SD Mode, '1' SPI Mode
3	0h	**blkgapctrl_interrupt (blkgapctrl_interrupt):** This bit is valid only in 4-bit mode of the SD card andselects a sample point in the interrupt cycle.
2	0h	**blkgapctrl_rdwaitctrl (blkgapctrl_rdwaitctrl):** The read wait function is optional for SD cards.
1	0h	**blkgapctrl_continue (blkgapctrl_continue):** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request.
0	0h	**blkgapctrl_stopatblkgap (blkgapctrl_stopatblkgap):** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers.

20.5.18 Wakeup Control Register (wakeupcontrol)—Offset 2Bh

This register is used to program the wakeup functionality

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**wkupctrl_cardremoval (wkupctrl_cardremoval):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
1	0h	**wkupctrl_cardinsertion (wkupctrl_cardinsertion):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
0	0h	**wkupctrl_cardinterrupt (wkupctrl_cardinterrupt):** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register.

20.5.19 Clock Control Register (clockcontrol)—Offset 2Ch

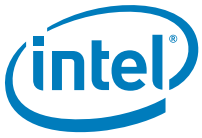
This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h	**clkctrl_sdclkfreqsel (clkctrl_sdclkfreqsel):** This register is used to select the frequency of the SDCLK pin.
7:6	0h	**clkctrl_sdclkfreqsel_upperbits (clkctrl_sdclkfreqsel_upperbits):** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select
5	0h	**clkctrl_clkgensel (clkctrl_clkgensel):** This bit is used to select the clock generator mode in SDCLK Frequency Select.
4:3	0h RO	Reserved.
2	0h	**clkctrl_sdclkena (clkctrl_sdclkena):** This bit enables/disables SD Clock. '0' Disable, '1' Enable



Bit Range	Default & Access	Field Name (ID): Description
1	0h	**sdhcclkgen_intclkstable_dsync (sdhcclkgen_intclkstable_dsync):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1.
0	0h	**clkctrl_intclkena (clkctrl_intclkena):** This bit enables setting of internal clock.'0' Stop, '1' Oscillate

20.5.20 Timeout Control Register (timeoutcontrol)—Offset 2Eh

The register sets the Data Timeout counter value

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h	**timeout_ctrvalue (timeout_ctrvalue):** This value determines the interval by which DAT line time-outs are detected.

20.5.21 Software Reset Register (softwarereset)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**swreset_for_dat (swreset_for_dat):** Only part of data circuit is reset. '0' Work, '1' Reset
1	0h	**swreset_for_cmd (swreset_for_cmd):** Only part of command circuit is reset.'0' Work, '1' reset.
0	0h	**swreset_for_all (swreset_for_all):** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD.

20.5.22 Normal Interrupt Status Register (normalintrsts)—Offset 30h

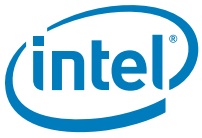
This register gives the status of all the interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**reg_errorintrsts (reg_errorintrsts):** This bit is set If any of the bits in the Error Interrupt Status Register are set.
14	0h	**normalintrsts_bootcomplete (normalintrsts_bootcomplete):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_rcvbootack (normalintrsts_rcvbootack):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_retuningevent (normalintrsts_retuningevent):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h	**normalintrsts_intc (normalintrsts_intc):** This status is set if INT_C is enabled and INT_C# pin is in low level. It is cleared by resetting the INT_C interrupt factor.
10	0h	**normalintrsts_intb (normalintrsts_intb):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h	**normalintrsts_inta (normalintrsts_inta):** This status is set if INT_A is enabled and INT_A# pin is in low level. It is cleared by resetting
8	0h	**normalintrsts_cardintsts (normalintrsts_cardintsts):** This status is set to generate Card Interrupt. '0' No Card Interrupt, '1' Generate Card Interrupt
7	0h	**normalintrsts_cardremsts (normalintrsts_cardremsts):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h	**normalintrsts_cardinssts (normalintrsts_cardinssts):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_bufrdready (normalintrsts_bufrdready):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_bufwrready (normalintrsts_bufwrready):** This status is set if the Buffer Write Enable changes from 0 to 1.



Bit Range	Default & Access	Field Name (ID): Description
3	0h	**normalintrsts_dmainterrupt (normalintrsts_dmainterrupt):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_blkgapevent (normalintrsts_blkgapevent):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h	**normalintrsts_xfercomplete (normalintrsts_xfercomplete):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_cmdcomplete (normalintrsts_cmdcomplete):** This bit is set when we get the end bit of the command response.

20.5.23 ErrorInterruptStatus_Register (errorintrsts)—Offset 32h

This register gives the status of the error interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_hosterror (errorintrsts_hosterror):** Occurs when detecting Host ERROR
11:10	0h RO	Reserved.
9	0h	**errorintrsts_admaerror (errorintrsts_admaerror):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h	**errorintrsts_autocmderror (errorintrsts_autocmderror):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_currlimiterror (errorintrsts_currlimiterror):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_dataendbiterror (errorintrsts_dataendbiterror):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.

Bit Range	Default & Access	Field Name (ID): Description
5	0h	**errorintrsts_datacrcerror (errorintrsts_datacrcerror):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h	**errorintrsts_datatimeouterror (errorintrsts_datatimeouterror):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_cmdindexerror (errorintrsts_cmdindexerror):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_cmdendbiterror (errorintrsts_cmdendbiterror):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_cmdcrcerror (errorintrsts_cmdcrcerror):** This bit is set when Command CRC Error is generated. '0' No Error, '1' CRC Error
0	0h	**errorintrsts_cmdtimeouterror (errorintrsts_cmdtimeouterror):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

20.5.24 Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h

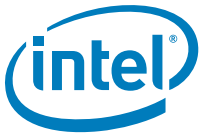
This register is used to enable the normal interrupt status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HC shall control error Interrupts using the Error Interrupt Status Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.



Bit Range	Default & Access	Field Name (ID): Description
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** This bit is set when we get the end bit of the command response.

20.5.25 Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h

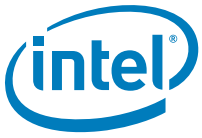
This register is used to enable the Error Interrupt Status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_enableregbit12 (errorintrsts_enableregbit12):** Occurs when detecting ERROR in m_hresp(dma transaction)
11	0h RO	Reserved.
10	0h	**errorintrsts_enableregbit10 (errorintrsts_enableregbit10):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h	**errorintrsts_enableregbit9 (errorintrsts_enableregbit9):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h	**errorintrsts_enableregbit8 (errorintrsts_enableregbit8):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_enableregbit7 (errorintrsts_enableregbit7):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_enableregbit6 (errorintrsts_enableregbit6):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h	**errorintrsts_enableregbit5 (errorintrsts_enableregbit5):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h	**errorintrsts_enableregbit4 (errorintrsts_enableregbit4):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_enableregbit3 (errorintrsts_enableregbit3):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_enableregbit2 (errorintrsts_enableregbit2):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_enableregbit1 (errorintrsts_enableregbit1):** This bit is set when Command CRC Error is generated.
0	0h	**errorintrsts_enableregbit0 (errorintrsts_enableregbit0):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.



20.5.26 Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h

This register is used to enable the Normal Interrupt Signal register

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HD shall control error Interrupts using the Error Interrupt Signal Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** Boot Terminate Interrupt Signal Enable
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** Boot ack rcv Signal Enable
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** Re-Tuning Event Signal Enable
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** INT_C Signal Enable
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** INT_B Signal Enable
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** INT_A Signal Enable
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** Card Interrupt Signal Enable
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** Card Removal Signal Enable
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** Card Insertion Signal Enable
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** Buffer Read Ready Signal Enable
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** Buffer Write Ready Signal Enable
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** DMA Interrupt Signal Enable
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** Block Gap Event Signal Enable

Bit Range	Default & Access	Field Name (ID): Description
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** Transfer Complete Signal Enable
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** Command Complete Signal Enable

20.5.27 Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah

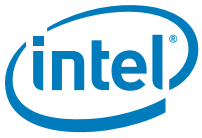
This register is used to enable Error Interrupt Signal register

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsig_enableregbit12 (errorintrsig_enableregbit12):** Target Response Error Signal Enable
11	0h RO	Reserved.
10	0h	**errorintrsig_enableregbit10 (errorintrsig_enableregbit10):** Tuning Error Signal Enable
9	0h	**errorintrsig_enableregbit9 (errorintrsig_enableregbit9):** ADMA Error Signal Enable
8	0h	**errorintrsig_enableregbit8 (errorintrsig_enableregbit8):** Auto CMD Error Signal Enable
7	0h	**errorintrsig_enableregbit7 (errorintrsig_enableregbit7):** Current Limit Error Signal Enable
6	0h	**errorintrsig_enableregbit6 (errorintrsig_enableregbit6):** Data End Bit Error Signal Enable
5	0h	**errorintrsig_enableregbit5 (errorintrsig_enableregbit5):** Data CRC Error Signal Enable
4	0h	**errorintrsig_enableregbit4 (errorintrsig_enableregbit4):** Data Timeout Error Signal Enable
3	0h	**errorintrsig_enableregbit3 (errorintrsig_enableregbit3):** Command Index Error Signal Enable
2	0h	**errorintrsig_enableregbit2 (errorintrsig_enableregbit2):** Command End Bit Error Signal Enable



Bit Range	Default & Access	Field Name (ID): Description
1	0h	**errorintrsig_enableregbit1 (errorintrsig_enableregbit1):** Command CRC Error Signal Enable
0	0h	**errorintrsig_enableregbit0 (errorintrsig_enableregbit0):** Command Timeout Error Signal Enable

20.5.28 Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**autocmderrsts_nexterror (autocmderrsts_nexterror):** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23
6:5	0h RO	Reserved.
4	0h	**autocmderrsts_indexerror (autocmderrsts_indexerror):** Occurs if the Command Index error occurs in response to a command.
3	0h	**autocmderrsts_endbiterror (autocmderrsts_endbiterror):** Occurs when detecting that the end bit of command response is 0.
2	0h	**autocmderrsts_crcerror (autocmderrsts_crcerror):** Occurs when detecting a CRC error in the command response.
1	0h	**autocmderrsts_timeouterror (autocmderrsts_timeouterror):** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command.
0	0h	**autocmderrsts_notexecerror (autocmderrsts_notexecerror):** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error.

20.5.29 Host Control2 Register (hostcontrol2)—Offset 3Eh

This register is used to program UHS Select Mode,UHS Select Mode,Driver Strength Select,Execute Tuning,Sampling Clock Select,Asynchronous Interrupt Enable and Preset value enable

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

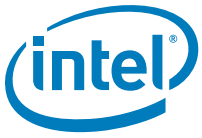
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**hostctrl2_presetvalueenable (hostctrl2_presetvalueenable):** This bit enables the functions defined in the Preset Value registers.
14	0h	**hostctrl2_asynchintrenable (hostctrl2_asynchintrenable):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register.
13:10	0h RO	Reserved.
9	0h	**hostctrl2_driverstrength_bit2 (hostctrl2_driverstrength_bit2):** This is the programmed Drive STrength output and Bit[2] of the sdhccore_drivestrength value.
8	0h RO	Reserved.
7	0h	**hostctrl2_samplingclkselect (hostctrl2_samplingclkselect):** This bit is set by tuning procedure when Execute Tuning is cleared.
6	0h	**hostctrl2_executetuning (hostctrl2_executetuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed.
5:4	0h	**hostctrl2_driverstrength (hostctrl2_driverstrength):** Host Controller output driver in 1.8V signaling is selected by this bit.
3	0h	**hostctrl2_1p8vsignallingena (hostctrl2_1p8vsignallingena):** This bit controls voltage regulator for I/O cell.
2:0	0h	**hostctrl2_uhsmodeselect (hostctrl2_uhsmodeselect):** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1.

20.5.30 Capabilities Register (capabilities)—Offset 40h

This register provides the host driver with information specific to the host controller implementation

Access Method



Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

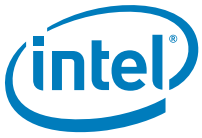
Bit Range	Default & Access	Field Name (ID): Description
63	0h	**corecfg_hs400support (corecfg_hs400support):** This field indicates whether HS400 is supported or not.
62:58	0h RO	Reserved.
57	0h	**corecfg_spiblkmode (corecfg_spiblkmode):** This field indicates whether SPI Block Mode is supported or not.
56	0h	**corecfg_spisupport (corecfg_spisupport):** This field indicates whether SPI Mode is supported or not.
55:48	0h	**corecfg_clockmultiplier (corecfg_clockmultiplier):** This field indicates clock multiplier value of programmable clock generator.
47:46	0h	**corecfg_retuningmodes (corecfg_retuningmodes):** This field defines the re-tuning capability of a Host Controller.
45	0h	**corecfg_tuningforsdr50 (corecfg_tuningforsdr50):** If this bit is set to 1, this Host Controller requires tuning to operate SDR50.
44	0h RO	Reserved.
43:40	0h	**corecfg_retuningtimercnt (corecfg_retuningtimercnt):** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3.
39	0h	**corecfg_type4support (corecfg_type4support):** This bit indicates support of Type 4 Driver.
38	0h	**corecfg_ddriversupport (corecfg_ddriversupport):** This bit indicates support of Driver Type D for 1.8 Signaling.
37	0h	**corecfg_cdriversupport (corecfg_cdriversupport):** This bit indicates support of Driver Type C for 1.8 Signaling.
36	0h	**corecfg_adriversupport (corecfg_adriversupport):** This bit indicates support of Driver Type A for 1.8 Signaling.
35	0h RO	Reserved.
34	0h	**corecfg_ddr50support (corecfg_ddr50support):** This bit indicates whether DDR50 is supported.
33	0h	**corecfg_sdr104support (corecfg_sdr104support):** This bit indicates whether SDR104 is supported.SDR104 requires tuning.
32	0h	**corecfg_sdr50support (corecfg_sdr50support):** This bit indicates whether SDR50 is supported.
31:30	0h	**corecfg_slottype (corecfg_slottype):** This field indicates usage of a slot by a specific Host System
29	0h	**corecfg_asynchintrsupport (corecfg_asynchintrsupport):** Asynchronous Interrupt Support

Bit Range	Default & Access	Field Name (ID): Description
28	0h	**corecfg_64bitsupport (corecfg_64bitsupport):** This bit indicates whether the HC supports 64bit System Bus
27	0h RO	Reserved.
26	0h	**corecfg_1p8voltsupport (corecfg_1p8voltsupport):** This bit indicates whether the HC supports 1.8V.
25	0h	**corecfg_3p0voltsupport (corecfg_3p0voltsupport):** This bit indicates whether the HC supports 3.0V.
24	0h	**corecfg_3p3voltsupport (corecfg_3p3voltsupport):** This bit indicates whether the HC supports 3.3V.
23	0h	**corecfg_suspressupport (corecfg_suspressupport):** This bit indicates whether the HC supports Suspend/Resume functionality.
22	0h	**corecfg_sdmasupport (corecfg_sdmasupport):** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly.
21	0h	**corecfg_highspeedsupport (corecfg_highspeedsupport):** This bit indicates whether the HC and the Host System support High Speed mode.
20	0h RO	Reserved.
19	0h	**corecfg_adma2support (corecfg_adma2support):** '0'ADMA2 Not Supported
18	0h	**corecfg_8bitsupport (corecfg_8bitsupport):** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode.
17:16	0h	**corecfg_maxblklength (corecfg_maxblklength):** This value indicates the maximum block size that the HD can read and write to the buffer in the HC.
15:8	0h	**corecfg_baseclkfreq (corecfg_baseclkfreq):** 6-bit Base Clock Frequency
7	0h	**corecfg_timeoutclkunit (corecfg_timeoutclkunit):** This bit shows the unit of base clock frequency used to detect Data Timeout Error.
6	0h RO	Reserved.
5:0	0h	**corecfg_timeoutclkfreq (corecfg_timeoutclkfreq):** This bit shows the base clock frequency used to detect Data Timeout Error.

20.5.31 Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h

This register indicates maximum current capability for each voltage

Access Method



Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0h RO	Reserved.
23:16	0h	**corecfg_maxcurrent1p8v (corecfg_maxcurrent1p8v):** Maximum Current for 1.8V
15:8	0h	**corecfg_maxcurrent3p0v (corecfg_maxcurrent3p0v):** Maximum Current for 3.0V
7:0	0h	**corecfg_maxcurrent3p3v (corecfg_maxcurrent3p3v):** Maximum Current for 3.3V

20.5.32 Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**forcecmdnotissuedbyautocmd12err (forcecmdnotissuedbyautocmd12err):** Force Event for Command Not Issued by AUTO CMD12 Error
6:5	0h RO	Reserved.
4	0h	**forceautocmdindexerr (forceautocmdindexerr):** Force Event for AUTO CMD Index Error
3	0h	**forceautocmdendbiterr (forceautocmdendbiterr):** Force Event for AUTO CMD End Bit Error
2	0h	**forceautocmdcrcerr (forceautocmdcrcerr):** Force Event for AUTO CMD Timeout Error
1	0h	**forceautocmdtimeouterr (forceautocmdtimeouterr):** Force Event for AUTO CMD Timeout Error
0	0h	**forceautocmdnotexec (forceautocmdnotexec):** Force Event for AUTO CMD12 Not Executed

20.5.33 Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

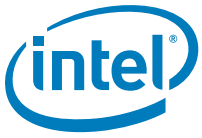
Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h	**forcetuningerr (forcetuningerr):** Force Event for Tuning Error
9	0h	**forceadmaerr (forceadmaerr):** Force Event for ADMA Error'0' no interrupt, '1' interrupt generated
8	0h	**forceautocmderr (forceautocmderr):** Force Event for Auto CMD Error '0' no interrupt, '1' interrupt generated
7	0h	**forcecurrlimerr (forcecurrlimerr):** Force Event for Current Limit Error '0' no interrupt, '1' interrupt generated
6	0h	**forcedatendbiterr (forcedatendbiterr):** Force Event for Data End Bit Error. '0' no interrupt, '1' interrupt generated
5	0h	**forcedatcrcerr (forcedatcrcerr):** Force Event for Data CRC Error
4	0h	**forcedattimeouterr (forcedattimeouterr):** Force Event for Data Timeout Error '0' no interrupt, '1' interrupt generated
3	0h	**forcecmdindexerr (forcecmdindexerr):** Force Event for Command Index Error
2	0h	**forcecmdendbiterr (forcecmdendbiterr):** Force Event for Command End Bit Error '0' no interrupt, '1' interrupt generated
1	0h	**forcecmdcrcerr (forcecmdcrcerr):** Force Event for Command CRC Error
0	0h	**forcecmdtimeouterr (forcecmdtimeouterr):** Force Event for CMD Timeout Error '0' No interrupt, '1' interrupt generated

20.5.34 ADMA Error Status Register (admaerrsts)—Offset 54h

When the ADMA Error interrupt occur, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**admaerrsts_admalenmismatcherr (admaerrsts_admalenmismatcherr):** ADMA Length Mismatch Error
1:0	0h	**admaerrsts_admaerrorstate (admaerrsts_admaerrorstate):** This field indicates the state of ADMA when error is occurred during ADMA data transfer.

20.5.35 ADMA System Address Register0&1 (admasysaddr01)—Offset 58h

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**adma_sysaddress0 (adma_sysaddress0):** This register holds byte address of executing command of the Descriptor table.

20.5.36 ADMA System Address Register1 (admasysaddr2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress2 (adma_sysaddress2):** This register holds byte address of executing command of the Descriptor table.

20.5.37 ADMA System Address Register1 (admasysaddr3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress3 (adma_sysaddress3):** This register holds byte address of executing command of the Descriptor table.

20.5.38 Boot Timeout Control Register (boottimeoutcnt)—Offset 70h

This is used to program the boot timeout value counter

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**boot_timeoutcnt (boot_timeoutcnt):** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card.

20.5.39 Slot Interrupt Status Register (slotintrsts)—Offset FCh

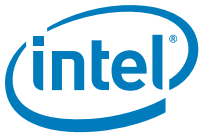
This register is used to read the interrupt signal for each slot.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
7:0	0h	**sdhchostif_slotintrsts (sdhchostif_slotintrsts):** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot.

20.5.40 Host Controller Version Register (hostcontrollerver)—Offset FEh

This register is used to read the vendor version number and specification version number

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1002h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h	**SDHC_VENVERNUM (SDHC_VENVERNUM):** This status is reserved for the vendor version number.
7:0	2h	**SpecificationVersionNumber (SpecificationVersionNumber):** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.

20.6 Registers Summary

Table 20-6. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	(DEVVENDID)—Offset 0h	8086h
4h	7h	(STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	(REVCLASSCODE)—Offset 8h	8050100h
Ch	Fh	(CLLATHEADERBIST)—Offset Ch	0h
10h	13h	(BAR)—Offset 10h	4h
14h	17h	(BAR_HIGH)—Offset 14h	0h
18h	1Bh	(BAR1)—Offset 18h	4h
1Ch	1Fh	(BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	(SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	(EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	(CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	(INTERRUPTREG)—Offset 3Ch	0h
80h	83h	(POWERCAPID)—Offset 80h	39001h
84h	87h	(PMECTRLSTATUS)—Offset 84h	8h

Table 20-6. Summary of soc_regs_wrapper Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
90h	93h	(PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	(DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	(D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	8041h
9Ch	9Fh	(DEVICE_IDLE_POINTER_REG)—Offset 9Ch	81C1h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	290800h

20.6.1 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

20.6.2 (STATUSCOMMAND)—Offset 4h

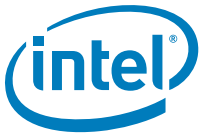
STATUSCOMMAND- Status and Command

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**



Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

20.6.3 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 8050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	80501h RO	**CLASS_CODES**
7:0	0h RO	**RID**

20.6.4 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

20.6.5 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

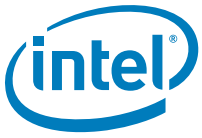
20.6.6 (BAR_HIGH)—Offset 14h

BAR -Base Address Register High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH**

20.6.7 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

20.6.8 (BAR1_HIGH)—Offset 1Ch

BAR1 -Base Address Register1 High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH**

20.6.9 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

20.6.10 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

20.6.11 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

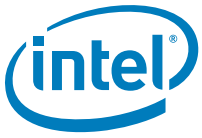
Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

20.6.12 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method



Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	0h RO	**INTPIN**
7:0	0h RW	**INTLINE**

20.6.13 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 39001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

20.6.14 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

20.6.15 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

20.6.16 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

20.6.17 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 8041h

Bit Range	Default & Access	Field Name (ID): Description
31:4	804h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**
0	1h RO	**SW_LAT_VALID**

20.6.18 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 81C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	81Ch RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

20.6.19 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 30 **Function:** 0

Default: 290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	1h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**
16	1h RW	**PMCRE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

20.7 Registers Summary

Table 20-7. Summary of SDHOST_OCP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h	0h
4h	5h	BlockSize Register (blocksize)—Offset 4h	0h
6h	7h	BlockCount Register (blockcount)—Offset 6h	0h
8h	Bh	Argument1 Register (argument1)—Offset 8h	0h
Ch	Dh	TransferMode Register (transfermode)—Offset Ch	0h
Eh	Fh	Command Register (command)—Offset Eh	0h
10h	13h	Response Register (response01)—Offset 10h	0h
14h	15h	Response Register (response2)—Offset 14h	0h
16h	17h	Response Register (response3)—Offset 16h	0h

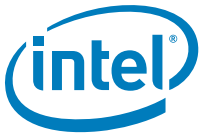


Table 20-7. Summary of SDHOST_OCP Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
18h	19h	Response Register (response4)—Offset 18h	0h
1Ah	1Bh	Response Register (response5)—Offset 1Ah	0h
1Ch	1Dh	Response Register (response6)—Offset 1Ch	0h
1Eh	1Fh	Response Register (response7)—Offset 1Eh	0h
20h	23h	Buffer DataPort Register (dataport)—Offset 20h	0h
28h	28h	HostControl1 Register (hostcontrol1)—Offset 28h	0h
29h	29h	PowerControl Register (powercontrol)—Offset 29h	0h
2Ah	2Ah	BlockGapControl Register (blockgapcontrol)—Offset 2Ah	80h
2Bh	2Bh	Wakeup Control Register (wakeupcontrol)—Offset 2Bh	0h
2Ch	2Dh	Clock Control Register (clockcontrol)—Offset 2Ch	0h
2Eh	2Eh	Timeout Control Register (timeoutcontrol)—Offset 2Eh	0h
2Fh	2Fh	Software Reset Register (softwarereset)—Offset 2Fh	0h
30h	31h	Normal Interrupt Status Register (normalintrsts)—Offset 30h	0h
32h	33h	ErrorInterruptStatus_Register (errorintrsts)—Offset 32h	0h
34h	35h	Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h	0h
36h	37h	Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h	0h
38h	39h	Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h	0h
3Ah	3Bh	Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah	0h
3Ch	3Dh	Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch	0h
3Eh	3Fh	Host Control2 Register (hostcontrol2)—Offset 3Eh	0h
40h	47h	Capabilities Register (capabilities)—Offset 40h	0h
48h	4Fh	Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h	0h
50h	51h	Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h	0h
52h	53h	Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h	0h
54h	54h	ADMA Error Status Register (admaerrsts)—Offset 54h	0h
58h	5Bh	ADMA System Address Register0&1 (admasysaddr01)—Offset 58h	0h
5Ch	5Dh	ADMA System Address Register1 (admasysaddr2)—Offset 5Ch	0h
5Eh	5Fh	ADMA System Address Register1 (admasysaddr3)—Offset 5Eh	0h
70h	73h	Boot Timeout Control Register (boottimeoutcnt)—Offset 70h	0h
FCh	FDh	Slot Interrupt Status Register (slotintrsts)—Offset FCh	0h
FEh	FFh	Host Controller Version Register (hostcontrollerver)—Offset FEh	1002h

20.7.1 SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h

This register contains concatinates reg_sdmasysaddrlo and reg_sdmasysaddrhi

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdma_sysaddress (sdma_sysaddress):** refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi

20.7.2 BlockSize Register (blocksize)—Offset 4h

This register is used to configure the number of bytes in a data block

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14:12	0h	**sdma_bufboundary (sdma_bufboundary):** This Field specifies DMA Buffer Boundary
11:0	0h	**xfer_blocksize (xfer_blocksize):** This Field specifies Block Size for Data Transfers

20.7.3 BlockCount Register (blockcount)—Offset 6h

This register is used to configure the number of data blocks

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**xfer_blockcount (xfer_blockcount):** This Register specifies Block Size for Data Transfers

20.7.4 Argument1 Register (argument1)—Offset 8h

This register contains concatinates argument1lo and argument1hi registers to result SD Command Argument

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_argument1 (command_argument1):** refer t oreg_argument1lo and reg_argument1hi.

20.7.5 TransferMode Register (transfermode)—Offset Ch

This register is used to control the operations of data transfers

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h	**xfermode_multiblksel (xfermode_multiblksel):** This bit enables multiple block data transfers.
4	0h	**xfermode_dataxferdir (xfermode_dataxferdir):** This bit defines the direction of data transfers.
3:2	0h	**xfermode_autocmdena (xfermode_autocmdena):** This field determines use of auto command functions.
1	0h	**xfermode_blkcntena (xfermode_blkcntena):** This bit is used to enable the Block count register, which is only relevant for multiple block transfers
0	0h	**xfermode_dmaenable (xfermode_dmaenable):** '1' to enable DMA,

20.7.6 Command Register (command)—Offset Eh

This register is used to program the Command for host controller

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	0h	**command_cmdindex (command_cmdindex):** This bit shall be set to the command number (CMD0-63, ACMD0-63).
7:6	0h	**command_cmdtype (command_cmdtype):** This bit is used for select different command types.
5	0h	**command_datapresent (command_datapresent):** This bit is used to checking whether data present or not.
4	0h	**command_indexchkena (command_indexchkena):** This bit is used to enable/disable Command Index checking.
3	0h	**command_crcchkena (command_crcchkena):** This bit is used to enable/disable CRC checking.
2	0h RO	Reserved.
1:0	0h	**command_responsetype (command_responsetype):** Response Type Select.

20.7.7 Response Register (response01)—Offset 10h

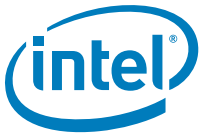
This register is used to store responses from SD Cards (concatinates response0 & response1 registers)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit



20.7.8 Response Register (response2)—Offset 14h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.7.9 Response Register (response3)—Offset 16h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.7.10 Response Register (response4)—Offset 18h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.7.11 Response Register (response5)—Offset 1Ah

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.7.12 Response Register (response6)—Offset 1Ch

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.7.13 Response Register (response7)—Offset 1Eh

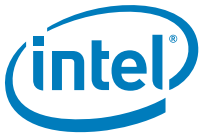
This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit



20.7.14 Buffer DataPort Register (dataport)—Offset 20h

This register is used to access internal buffer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdhcdmactrl_piobufrddata (sdhcdmactrl_piobufrddata):** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

20.7.15 HostControl1 Register (hostcontrol1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h	**hostctrl1_cdsigselect (hostctrl1_cdsigselect):** This bit selects source for card detection.
6	0h	**hostctrl1_cdtestlevel (hostctrl1_cdtestlevel):** This bit is used for indicating whether card is inserted or not.
5	0h	**hostctrl1_extdatawidth (hostctrl1_extdatawidth):** This bit controls 8-bit bus width mode for embedded device.
4:3	0h	**hostctrl1_dmaselect (hostctrl1_dmaselect):** One of supported DMA modes can be selected.
2	0h	**hostctrl1_highspeedena (hostctrl1_highspeedena):** This bit is used for setting speed mode.
1	0h	**hostctrl1_datawidth (hostctrl1_datawidth):** This bit selects the data width of the HC.
0	0h	**hostctrl1_ledcontrol (hostctrl1_ledcontrol):** This bit is used to caution the user not to remove the card while the SD card is being accessed.

20.7.16 PowerControl Register (powercontrol)—Offset 29h

This register is used to program the SD Bus power and voltage level

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h	**emmc_hwreset (emmc_hwreset):** Hardware reset signal is generated for eMMC card.
3:1	0h	**pwrctrl_sdbusvoltage (pwrctrl_sdbusvoltage):** By setting these bits, the HD selects the voltage level for the SD card.
0	0h	**pwrctrl_sdbuspower (pwrctrl_sdbuspower):** This bit is used detect whether power is on or off.

20.7.17 BlockGapControl Register (blockgapcontrol)—Offset 2Ah

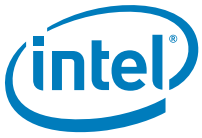
This register is used to program the block gap request, read wait control and interrupt at block gap

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h	**blkgapctrl_bootackena (blkgapctrl_bootackena):** To check for the boot acknowledge in boot operation.
6	0h	**blkgapctrl_altbootmode (blkgapctrl_altbootmode):** To start boot code access in alternative mode.
5	0h	**blkgapctrl_bootenable (blkgapctrl_bootenable):** To start boot code access. '0' To stop boot code access, '1' To start boot code access
4	0h	**blkgapctrl_spimode (blkgapctrl_spimode):** SPI mode enable bit. '0' SD Mode, '1' SPI Mode
3	0h	**blkgapctrl_interrupt (blkgapctrl_interrupt):** This bit is valid only in 4-bit mode of the SD card andselects a sample point in the interrupt cycle.
2	0h	**blkgapctrl_rdwaitctrl (blkgapctrl_rdwaitctrl):** The read wait function is optional for SD cards.



Bit Range	Default & Access	Field Name (ID): Description
1	0h	**blkgapctrl_continue (blkgapctrl_continue):** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request.
0	0h	**blkgapctrl_stopatblkgap (blkgapctrl_stopatblkgap):** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers.

20.7.18 Wakeup Control Register (wakeupcontrol)—Offset 2Bh

This register is used to program the wakeup functionality

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**wkupctrl_cardremoval (wkupctrl_cardremoval):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
1	0h	**wkupctrl_cardinsertion (wkupctrl_cardinsertion):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
0	0h	**wkupctrl_cardinterrupt (wkupctrl_cardinterrupt):** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register.

20.7.19 Clock Control Register (clockcontrol)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h	**clkctrl_sdclkfreqsel (clkctrl_sdclkfreqsel):** This register is used to select the frequency of the SDCLK pin.

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h	**clkctrl_sdclkfreqsel_upperbits (clkctrl_sdclkfreqsel_upperbits):** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select
5	0h	**clkctrl_clkgensel (clkctrl_clkgensel):** This bit is used to select the clock generator mode in SDCLK Frequency Select.
4:3	0h RO	Reserved.
2	0h	**clkctrl_sdclkena (clkctrl_sdclkena):** This bit enables/disables SD Clock. '0' Disable, '1' Enable
1	0h	**sdhcclkgen_intclkstable_dsync (sdhcclkgen_intclkstable_dsync):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1.
0	0h	**clkctrl_intclkena (clkctrl_intclkena):** This bit enables setting of internal clock.'0' Stop, '1' Oscillate

20.7.20 Timeout Control Register (timeoutcontrol)—Offset 2Eh

The register sets the Data Timeout counter value

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h	**timeout_ctrvalue (timeout_ctrvalue):** This value determines the interval by which DAT line time-outs are detected.

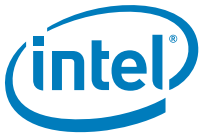
20.7.21 Software Reset Register (softwarereset)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h



Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**swreset_for_dat (swreset_for_dat):** Only part of data circuit is reset. '0' Work, '1' Reset
1	0h	**swreset_for_cmd (swreset_for_cmd):** Only part of command circuit is reset.'0' Work, '1' reset.
0	0h	**swreset_for_all (swreset_for_all):** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD.

20.7.22 Normal Interrupt Status Register (normalintrsts)—Offset 30h

This register gives the status of all the interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**reg_errorintrsts (reg_errorintrsts):** This bit is set If any of the bits in the Error Interrupt Status Register are set.
14	0h	**normalintrsts_bootcomplete (normalintrsts_bootcomplete):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_rcvbootack (normalintrsts_rcvbootack):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_retuningevent (normalintrsts_retuningevent):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h	**normalintrsts_intc (normalintrsts_intc):** This status is set if INT_C is enabled and INT_C# pin is in low level. It is cleared by resetting the INT_C interrupt factor.
10	0h	**normalintrsts_intb (normalintrsts_intb):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h	**normalintrsts_inta (normalintrsts_inta):** This status is set if INT_A is enabled and INT_A# pin is in low level. It is cleared by resetting
8	0h	**normalintrsts_cardintsts (normalintrsts_cardintsts):** This status is set to generate Card Interrupt. '0' No Card Interrupt, '1' Generate Card Interrupt

Bit Range	Default & Access	Field Name (ID): Description
7	0h	**normalintrsts_cardremsts (normalintrsts_cardremsts):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h	**normalintrsts_cardinssts (normalintrsts_cardinssts):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_bufrdready (normalintrsts_bufrdready):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_bufwrready (normalintrsts_bufwrready):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h	**normalintrsts_dmainterrupt (normalintrsts_dmainterrupt):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_blkgapevent (normalintrsts_blkgapevent):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h	**normalintrsts_xfercomplete (normalintrsts_xfercomplete):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_cmdcomplete (normalintrsts_cmdcomplete):** This bit is set when we get the end bit of the command response.

20.7.23 ErrorInterruptStatus_Register (errorintrsts)—Offset 32h

This register gives the status of the error interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_hosterror (errorintrsts_hosterror):** Occurs when detecting Host ERROR
11:10	0h RO	Reserved.
9	0h	**errorintrsts_admaerror (errorintrsts_admaerror):** This bit is set when the Host Controller detects errors during ADMA based data transfer.

Bit Range	Default & Access	Field Name (ID): Description
8	0h	**errorintrsts_autocmderror (errorintrsts_autocmderror):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_currlimiterror (errorintrsts_currlimiterror):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_dataendbiterror (errorintrsts_dataendbiterror):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h	**errorintrsts_datacrcerror (errorintrsts_datacrcerror):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h	**errorintrsts_datatimeouterror (errorintrsts_datatimeouterror):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_cmdindexerror (errorintrsts_cmdindexerror):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_cmdendbiterror (errorintrsts_cmdendbiterror):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_cmdcrcerror (errorintrsts_cmdcrcerror):** This bit is set when Command CRC Error is generated. '0' No Error, '1' CRC Error
0	0h	**errorintrsts_cmdtimeouterror (errorintrsts_cmdtimeouterror):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

20.7.24 Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h

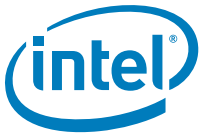
This register is used to enable the normal interrupt status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HC shall control error Interrupts using the Error Interrupt Status Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.



Bit Range	Default & Access	Field Name (ID): Description
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** This bit is set when we get the end bit of the command response.

20.7.25 Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h

This register is used to enable the Error Interrupt Status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_enableregbit12 (errorintrsts_enableregbit12):** Occurs when detecting ERROR in m_hresp(dma transaction)
11	0h RO	Reserved.
10	0h	**errorintrsts_enableregbit10 (errorintrsts_enableregbit10):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h	**errorintrsts_enableregbit9 (errorintrsts_enableregbit9):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h	**errorintrsts_enableregbit8 (errorintrsts_enableregbit8):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_enableregbit7 (errorintrsts_enableregbit7):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_enableregbit6 (errorintrsts_enableregbit6):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h	**errorintrsts_enableregbit5 (errorintrsts_enableregbit5):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.

Bit Range	Default & Access	Field Name (ID): Description
4	0h	**errorintrsts_enableregbit4 (errorintrsts_enableregbit4):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_enableregbit3 (errorintrsts_enableregbit3):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_enableregbit2 (errorintrsts_enableregbit2):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_enableregbit1 (errorintrsts_enableregbit1):** This bit is set when Command CRC Error is generated.
0	0h	**errorintrsts_enableregbit0 (errorintrsts_enableregbit0):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

20.7.26 Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h

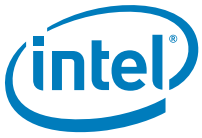
This register is used to enable the Normal Interrupt Signal register

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HD shall control error Interrupts using the Error Interrupt Signal Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** Boot Terminate Interrupt Signal Enable
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** Boot ack rcv Signal Enable
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** Re-Tuning Event Signal Enable
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** INT_C Signal Enable
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** INT_B Signal Enable
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** INT_A Signal Enable



Bit Range	Default & Access	Field Name (ID): Description
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** Card Interrupt Signal Enable
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** Card Removal Signal Enable
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** Card Insertion Signal Enable
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** Buffer Read Ready Signal Enable
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** Buffer Write Ready Signal Enable
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** DMA Interrupt Signal Enable
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** Block Gap Event Signal Enable
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** Transfer Complete Signal Enable
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** Command Complete Signal Enable

20.7.27 Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah

This register is used to enable Error Interrupt Signal register

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsig_enableregbit12 (errorintrsig_enableregbit12):** Target Response Error Signal Enable
11	0h RO	Reserved.
10	0h	**errorintrsig_enableregbit10 (errorintrsig_enableregbit10):** Tuning Error Signal Enable

Bit Range	Default & Access	Field Name (ID): Description
9	0h	**errorintrsig_enableregbit9 (errorintrsig_enableregbit9):** ADMA Error Signal Enable
8	0h	**errorintrsig_enableregbit8 (errorintrsig_enableregbit8):** Auto CMD Error Signal Enable
7	0h	**errorintrsig_enableregbit7 (errorintrsig_enableregbit7):** Current Limit Error Signal Enable
6	0h	**errorintrsig_enableregbit6 (errorintrsig_enableregbit6):** Data End Bit Error Signal Enable
5	0h	**errorintrsig_enableregbit5 (errorintrsig_enableregbit5):** Data CRC Error Signal Enable
4	0h	**errorintrsig_enableregbit4 (errorintrsig_enableregbit4):** Data Timeout Error Signal Enable
3	0h	**errorintrsig_enableregbit3 (errorintrsig_enableregbit3):** Command Index Error Signal Enable
2	0h	**errorintrsig_enableregbit2 (errorintrsig_enableregbit2):** Command End Bit Error Signal Enable
1	0h	**errorintrsig_enableregbit1 (errorintrsig_enableregbit1):** Command CRC Error Signal Enable
0	0h	**errorintrsig_enableregbit0 (errorintrsig_enableregbit0):** Command Timeout Error Signal Enable

20.7.28 Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch

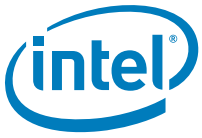
This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**autocmderrsts_nexterror (autocmderrsts_nexterror):** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23
6:5	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
4	0h	**autocmderrsts_indexerror (autocmderrsts_indexerror):** Occurs if the Command Index error occurs in response to a command.
3	0h	**autocmderrsts_endbiterror (autocmderrsts_endbiterror):** Occurs when detecting that the end bit of command response is 0.
2	0h	**autocmderrsts_crcerror (autocmderrsts_crcerror):** Occurs when detecting a CRC error in the command response.
1	0h	**autocmderrsts_timeouterror (autocmderrsts_timeouterror):** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command.
0	0h	**autocmderrsts_notexecerror (autocmderrsts_notexecerror):** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error.

20.7.29 Host Control2 Register (hostcontrol2)—Offset 3Eh

This register is used to program UHS Select Mode,UHS Select Mode,Driver Strength Select,Execute Tuning,Sampling Clock Select,Asynchronous Interrupt Enable and Preset value enable

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**hostctrl2_presetvalueenable (hostctrl2_presetvalueenable):** This bit enables the functions defined in the Preset Value registers.
14	0h	**hostctrl2_asynchintrenable (hostctrl2_asynchintrenable):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register.
13:10	0h RO	Reserved.
9	0h	**hostctrl2_driverstrength_bit2 (hostctrl2_driverstrength_bit2):** This is the programmed Drive STrength output and Bit[2] of the sdhccore_drivestrength value.
8	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7	0h	**hostctrl2_samplingclkselect (hostctrl2_samplingclkselect):** This bit is set by tuning procedure when Execute Tuning is cleared.
6	0h	**hostctrl2_executetuning (hostctrl2_executetuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed.
5:4	0h	**hostctrl2_driverstrength (hostctrl2_driverstrength):** Host Controller output driver in 1.8V signaling is selected by this bit.
3	0h	**hostctrl2_1p8vsignallingena (hostctrl2_1p8vsignallingena):** This bit controls voltage regulator for I/O cell.
2:0	0h	**hostctrl2_uhsmodeselect (hostctrl2_uhsmodeselect):** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1.

20.7.30 Capabilities Register (capabilities)—Offset 40h

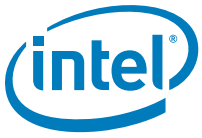
This register provides the host driver with information specific to the host controller implementation

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h	**corecfg_hs400support (corecfg_hs400support):** This field indicates whether HS400 is supported or not.
62:58	0h RO	Reserved.
57	0h	**corecfg_spiblkmode (corecfg_spiblkmode):** This field indicates whether SPI Block Mode is supported or not.
56	0h	**corecfg_spisupport (corecfg_spisupport):** This field indicates whether SPI Mode is supported or not.
55:48	0h	**corecfg_clockmultiplier (corecfg_clockmultiplier):** This field indicates clock multiplier value of programmable clock generator.
47:46	0h	**corecfg_retuningmodes (corecfg_retuningmodes):** This field defines the re-tuning capability of a Host Controller.
45	0h	**corecfg_tuningforsdr50 (corecfg_tuningforsdr50):** If this bit is set to 1, this Host Controller requires tuning to operate SDR50.
44	0h RO	Reserved.



Bit Range	Default & Access	Field Name (ID): Description
43:40	0h	**corecfg_retuningtimercnt (corecfg_retuningtimercnt):** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3.
39	0h	**corecfg_type4support (corecfg_type4support):** This bit indicates support of Type 4 Driver.
38	0h	**corecfg_ddriversupport (corecfg_ddriversupport):** This bit indicates support of Driver Type D for 1.8 Signaling.
37	0h	**corecfg_cdriversupport (corecfg_cdriversupport):** This bit indicates support of Driver Type C for 1.8 Signaling.
36	0h	**corecfg_adriversupport (corecfg_adriversupport):** This bit indicates support of Driver Type A for 1.8 Signaling.
35	0h RO	Reserved.
34	0h	**corecfg_ddr50support (corecfg_ddr50support):** This bit indicates whether DDR50 is supported.
33	0h	**corecfg_sdr104support (corecfg_sdr104support):** This bit indicates whether SDR104 is supported.SDR104 requires tuning.
32	0h	**corecfg_sdr50support (corecfg_sdr50support):** This bit indicates whether SDR50 is supported.
31:30	0h	**corecfg_slottype (corecfg_slottype):** This field indicates usage of a slot by a specific Host System
29	0h	**corecfg_asynchintrsupport (corecfg_asynchintrsupport):** Asynchronous Interrupt Support
28	0h	**corecfg_64bitsupport (corecfg_64bitsupport):** This bit indicates whether the HC supports 64bit System Bus
27	0h RO	Reserved.
26	0h	**corecfg_1p8voltsupport (corecfg_1p8voltsupport):** This bit indicates whether the HC supports 1.8V.
25	0h	**corecfg_3p0voltsupport (corecfg_3p0voltsupport):** This bit indicates whether the HC supports 3.0V.
24	0h	**corecfg_3p3voltsupport (corecfg_3p3voltsupport):** This bit indicates whether the HC supports 3.3V.
23	0h	**corecfg_suspressupport (corecfg_suspressupport):** This bit indicates whether the HC supports Suspend/Resume functionality.
22	0h	**corecfg_sdmasupport (corecfg_sdmasupport):** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly.
21	0h	**corecfg_highspeedsupport (corecfg_highspeedsupport):** This bit indicates whether the HC and the Host System support High Speed mode.
20	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
19	0h	**corecfg_adma2support (corecfg_adma2support):** '0'ADMA2 Not Supported
18	0h	**corecfg_8bitsupport (corecfg_8bitsupport):** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode.
17:16	0h	**corecfg_maxblklength (corecfg_maxblklength):** This value indicates the maximum block size that the HD can read and write to the buffer in the HC.
15:8	0h	**corecfg_baseclkfreq (corecfg_baseclkfreq):** 6-bit Base Clock Frequency
7	0h	**corecfg_timeoutclkunit (corecfg_timeoutclkunit):** This bit shows the unit of base clock frequency used to detect Data Timeout Error.
6	0h RO	Reserved.
5:0	0h	**corecfg_timeoutclkfreq (corecfg_timeoutclkfreq):** This bit shows the base clock frequency used to detect Data Timeout Error.

20.7.31 Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h

This register indicates maximum current capability for each voltage

Access Method

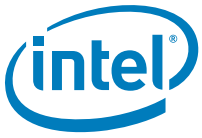
Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0h RO	Reserved.
23:16	0h	**corecfg_maxcurrent1p8v (corecfg_maxcurrent1p8v):** Maximum Current for 1.8V
15:8	0h	**corecfg_maxcurrent3p0v (corecfg_maxcurrent3p0v):** Maximum Current for 3.0V
7:0	0h	**corecfg_maxcurrent3p3v (corecfg_maxcurrent3p3v):** Maximum Current for 3.3V

20.7.32 Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.



Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**forcecmdnotissuedbyautocmd12err (forcecmdnotissuedbyautocmd12err):** Force Event for Command Not Issued by AUTO CMD12 Error
6:5	0h RO	Reserved.
4	0h	**forceautocmdindexerr (forceautocmdindexerr):** Force Event for AUTO CMD Index Error
3	0h	**forceautocmdendbiterr (forceautocmdendbiterr):** Force Event for AUTO CMD End Bit Error
2	0h	**forceautocmdcrcerr (forceautocmdcrcerr):** Force Event for AUTO CMD Timeout Error
1	0h	**forceautocmdtimeouterr (forceautocmdtimeouterr):** Force Event for AUTO CMD Timeout Error
0	0h	**forceautocmdnotexec (forceautocmdnotexec):** Force Event for AUTO CMD12 Not Executed

20.7.33 Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h	**forcetuningerr (forcetuningerr):** Force Event for Tuning Error
9	0h	**forceadmaerr (forceadmaerr):** Force Event for ADMA Error'0' no interrupt, '1' interrupt generated

Bit Range	Default & Access	Field Name (ID): Description
8	0h	**forceautocmderr (forceautocmderr):** Force Event for Auto CMD Error '0' no interrupt, '1' interrupt generated
7	0h	**forcecurrlimerr (forcecurrlimerr):** Force Event for Current Limit Error '0' no interrupt, '1' interrupt generated
6	0h	**forcedatendbiterr (forcedatendbiterr):** Force Event for Data End Bit Error. '0' no interrupt, '1' interrupt generated
5	0h	**forcedatcrcerr (forcedatcrcerr):** Force Event for Data CRC Error
4	0h	**forcedattimeouterr (forcedattimeouterr):** Force Event for Data Timeout Error '0' no interrupt, '1' interrupt generated
3	0h	**forcecmdindexerr (forcecmdindexerr):** Force Event for Command Index Error
2	0h	**forcecmdendbiterr (forcecmdendbiterr):** Force Event for Command End Bit Error '0' no interrupt, '1' interrupt generated
1	0h	**forcecmdcrcerr (forcecmdcrcerr):** Force Event for Command CRC Error
0	0h	**forcecmdtimeouterr (forcecmdtimeouterr):** Force Event for CMD Timeout Error '0' No interrupt, '1' interrupt generated

20.7.34 ADMA Error Status Register (admaerrsts)—Offset 54h

When the ADMA Error interrupt occur, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor

Access Method

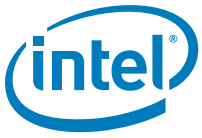
Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**admaerrsts_admalenmismatcherr (admaerrsts_admalenmismatcherr):** ADMA Length Mismatch Error
1:0	0h	**admaerrsts_admaerrorstate (admaerrsts_admaerrorstate):** This field indicates the state of ADMA when error is occurred during ADMA data transfer.

20.7.35 ADMA System Address Register0&1 (admasysaddr01)—Offset 58h

This register contains the physical address used for ADMA data transfer



Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**adma_sysaddress0 (adma_sysaddress0):** This register holds byte address of executing command of the Descriptor table.

20.7.36 ADMA System Address Register1 (admasysaddr2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress2 (adma_sysaddress2):** This register holds byte address of executing command of the Descriptor table.

20.7.37 ADMA System Address Register1 (admasysaddr3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress3 (adma_sysaddress3):** This register holds byte address of executing command of the Descriptor table.

20.7.38 Boot Timeout Control Register (boottimeoutcnt)—Offset 70h

This is used to program the boot timeout value counter

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**boot_timeoutcnt (boot_timeoutcnt):** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card.

20.7.39 Slot Interrupt Status Register (slotintrsts)—Offset FCh

This register is used to read the interrupt signal for each slot.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7:0	0h	**sdhchostif_slotintrsts (sdhchostif_slotintrsts):** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot.

20.7.40 Host Controller Version Register (hostcontrollerver)—Offset FEh

This register is used to read the vendor version number and specification version number

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1002h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h	**SDHC_VENVERNUM (SDHC_VENVERNUM):** This status is reserved for the vendor version number.

Bit Range	Default & Access	Field Name (ID): Description
7:0	2h	**SpecificationVersionNumber (SpecificationVersionNumber):** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.

20.8 Registers Summary

Table 20-8. Summary of soc_regs_wrapper Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	(DEVVENDID)—Offset 0h	8086h
4h	7h	(STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	(REVCLASSCODE)—Offset 8h	8050100h
Ch	Fh	(CLLATHEADERBIST)—Offset Ch	0h
10h	13h	(BAR)—Offset 10h	4h
14h	17h	(BAR_HIGH)—Offset 14h	0h
18h	1Bh	(BAR1)—Offset 18h	4h
1Ch	1Fh	(BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	(SUBSYSTEMID)—Offset 2Ch	0h
30h	33h	(EXPANSION_ROM_BASEADDR)—Offset 30h	0h
34h	37h	(CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	(INTERRUPTREG)—Offset 3Ch	0h
80h	83h	(POWERCAPID)—Offset 80h	39001h
84h	87h	(PMECTRLSTATUS)—Offset 84h	8h
90h	93h	(PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	(DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	(D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	8041h
9Ch	9Fh	(DEVICE_IDLE_POINTER_REG)—Offset 9Ch	81C1h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	290800h

20.8.1 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

20.8.2 (STATUSCOMMAND)—Offset 4h

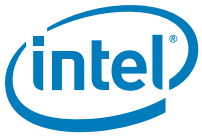
STATUSCOMMAND- Status and Command

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**



20.8.3 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 8050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	80501h RO	**CLASS_CODES**
7:0	0h RO	**RID**

20.8.4 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

20.8.5 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

20.8.6 (BAR_HIGH)—Offset 14h

BAR -Base Address Register High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH**

20.8.7 (BAR1)—Offset 18h

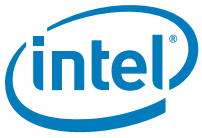
BAR1 -Base Address Register1

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**



Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**MESSAGE_SPACE1**

20.8.8 (BAR1_HIGH)—Offset 1Ch

BAR1 -Base Address Register1 High

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH**

20.8.9 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

20.8.10 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

20.8.11 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

20.8.12 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

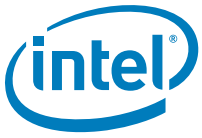
Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	0h RO	**INTPIN**
7:0	0h RW	**INTLINE**

20.8.13 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID



Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 39001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

20.8.14 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

20.8.15 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

20.8.16 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

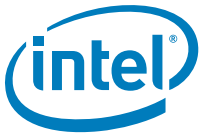
20.8.17 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 8041h



Bit Range	Default & Access	Field Name (ID): Description
31:4	804h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**
0	1h RO	**SW_LAT_VALID**

20.8.18 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 81C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	81Ch RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

20.8.19 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 27 **Function:** 0

Default: 290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	1h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**
16	1h RW	**PMCRE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

20.9 Registers Summary

Table 20-9. Summary of SDHOST_OCP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h	0h
4h	5h	BlockSize Register (blocksize)—Offset 4h	0h
6h	7h	BlockCount Register (blockcount)—Offset 6h	0h
8h	Bh	Argument1 Register (argument1)—Offset 8h	0h
Ch	Dh	TransferMode Register (transfermode)—Offset Ch	0h
Eh	Fh	Command Register (command)—Offset Eh	0h
10h	13h	Response Register (response01)—Offset 10h	0h
14h	15h	Response Register (response2)—Offset 14h	0h
16h	17h	Response Register (response3)—Offset 16h	0h
18h	19h	Response Register (response4)—Offset 18h	0h
1Ah	1Bh	Response Register (response5)—Offset 1Ah	0h
1Ch	1Dh	Response Register (response6)—Offset 1Ch	0h
1Eh	1Fh	Response Register (response7)—Offset 1Eh	0h
20h	23h	Buffer DataPort Register (dataport)—Offset 20h	0h
28h	28h	HostControl1 Register (hostcontrol1)—Offset 28h	0h
29h	29h	PowerControl Register (powercontrol)—Offset 29h	0h
2Ah	2Ah	BlockGapControl Register (blockgapcontrol)—Offset 2Ah	80h
2Bh	2Bh	Wakeup Control Register (wakeupcontrol)—Offset 2Bh	0h
2Ch	2Dh	Clock Control Register (clockcontrol)—Offset 2Ch	0h
2Eh	2Eh	Timeout Control Register (timeoutcontrol)—Offset 2Eh	0h
2Fh	2Fh	Software Reset Register (softwarereset)—Offset 2Fh	0h
30h	31h	Normal Interrupt Status Register (normalintrsts)—Offset 30h	0h
32h	33h	ErrorInterruptStatus_Register (errorintrsts)—Offset 32h	0h
34h	35h	Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h	0h

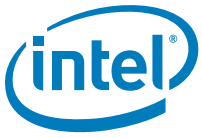


Table 20-9. Summary of SDHOST_OCP Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
36h	37h	Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h	0h
38h	39h	Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h	0h
3Ah	3Bh	Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah	0h
3Ch	3Dh	Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch	0h
3Eh	3Fh	Host Control2 Register (hostcontrol2)—Offset 3Eh	0h
40h	47h	Capabilities Register (capabilities)—Offset 40h	0h
48h	4Fh	Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h	0h
50h	51h	Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h	0h
52h	53h	Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h	0h
54h	54h	ADMA Error Status Register (admaerrsts)—Offset 54h	0h
58h	5Bh	ADMA System Address Register0&1 (admasysaddr01)—Offset 58h	0h
5Ch	5Dh	ADMA System Address Register1 (admasysaddr2)—Offset 5Ch	0h
5Eh	5Fh	ADMA System Address Register1 (admasysaddr3)—Offset 5Eh	0h
70h	73h	Boot Timeout Control Register (boottimeoutcnt)—Offset 70h	0h
FCh	FDh	Slot Interrupt Status Register (slotintrsts)—Offset FCh	0h
FEh	FFh	Host Controller Version Register (hostcontrollerver)—Offset FEh	1002h

20.9.1 SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h

This register contains concatinates reg_sdmasysaddrlo and reg_sdmasysaddrhi

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdma_sysaddress (sdma_sysaddress):** refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi

20.9.2 BlockSize Register (blocksize)—Offset 4h

This register is used to configure the number of bytes in a data block

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14:12	0h	**sdma_bufboundary (sdma_bufboundary):** This Field specifies DMA Buffer Boundary
11:0	0h	**xfer_blocksize (xfer_blocksize):** This Field specifies Block Size for Data Transfers

20.9.3 BlockCount Register (blockcount)—Offset 6h

This register is used to configure the number of data blocks

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**xfer_blockcount (xfer_blockcount):** This Register specifies Block Size for Data Transfers

20.9.4 Argument1 Register (argument1)—Offset 8h

This register contains concatinates argument1lo and argument1hi registers to result SD Command Argument

Access Method

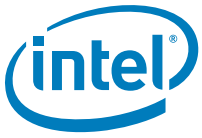
Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_argument1 (command_argument1):** refer t oreg_argument1lo and reg_argument1hi.

20.9.5 TransferMode Register (transfermode)—Offset Ch

This register is used to control the operations of data transfers



Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h	**xfermode_multiblksel (xfermode_multiblksel):** This bit enables multiple block data transfers.
4	0h	**xfermode_dataxferdir (xfermode_dataxferdir):** This bit defines the direction of data transfers.
3:2	0h	**xfermode_autocmdena (xfermode_autocmdena):** This field determines use of auto command functions.
1	0h	**xfermode_blkcntena (xfermode_blkcntena):** This bit is used to enable the Block count register, which is only relevant for multiple block transfers
0	0h	**xfermode_dmaenable (xfermode_dmaenable):** '1' to enable DMA,

20.9.6 Command Register (command)—Offset Eh

This register is used to program the Command for host controller

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	0h	**command_cmdindex (command_cmdindex):** This bit shall be set to the command number (CMD0-63, ACMD0-63).
7:6	0h	**command_cmdtype (command_cmdtype):** This bit is used for select different command types.
5	0h	**command_datapresent (command_datapresent):** This bit is used to checking whether data present or not.
4	0h	**command_indexchkena (command_indexchkena):** This bit is used to enable/disable Command Index checking.
3	0h	**command_crcchkena (command_crcchkena):** This bit is used to enable/disable CRC checking.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	Reserved.
1:0	0h	**command_responsetype (command_responsetype):** Response Type Select.

20.9.7 Response Register (response01)—Offset 10h

This register is used to store responses from SD Cards (concatinates response0 & response1 registers)

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.8 Response Register (response2)—Offset 14h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

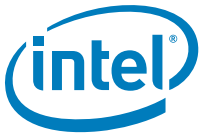
Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.9 Response Register (response3)—Offset 16h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.10 Response Register (response4)—Offset 18h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.11 Response Register (response5)—Offset 1Ah

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.12 Response Register (response6)—Offset 1Ch

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.13 Response Register (response7)—Offset 1Eh

This register is used to store responses from SD Cards

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

20.9.14 Buffer DataPort Register (dataport)—Offset 20h

This register is used to access internal buffer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

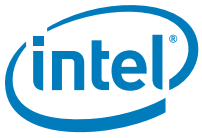
Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**sdhcdmactrl_piobufrddata (sdhcdmactrl_piobufrddata):** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

20.9.15 HostControl1 Register (hostcontrol1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**



Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h	**hostctrl1_cdsigselect (hostctrl1_cdsigselect):** This bit selects source for card detection.
6	0h	**hostctrl1_cdtestlevel (hostctrl1_cdtestlevel):** This bit is used for indicating whether card is inserted or not.
5	0h	**hostctrl1_extdatawidth (hostctrl1_extdatawidth):** This bit controls 8-bit bus width mode for embedded device.
4:3	0h	**hostctrl1_dmaselect (hostctrl1_dmaselect):** One of supported DMA modes can be selected.
2	0h	**hostctrl1_highspeedena (hostctrl1_highspeedena):** This bit is used for setting speed mode.
1	0h	**hostctrl1_datawidth (hostctrl1_datawidth):** This bit selects the data width of the HC.
0	0h	**hostctrl1_ledcontrol (hostctrl1_ledcontrol):** This bit is used to caution the user not to remove the card while the SD card is being accessed.

20.9.16 PowerControl Register (powercontrol)—Offset 29h

This register is used to program the SD Bus power and voltage level

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h	**emmc_hwreset (emmc_hwreset):** Hardware reset signal is generated for eMMC card.
3:1	0h	**pwrctrl_sdbusvoltage (pwrctrl_sdbusvoltage):** By setting these bits, the HD selects the voltage level for the SD card.
0	0h	**pwrctrl_sdbuspower (pwrctrl_sdbuspower):** This bit is used detect whether power is on or off.

20.9.17 BlockGapControl Register (blockgapcontrol)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h	**blkgapctrl_bootackena (blkgapctrl_bootackena):** To check for the boot acknowledge in boot operation.
6	0h	**blkgapctrl_altbootmode (blkgapctrl_altbootmode):** To start boot code access in alternative mode.
5	0h	**blkgapctrl_bootenable (blkgapctrl_bootenable):** To start boot code access. '0' To stop boot code access, '1' To start boot code access
4	0h	**blkgapctrl_spimode (blkgapctrl_spimode):** SPI mode enable bit. '0' SD Mode, '1' SPI Mode
3	0h	**blkgapctrl_interrupt (blkgapctrl_interrupt):** This bit is valid only in 4-bit mode of the SD card andselects a sample point in the interrupt cycle.
2	0h	**blkgapctrl_rdwaitctrl (blkgapctrl_rdwaitctrl):** The read wait function is optional for SD cards.
1	0h	**blkgapctrl_continue (blkgapctrl_continue):** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request.
0	0h	**blkgapctrl_stopatblkgap (blkgapctrl_stopatblkgap):** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers.

20.9.18 Wakeup Control Register (wakeupcontrol)—Offset 2Bh

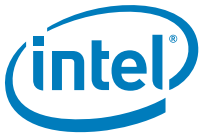
This register is used to program the wakeup functionality

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**wkupctrl_cardremoval (wkupctrl_cardremoval):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.



Bit Range	Default & Access	Field Name (ID): Description
1	0h	**wkupctrl_cardinsertion (wkupctrl_cardinsertion):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
0	0h	**wkupctrl_cardinterrupt (wkupctrl_cardinterrupt):** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register.

20.9.19 Clock Control Register (clockcontrol)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h	**clkctrl_sdclkfreqsel (clkctrl_sdclkfreqsel):** This register is used to select the frequency of the SDCLK pin.
7:6	0h	**clkctrl_sdclkfreqsel_upperbits (clkctrl_sdclkfreqsel_upperbits):** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select
5	0h	**clkctrl_clkgensel (clkctrl_clkgensel):** This bit is used to select the clock generator mode in SDCLK Frequency Select.
4:3	0h RO	Reserved.
2	0h	**clkctrl_sdclkena (clkctrl_sdclkena):** This bit enables/disables SD Clock. '0' Disable, '1' Enable
1	0h	**sdhcclkgen_intclkstable_dsync (sdhcclkgen_intclkstable_dsync):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1.
0	0h	**clkctrl_intclkena (clkctrl_intclkena):** This bit enables setting of internal clock.'0' Stop, '1' Oscillate

20.9.20 Timeout Control Register (timeoutcontrol)—Offset 2Eh

The register sets the Data Timeout counter value

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h	**timeout_ctrvalue (timeout_ctrvalue):** This value determines the interval by which DAT line time-outs are detected.

20.9.21 Software Reset Register (softwarereset)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h	**swreset_for_dat (swreset_for_dat):** Only part of data circuit is reset. '0' Work, '1' Reset
1	0h	**swreset_for_cmd (swreset_for_cmd):** Only part of command circuit is reset.'0' Work, '1' reset.
0	0h	**swreset_for_all (swreset_for_all):** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD.

20.9.22 Normal Interrupt Status Register (normalintrsts)—Offset 30h

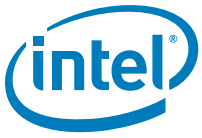
This register gives the status of all the interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**reg_errorintrsts (reg_errorintrsts):** This bit is set If any of the bits in the Error Interrupt Status Register are set.



Bit Range	Default & Access	Field Name (ID): Description
14	0h	**normalintrsts_bootcomplete (normalintrsts_bootcomplete):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_rcvbootack (normalintrsts_rcvbootack):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_retuningevent (normalintrsts_retuningevent):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h	**normalintrsts_intc (normalintrsts_intc):** This status is set if INT_C is enabled and INT_C# pin is in low level. It is cleared by resetting the INT_C interrupt factor.
10	0h	**normalintrsts_intb (normalintrsts_intb):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h	**normalintrsts_inta (normalintrsts_inta):** This status is set if INT_A is enabled and INT_A# pin is in low level. It is cleared by resetting
8	0h	**normalintrsts_cardintsts (normalintrsts_cardintsts):** This status is set to generate Card Interrupt. '0' No Card Interrupt, '1' Generate Card Interrupt
7	0h	**normalintrsts_cardremsts (normalintrsts_cardremsts):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h	**normalintrsts_cardinssts (normalintrsts_cardinssts):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_bufrdready (normalintrsts_bufrdready):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_bufwrready (normalintrsts_bufwrready):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h	**normalintrsts_dmainterrupt (normalintrsts_dmainterrupt):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_blkgapevent (normalintrsts_blkgapevent):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h	**normalintrsts_xfercomplete (normalintrsts_xfercomplete):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_cmdcomplete (normalintrsts_cmdcomplete):** This bit is set when we get the end bit of the command response.

20.9.23 ErrorInterruptStatus_Register (errorintrsts)—Offset 32h

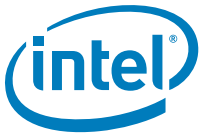
This register gives the status of the error interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_hosterror (errorintrsts_hosterror):** Occurs when detecting Host ERROR
11:10	0h RO	Reserved.
9	0h	**errorintrsts_admaerror (errorintrsts_admaerror):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h	**errorintrsts_autocmderror (errorintrsts_autocmderror):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_currlimiterror (errorintrsts_currlimiterror):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_dataendbiterror (errorintrsts_dataendbiterror):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h	**errorintrsts_datacrcerror (errorintrsts_datacrcerror):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h	**errorintrsts_datatimeouterror (errorintrsts_datatimeouterror):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_cmdindexerror (errorintrsts_cmdindexerror):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_cmdendbiterror (errorintrsts_cmdendbiterror):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_cmdcrcerror (errorintrsts_cmdcrcerror):** This bit is set when Command CRC Error is generated. '0' No Error, '1' CRC Error



Bit Range	Default & Access	Field Name (ID): Description
0	0h	**errorintrsts_cmdtimeouterror (errorintrsts_cmdtimeouterror):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

20.9.24 Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h

This register is used to enable the normal interrupt status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HC shall control error Interrupts using the Error Interrupt Status Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** This status is set if the boot operation gets terminated.
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** This status is set if the boot acknowledge is received from device.
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.

Bit Range	Default & Access	Field Name (ID): Description
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** This bit is set when a read / write transaction is completed.
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** This bit is set when we get the end bit of the command response.

20.9.25 Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h

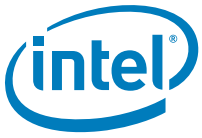
This register is used to enable the Error Interrupt Status register fields

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsts_enableregbit12 (errorintrsts_enableregbit12):** Occurs when detecting ERROR in m_hresp(dma transaction)
11	0h RO	Reserved.
10	0h	**errorintrsts_enableregbit10 (errorintrsts_enableregbit10):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting



Bit Range	Default & Access	Field Name (ID): Description
9	0h	**errorintrsts_enableregbit9 (errorintrsts_enableregbit9):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h	**errorintrsts_enableregbit8 (errorintrsts_enableregbit8):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h	**errorintrsts_enableregbit7 (errorintrsts_enableregbit7):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h	**errorintrsts_enableregbit6 (errorintrsts_enableregbit6):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h	**errorintrsts_enableregbit5 (errorintrsts_enableregbit5):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h	**errorintrsts_enableregbit4 (errorintrsts_enableregbit4):** This status is set if Data Timeout error occurs.
3	0h	**errorintrsts_enableregbit3 (errorintrsts_enableregbit3):** Occurs if a Command Index error occurs in the Command Response.
2	0h	**errorintrsts_enableregbit2 (errorintrsts_enableregbit2):** Occurs when detecting that the end bit of a command response is 0.
1	0h	**errorintrsts_enableregbit1 (errorintrsts_enableregbit1):** This bit is set when Command CRC Error is generated.
0	0h	**errorintrsts_enableregbit0 (errorintrsts_enableregbit0):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

20.9.26 Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h

This register is used to enable the Normal Interrupt Signal register

Access Method

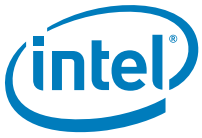
Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HD shall control error Interrupts using the Error Interrupt Signal Enable register.
14	0h	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** Boot Terminate Interrupt Signal Enable
13	0h	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** Boot ack rcv Signal Enable
12	0h	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** Re-Tuning Event Signal Enable
11	0h	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** INT_C Signal Enable
10	0h	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** INT_B Signal Enable
9	0h	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** INT_A Signal Enable
8	0h	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** Card Interrupt Signal Enable
7	0h	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** Card Removal Signal Enable
6	0h	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** Card Insertion Signal Enable
5	0h	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** Buffer Read Ready Signal Enable
4	0h	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** Buffer Write Ready Signal Enable
3	0h	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** DMA Interrupt Signal Enable
2	0h	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** Block Gap Event Signal Enable
1	0h	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** Transfer Complete Signal Enable
0	0h	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** Command Complete Signal Enable

20.9.27 Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah

This register is used to enable Error Interrupt Signal register



Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h	**errorintrsig_enableregbit12 (errorintrsig_enableregbit12):** Target Response Error Signal Enable
11	0h RO	Reserved.
10	0h	**errorintrsig_enableregbit10 (errorintrsig_enableregbit10):** Tuning Error Signal Enable
9	0h	**errorintrsig_enableregbit9 (errorintrsig_enableregbit9):** ADMA Error Signal Enable
8	0h	**errorintrsig_enableregbit8 (errorintrsig_enableregbit8):** Auto CMD Error Signal Enable
7	0h	**errorintrsig_enableregbit7 (errorintrsig_enableregbit7):** Current Limit Error Signal Enable
6	0h	**errorintrsig_enableregbit6 (errorintrsig_enableregbit6):** Data End Bit Error Signal Enable
5	0h	**errorintrsig_enableregbit5 (errorintrsig_enableregbit5):** Data CRC Error Signal Enable
4	0h	**errorintrsig_enableregbit4 (errorintrsig_enableregbit4):** Data Timeout Error Signal Enable
3	0h	**errorintrsig_enableregbit3 (errorintrsig_enableregbit3):** Command Index Error Signal Enable
2	0h	**errorintrsig_enableregbit2 (errorintrsig_enableregbit2):** Command End Bit Error Signal Enable
1	0h	**errorintrsig_enableregbit1 (errorintrsig_enableregbit1):** Command CRC Error Signal Enable
0	0h	**errorintrsig_enableregbit0 (errorintrsig_enableregbit0):** Command Timeout Error Signal Enable

20.9.28 Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**autocmderrsts_nexterror (autocmderrsts_nexterror):** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23
6:5	0h RO	Reserved.
4	0h	**autocmderrsts_indexerror (autocmderrsts_indexerror):** Occurs if the Command Index error occurs in response to a command.
3	0h	**autocmderrsts_endbiterror (autocmderrsts_endbiterror):** Occurs when detecting that the end bit of command response is 0.
2	0h	**autocmderrsts_crcerror (autocmderrsts_crcerror):** Occurs when detecting a CRC error in the command response.
1	0h	**autocmderrsts_timeouterror (autocmderrsts_timeouterror):** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command.
0	0h	**autocmderrsts_notexecerror (autocmderrsts_notexecerror):** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error.

20.9.29 Host Control2 Register (hostcontrol2)—Offset 3Eh

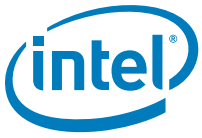
This register is used to program UHS Select Mode,UHS Select Mode,Driver Strength Select,Execute Tuning,Sampling Clock Select,Asynchronous Interrupt Enable and Preset value enable

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h	**hostctrl2_presetvalueenable (hostctrl2_presetvalueenable):** This bit enables the functions defined in the Preset Value registers.



Bit Range	Default & Access	Field Name (ID): Description
14	0h	**hostctrl2_asynchintrenable (hostctrl2_asynchintrenable):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register.
13:10	0h RO	Reserved.
9	0h	**hostctrl2_driverstrength_bit2 (hostctrl2_driverstrength_bit2):** This is the programmed Drive STrength output and Bit[2] of the sdhccore_drivestrength value.
8	0h RO	Reserved.
7	0h	**hostctrl2_samplingclkselect (hostctrl2_samplingclkselect):** This bit is set by tuning procedure when Execute Tuning is cleared.
6	0h	**hostctrl2_executetuning (hostctrl2_executetuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed.
5:4	0h	**hostctrl2_driverstrength (hostctrl2_driverstrength):** Host Controller output driver in 1.8V signaling is selected by this bit.
3	0h	**hostctrl2_1p8vsignallingena (hostctrl2_1p8vsignallingena):** This bit controls voltage regulator for I/O cell.
2:0	0h	**hostctrl2_uhsmodeselect (hostctrl2_uhsmodeselect):** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1.

20.9.30 Capabilities Register (capabilities)—Offset 40h

This register provides the host driver with information specific to the host controller implementation

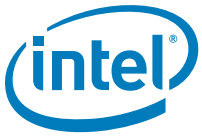
Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h	**corecfg_hs400support (corecfg_hs400support):** This field indicates whether HS400 is supported or not.
62:58	0h RO	Reserved.
57	0h	**corecfg_spiblkmode (corecfg_spiblkmode):** This field indicates whether SPI Block Mode is supported or not.

Bit Range	Default & Access	Field Name (ID): Description
56	0h	**corecfg_spisupport (corecfg_spisupport):** This field indicates whether SPI Mode is supported or not.
55:48	0h	**corecfg_clockmultiplier (corecfg_clockmultiplier):** This field indicates clock multiplier value of programmable clock generator.
47:46	0h	**corecfg_retuningmodes (corecfg_retuningmodes):** This field defines the re-tuning capability of a Host Controller.
45	0h	**corecfg_tuningforsdr50 (corecfg_tuningforsdr50):** If this bit is set to 1, this Host Controller requires tuning to operate SDR50.
44	0h RO	Reserved.
43:40	0h	**corecfg_retuningtimercnt (corecfg_retuningtimercnt):** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3.
39	0h	**corecfg_type4support (corecfg_type4support):** This bit indicates support of Type 4 Driver.
38	0h	**corecfg_ddriversupport (corecfg_ddriversupport):** This bit indicates support of Driver Type D for 1.8 Signaling.
37	0h	**corecfg_cdriversupport (corecfg_cdriversupport):** This bit indicates support of Driver Type C for 1.8 Signaling.
36	0h	**corecfg_adriversupport (corecfg_adriversupport):** This bit indicates support of Driver Type A for 1.8 Signaling.
35	0h RO	Reserved.
34	0h	**corecfg_ddr50support (corecfg_ddr50support):** This bit indicates whether DDR50 is supported.
33	0h	**corecfg_sdr104support (corecfg_sdr104support):** This bit indicates whether SDR104 is supported.SDR104 requires tuning.
32	0h	**corecfg_sdr50support (corecfg_sdr50support):** This bit indicates whether SDR50 is supported.
31:30	0h	**corecfg_slottype (corecfg_slottype):** This field indicates usage of a slot by a specific Host System
29	0h	**corecfg_asynchintrsupport (corecfg_asynchintrsupport):** Asynchronous Interrupt Support
28	0h	**corecfg_64bitsupport (corecfg_64bitsupport):** This bit indicates whether the HC supports 64bit System Bus
27	0h RO	Reserved.
26	0h	**corecfg_1p8voltsupport (corecfg_1p8voltsupport):** This bit indicates whether the HC supports 1.8V.
25	0h	**corecfg_3p0voltsupport (corecfg_3p0voltsupport):** This bit indicates whether the HC supports 3.0V.
24	0h	**corecfg_3p3voltsupport (corecfg_3p3voltsupport):** This bit indicates whether the HC supports 3.3V.



Bit Range	Default & Access	Field Name (ID): Description
23	0h	**corecfg_suspressupport (corecfg_suspressupport):** This bit indicates whether the HC supports Suspend/Resume functionality.
22	0h	**corecfg_sdmasupport (corecfg_sdmasupport):** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly.
21	0h	**corecfg_highspeedsupport (corecfg_highspeedsupport):** This bit indicates whether the HC and the Host System support High Speed mode.
20	0h RO	Reserved.
19	0h	**corecfg_adma2support (corecfg_adma2support):** '0'ADMA2 Not Supported
18	0h	**corecfg_8bitsupport (corecfg_8bitsupport):** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode.
17:16	0h	**corecfg_maxblklength (corecfg_maxblklength):** This value indicates the maximum block size that the HD can read and write to the buffer in the HC.
15:8	0h	**corecfg_baseclkfreq (corecfg_baseclkfreq):** 6-bit Base Clock Frequency
7	0h	**corecfg_timeoutclkunit (corecfg_timeoutclkunit):** This bit shows the unit of base clock frequency used to detect Data Timeout Error.
6	0h RO	Reserved.
5:0	0h	**corecfg_timeoutclkfreq (corecfg_timeoutclkfreq):** This bit shows the base clock frequency used to detect Data Timeout Error.

20.9.31 Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h

This register indicates maximum current capability for each voltage

Access Method

Type: MEM Register (Size: 64 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h	**corecfg_maxcurrent1p8v (corecfg_maxcurrent1p8v):** Maximum Current for 1.8V
15:8	0h	**corecfg_maxcurrent3p0v (corecfg_maxcurrent3p0v):** Maximum Current for 3.0V
7:0	0h	**corecfg_maxcurrent3p3v (corecfg_maxcurrent3p3v):** Maximum Current for 3.3V

20.9.32 Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

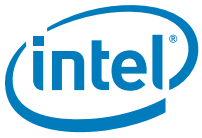
Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h	**forcecmdnotissuedbyautocmd12err (forcecmdnotissuedbyautocmd12err):** Force Event for Command Not Issued by AUTO CMD12 Error
6:5	0h RO	Reserved.
4	0h	**forceautocmdindexerr (forceautocmdindexerr):** Force Event for AUTO CMD Index Error
3	0h	**forceautocmdendbiterr (forceautocmdendbiterr):** Force Event for AUTO CMD End Bit Error
2	0h	**forceautocmdcrcerr (forceautocmdcrcerr):** Force Event for AUTO CMD Timeout Error
1	0h	**forceautocmdtimeouterr (forceautocmdtimeouterr):** Force Event for AUTO CMD Timeout Error
0	0h	**forceautocmdnotexec (forceautocmdnotexec):** Force Event for AUTO CMD12 Not Executed

20.9.33 Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

Access Method



Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h	**forcetuningerr (forcetuningerr):** Force Event for Tuning Error
9	0h	**forceadmaerr (forceadmaerr):** Force Event for ADMA Error'0' no interrupt, '1' interrupt generated
8	0h	**forceautocmderr (forceautocmderr):** Force Event for Auto CMD Error '0' no interrupt, '1' interrupt generated
7	0h	**forcecurrlimerr (forcecurrlimerr):** Force Event for Current Limit Error '0' no interrupt, '1' interrupt generated
6	0h	**forcedatendbiterr (forcedatendbiterr):** Force Event for Data End Bit Error. '0' no interrupt, '1' interrupt generated
5	0h	**forcedatcrcerr (forcedatcrcerr):** Force Event for Data CRC Error
4	0h	**forcedattimeouterr (forcedattimeouterr):** Force Event for Data Timeout Error '0' no interrupt, '1' interrupt generated
3	0h	**forcecmdindexerr (forcecmdindexerr):** Force Event for Command Index Error
2	0h	**forcecmdendbiterr (forcecmdendbiterr):** Force Event for Command End Bit Error '0' no interrupt, '1' interrupt generated
1	0h	**forcecmdcrcerr (forcecmdcrcerr):** Force Event for Command CRC Error
0	0h	**forcecmdtimeouterr (forcecmdtimeouterr):** Force Event for CMD Timeout Error '0' No interrupt, '1' interrupt generated

20.9.34 ADMA Error Status Register (admaerrsts)—Offset 54h

When the ADMA Error interrupt occur, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h	**admaerrsts_admalenmismatcherr (admaerrsts_admalenmismatcherr):** ADMA Length Mismatch Error
1:0	0h	**admaerrsts_admaerrorstate (admaerrsts_admaerrorstate):** This field indicates the state of ADMA when error is occurred during ADMA data transfer.

20.9.35 ADMA System Address Register0&1 (admasysaddr01)—Offset 58h

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**adma_sysaddress0 (adma_sysaddress0):** This register holds byte address of executing command of the Descriptor table.

20.9.36 ADMA System Address Register1 (admasysaddr2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress2 (adma_sysaddress2):** This register holds byte address of executing command of the Descriptor table.

20.9.37 ADMA System Address Register1 (admasysaddr3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h	**adma_sysaddress3 (adma_sysaddress3):** This register holds byte address of executing command of the Descriptor table.

20.9.38 Boot Timeout Control Register (boottimeoutcnt)—Offset 70h

This is used to program the boot timeout value counter

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h	**boot_timeoutcnt (boot_timeoutcnt):** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card.

20.9.39 Slot Interrupt Status Register (slotintrsts)—Offset FCh

This register is used to read the interrupt signal for each slot.

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7:0	0h	**sdhchostif_slotintrsts (sdhchostif_slotintrsts):** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot.

20.9.40 Host Controller Version Register (hostcontrollerver)—Offset FEh

This register is used to read the vendor version number and specification version number

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 1002h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h	**SDHC_VENVERNUM (SDHC_VENVERNUM):** This status is reserved for the vendor version number.
7:0	2h	**SpecificationVersionNumber(SpecificationVersionNumber) :** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.
